"A Jdttown personality, that is, a life--- with which the_ncomprehensive realizer is concerned--- is a unique bundle of

- Cite TOTAL THINKING, !«.!, pp.238-239, ('ayUV

"accumulated experience to which the ` new experience must always be dissynchronous, but only at the moment of original interference, else the new interaction of the greater complex of truth would not have been recognisable and acquirable as new experience and tactical advantage.

"The greatest overall misapprehension regarding the complex- continuities is that which assigns a static or 'at rest' analysis to the sum total sensation of individual experience and consequently to the sum total of all individuals' experience. Against the inertia of a seemingly static whole, each new harmonic incorporation of life therefore seemingly impinges as a dynamic perversity. This is why we frequently remark, 'Kan tends to back up into his future.'

"In addition to the simple arithmetical, algebraic, and geometrical progressions of the first, second, and third degrees of acceleration, mathematics discloses other series, and superseries, of superficially unpredictable mathematical frequencies because they are composed of complementary and reciprocal numbers whose products alone, though never occurring

- Cite TOTAL THINKING, I&I, p.2J9, blay'49

"simultaneously or in whole, are compositely congruent with complex progressions. But these complex components occur in discontinuous series, and are inherently self-inexplicable. The complementary functions must therefore Impinge upon consciousness only as meaningless. As immediately contemplated upon first experience, they of necessity, alone, constitute seemingly absolute perversity of interference. Synergy--- wholistic behavior unpredicted by parts.

"It is, therefore, the unpredictable degree of the super- and the supersuper-¹ n' degrees of complex association of energy frequencies which seem most preposterous. Je cannot view the great confluences of separately and remotely significant events forwardly resultant to now. Synergy is inherently surprising.

"When, however, these complexities are viewed in reverse, from the advantage of even the most mathematically supersuper- interference, the whole regains the acceptable sublimity of aspect, such as a fleet of little ocean racers 100 miles off Bermuda struggling with the waves of interference of the Atlantic turning the perversely interfering winds to advantage by virtue"

- Cite TOTAL THINKING, I&I, pp.239-240, May*49

"of the relative inertia of the relative waves of water, eventually to pass Bermuda, as the whole picture is observed from the airplane and its infinitude of subcomplexities.

"Though both are designed with the same family of principles called 'factors of ships,* the comprehensive r>alizer can see that the superficial difference between the collections of frequencies which makes the Bermuda cruising boat seemingly different from the airplane--- or indeed, man from elephant--- may be in principle the same difference as understandably exists between an early Wright airplane and the latest supersonic alrplabe, or, yet, between an early Chinese hot air balloon and a late helicopter,

"The only difference between the Wright and the supersonic planes is the sum total of recurrent synchronised cyclic events known as the 'succession of design models' --- evolved in complex out of the physical experience with each trial balance of the designed

complex effected by VCHB man, and as let loose after static-load-test-within-limited-controlled- conditlons of variables, into the dynamic-load-tests within the unknown, uncontrolled, comprehensive and a priori design"

- Cite TOTAL THiH KING, (lie I), p.240, Kay*49

"complex of the residual uncharted variables of Universe. The uncharted residual function of Universe balances the special-set function of derived functions--- called from out of the total principles of energetic Universe by the designer as a newly realized mutation of species evolution accomplished by synergetic extension.

"Though having no one common component part identification, the difference between the 1904 Wright Brothers' biplane and the 1963 superJet, supersonic, stratosphere monoplane is only a group difference of a minor complex of almost 60 packed years of experience with the same body of experience called airship; which, in turn, only specialized in a few of the greater body of principles called ship; which specialized in a few of the greater body of principles called Garth; which specialized in a few of the greater body of principles called motion; which specialized in a few of the greater body of principles called energy, which specialized as an original function for the comprehensive Universe. The first derived coordinates of Universe would seem to be functions of energy variant® in respect to intellect.

- Cite TOTAL THIL KING, Ifcl, pp,240-241 , llay'49 **"We can see that the concept of original separation of Universe into two inherent functions— and the further subdivision and expansion of one function into a unique plurality of subsets of functions— and subsequent acceleration of specialized experience with new design events of any one unique subset's evolution, as contrasted against another, can only accelerate superficial differences between any degrees of subsets.**

"It is obvious that if the frequency of cyclic events differs in one geographical environment from another, the life within one environment may be accelerated to increasing degrees of experience over the life within another and, therefore, to sets of superficial difference of existence and trend. It can then be seen that what we might designate as natural education--- by induced self-discipline advantage--- represents an accelerated testing of objective-subjective experience, and that acceleration is natural and that natural education may potentially evaporate the inadequacy predilections of original vanity and superstitions and that the original springs of action may become obsolete as the realizations of intellect and the hitherto preoccupations with seeming frustration and self-destruction may be supplanted, through the self-disciplining

- Cite TOTAL THINKING, (I&I), p.21»1, HayU9

"of the comprehensive designer to orderings of integrity of Universe.

"Where, geographically speaking, of a priori unique environment continuities, the inherent periodicity of the occurrence of interference is at a relatively low frequency, then the rate of dissipation of ignorance is proportionally low, and vice versa.

"The relatively lowest inherent periodicity of interference of forceful variables--- of experience in the dynamic environment (geography)--- occurs in the dry land near sea level in the region of the equator. The periodic frequency of Interference by physical variables increases outwardly from the Earth's center into the colder climates of mountain and toward the Earth poles. The periodicity and magnitude of forceful interferences increase even more upon the seas, and yet more as man penetrates outwardly from the unique energy fixations of Earth into the cosmos of major categories of general dynamic principles.

"Sum totally on Earth the residual vanities and superstitions of the ego bulk up most obviously in the warm and mild climates - Cite TOTAL THINKIS, (I&I), pp.24-242, Kay*49

(10)

"originally most ftivorable to the naked, ignorant man, and are most rapidly dispersed and replaced with intellectual ordering in the environments of highest frequency of unprecedented Intensities of interference, penetrated now by man at will by virtue of his contriving of realizations in complex princ- ciples.

"r-ach of the sumtotal variety of biological forms represents in simple principle the complex bundling of unique internal experience continuities, and the latter's individual accumulations of external periodic experience, within the greater bundle of persistently uniaue environmental sequences--- of variable geographic frequency bundle limitations. Humans have abstract 'tree rings' of experience.

` ` The circling bands of cross-sectioned tree or the scalloped terraces of the shellfish are convergently secreted structures (interference of higher order) of cyclic bundling of experiences. Wave embodiments of cyclic experience appear everywhere in the accredited morphology of nature's omnidirectional, convergent- divergent, synchronous- dlssynchronous, infinite plurality of pulsating controls of interactive events in principle."

- Cite TOTAL TrtINKL.G, (I&I), p.242, i-ay'49
Periodic HxcgrXence.» (11)

The cyclic wave accretions--- unique to parents and parent's parent--- make overlapping internal impressions of the periodic and cyclic interferences-3tructuring-by-accretion, prearranging thereby internal angles of the original turbinig tendency of unfoldment,

upon the gestating seed of periodic secretion of outside-in then inside-out pulsation-inversion which we call regenerative birth. This is, of course, a union of the infinite inwardness with the infinite outwardness to fulfill the comprehensive duality principle of uni-verse. Hunan egos are multiconcentric frequency 'halo⁵⁰ systems.

"As with the complex of synchronized convergent principles called airplane, compounded of the succession of flight experiences with a succession of 'improved* designs in-corpor-ating all previous experience in action-reaction juxtapositions (called structure and mechanics), a trend to further Inclusion and refinement of accelerating acceleration of improvement is inherent, but always improvement is relative to the whole of already-secreted true experiences, whether as yet detected or not by the redesign-cycle mutators.

""A new design's 'sport' or subspecies may long be latent, a helicopter development postponed by preoccupation with the"

"initial concept of 'airship.* The relative, realized-complex trend accelerates Itself in compounding degrees, whereby, eventually, the probability of numbers of immediately detected forward mutations to be refiningly anticipated exceeds in number the sum total of the previously secreted, or experienced, impressions, innately preoccupying the species division.

"A historical shift is now occurring in the scientific viewpoint, induced by this shift in balance of MB preponderant numbers of effective impressions, pre-and-post-natal, upon behavior probabilities of the various species to be affected preponderantly by the relative number of post-natal, periodic, and cyclic accelerations.

50 Cite TOTAL TH 11.K1LG, (Ikl), pp.242-243, May'49

"Hazy awareness of the significance of this historically pivotal event is at the core of hastily taken political positions seeking to establish monopolistic validity of comprehensive viewpoint (where mono-logical explanation of the biologically functioning derivatives of Universe may never be tolerable). Both sides are right about their specially selected cases; neither may increase their understanding by arbitrary limitations of experience and conception regarding the next

Periodic Table and Closest Packing:

In closest packing of spheres "the third layer of 92 spheres contain eight new potential nuclei which however do not become active nuclei until each has three Bore layers surrounding it--- three layers being unique to each nucleus. This tells us that the nuclear group with 92 spheres in its outer or third layer is the limit of unique, closest-packed assemblage of unit wavelength and frequency, nuclear symmetry systems. This is impressive for the system's three layers of 12, 42, y2

add to 146 which is the number of neutrons in uranium, which has the highest nucleon population of all the self-regenerative chemical elements--- and whose 14b neutrons plus the y2, unengaged mass attracting protons of the outer layer adds y2 to 146 giving the predominant uranium 23« from whose outer layer the excess two of each layer--- which functions as a neutral axis of spin--- can be disengaged, which leaves the chain reacting, uranium 23b."

Photon;

Max Planck's photons of light are separately packaged at the radiation source and travel in a group-coordinated flight formation spherical surface pattern which is ever expanding outwardly as they gradually separate from one another. Every photon always travels radially away from the common origin. This group-developed pattern produces a sum-totally expanding spherical wave-surface determined by the plurality of outwardly traveling photons, although any single photon travels linearly outwardly in only one radial direction. This total

energy effort is exactly expressed in terms of the exponential second-power, or areal 'squaring,' rate of surface growth of the overall spherical wave; i.e., as the second power of the energy effort expended in lifting one gram in each second of time a distance of one 'vertical' centimeter radially outward from the origin center."

» iltaa* Child»s Spontaneous Geometry: (1)

' • Study of the child's discovery of spatial relationships— what may be called the child' s spontaneous geometry— is no less rewarding than the investigation of his number concepts* A child's order of development in geometry seems to reverse the order of historical discovery. Scientific geometry began with the Euclidean system (concerned with figures, angles, and so on), developed in the 17th century to the

so-called projective geometry (dealing with problems of perspective), and finally came in the 19th century to topology (describing spatial relationships in a general qualitative way— for instance, the distinction between open and closed structures, interiority and exteriority, proximity and separation).

A child begins with the last: his first geometrical discoveries are topological. At the age of three he readily distinguishes between open and closed figures: if you ask him to copy a square or a triangle, he draws a closed circle; he draws a cross with two separate lines. If you show him a drawing of a large circle with a small circle inside, he is quite capable of reproducing this relationship, and he can also draw a small circle outside or attached to the edge of the large one. All this he can do before he can draw a”

Pirates* GT-pat Pirateff*

Q. "Are there still great pirates?... 'an I become one?"

RBF: "The top ones were called sovereigns and the lesser

ones were called pirates, and the even lesser ones hi-jackers. The British Empire began as a subterfuge for Queen Elisabeth I to go into private enterprise with the East, India Comnany... The American flag was actually derived from that of the East India Company,... 'The German cartels were owned partly by the allies and they nlayed both sides. The East India people swithhed over and backed th? new American colonies.

"There are no great pirates left. It's all lawyers now, and lawyer-capitalism. It's all now corporate: the safest and surest way to make the most money."

- Cite RGF to '»orld Game Workshop'77; Phila., PA: 22 Jun'77

` ` Penobscot, Blue Hill, and Frenchman's Bay were up to '.7orld War I the summer residence country of what Ducky Fuller speaks of as history's 'Great Pirates.' These were the men who ran the world as a consequence of their commanding the oceans of the Earth--- for the

oceans of the Earth governed three-quarters of our planet. Because the laws invented and adopted by dryland-dwelling people cannot be enforced either logically or practically over the ever moving ocean waters beyond their political entity's shores, the ocean seas are inherently outside the man-made laws. Only the physical laws of raw nature govern the seas.

"The high seas sailormen were inherently 'outlaws'--- therefore pirates. When one high seas crew seized another ship, she was called a prize into which they entered--- ergo, enterprise.

Because the greatest purates were, literally speaking, 'privately enterprising outlaws,' Bucky used the contracted form of this term, which is simply 'pirate', to identify them. The great pirates were inherently world people because they were masters of the World Ocean. Land people are local people and think locally. Ocean people are world people and think world."

- Cite BEAR ISLAND STORY, galley pp.25-26, 1968

"The headquarters of the 'Greatest Pirates' were the British isles because the British Isles represented the unsinkable flagships commanding the majority of the best harbors of Europe where lived the richest customers for their world trade. The greatest pirates manned their ships with men from their shipyard's country. Because the most conveniently recruited or 'Shanghaied' their sailors from the British Isles waterfront saloons, their operation came to be called the 'British Empire' though such an empire was never the democratic ambition of the British Isles people. World-around sea battling narrowed the field of contenders for world supremacy. Finally there was established amongst the greatest pirates the top or IL pirates. The IN pirates called themselves 'sovereign' and collect all the OUT pirates 'outlaws.'

"When the North American colonists broke away from the

greatest IN pirates in 1775, those British Isles-based great pirates came to America where, finding it impossible to dominate or conquer the colonists politically, they conquered their business world through financing acumen and control of the corporation shares."

- Cite BEAR ISLAND STORMY, galley p.2t>, 1968

"When World War I was declared in August 19H» the British Ambassador to the United States, Sir Arthur Spring-Rice was in residence at Isleboro in Penobscot Bay. That's where the great IN pirates were making their war defense plans. World War I was waged by the greatest OUT pirates against the great IN pirates. With its mighty new armored steel ships replete with modern mechanics, World War I was the first comprehensive world-around industrial technology and science war in history. It was waged around the /hole planet Earth between the great IN and great OUT world pirates.

"World War I and its post-war decade saw the end of the world ruled by either the top IN or OUT great pirates. In 'World War I the great pirates lost their world mastery forever because the fundamental controls of the new world of industry, technology, and science went from wire to wireless communication, from tracked to trackless transport, and from visible to the invisible structural strengths of atomic element alloying. Concomitantly the controlling factors of science and technology founded Industry went entirely out of human sight into the vast ranges of the nonsensorially tunable m electromagnetic spectrum.

The great pirates who ruled with their senses were helplessly and"

"hopelessly blind. Also in 1929 a one-ton airplane in flight launched a torpedo which sank a 20-ton battle cruiser and this shifted mastery of the economic and social affairs of Spaceship Earth from a sea to an air dominance strategy.

"Kot long before the stock market crash of 1929 when the great pirates lost their world power by silent default, J.P. Morgan's great steam yacht, the 'Corsair' went on a reef entering Gilkey's harbor on Isleboro. No Morgan yacht had ever before touched a rock. The captain claimed the reef was uncharted. The 'Corsair' was floated safely off on the next tide. No one ever knew what happened to that captain. This event however was full of mystical foreboding of the great stock market crash that took place two months later. The great pirates went on the rocks forever.

"The great pirates were great! They did run the world and they ran it with magnificent selfishness and brilliant foresight--- that is within the limits of their comprehension of the supreme scheme of physical laws of Universe. Their thinking was however too limited. It was based on the seemingly scientific 1810 finding of Thomas Malthus, Professor of Political Economics of"

Planck's Constant:

"Planck's constant corrects the cubic centimeter. It accommodates a number which relates what man is doing to electromagnetic theory."

- Cite RBF to SIMS Seminar, U.Mass, Amherst, 22 Jul'71

Planck's Constant:

"Now Planck's Constant was simply how you forced what you find out about energy into calculatability and manipulatability mathematically in respect to rectilinear analytic geometry. That's plotting things only on the XYZ coordinates. Always having to go round corners. . . **

- Cite' RBF tape transcript to BO'R, Carbondale Dome, 1 May 1971. Page 43.

"Planck's constant is purely an accommodative number. Put together. The central angles of the octahedron are the 90- degree coordinate system; the coordinates are there, but that's not what nature uses. There's no denying man's way of accounting for things--- which is absolutely awkward. With the synergetics conversion constant I'm discovering how you can take the same fundamental data and really make it come out right."

- Tape #6A, Side A. transcript p.3; RBF to Barry FarreJ, Bear Island, 10 Aug'70

"In synergetic geometry the vector equilibrium's mass value of 20 shows why nature requires that the cube's volumetric value of three be multiplied by Planck's empirically discovered , but heretofore scientifically inexplicable, constant 6.665---? to correct for the mistaken assumption by both mathematics and physics that the cube's volume was nature's logical volume of one--- instead of its actual volume of three, in nature's most economical system of both physical and metaphysical accounting. The physicist finds that nature is always most economical. Planck's empirical constant of correction was also required to remedy the mistaken assumption by physics that the cube of one centimeter to the edge, filled with water at four degrees centigrade (as the unity of the XYZ, 90-degree-coordinate, gram" temperature "second system) was also suitable as the basic unit of energy for

computing radiational propagation. The 6.6 radiational constant correction, of the mistakenly assumed suitability of the cube and its conversion thereby to the value of the vector equilibrium's base 20 also required the further 10" reduction in size to reduce the gram of water's reference size to a photon's energy magnitude."

- Cite NEHHU SPEECH, pp. 27-28. 13 Nov'69

"The closest packed sphere layers of the vector equilibrium account for the non-solid proton-quantation of the wave's outer layer value of frequency (or velocity) to the second power as required by Einstein's c^2 of his equation $E = Me^*$ and eliminates the necessity to consider the second power as characterizing continuous surfaces of systems.

"The vector equilibrium's surface sphere growth rate of the second power also accommodates Newton's discovery of gravitation mass attraction as being governed by the second power of the relative proximities of the masses, expressed in terms of their respective radii (or modular frequency.) The gravitational constant also requires the 6.66+1 correction of its gram-cube base to conform to the vector equilibrium and requires a 10" reduction of size to conform to the electron volt magnitude of energy."

- Cite NEHRU SPEECH, p. 28. 13 Nov'69

"The many mildly differing values arrived at empirically for both Planck's constant and for the gravitational constant seem to indicate that the radiational constant is just a little less than 6.666 and that the gravitational constant is complementarily just a little bit greater than 6,666

- Cite NEHRU SPEECH, p. 28, 13 Nov'69

KBF DEFINITIONS

Plane;

"All lines are curvilinear and ultimately close back on themselves, ergo short line increments are always segments of weak geodesic loopings. In the same way a plane is always just a local facet aspect of a system. Planes do not exist independent of systems. The nonsynergetic consideration and articulated employment of points, lines, and planes exclusive of system identities induces unconsidered, inexorably complex developments of covariant functions of always integrated generalized system laws. The unconsidered complex of omnidirectional event developments of an almost exclusively 'specializing,' self-considerate society occasions the continuous generation of unwanted problems at ever greater scale in twentieth century world affairs. A linear preoccupied strategical play scenario in which Monte Carlo and Wall Street may win money while vitiating the wealth accounting system and deferring the realization and general distribution of synergetically augmented commonwealth."

Q: (Sen. Clark): "Do you feel any form of world government is in order or that we are moving toward that? Or that there is any possibility that the American people, after years of plowing the field, are ready to accept any concept like that?"

A: (RBF): "I have been asking myself the question you ask me for a very long time. I am a student of large patterns and am trying to see what evolution does to some of these things. I think that human beings do not

often realise how powerful, knowledgeable, and competent is universal evolution.

"X-ray cinema makes visible organisation of a chicken--- the gradual assembly from its embryo, all taking place inside the egg, much of which process seems chaotic and discretely uncontrolled. Humans do not see the logical interrelatedness of big evolutionary development. All the technical happenings which were unpredicted in my youth seem only in retrospect to have been obviously sequitur to their immediate predecessor"

- Cite RBF in committee transcript, US Senate, 15 May '75

"developments. Humans tend to think that Universe is waiting upon them to make the evolutionary decisions. I do not. That is why I have tried to stress the fact with you today that--- when considered before they occurred--- all the technological events in my life were thought to be absolutely impossible.

Therefore, they were not the consequence of society deliberately undertaking to bring them about. Individual inventors, often called 'crackpots,* brought them into realisation. It was completely unexpected.

"When I was five years of age no one realised that we would develop any of the 20th Century technology. Anyone who even suggested humans reaching safely to and returning from the Moon were called lunatics and in jeopardy of being incarcerated in a lunatic asylum.

"As an infinitely small detail in designing terrestrial ecology Nature designed the honey bees with their chromosomal drive to go after honey in order to have them inadvertently crosspollinate the vegetation; so too, by a million other chromosomally programmed behaviors, nature arranged to grow and"

- Cite RBF in committee transcript, US Senate, 15 May '75

"sustain humans on our planet. Also, 99-percent-programmed humans usually have been doing a lot of the right things for the wrong reasons, What we think of as side effects are usually evolution's main events. The time has come when we must participate directly in the mainstream of Universe, instead of only accidentally, while playing lethally-biased, exclusivesurvival games instead of the all-inclusive main show.

"When our forebears evolved the system of democratic representation of the United States all the first representatives were well and favorably known to their neighbors. Everybody knew them. Their term of office was predicated on the realization that they would have to go to the central meeting place in Philadelphia by foot or by horse over footpaths, Indian trails, or very small highways, stopping overnight at inns and talking with everybody along the way. And while in Philadelphia--- or later in Washington--- three or four important letters might come from Europe during the whole year you were there. Everybody at the capital knew what the letters said. They all* talked about the letters with one another. Then all of the representatives started back homeward talking to the people"

- Cite RBF in committee transcript, US Senate, 15 May '75

"along the way. at the inns and homes. They would tell everybody at home about the four letters from Europe this year and what everybody in Philadelphia (or later in Washington) thought about the situation, and what the people along the way think, and would then say to their home people, 'How do you feel about it and what do you want me to do about it?' They were told; and then they walked or rode on these, often many-days travel to the capitol. We had what scientists call a one-to-one correspondence between stimulation and response.

"With the unexpected development of the telegraph 30 years later news short-circuited the representatives' direct communications system and reached people in minutes instead of in months; and the people had no way to respond to the stimulation. Since that time radio and television broadcasting have added to the telegraph-fed newspapers in producing a constant barrage adding to hundreds of thousands of stimulations before any political response could be manifest by the citizenry.

"Democracy worked well with the initial one-to-one correspondence. Today, democracy is not working. It is not the fault"

- Cite RBF in committee transcript, US Senate, 15 May '75

"of the concept of democracy» Democracy is unable to express itself. That is why samplings of political viewpoints have developed. The Congress conducts as many Inquiries as Possible to discover in advance of elections what their constituents are thinking. Particularly amongst the young there is a feeling of absolute futility. The system is not working.

"Over a great many years I have been following the technology of electromagnetic communications to find out if it did not contain its own answer to how one-to-one correspondence might be regained. In 1940 I was science and technology consultant to 'Fortune' magazine. After checking with the telephone system engineers and finding it technically feasible, and not disruptive of all other regular services.. I proposed daily voting by telephone on all prominent questions before Congress. That was back in 1940 and I published my proposal in my book, 'No More Secondhand God.'

"Since World War II studies have been scientifically conducted disclosing the electromagnetic energy output of human brains. The work has been scientifically conducted in veterans' hospitals with electrodes fastened to the heads of volunteers. Then, "

- Cite RSF in committee transcript, US Senate, 15 May '75

"using recording oscillographs, unique patterns were discovered to be identified with certain dreams* Most recently experiments have disclosed an electromagnetic field surrounding the whole body of a human, which field discloses a positive or a negative attitude of response to various stimuli--- very much as does the polygraph or lie detector through direct contact.

"With the sensors now mounted in satellites orbiting our planet, broadcasting to us, there is present in this room right now one electromagnetic program amongst several million, which, if tuned in by the right radio set, can tell us where every beef cattle on Earth is located. As a consequence, we may soon have the capability to directly sense how each and every human feels about each and every common human problem of the moment as each such problem and its alternative solutions are separately broadcast. This might well develop within the critical 10 years of which I have been speaking.

"Senator Percy, you have asked me what kind of world government may develop. It may well be akin to the city management concept, where the management has to do whatever the satellite-sensor-" harvested and computer analysis says that the world majority"

- Cite RBF in committee transcript, US Senate, 15 May*75

"thinks ought to be done. Undoubtedly the world majority would make many mistakes, but as the mistake becomes evident the majority of humans will think that this alternative will work better; and because they think so, it will be satellite sensed and the computer will instruct management to immediately alter the course.

"This is the way all mechanical steering mechanisms of airplanes or ships of the sea work. The servomechanisms responding to sensed error in first one direction and then the other, successively correcting the steering--- first this way, then that way--- averaging an accomplished course halfway between. The variations get finer and finer, trending toward but never attaining, 'absolute straightness.' This is the essence of cybernetics. This way humans reached the Moon. It is the essence of all life growth. Development of such satellite- harvested, electromagnetic-field sensing of how world democracy feels about any proposed solution of any given problem is close at hand or has already been technically prototyped. An incorruptible, true, direct planetary demdcracy with all of humanity franchised and always voting, may well render all of humanity sustainable, successful. So those are my thoughts, sir."

"My self-disciplining strategy of never losing the large- pattern comprehensivity doesn't mean that you have to disregard the particulars. For instance, when I was designing my stamped-out bathroom, doing the research for it. I discovered that there was one man in Toledo, Ohio, who designed all the toilet bowls in the U.S. His problem was largely one of manufacture, where the crude ceramics employed did not permit any fine tolerances.

"Scientists are simply not looking at plumbing. There is a feeling that pure scientists shouldn't stoop to that sort of nonsense. Nature spends a lot of time separating materials out into solids and liquid---as you know if you've ever done any mining or refining. We should always pay close attention when nature does this kind of thing. If we employed stainless steel instead of ceramics we could have very fine tolerances and we wouldn't have to waste seven gallons 3^{ust} to flush one pint of waste.

"The point is that you can be a generalist and still plunge into the particular. I've done such plunges for one month at a time or for six months at a time, such as the time I was dping my

Plumbing:

R» • . Science has hooked up the everyday plumbing to the cosmic reservoir.¹

- Citation and context at Junkyard, 1971

Plumbing:

"Many scientists live in houses--- they look at the plumbing, often find that the plumbing isn't working, twiddle the knob, and send for the plumber. You know as architects that you do not design the plumbing which you buy. You design the superficial use and arrangement of fixtures which are designed by non-architects and manufactured by commerce for you. You are free only to choose the coloring of the bathroom tiles and the coloring of the fixtures. But what goes on back of the bathroom tile is not part of the architectural design. Even if you studied 'plumbing' and detailed the pipe layouts, your design would not be followed or even looked at. The layout would be as dictated by the plumbesB' scientifically illiterate craft code and frequent whimsy.

"The fact is that the plumbing system and the sewer system and the aqueduct system have not been importantly changed for 4,500 years. Only one improvement in the system was made, 100 years ago, in England. That was the development of the roof vented plumbing stack and water seal in plumbing fixtures to keep the sewer gases from entering the house."

Pneumatic tog;

"We assume that pneumatic bags are not permitted as solutions of the
problem as they prohibit omnidirectional penetrations and provide no
local resistance against high impact."

- Cite Pennsylvania Triangle, Nov. *52, p. 11.

Pneumatic-hydraulic Structures:

"Hydraulics and aerodynamics and pneumatics--- Nature is using them in making trees and everything else, but we're Just beginning to use them in buildings. This is the reason great trees can go through hurricanes. Nature uses the crystals only for tension; all the compression she uses hydraulics for. In between the molecules of liquids of the tree are the gases, so the branches sway--- five tons, ten tons--- waving in the wind. And it's doing so because the hydraulics holds its shape under pressure in compression, with the very high tensile strength of the fibers, and the pneumatics there, taking all that shock.

"No man has built any buildings like that yet. That's the truth. That's the way nature does it. That's the way she designs you. You're a beautiful piece of design, and what a contrast you are to a stone fortress! Can you imagine architects saying I am unaesthetic because I didn't want to work with stone? Yes, Italy is beautiful: every stone laid by a prisoner. The reason you don't have stone buildings now is that a man has to earn a wage. If you pay him so he can live decently you can't afford to lay stone." / QE3BHH

Humans as Machines, (1)

EMuaaUc Strartwoa;

"A fleet of ships maneuvering under power needs more room than do the ships of the same fleet when docked side by side. The higher the speed of the individual ships, the greater the room required. This means that the enclosed and pressurised molecules in pneumatic structural systems are accelerated in outward-bound paths by the addition of more molecules by the pump and, without additional room, each must move faster to get out of the way of the others."

- Cite SYNERGETICS draft At Sec. 703.04, 25 Sep'72

Pneumatic Structures; p j

**I have considered a great deal about footballs and balls and pneumatics from being a little kid. And I saw that as I pumped up my basketball or football, it went from supine . . . flat, into this beautiful firm condition. But this is because the molecules of gas were trying to get out of the system. And they got hot because they were in such action. The kinetics of gas are something easy for the brain to understand and feel. . . the action of those individual molecules of gas. I saw all the molecules of gas were trying to get out of the system--- that gives it the high pressure--- and they were stretching it outwardly and so, therefore, the skin is designed to go the other way, holding it inwardly so that the skin is finite and comes back upon itself. And it represents a tensional force with the arrows bound inwardly, balancing all the molecules, bouncing, hitting it, caroming around every action having its reaction. So I began to see that it would be possible that geodesics could be similar to what could be called discontinuous compression/continuous tension, where every molecule has to have one it pushes from, like two swimmers in the middle of a tank.¹

- Cite RBF Interview by Hans Meyer, dome Book II. p. 90. Dec¹70

~\$ ALL ood 3 -J **C\$1, la** \

' 'When you are swimming you dive from one end of the tank gives you a little acceleration into the tank, when you get to the end, you can put your feet up and double your body up and so forth and shove off from the tank, and if two swimmers could meet in the middle of the tank and double their bodies up like that and put the soles of their feet together and thrust and go in opposite directions, I saw that the molecules that are in motion... and every action has its reaction... there has to be some reaction set, so each molecule which is caroming around, circularly hitting glancing blows and then making a chord, then another glancing blow, had to have one it shoved off from. Each one would have to be balanced, so a balanced pair... all the forces are caroming around... each one will represent one of the chords, the compression chords, which

the two ends pressing outwardly glancing blows against the tension skin, which are trying to pull inwardly and they are pulling outwardly. So there's a net arrow outwardly in the middle of the chord against the net of arrows pointing inwardly. So... I saw this represents what the gases are doing and you could make discontinuous compression/continuous tension geodesic structures in this way. So all this came

_Z_Si“JIBF_l£!SSI, vie*’ by Hans Keyer, Domebook, II, p. 90. Deec'70 gaU.w -
secy.]

"in as a fundamental feeling that in dealing with geodesics in contradistinction to compressional arches where men had made lesser rings of stone and bricks and so forth, like Santa Sophia, fitting them beautifully and very mathematically, one to the other, so they wouldn't fall in, and taking and putting chain around the bottom of the dome to take care of the thrust of the enormous weights of the buildings, they could build a dome that would not thrust outwardly at the base and allow it to collapse.... I saw that in tension flA there is no limit--- you can make as big a pneumatic bag as you want . . , I saw

that in the comprehensive geodesically omnitriangulated tensegrity structure I would be able to go to unlimited spans, because your only limitation is tension. I've found that there, is no inherent limit to cross section due to length. We get to where there is no cross section visible at all, as in the pull between the Earth and the Moon. . . The beautiful intuitive feelings have been there right from the beginning. Always I could really feel the apple in those terms of hydraulics and doing the same tricks."

Poets :

"The young life realises that the older life is holding to the familiar, in opposition to evolution. This is an interesting point to identify the prescience of the poet, What man tends to call a poet is one whose sensitivity has not been so damaged, where the thoughts flow

almost subconsciously, where all the tastebuds of sound have been undamaged and the communication capability is very, very high. Their full vision is unimpaired. Time and again the poet will say what the nonpoet will not dare to say. He is afraid to hear his own voice— the poet's not. The poet's not afraid because he's not thinking in terms of his own voice. It's irrepressible; and so time and again poets have said very extraordinary things long before the rest of society recognized the significance of what they were saying."

Polaon Effect:

"These vectorial resultants of forces articulated in planes perpendicular to the axis of the applied force vector, with concomitant right-angle transformation of compression into tension, and vice versa, are altogether known as the Poisson Effect (as named for their human discoverer and not for a fish-like behavior). We now know that this imprecisely recognized reciprocal effect is a precisely operative physical system phenomenon known as precession."

Polarity;

"Absolutely straight lines or an absolutely flat plane would, theoretically, continue outwardly to infinity. . . The difference between infinity and finity is governed by the taking out of angular sinuses, like pieces of pie, out of surface areas around a point in an absolute plane. This is the way lampshade and skirts are cede. Joining the sinused fan-ends together makes a cone; if two cones are made and their open end, ergo infinitely trending, edges are brought together, a finite system results. It has two polar points and an equator. These are inherent and primary characteristics of all systems."

Politicians:

"Politicians are going to confess the obvious--- that no human beings can keep in mind all the special interests of all people and all the whereabouts and unique behaviors of all the resources of Earth. No human beings can persuade other people to behave in unfamiliar, untried ways, but the computer can integrate and disclose the critical information and be completely convincing... As the world game is played progressively it will disclose a myriad of politically untried, unprecedented yet effective ways of solving hitherto unsurmountable problems. These will become big news items of the world's press and international wire services. As man gets into more critical proximity to a full-scale World War Three, the people of the world will begin to say in increasing numbers, 'Now that we can see a way in which this and that can be done, we must obviously adopt the policies indicated by the World Game.' Popular pressures will gradually force world politics to yield to these mutually beneficial world game programs.

"Our greatest problem is the educational problem of getting man to realize in time what his programs are, and what the most effective priorities may be for saving them,"

Politics:

"Politics are only appropriate to an economy of scarcity. Within the scarcity context politics play tricks short-of- war by which the successful politicians' side monopolizes the limited survival supply. Death by want--- i.e., by metabolic inadequacies is much slower than by the sword ta or gun and causes much more anguish and pain than that of the swift hero's death. Death by want imposed on many by the successful politicians' warfaring only with laws and police guns obscures the identity of their executioner from both the politicians and the slow-dying victim. Only if there is an inherent major life support inadequacy aboard our planet and even in the Universe, politics and politicians are valid functions of Universe. If there is a fundamental adequacy of life support aboard our planet which is as-yet popularly unrealized, politicians can go on playing their trincks in seemingly good conscience. But the politicians* self-deceptive scarcity game playing and the ultimately lethal consequences for many hurrans inherent in the politicians' one-sided victories tend to prolong and obscure from social consideration the now dawning scientific awareness of the technical feasibility of universal economic'success for all?

Politics: p j

"We need not be against politicians to realise that their local preoccupations are futile. They have good convictions and are individually moved as human beings by what they regard as a responsibility to 'their* side or 'our* side. But every political ideology and all extant political systems assume that there is not enough to go around: it is either you or me; there can't be enough for both. So we eventually assume war; and that is the cause of the weapons race.

"The reasoning was once correct. When there is enough available a healthy human will eat three pounds of dry food a day, drink six pounds of water, and breathe 54 pounds of air: or six pounds net of oxygen. For most of the history of man on Earth there has not been enough of that dry food and humanity has fought about this, time and again. Many times there has not been enough water; and humanity has fought over this. There has been no time when there has not been enough air. Humanity has so much air available that no one has even thought of putting meters on air and trying to make money out of it. But there are times, for example in a great theater fire, when humanity, completely unused to competing for air, finds itself suffocating and goes mad."

- Cite YEAR 2000, AD, Feb*67

Politics: (2)

**It seems perfectly clear that when there is enough to go around, man will not fight any more than he now fights for air. When man is successful in doing so much more with so much less that he can take care of everybody at a higher standard, then there will be no fundamental cause for war.

` ` In the years ahead, as man does become successful, the root cause of war will be eliminated. Scientists assure us over and over again that this is feasible. There can be enough energy and organised capability for all men to enjoy the whole Earth.

"This is the most important prediction I can make: in 10 years from now we will have changed so completely that no one will say that you have to demonstrate your right to live, that you have to earn a living. Within 10 years it will be normal for man to be successful--- just as through all history it has been the norm for more than 99 percent to be economic and physical failures.

"Politics will become obsolete.**

- Cite YEAR 2000, AD, Feb*67

££liU£s:

"Science paces technology, technology paces industry, industry paces economics, and economics paces politics. Quite clearly, then, political leaders are at the tail end of affairs. And for man to ask change of political leaders is like asking the cow's tail to redesign to cow."

- Cite KBF quoted by Michael S. Gruen, Harvard Crimson story on Charles Eliot Norton lectures, January 1962.

Politics:

"The unfamiliar complex of the new wealth accounting requirements of the evolving human experiences emerges as an aggregate of Unique and popularly discerned everyday 'news' problems. In turn the popularly discerned inventory of problems altogether provides the raw materials to be processed by the machinery of politics. - It is the purpose of politics to digest the problems and to provide adequate accounting and readjustments to the unexpected and often disconcerting changes in the patterns of technical advantage realizations. Politics must thus implement life's continually increasing sweepout and penetration of Universe with a continually changing set of operational rules and accounting conventions."

Pollution:

"Collect it in the nozzle— not in the spray!"

- KBF to EJA, 1970

Pollution;

' 'Ignorant humans aboard Space Vehicle Earth are now screaming, "Pollution!"* There is no such phenomenon. What they call pollution is extraordinarily valuable chemistry essential to Universe and essential to man on Earth, 'What is happening is that the egocentricity of omnispecialized man makes him ignorant of the value with which his processing is confronting him. The yellow-brown content of fume and smog is mostly sulfur. The amount of sulfur going out of the smokestacks around the world each year is exactly the same as the

amount of sulfur being taken from the Earth each year to keep the world ecology going. It would be far less expensive to catch that sulfur while concentrated in the stack, and to distribute it to the original users, than to do the original mining and to get it out of human Jdngs, etcetera, when all the costs to society over a deteriorating 25 years are taken into account. But humanity insists on holding to this year's profits, crops, and elections. World society is lethally shortsighted

Pollution:

"When people use the word pollution it simply means that they have some chemistry they aren't familiar with. . . There is powerful evidence as you study the total Universe and the total relative abundances that there is an extraordinary continuous interplay of those chemistries, and so it's simply a matter of man getting much too overspecialized and not realizing that what you have here, is exactly what's needed there."

HBT VEHHTtiMS

Pollution;

"For the strange carelessness of urban society in polluting and corrupting the beauty of the environment is an inherited precedent set by big corporation factories belching smoke into the sky and vomiting chemical residues into the waters. Finding one's self born within the ugly city streets with no fundamental outlet for the innate energies and explorational initiatives, breeds early contempt for the environment and for those who perpetuate its inadequacies. Because

humanity has been born without asking so to be, and must frequently grow within environments which disregard their developing needs, most of society tends to cast aside its refuse in unmeditated disdain for the economic masters who seem exclusively preoccupied with making quick profits out of men's desperately vital needs."

- Bite BEAR ISLAND STORY, galley p.32, 1968

"I was told by the chief engineer of Combustion Engineering that the apparatus for precipitating all of the fumes, particularly the sulfur which makes the public utilities the worst urban sky polluters, was in complete mechanical solution. I asked what the additional cost per kilowatt hour would be if the apparatus were installed. The answer was 25 percent additional.

"On speaking to the Edison Electric utility managers I pointed this out and was told by them that the chief customers were industries and that the industries only buy from them because the public utilities can provide power at only a fraction less than it would cost the companies to produce their own. Therefore, if they did add the 25 percent, the public would gladly pay but their prime customers would forsake them; ergo, they could not do so.

"The sulfur coming out of all the world's chimneys annually exactly equals what we are taking out of the Earth annually to supply industry's rubber making and other such needs. Vast amounts of energy, knowledge, and skill are expended in the progressive stages of separating out and refining metals from"

"their original random ore matrix. This process of separating out that which the processor desires inadvertently produces a left-over concentrate of chemical substances unwanted by the producer, which are now or soon may be essential constituents of other humanity serving industries. Therefore the unwanted or so-called waste products are highly valuable concentrates--- before diffusion out of the stacks or nozzles.

"Nature has no exclusively polluting substances. All physical substances consist of complexes of some of the 92 regenerative chemical elements all of which are essentials at different frequencies of time and in different magnitudes to the success of eternally regenerative Universe. Pollution is a word invented by and manifesting human ignorance.

"Many metallic elements may be combined to produce special behavior alloys which other elements serve as catalyzers, and so forth, while altogether accommodating all of Universe's intratransformative capabilities with only a few of which humanity is as yet familiar and many of which may be essential to humanity's future survival and service functions."

- Cite RBF Ltr. to Marshall McLuhan, 2 Sep'74

"When any one of our various competitively producing industrial companies are told that they must stop polluting the atmosphere or waters, they say that the added cost would prevent them from competing in their respective industries; ergo pollution abatement would mean bankruptcy for them; ergo no compliances. The atmospheric air drifts and the waters flow interconnectedly around our planet. They and all resources are essential to all humanity and the Universe of which humans are just such a function.

'•Clearly the problem won't be solved until central governments make complete precipitation mandatory and rebate the costs thereof from the annual taxes of the industries while forcing the utilities to turn over to the central government all the valuable chemical elements recovered. The governments would find their stockpiles worth many times what they seemingly were losing in tax rebates. The saving to governments in medicare and general pollution-caused deteriorations would be profound. The computers would soon inform the government that they were saving so much money that they could almost completely eliminate taxes. They would be converting commonwealth to sorted-out metals that would continually recirculate and with each 22-year"

- Cite HBF Ltr. to Marshall McLuhan, 2 Sep*74

` `average recirculation would employ the interim harvest of improved know-how to produce the manyfold performance increase per pound of the previous recirculation. As for instance, each melted down Cadillac today can produce two superior-to-Caailac Japanese vehicles. I am not promoting automobiles, just clarifying the point.'*

' • If there is an infinite system, then there are an infinite number of resources to be exploited. You can be just as careless and stupid as you want, since there are an infinite number of resources out there and we'll never run out. And there's an infinite amount of space in which you can get rid of all your filth as you waste all those resources. But in a closed system you can't do that— and that's the kind of system we're in. We have anything but an infinite number of resources! I have just enough to make the experiment."

- Cite APPROACHING THE BENIGN ENVIRONMENT, pp. 77-78 1970
RbF DEFINITIONS

"Thinking of Universe only as an infinitely extensive plane, humanity felt itself logically justified in throwing away its refuse outside the boundaries of its particular domain--- there was infinity into which all pollution would be ultimately dissipated into infinite innocuousness. It meant nothing to dump a teacup into an infinite ocean. If there is an infinitely extended world, then we may assume that when we exhaust the present familiar resources, we will, as in the past, keep on finding new and better alternate resources, ad infinitum--- so why should we worry and be fussy. Never mind about tomorrow. Never mind about the other fellow. The more ruthlessly selfish one is, the better off is one and all who dependents."

"So the difference between closed system surfaces and a closed Universe in respect to the utterly open, infinite flat slab world concept with which man has been ignorantly rationalizing all past experience, is the 'similar difference' between humanity's extinction or its continuation upon this beautifully equipped and provisioned, closed system, space vehicle Earth. It is clearly to be utopia or oblivion--- and no half measures, ./e must begin today to expose our youth and ourselves to the fundamental self-discipline conceptioning 13Nov(<S) which is the only real educational process." _ HEHRUSPEECH pp 22-23

"I find that as industrialisation increases, the population decreases* With industrialisation, the life expectancy increases* When that happens, families don't have to be large. In the last five years the absolute number of babies has been less each year. The big bulge everyone's worried about occurred because all the people that used to die have not been dying, particularly at birth. This bulge is working up to a time when there will be a great, great many people who are very old. But the number coming in at the bottom is lessening very rapidly."

"Here is how New York is going to solve its transportation problem. First you*11 have to do away with the automobile altogether. It is a matter of geometries. You take a point and then a line. That's what a highway is, a line between two points. Well, you have areas which are much vaster than lines, and you have all the volume above the areas, which is space. If you take all the 30 million people of the New York metropolitan area and give them little harnesses with jets and have them put on the proper clothes, and if you send them up in the air to a reasonable altitude, say 10,000 feet, where they wouldn't need any additional oxygen, all simultaneously, people would be so far apart they couldn't see each other. That would solve your traffic jams!"

"The population explosion is a myth. As we industrialize, down goes the annual birth rate. If we survive, by 1965, the whole world will be industrialized, and, as with the United States, and as with all Europe and Russia and Japan today, the birth rate will be dwindling, and the bulge in population will be recognized as accounted for exclusively by those who are living longer.

"When world realization of its unlimited wealth has been established there as yet will be room for the whole of humanity to stand indoors in greater New York City, with more room for each human than at an average cocktail party.

"We will oscillate progressively between social concentrations in cultural centers and in multideployment in greater areas of our Spaceship Earth's as yet very ample accommodations. The same humans will increasingly converge for metaphysical intercourse and deploy for physical experiences."

TEXT GirATlunS

Population Explosion:

"Thinking Out Loud (1): Disproving the Population Explosion, □World wag. J Jul'73

"Playboy, Ltrs, to Editor, Feb<72 pp. 50-51, (Discussion of KBF Views.)

FwuXatlQB fiaamcfi,; H)

"There are many prognostications about immediate technology... It is all Buck Rogers and it will happen. But, such speculation is a waste of time, it is more important to consider what will happen to our relationship one with another.

"In its broadest aspect this area must be considered under ¹population.¹ There has been a great debate about the so-called population explosion in recent years. This has been occasioned in part by the fact that we have only recently had accurate census in many countries. Even in Europe population figures only go back a short time.

"In the USA, though there was an increase in the post-war birth rate between 1947 and 1954. since then it has declined. This trend is also evident in all the industrialised countries, including Russia. During the last 12 years then the birth rate has been declining in the industrialized countries, yet the main problem is thought to be population increase. The cause of the bulge in census population of these countries, is of course, that more people are living longer. But the underlying reality of the population problem, if there is a problem, is that as we industrialize, the rate of births decreases. We may see this most clearly in, for example, the US, where the"

- Cite THE YoAK 2000. reprinted in AD. Feb»67

"the early settlers had an average of 13 children per family and survival rate was very poor. We may then plot the decrease in number of children per family against improvement in technological services, public health, indoor water supply, bathrooms refrigeration, general improvement in life expectancy, and so on. Clearly as man industrializes and improves the probability of human survival, whatever the drives or controls of nature are, she does not have to have anywhere as many birth 'starts'.¹ This is one of the fundamental points about industrialization.

"We should also consider the rate at which countries become industrialized. England took 200 years to get industrialization going and up to the present level. The US 'took off' from England's vantage point and did it in 100 years. Russia came in and accomplished in 50 what

had taken the USA 100 years, because it was able to start at a more advantageous point. We find the new countries come in where others left off, not where they started. Japan did not start flying with the Wright Brothers bi-planes, but with the 'Zero' and 'Spitfire' types; China has never flown anything but jets. China came into the world of industrialization after the transistors, computers, and atomic fission were available--- so she will come to Indus"

- Cite THE YEAR 2000, reprinted in AD, Feb'67

Population Sequence: (3)

"trial parity with the west in about five years. India will probably be even faster. The acceleration of capabilities coming to bear on India and Africa are of the very highest. As far as one can see, industrialisation will be worldwide by 1985.

"By this date, as the world industrial process is completing, and birth rates reducing, every individual human being will still have about ten acres of dry land and approximately 20 acres of ocean averaging half a mile deep, in terms of a family of five that would be 50 acres of land and 100 acres of ocean- 150 acres per family. The amount of food supply would be ample.

"We may glimpse in such patterning certain total behaviors in Universe that we know little about. We noted, for instance, that as survival rate and life sustaining capability increased fewer birth starts were required. This may be related to our developing capacities in interchanging our physical parts, of producing mechanical organs, of having progressively fewer human organisms to replenish. The drive in humanity to reproduce as prodigally as possible decreases considerably.

This may be reflected in social behaviors— when all the girls

- Cite THE YEAR 2000, reprinted in AD, Feb*6?

Population Sequence: (4)

"begin to look like boys and boys and girls wear the same clothes. This may be part of a discouraging process in the idea of producing more babies.

"We shall have to stop looking askance on trends in relation to sex merely as a reproductive capability, i.e., that it is normal to make babies. Society will have to change in its assessment of what the proclivities of humanity may be. Our viewpoints on homosexuality, for example, may have to be reconsidered and more wisely adjusted.

"Central to such readjustment will be the concept that man is not alone the physical machine he appears to be. He is not merely the food he consumes, the water he drinks, or the air he breathes. His physical processing is only an automated aspect of a total human experience which transcends the physical. As a knot in a series of spliced ropes of manila, cotton, nylon, etc., may be progressively slipped through all the material changes of thickness and texture along the length yet remain an identifiable pattern configuration, so man is an abstract pattern integrity which is sustained through all the physical changes and processing."

- Cite THE YEAR 2000, reprinted in AD, Feb'67

Population Sequence:

(5)

"We become more aware of this uniqueness of organising principle in the Universe, in science. The long-held myth that science wrests order out of chaos is fast disappearing in due ratio to the extent that all great scientists have found the Universe to exhibit an a priori orderliness. All the various specialties are discovering that their variously remote studies which seemingly 'ordered' local aspects of

nature are converging within progressively simpler and more comprehensive patterns. The 'ordering' is coming together. When we refer to the computer and automation's taking over we refer really to man's externalization of his internal and organic functions into a total organic system which we call industrialization. This metabolic regenerating automated organism is going to be able to support life in an Extraordinary way. The machines will increasingly assume various specialized functions. Man who was born spontaneously comprehensive but was focused by survival needs into specialization is now to be * brought back to comprehensivity.

"As enormous numbers of men are freed for more education and research and as they become more and more comprehensive in their dealings with nature, there will be engendered a total"

- Cite THE TEAR 2000, reprinted in AD, Feb'67

"philosophic awareness of the significance of the whole human experience. There will be a rediscovery of what Einstein described in 1930. in an article on the 'cosmic religious sense'¹--- the intellectual integrity of the Universe and an orderliness that was manifestly a priori to man.

"We are going to have an increasing number of human beings as scientists and philosophers thinking about the total significance of human experience and realizing that there is an intellect far greater and far more powerful than that of man--- and anticipatory of the whole trend of his development. An era of extraordinary integrity might ensue.

"This would be for me, the most important and exciting aspect of all the trend curves--- that in A.D. 2000, to a marked extent, the Integrity of humanity will be of an unbelievably high order. What one human being says to another regarding what he thinks or what he has ob-

served, will be reliable. There will be play-acting still, but it will very clearly be play-acting. In looking forward to the year 2000 it is not the 'Buck Rogers' details which are important but whether the world will be a good place for our children and grandchildren. In the past,"

- Cite THE YEAR 2000, reprinted in AD, Feb'67

Population Sequence: (7)

"man had to do many things shortsightedly and we have wasted a great deal of our natural heritage. We have squandered the fossil fuels which represented an extraordinary 'savings* or energy capability account stored up in the Earth. The great change now will be in a new type of accounting when we begin to draw more consciously on the fabulous 'income* energies of Sun, water, wind, and tidal powers-- which, if not used, will not be 'saved' or impounded on the Earth. We will adopt new accountancy standards for all wealth. To account our success in terms of gold and various traditional banking practices is irrelevant. Real wealth is organised capability. One of its major characteristics is that it is irreversible. No matter how much wealth you have, you cannot change one iota of yesterday. Wealth can only be used now and in the future. What we really mean by wealth is how many days forward we have energy available and organized for work to keep the machines running, to keep the foods growing, the refrigeration, transportation, and so on. The basis for our new accounting system will be 'How many forward days of organized capability do we have available to serve how many men'. We will be able to make the working assumption that it is normal not only for man to be successful but also normal for him to move as freely as he wishes without interfering with any other man. Our overall" - Cite THE YEAR 2000 reprinted in AD, Feb*67

"accounting assumption will be based on whatever amount of organized energy capability is required so as to make it possible for any man to travel around and enjoy the whole Earth, and be completely supported in doing so. There will be no such thing as deficit accounting. You cannot live on deficit accounting. You cannot eat deficitly or drink water deficitly. What is to eat is there--- as the water is there.

"All such negative accounting procedures went along with the need for exploiting others in the 'you or me' phase of man's past struggle for basic survival.

"Much of the most exciting and important part about tomorrow is not the technology or the automation at all, but that man is going to come into entirely new relationships with his fellow men. He will retain much more in his everyday relations of what we term the naivete and idealism of the child. This will be completely justified and not exploited or exploitable in any way. I think then that the way to see what tomorrow is going to look like is just to look at our children."

- Cite THE YEAR 2000 reprinted in AD, Feb'67

"Japan was the first country in the world to actually stabilize its population. China is going in for birth control in a major way if they industrialize, sjnd they industrialize at a very rapid rate. The only place where we're making an enormous amount of babies is in the nonindustrial countries where the probability of survival is very poor: just as clearly identified as it can be. . . "

Re Equation 10 F +2:

"That is a very interesting kinder mathematics for you to think about for certain reasons. To start off, you have second power. This second power- is a number characterising layers or surfaces. What we use for surface is a shell— in a sense it becomes the. 'surface' or a package in the system. I get a bigger package and I can tell what the number is by using the second power. We have been very used to using second power for the surface of a cube or any other thing. We say the linear measure is first power; this is the radius or edge of the cube and the surface is the second power, and the volume is the third power. Second power has been connected uniquely with surface area and it is still the surface or the shall. But what it is showing is very Interesting: there is no continuous shell, there are actually only points. They are little spheres. You can have this very high frequency and we would be counting the points in the shell, and not the surface as a whole, so we find second power representing points in the system and not surface. . . What we really discover in physics is that there are no such things as solids, and there are no such things as surfaces, because what we simply meant was a solid surface.

nf- sec 770sA - Cite Orbn Lecture #7, p.2jy, 11 jul'62

Powering: (B)

"We have been used to the idea of the second power for plotting the solid surface. In the quantum and wave phenomena they have been dealing in individual packages that do all of their accounting. They don't have continuous surface at all. Suddenly we find here then a congruence of the phenomena we have been very familiar with, the second power, and we understand it now to mean the shell and you can identify the second power with points or little separate packages

and not as a continuous solid surface. You could relate it to little energy actions, little separate stars, and you are coming out all right. This is what you really mean by quantum. Now you have actually conceptuality in respect to the quantum.**

Powering: {1)

"Science had thought that it was impossible to be conceptual because it had felt that fourth dimensionality which had been showing up time and again as an arithastleal behavior of the physics, could not be accommodated by the XYZ coordinate system and it can be accommodated by synergetics. Why can it be? Because the vector equilibrium has a volume of 20. You can get eight cubes around one point, and so the third power of two, which is eight, has used up all the space, but using the tetrahedra I can get a volume of 20 around one point as I do in the vector equilibrium. Twenty is two to the fourth power plus two to the second power and it makes it quite possible to make models of fourth powering by using tetrahedroning. In fact we find vector equilibrium is unity because its edge module is one, as is the cube the module of one. It is when it is one, when it is unity, that its volume is 20. When its edge module is two, it is two to the third power times 20 which is 160 and the volume is 160 where the edge module is two. It will accommodate very high powering, the sixth powering, and so forth. It makes possible the actual modelling of the multipowers that have characterised some of the physics and some of the chemistry which have not been modellable before and had only been treatable mathematically--- and calculatable but

- Cite Orgeon Lecture #6, p.233, 10 Jul¹62

Powering:

"not modellable. Now that they are modellable again, we find that modellability goes with using the right coordinate system and therefore conceptuality and modelability has returned and is valid so that we will probably have an entirely new kind of day dawning for man because it is going to mean that it is possible for the scientist really to talk to the kindergarten children and these are very simple increments. We are not having any numbers that are not easy to handle in the very earliest phases, so the coordinating capability of the child is going to be able to accommodate the nuclear physics and that is a very new kind of day."

Powering: Second Powering:

(1)

"Second powering¹ in this topology is identifiable only with the vertexes and not with something we call 'area,' i.e., not with a surface or an experimentally nondemonstrable continuum.

"There are no topologically indicated or implied surfaces or solids. Because the vertexes are the external points--- the higher the frequency of the system, the more dense the number of external points. We discover then that 'second powering' does not refer to 'squaring' or to surface amplification but to the number of the system's external vertexes in which equating the second power and the radial or circumferential modular subdivisions of the system multiplied by the prime number one if a tetrahedral system; by the prime number two if an

octahedral system; the prime number three if a triangulated cubical system; and the prime number five if an icosahedral system; each multiplied by two and added to by two will accurately predict the number of superficial points of the system. This fact eliminates our dilemma of having to think of the second and third powers of systems as referring exclusively to continuum

Powering: Fourth Dimension and Sixth Dimension:

.. Whereas we can only get eight cubes around a point. . . 90 degree-ness uses up all the space around a point. When I am dealing in 60 degree-ness, when I am using tetrahedron as unity, we can get the whole volume of 20 tetrahedra around one point. The tetrahedron is unity. Then we are getting 20 around a point instead of eight around

a point. Eight is the third power of two. 'When I have a stack of cubes coming together around a point, the edge count is two cubes. Unity is two there. There is just one set of radii from the center of gravity in the system and you can only have a total volume of eight which is the third power of two. If I have a volume of 20 around a point, then two to the fourth power is 16, plus two to the second power. I can then accommodate two to the fourth power plus two to the second power around a point. It is very easy to make models of the fourth dimensionalities. We discover that when we do that--- this is what we call the vector equilibrium the edge count is sooi one. When the edge count is one we have a vector equilibrium, not two as in the cubes. The volume is 20. You start with unity as 20. . . And we find that we are able to accommodate sixth powering."

Precession:

"Precession is the effect of any body in motion upon any other body in motion and the closer the proximity the more powerful the effect, and since all known bodies of macro-micro Universe are always in motion all the inter-effects of all bodies are always precessional and those effects always result in the production of an angular change of course in the affected bodies--- thus, for instance, does the Sun's pull on the Earth induce its orbiting in a course around the Sun at 90 degrees to the gravitational pull; that is, the effect on the other body is always produced as an angular re-direction other than a 180 degrees direction towards or away from one another. • . .

"Mass attraction is also involved in precession, which is another of the important, but popularly unknown, generalized principles. Precession allows a spinning top to lean over sideways without tipping further. Precession makes the gyro-compass hold its true north orientation without magnets and despite the ship's changes in course."

ixrSwW*- ffectisuu- clts I,taRU SPEECH > p- 35, 13 Kov'69

Precession;

"The effects of one moving system upon another moving system.

Precession is describable in vectorial terms: i.e.. of physically-realized, design, expressed differentially as relative angle, velocity and mass (size) modification's in respect to an axis.

The precessional result of all events are always threefold. embracing (1) action. (2> reaction, and (3) resultant. None of these interppeces-sional event components occur at 180° to any other components.

A system must have a minimum of four vertexes in order to have an omni-directional insideness and outsideness and six is the minimum number of vectorial edges uniquely connecting the four vertexes of the minimum system. The six vectorial edges are comprised of two energy event's inherent three-vector componentation of action, reaction, and resultant."

"I'm sure a number of you have been with me at previous lectures and you may have seen these two sets of 10 closest-packed spheres--- see sec. 260.50 π , but the majority of you, I am sure, still have not been with me all this time. I know that four years ago I was asked to speak at a congress of mathematics teachers in Oregon and there were 2000 mathematicians there and I asked them if any of them were familiar with these objects. And they said •No.* And I said would any of them be willing to come up on the stage with me and put them together in a way that we would all agree is the way. There is a thg way.

"So one of them came up and he looked them over, and he saw these two quadrangles and he tried matching those... then he saw two triangles and he tried matching those... then he saw these---what we call trapezoids---and he tried matching those. So then he tried to put them together like that, and that didn't seem to be too impressive either. Then he tried what we might call like a raft and that wasn't too good either.

So he started all over again and I saw he wasn't getting anywhere, so I said I'm going to have to show you how to do it."

- Cite RBF talk at Am. Museum of Natural History, NYC, EJA transcript, pp.8-9; 1 May'77

"One reason that this is not self-evident is that because, in all the great motions employed by Universe, there are six fundamental kinds of motion and five of them very familiar: spinning, orbiting, turning inside-out, expanding, and torquing.... These are very well-known fundamental behaviors of nature. But there's a sixth one called precession. And you say: I don't remember... I've heard of it. I've heard of the word precession, but that's about the most people can do....

"Precession is one of the most important things to understand--- and it's the mistaken 180-degreeness that finds humanity

missing a lot. At any rate, I'm going to precess these (two M sets of 10 closest-packed spheres! now at 90 degrees. OK?

And I'm going to now put them together and obviously they are now not going to fit⁵ (Applause.) And the reason you didn't see that---and the thing about it is---that you all went to school being taught the XYZ coordinates of parallels and perpendiculars.... And you try to bring in together perpendicularly. But Universe is not operating that way. Universe is operating in radiations¹-divergence and gravitational- convergence. Divergent and convergent: that's the way Universe operates. This is nothing like the XYZ coordinates"

- Cite_RBF talk at Am. Museum of Natural History, NYC, □□□ EJA transcript, pp. 9-10, 1 Ray'77

RBF DEFINITIONS

"and all that---they have nothing to do with the way the Universe works. Things in parallel never get resolved. Convergent things get beautifully resolved, they get exactly ... they get nature into a corner... that's why you couldn't have a nucleus in a perpendicularparallel system. You can only have nuclei when you have convergence. And that's why I say how far out our schooling really is."

"There are six edges of a tetrahedron, and each edge precesses the opposite edge toward a 90-degrees-maximum of attitudinal difference of orientation. Any two discrete opposite edges can be represented by two aluminum tubes, X and *, which can move longitudinally anywhere along their respective axes while the volume of the irregular tetrahedra remains constant. They may shuttle along on these lines and produce all kinds of asyrranet- rical tetrahedra whose volume will always remain unit by virtue of their developed tetrahedra's constant base areas and identical altitudes. The two tubes' four ends produce the other four interconnecting edges of the tetrahedron, which vary as required without altering the constantly uniform volume."

Prestressed Concrete Sequence; (1)

"I began to initiate such a 'regenerative tree' 2~See Trees7 strategy in experimental undertakings in structures about a third of a century ago. I gave myself the task of exploring the practicality of assembling the components of buildings under the most preferred conditions of technology and science, in order to achieve a very high degree

of efficiency. This collection of components had to be capable of economical air transport to any part of the Earth. I saw that the essentials were local hydraulics and pneumatics and generalized tensional packages--- broadly speaking. Familiar examples of this are all kinds of pneumatic structures, from inflatable toy sea horses and life rafts to dirigibles. Beyond these, there are very complex structures. For examples, I have made geodesic domes--- omnitriangulated spheres-- with pneumatic components, geodesic tensegrity spheres are highly magnified, pneumatic principle structures."

- Cite CONCEPTUALITY OF FUNDAMENTAL STRUCTURES, Ed. Kepes, 1965. p. 86.

Prestressed Concrete Sequence; (2)

"The hydraulics possibilities include the local cements, water, air, gravel, sand, and rocks. The economic theory behind prestressed concrete is based on prefabrication and shipping only the small bulk of steel as a tensional system, and applying the local water, sand, gravel, and cement as the building bulk. The particles which make up cement are sifted sand and gravel, which, though they look rough, pack averagedly as spheres would pack--- in 60-degree angular packing. Few people think of cement that way, but if it is shaken down, agitated well, and lubricated together with a colloid, it will automatically avail itself of nature's tetrahedral structuring in closest packing pattern."

- Cite CONCEPTUALITY OF FUNDAMENTAL STRUCTURES, Ed. Kepes, 1965, p. 86.

Prestressed Concrete Sequence? (3)

"This principle of tensional blueprints— prestressed concrete is an example—is manifesting itself as the direction which building will take. In order to make the resources of the Earth adequate to the needs of all people, we must increase the performance per pound of those resources in a very big way, thus giving man

environmental controls. This must be done to accommodate all the new shifting patterns of man around the face of the Earth. We will have to employ nature's much more economical grand logistical strategies. Emulating nature, man must distribute mathematical information as basic pattern, which does not weigh anything at all. The highly technical components of very fine high-tension steels and aluminums and fine alloys can then be centrally processed and distributed. Those will be used primarily for tensional functions, and will be rigidified by the local compressional pneumatic and hydraulics. •. This is the most comprehensive statement that I could make regarding the most recent discovery of nature's forever permitted structural strategies."

Pretending

"There's nothing wrong with pretending; in fact we have to pretend. Pretending is just the same thing as our imagination. We have to formulate something like 'going down town' before we can actually go down town. Even Christopher Robin with Alice. It's really not a matter of pretence but more of a trial balance. It's not a pretence: you might just not have had time to do it yet,

"You write the play) Then you act the play. You have to write it first. It's like the lag between the navigating and the conception. You can't just go, except off the deep end, and even a child knows better than that!"

Prime Domains:

"While generalizably conceptual the prime structural systems and their prime domains, linear, areal, and volumetric, are inherently subfrequency, ergo independent of time and size."

- Citation and context at Subfrequency. 17 Feb*73

Prime Domains:

See Prime Volumes Spheric Domain

"Omnitopology describes prime volumes. Prime volume domains are described by Euler's minimum set of visually unique topological aspects of polyhedral systems. Systems divide all Universe into all of the Universe occurring outside the system, all of the Universe occurring inside the system, and the remainder of the Universe constituting the system itself. Any point or locus inherently lacks insideness. Two event points cannot provide enclosure. Two points have betweenness but not insideness. Three points cannot enclose. Three points describe a volumeless plane. Three points have betweenness but no insideness. A three-point array plus a fourth point which is not in the plane described by the first three points constitutes prime enclosure. It requires a minimum of four points to definitively differentiate cosmic insideness and outsideness, i.e., to differentiate macrocosm from microcosm, and both of them from here and now."

- Cite SYNERGETICS draft at Sec. 1011.11, 17 Feb'73

Prime Enclosure:

"• , » Two points do not constitute enclosure. A point by itself does not enclose. Three points do not constitute enclosure. Three points constitute a plane.

A three-point array plus a fourth point not in the plane of the first three points do constitute prime enclosure. Four points minimum have insideness and outsideness."

"Prime otherness demands identification of the other's--- initially nebulous-**- entity integrity, which entity and subentities' integrities first attain cognisable self-inter- patterning stabilization, ergo, discrete considerability, only at the tetrahedron stage of generalizable entity interrelationships. Resolvability and constituent enumerability, and systematic interrelationship cognition of entity regeneration presence, can be discovered only operationally. (See Secs. 411, 411.10, 411.20, and 411.30.) After the four-ball structural interpatterning stability occurs, and a fifth ball comes along and, pulled by mass attraction, rolls into a three-ball nest, and there are now two tetrahedra bonded face-to-face."

Prllfg Otiwrnwa:

- prime otherness wa flrat hypothetically diacovered In the early 1920'a and was Identified by the term 'fundamental complementarity'*¹

"Prime otherneaa haa been experimentally evidenced in 1956 when the Nobel prize waa given for the proof that the complemenerlea were inherently dissimilar, non-mirror-imaged systems. For Instance, proton and neutron always and only coexist; they are interchangeable but have different masses and other dissimilar characteristics.

"The limit case of prime otherness la that of the point and the no-points; the events and the novents. Numerically, one vs.zero. Because it is the limit case it is prime. Zero is prime otherness.**

Primg Structural Sygyepig: (1)

"The domain of the tetrahedron is the tetrahedron as defined by four spheres in a tetrahedral, omni-embracing, closest- packed tangency network. The domain of an octahedron is an octahedron as defined by six spheres closest packed octahedrally. The domain of an icosahedron is an icosahedron as defined by 12 spheres closest packed without a nucleus. All of the three foregoing non-nuclear-containing domains of the tetrahedron, octahedron, and icosahedron are defined by superficially omnitriangulated closest packing of the four spheres, six spheres, and 12 spheres, respectively, which we have defined elsewhere as omnitriangulated systems or as prime structural systems. There are no other symmetrical non-nuclear-containing domains of closest-packed volumeembracing agglomerations.

"While other total closest-packed-sphere enbracements, or agglomerations, may be symmetrical or superficially asymmetrical in the form of crocodiles, alligators, pears, or billiard balls, they constitute complex associations of prime structural systems. Only the tetrahedral, octahedral, and icosahedral domains are basic structural systems without nuclei."

Erlw structwl Sys:

"there are only three possible cases of fundamental

omni-symmetrical. omni-triangulated, least effort structural systems in nature: the tetrahedron with three triangles at each vertex, the octahedron with four triangles at each vertex, and the icosahedron with five triangles at each

vertex."

Cite SYNERGETICS ILLUSTRATIONS - # 7, 1967

"A structure divides Universe into two main parts--- all the Universe that is inside and all the rest Of the Universe which is outside of the structural system. We find that there are only three types of fundamental omnitriangular, symmetrical structural systems. We can have three triangles around each vertex of a symmetrical

structure; this makes a regular tetrahedron. Or we can have four triangles around each vertex; this makes the regular octahedron. Finally we can have five triangles around each vertex which makes the icosahedron. The tetrahedron, Octahedron, and icosahedron, are made up respectively of one, two, and five pairs of positively and negatively functioning open triangles. We cannot have six symmetrical or equilateral triangles around each vertex because the angles add up to 360° --- thus forming an infinite edgeless plane. The structural system with six equilaterals around each vertex never comes back upon itself. It can have no withinness and withoutness. It cannot be constructed with pairs of positive-negative function open triangles. In order to have a structural system it must return upon itself in all directions. If the system's openings are all triangulated it is structured with minimum

rrXac Strwrtwrftl Smspp:

"We find there are only three possible ottni triangulated systems that subdivide Universe. There are the three faces around one vertex which is the tetrahedron; the four faces around one vertex which is the octahedron; and the five faces around one vertex which is the Icosahedron,

"You can't have six because it would be flat and would not close back on itself to close the system, It would be neither concave nor convex. We have the positive and negative condition of these three things. Remember that you cannot have a polygon of less than three sides. So the triangle is minimum polygon; it is the only polygon that is inherently stable. We have learned that the triangle stabilizes itself with minimum effort, so we learn that triangulated systems are the systems of the least effort. If they are equilateral triangles then all the system is of equal effort in all directions... so that there are only three possible cases: tetrahedron, octahedron, and icosahedron.¹⁵¹ `` Exploring experimentally, synergetics finds the tetrahedron, whose volume is one-third that of the cube, to be the prime structural system of Universe: prime structure because stabilised exclusively by triangles that are experimentally demonstrable as being the only self-stabilising polygons: and finally, because accomplishing the subdivision of all universe into an Interior microcosm and an external microcosm and doing so structurally with only the minimum four vertices topologically defining the insideness and outness.

HBF DEFINITIONS

"All structural accounting of nature is accomplished with rational quantities of tetrahedra. The ITZ coordinates may be employed to describe the arrangements, but only in awkward irrationality because the edge of the cuGe is Inherently irrational in rtspect to the cube's facial diagonal. The hypotenuses actually function only as the edges of the positive and negative tetrahedra which alone permit the cube to exist as a structure. The hypotenuses connect the sphere centers at the cube corners; they function concurrently and simulatane- ously as the natural structuring of the tetrahedra edges in the omnidirectional isotropic vector matrix; as either hypotenuse or tetra edge they are prime vectors-"

"Of the eight corners of the cube only four coincide with the sphere centers of closest-paeked, unit-radius spheres; therefore only the cube's facial diagonals can interconnect closest packed spheres. One closed set of six cube fhce diagonals can only interconnect four sphere centers corners of the prime tetrahedron which alone provides the structural stability of the cube, whose eight-cornered, structural stability completeness requires the saturation of the alternate set of six diagonals*

- Cite SINEKGERlCb, 2nd. Ed., at Secs. 540.11 +.12, 1y Hov'74
rrtJW^v<Ctgr- 12)

"in each of the cube's six faces, which alternate set of six diagonals intertriangulates the other four sphere centers of the cube's eight corners. The cube diagonals and the edges of the tetrahedra structuring the cube are two aspects of the same phenomenon. The tetra-edge, cube-face diagonals connecting the two sets of four corners each of the cube's total of eight corners are the prime vectors of the vector equilibrium and the isotropic vector matrix.

"The second power of the length of the prime vector that constitutes the diagonal of the cube's face equals the sum of the second powers of any two edges of the cube. Because these two edges converge at the cube's corners to form one standing wave which may be multifrequenced to apparently coincide with the cube's facial diagonal, we discover that this relationship is what we are talking about in the deliberately nonstraight line. It is the same mathematical relationship demonstrated in the ancients' proof of the Pythagorean theorem, wherein the square of the hypotenuse is proven to be equal to the sum of the squares of the triangle's two legs. Thus the deliberately nonstraight line displays an evolutionary transformation from" coincidence with the two sides of the parallelogram to "

Principlei (i)

"I've worked very hard on my audiences to make sure that they understand that it's only the human mind that is able to discover those eternal principles that are operative, governing the eternal regeneration of the Universe. Humans are here for functioning in a special capability of reference to the eternal laws. When you have something as complex in design as the Boeing 747 you have to have all those

instruments up forward and every once in a while the instruments tell the pilot that they're non functioning— or they're not saying anything. It tells the pilot he's got to take over now himself, not to rely any more on automatic and only by direct access to the principles of the Universe can he possibly save his ship.

"The Universe must be a problem of design of eternal regeneration, a design that makes the Boeing 747 look like a toothpick in simplicity compared to the complexity of eternally regenerative Universe. There must be some local things that go on as there would be in the Boeing 747, where you find out where the stresses are, or where the heat is: something you've got to attend to. You need a local monitor on some part of the Universe... and that's what we're here for.

- Cite tape transcript RBF to W.. Wolf, Cloicester, Mass., p.13, 2 Jun'74

"The one thing common to all lives everywhere— regardless of differences in size, or ethnics— the one thing common is that we're here with this beautiful mind with access to principles to solve problems by principles not by force.

We're born as force; we're born as physical. But mind is our great function here. Our relationship to Universe is completely abstract.

"We find then humanity is still in a bind with all the politics, all the big business, all the organization, all for the power structure... who's got the biggest gun? And I say, if we're going to stay here it's so we can actually graduate in our function. This is a priori."

Privacy:

"Get yourself the tools and ways of enclosing enormous amounts of space, and make It possible for large numbers of human beings to come together under more preferred conditions than have ever before come together* Then give them large clear spaces so that their privacy results from having sufficient distance between people or groups of people. Get over the idea of partitions. Partitions are like socialism. They came out of living and working in fortresses where there wasn't enough room to go around, so they put up partitions--- really making cells. Partitions simply say you shall not pass. That's all they do. They are improvised to make thqt which is fundamentally inadequate work 'after a fashion,'

"There are four kinds of privacy: if I can't touch you, we're tactilely private; if I can't smell you, we're olfactorily private; if I can't hear you, we're aurally private; and if I can't see you, we're visually private. Just a little space will take care of the first three. For the fourth--- since we can see a great distance--- all we need are delicate occulting membranes, possibly rose bushes or soap bubbles or smoke screens

Probability Model of Three, Care On a Highway: (1)

"I an tying up the social experience, often observed, in which three independently and consistently velocitied autombies (and only three) come into close proximity on the highway--- often with no other cars in sight. Mathematically speaking, three ?oints--- and only three--- define both a plane and a triangle.

he cars make a triangle; and because it is mathematically discovered that the total number of points, or areas, or lines of a system are always even numbers; and that this BMHV divisibility by two accommodates polar-and-hemispherical positive-negativeness of all systems;

because the defining of one small triangle on the surface of a system always inadvertently defines a large triangle representing the remainder of the whole system's surface, and this large triangle's corners will always be more than 180-degrees each; ergo, the triangle is an 'inside-out,' i.e., negative triangle, and to convert it to positive condition requires halving or otherwise fractionating each of its three corners by great circle lines running together somewhere within the great negative triangle; thus there develops a minimum of four positive triangles embracing the Earth induced by such three-car convergences."

Probability Mrtfl of Three Qfira an fi-Hljway: (2)

"The triangle made by the three cars is a complementarity of the three other spherical triangles on the Earth's surface. The triangle formed by the two cars going one way, and one the other way, gets smaller and smaller and then reverses itself, getting ever larger. There is always a closer proximity between two of the three. This is all governed by topological "pattern integrity," Probability is exclusively abstract mathematics: theoretically calculated points on curves. The statisticians think almost exclusively in lines or planes; they are what I call planilinear. Willard Gibbs in evolving his phase rule was engaged in probability relating to chemistry when he inadvertently and intuitively conceived of his phase rule for explaining the number of energetic freedoms necessary to introduce into a system complexly constituted of crystals, liquids, and gases, in order to unlock them into a common state of liquidity. His discovered phase rule and topology are the same: they are both synergetic. Despite the synergetic work of such pioneers as Euler and Gibbs, all the different chemistries and topologies still seem to be random. But synergetics, by relating energy and topology to the tetrahedron, and to systems as defined, and by its synergetic hierarchy, replaces"

"randomness with a rational, cosmic, shape-and-structural- system hierarchy. This hierarchy discloses a constant relative abundance of the constituents; i.e., for every nonpolar point there are always two faces and three edges. But systems occur only as defined by four points. Prime structural systems are inherently tetrahedral, as is also the quantum.

"A social experience of three cars: they make a triangle changing from scaleneto equilateral to scalene. The triangles are where the cars don't hit. (These are simply the windows.) But you can't draw less than four triangles. The complementarity of the three triangles makes the spherical tetrahedron--- which makes the three-way grid. The little spherical triangle window is visible to human observers in greatest magnitude of human observability and awareness of such three-car triangles at 15 miles distance, which is 15 minutes of the spherical arc of our Earth. Such dynamically defined Earth triangulation is not a static grid because the lines do not go through the same point at the same time; lines--- which are always action trajectories--- never do. All we have is patterning integrity of critical proximities. There is always a nonviolated intervening boundary condition. This is all that nature ever has."

"Nature modulates probability and the degrees of freedom, i.e., frequency and angle, leads to the tensegrity sphere; which . leads to the pneumatic bag; all of which are the same kind of reality as the three automobiles. All the cosmic triangling of all variety of angles always average out to 60 degrees. That is the probability of all closed systems of which the Universe is the amorphous largest case. Probability is not linear or planar, but is always following the laws of sphericity or whole systems. Probability is always dependent on critical proximity, omnidirectional, and only dynamically defined, three-way grid-

ding pattern integrity, and with the concomitant topologically constant relative abundance of points, areas, and lines, all governed in an orderly way by low-order, prime-number, behavioral uniqueness as disclosed by synergetics.'*

- Cite SYNERGETICS draft at Sec. 536.14, 26 Sep'73

"I am tying up the social experience of three cars meeting on the highway. They make a triangle which is a complementarity of the three' other spherical triangles on the Earth's surface. The triangles get narrower and narrower and then reverse themselves. There is a proximity between two of the three, we have topology as a pattern integrity. . . Probability is pure mathematics, just points on curves. . . A social experience of three cars-. They make a triangle changing from scalene to equilateral to scalene. The triangles are where the cars don't hit. (These are simply the windows.) But. you can't draw less than four triangles. The complementarity of the three triangles makes the spherical tetrahedron— which makes the three-way grid. . . “

rtBF u*FIMTlvbb

AH”'

"in the early days of the auto on a lonely road--- when you saw another car coming--- there was always a third coming into view or already in view. Three cars frequently come to approximately the same highway point at approximately the same time. This is not surprising because when we, having first taken away the two points from the system to accommodate the axis of the observer, and you always have the topologically constant relative abundance of interference crossings, areas, and lines. Edges are lines. The guided car paths are in reality lines, traces, with universal threefoldness of energy event trajectory vectors. Universe keeps sorting its event traces into bundles of three. The social highway experience of three cars is the Inexorably present, tn-complementarity relationship of the little local triangle

on the Earth's surface complemented by the three other great circle triangles of the terrestrial spherical tetrahedron always inevitably produced in all systems formulations and transformings law. Critical proximity imposes triangulation.

Problem: Statement of the Problem:

"It is my philosophy that a properly stated problem is a problem solved. The adequate statement must contain an inventory of all the resources available and all the variable parameters uniquely involved. The solutions are inherent in such adequacy of statement,"

- Cite SET "Y", p. U, Au«»72

"Our problem is really one of information. We're in this condition where we have to get the information out to all humanity, which in the past was content with following a leader. Some time ago I made the discovery that if I can communicate something to somebody else, write it. put it into print, it goes out of me and I can look at it to be sure I'm not kidding myself. And then suddenly you make the discovery that if you state the problem correctly, the problem is solved. I simply happened to get to that realization a little earlier than others due to my comprehensive training and my thoroughness and the inspiration of knowing that if I could communicate these possibilities, humanity really might make it. I've had a deep feeling about this all along, and it's a very critical matter. Without that information that we need, we do risk a runaway of ignorance, and that's where the great peril lies."

- Cite RBF tape transcript for Barry Farrel Playboy Interview, Feb '72. Above passage deleted. See draft p. 61.

"Other men's consciously articulated awareness of the problem, its existence, and the sequitor conclusion that inherent in its comprehensive statement that once properly stated it could even then only by teleologically solved through competent design, and not by political reform, for not until the comprehensive-competent-teleologic

designer formulates and calculates the total involvement, differentiation and subsequent integration, and initiates the wheel-starting essential tasks do the minimum physical constituents of the 'reform' exist. Ergo, political reform is only and always accessory after the fact. And the concepts of the ultimate products consequent to our syngetically conceived designing, were all alike nonexistent prior to out persona11y-unique- experience-pattern induced abstract apprehension, and subsequent systematic design conception of them, and our production of their component subsystem items and their testing and assembly."

Procreation:

"If you think about it, it's probably a very difficult design problem to get an organism to want to procreate. Go to the mirror and stick your tongue way out and have a good look at it. If you didn't have one of those and a salesman came to your door and said, 'I'd like to sell you one of these things. You stick it in your mouth and it does you a lot of good,' I doubt that you'd be very likely to buy that tongue. If you were to take a look at your guts, your kidneys, and then had to go to a supermarket and buy a kit to make a baby, I don't think you could put it together at all. If each of us could see all the organic equipment required to regenerate this extraordinary walking coral reef that we really are, I don't think anybody would procreate."

"So in order to be able to get us to procreate, nature gave us a beautiful covering which sort of simplifies, at least, all the frightening colors and coils and such. We have a simplified skin stretched over us, and nature has done a whole lot of tricks, trying to make this thing attractive enough so that procreation will actually occur,*

RBF does not like above terminology. Approved designation is "Triangular Geodesics Transformational Projection."

- Cite RBF to EJA, 200 Locust, Phila., 22 Jan'73

"One of the things I've always wanted to be able to do was to see the whole Earth at once with minimum distortion and maximum effectiveness. That brought me to d method of translating spherical data to a flat surface, which was a direct extrapolation of my mathematical investigations. . • Making a world map took me into the high stratosphere of polyhedra. . . If we put information on a sphere, the maximum that can be read is about one-quarter of the sphere. The tangential information cannot be read. Since our real objective is to be able to read all the information of the total sphere, the whole Earth, then possibly a bigger globe would give more data. Dut if a bigger globe will do, then why not go to the maximum condition and use the Earth itself? Actually, the bigger the globe, the smaller the reader is in relation to it and the greater the re luction in the material that can' be read. There are certain optimal distances of readability. . . Rather empirically, a 12- to 16-inch globe held at arm's length is about the best that can be read from a sphere per se."

- Cite'RBF, Univ, of Rhode Island, 26 Aug, '66, pp. 195-196.

"How can I get a total surface to give me the best information? In traditional methods of projection such as Mercatfir, polyconic or polar-azimuthal, there is only one point, or line, or pair of lines where there is a true reading: that special line along which the conically or cylindrically curved paper is in actual contact with the sphere. From the line.of true contact, accuracy diminishes outwardly in projection. The

errors increase very rapidly, particularly in the Mercator projection in which the sphere is split open from the great circle of the equator and spread flat so that two points in the middle of Russia are split to the map's ends and seem to be 25,000 miles apart.

"I have found then, that instead of trying to use infinitely severed lines with two polar azimuthal projected hemispheres breaking the whole Earth into two separate circular planes, or the polyconic projection with the northern and southern hemispheres projected as fan-shaped planes with their curved edges tangent to one another at only one point, it is possible to avoid introducing infinity within the projected system."

- RBF, Univ, of Kftode Island, 26 Aug. '66. p. 196.

"I use three fundamental reference lines instead of two. When only two lines cross, infinity is involved since one or two lines are open-ended and have no finitely contained areas. If three lines overlap one another they make a triangle. Thus, a finite area is inherently contained. I do not have to break open the data transferred from the sphere to the plane by triangles.

"There is, however, what we call spherical excess in the topological transformation of the spherical data to the flat surface. Spherical excess is the only source of distortion. . . . Spherical excess refers to the amount by which the sum of the spherical triangle's angles exceed 180° . Spherical excess for a large spherical triangle is very much larger than for a small spherical triangle. For instance, on a spherical tetrahedron each of the angles is 120 degrees, so that the total of the three angles of each of the spherical tetrahedron's four triangles is 360 degrees/ 60 degrees minus 180 degrees leaves an excess of 180 degrees. In a spherical octahedron obtained by bisecting the edges of a spherical tetrahedron and interconnecting the three great circles, each of the angles will be 90 degrees, or

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66, p , 197.

"a spherical triangle total of 270 degrees, which means an excess of 90 degrees. If the edges are bisected again each of the corners will be $72^{\circ} 32'$ with a total of $221^{\circ} 36'$ so the spherical excess of $221^{\circ} 36'$ minus 180° is equal to $40^{\circ} 36'$ and is being reduced very rapidly. Smaller and smaller spherical triangles give less and less spherical excess. Therefore, I subtriangulate the total of the Earth's surface in the largest number of identical equi-edged small triangles, i.e., the spherical icosahedron, where the spherical excess is a minimal 36°"

"I have found that if I wanted to take off the total world's data in the largest number of identical triangles and have them symmetrical, the triangles have to be equilaterals. The maximum number of equilateral triangles into which we can subdivide a spherical unity is twenty: a spherical icosahedron.* You might ask, "Why can't you have more triangles than twenty?" To explain, I shall first take two triangles and put them together. We see that they hinge and just come to be congruent one to the other."

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66, p. 197. "A two triangle system has neither insideness nor outsideness. I want to make a system which subdivides Universe into all the Universe inside the system and all the Universe outside the system. Now, I can take three triangles and I can put them together around one vertex and make the tetrahedron. Around each vertex there are always a minimum of three triangles. I can insert a fourth triangle around each vertex and get the octahedron. I can next put a fifth triangle around each vertex and get the icosahedron. In this closed system there are 12 vertexes with five equilateral triangles around each vertex." In a system "the largest number of triangles you can possibly have around a vertex is five. I can take that into the planar condition or the spherical, and in the spherical each of the corners will be 72° . Now that I find that I can get the total Earth's surface on to the icosahedron, the edges of the

icosahedron's spherical triangles will all be $63^{\circ} 26'$. If possible, one of the things I want is to take the 12 vertexes of the icosahedron and manipulate them in such a way in relation to the sphere of the Earth that the vertexes always fall in the oceans."

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66, p. 197.

"Going from the spherical to the planar condition with fige 60° angle-around each vertex means that there are going to be sines opening up to 60° . I would like to have the sine opening in the ocean and not on the land because one of the most unsatisfactory things about looking at the Earth's data on classical map projections is that the continents themselves are always being distorted in an unfair way. The other fellow's continent is always being broken up instead of our own.

"Taking all the Earth's data from the spherical icosahedron to the planar icosahedron permits the corners of the large equilateral triangles to be 'reduced from 72° to 60° so that there remains only a 20° spherical excess. By using an equilateral triangle that is symmetrical with each of the corners having equal subsidence, the amount of contraction becomes invisible and concentric uniform boundary scale is held for the entire length of the triangle edge, and there is no change in this when going from the spherical to the planar condition. .

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66, pp. 197-198.

mo

"There is local contraction within each small triangle of the three-way grid and that contraction is symmetrical. In all the other familiar methods of map projection, projection errors are dismissed outwardly from the point or line of reference and thereby greatly increased.

Compare a circle of radius one with a circle of radius two; because the area of a circle of radius two is approximately four times the area of a circle of radius one, when the dimensional Variables of a projected surface are outwardly distributed, the proportion of total map area that is in relatively greatest distortion exceeds by the ratio of three to one the relatively least distorted areas. In my system, the spherical surface subsides inwardly by symmetrical contraction and the proportion of the map which is in relatively greatest dimensional distortion is less by a ratio of one to three than its relatively undistorted area. In my map the error is sent inwardly and is at maximum at the center of each small spherical triangle of the three-way grid system.' Every triangle is contracted symmetrically at the same rate."

- Cite RUF, Univ, of Rhode Island, 26 Aug. '66. p. 19d.

"Cutting out around the edge of the map in the planar condition and bringing the parts back together makes an icosahedron. If the edges of the triangle are six inches, the folded system is the same as a 12-inch diameter globe. Of course, if you make an icosahedron, you will find it faceted into 12 equilateral triangles. If, however, the faceted icosahedron is compared to a 12-inch globe, the efficiencies of conveying information are equal between the two map systems."

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66., p. 198.

"Since 1917 Mr. Fuller has been evolving his Airocean World Map and new projection method* . * Due to its inherent advantages in respect to astronomical observation, aerial mosaicing, and comprehensive world triangulation by great circle grid the projection comprises a world-around Airocean strip map of approximately invisible dimensional distortion. . * . The Dymaxion Airocean World Map and its projective transformation strategy was glimpse-conceived in 1917,

but required over a third of a century of development of" synergetics "to bring it to its present condition. . . the projection is contained entirely within a plurality of greatcircle bounded triangles--- or quadrangles--- of constant, uniform modular subdivision whose identical length edges. * * permit their hinging into flat mosaic-tiled continuities at the planar phase of the transformation and thereby permit a variety of hinged-open complete flat world mosaics."

- Cite Undated sheet THE DYMAXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION.

"To provide a continuous one-surface world map--- while peeling off the sections of the globe--- the transformation must be such that the pieces have straight and matching edges when peeled off and flattened out, Unlike any of its cartographic predecessors which present the whole spherical world surface data within a unit flat surface nfcpl the Fuller projection maintains a uniformly modulated and constant length great circle boundary scale in closed- 360 degree--- equilateral periphery controls,"

- Cite Undated sheet: THE DYMAXION AIROCEAN WORLD FULLER PROJECTIVE -TRANSFORMATION

"The Fuller Projection operates in a series of transformation stages. It first subdivides the total world surface into a plurality of great circle bound polygonal zones.

Next it transfers the data from the sphere's surface in separate mosaic 'tiles' corresponding to each of the great circle bound polygonal zones of step one. While migrating as a zonal mosaic tile, each tile (independently) transforms internally from compound curvature to flat surface by methods shown" in the projective transformation model. Each tile transforms entirely within the respective polygonally closed uniform symmetrical containers, allowing none of the data to spill outwardly in perverse distortion.

"When all the tiles have transformed independently from spherical to planar, their straight polygonal edges-- unaltered in length during the transformation in transit migration-* permit re-association in a variety of continuous data mosaics.

"The Fuller projection has the relationship to all other known projection methods that a mechanically fillable and sealable set of flasks bear to hair combs, hair pins, fish bones, and star spurs, as Instruments of liquid transfer."

- Cite Undated sheet: Dymaxion Airocean World Fuller Projective-

"The Fuller Projection not only contains its surface data increments within uniform and linearly unaltered closed great circle arc polygonal peripheries--- all the way from its spherical to its planar positions--- but also uniquely concentrates all of its spherical angle excess. It concentrates the excess into 60 degree symmetry within equilateral polygons. This means that the compound curvature subsides by symmetrical internal concentric contraction into a flattened condition entirely within its neither elongating nor shortening peripheral integrity. The internal subsidence of the Fuller Projection is in contrast to all predecessor projective methods for showing the whole world within one unitary surface. All the predecessors disperse spherical excess by outward 'fanning', i.e., by stretching out to flattened condition."

- Cite Undated Sheet: DYKAXION A'IROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

The projective transformation "transfers the spherical data to the planar by employing only great circle coordinates, while all other projections employ a progressively complex admixture of great circle and lesser circle coordinates."

In the projective transformation "from spherical to planar condition the radii of the sphere of reference which penetrate perpendicularly each spherical surface coordinate point of the comprehensive great circle grid, separate from one another at their respective internal ends-- and each and all remain constantly perpendicular to the transforming, internally shrinking surfaces throughout the transformation, and their original uniform lengths also continue as 'constant*' throughout the transformation."

- Cite Undated Sheet: DYXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

Proactive Transformation:

(6)

"Because of the constant perpendicularity of the Fuller Projection's radii to the transforming surface, the Fuller Projection greatly simplifies celestial calculations. All astronomical phenomena always occur in outward perpendicularity--- zenith--- to the Fuller Projection's internal spherical coordinates. On transformation to planar grids the astronomical data always remains in identical perpendicular zenith to the corresponding coordinate positions in the planar phase of the Fuller Transformation.

"Because of this property the Fuller Transformation would be more suitable than any other projection for a comprehensive planar mosaic of a total covering-set of world-around aerial photographs. Aerial photographs are always taken from zenith positions and at a constant altitude, or radius distance from the Earth's spherical fWML surface."

- Cite Undated Sheet: UYMAXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

The projective transformation "consists of great circle bounded triangles of any angular magnitude which can transform the comprehensive geographical data of the world from the spherical to the planar by employment of either the spherical tetrahedron, spherical cube, spherical octahedron, or spherical vector equilibrium and its alternate, the icosahedron, or any development of these. . . It is a discovery of synergetics that there are no other spherical triangular grid bases."

- Cite Undated Sheet: DYMAXION AIROCEAN WORLD FULLER
PROJECTIVE-TRANSFORMAT ION

"It is a matxpr of Dymaxion cartographic strategy that: the greater number of great circle polygonal zones employed in the transformation, the less the spherical excess to be subsidingly concentrated within each zone surface, and therefore the less the residual distortion distributed to each of the planar mosaic aspects of the whole world's reassembled surface when arrayed in one continuous flat 'skin.'"

The projective transformation presents the only method by which the whole world data can be transferred from the spherical to the planar within an all great circle grid triangularly, quadrangularly, multipolygonally or all two or three together."

"Because of a hemisphere's polar symmetry to its opposite polar hemisphere to the total inventory of great circle grid triangles in the comprehensive world grid is always even in number, therefore adjacent triangles may always be associated in total or partial quadrangular pattern-phases without increase in vertex count."

- Cite Undated Sheet: THE DIMAXION AIROCEAN WORLD FULLER
PROJECTIVE-TRANSFORMATION

Projective Transformation: Raleigh Edition:

"The man may be cut around its periphery and bent on its main triangular edges and the exterior edges brought together--- closing all exterior sinuses--- thus making a continuous or finite surface and constituting a planar facted icosahedron transformed from the pspherical icosahedron, 'tthen the surface is thus closed--- proving itself to be a finite continuity--- and the resulting icosahedron is compared to a globe of the world, the relative shapes and area sizes will be found to be entirely faithful to the spherical globe's relative sizes and shapes."

- Cite Undated Sheet: THE DYMAXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION The projective transformation employed "in the Raleigh Edition of the Dymaxion Airocean World is that of the spherical icosahedron , chosen because the latter has the largest number of identical and symmetrical spherical triangles, and therefore the least 'spherical excess*' of all the possible symmetrical triangular great circle bound mathematical cases. The spherical icosahedron was also chosen because its controlling arc boundary of 63 degrees 26 minutes 05.816... seconds was just adequate to the triangular spanning of the maximum continental aspects encountered in the unpeeling of the Earth's data--- within 20 symmetrical great-circle bound control triangles--- spanning those continents in such a manner that all 12 vertexes of the spherical icosahedron grid lay in the open waters. As a result this peeled strip map contains all the world's continental contours. . . with no displeasing distortions of the shapes."

- Cite Undated Shet: THE DYMAXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

Projective Transformation: (Dymaxion Airocean World Map;) "The projection system of the Dymaxion Airocean World Map divides the sphere into 20 equilateral spherical triangles which are then flattened to form the icosahedron. These 20 triangles are each projected into a flat plane. • • This method results in a map having less visible distortion than any previously known map projection system. . . . To flatten the globe it is simply necessary to 'unfold' the icosahedron."

- Cite Synergetics Illustration, 19, caption. 1967

•*I am going to give you a mental model of what I did in developing my method of projection. This is really a 'topological transformation' rather than a 'projection' since it isn't a shadowgram, I am going to take a thin tempered steel band and I am going to mark it with sub-modules, with increments like an engineer's scale. If I bend the band, the modules will all stay in their same original uniform lengths. In a bent condition, or in a flat condition the modules will all read the same. Now I'm going to punch holes vertically through both the end module marks of the band and I'm going to take two more such bands each marked with the same modules and I am going to overlap their hole-punched ends, and I'm going to put a round rod through the holes. The rods going through each of the corners of the steel band edged triangles make little swivels. The rods go through the bands vertically and perpendicular to the plane of the triangle formed by the steel bands. If I take hold of the bottom ends of two such rods that go through the holes at the end of one of the steel bands and pull them towards each other, I make the steel band bend. Now I take hold of the bottom ends of all three perpendicular steel rods and pull them towards one another."

- Cite RBF, Univ, of Rhode Island, 26a Aug, '66, p. 197.

"This will make each one of the steel bands bend. As each one of these bent or arched bands also rotates away from the others, each of the corner angles will be opening up and the three swivel end bands form a spherical triangle."

"In my projection I've used great circles for the edges of the spherical triangles and marked them with a uniform boundary scale. A set of fundamental perpendiculars to the great circles, as the radii of the sphere, come at even modules onto the great circles. I have interconnected these edge modules of the spherical triangles with the three-

way grid. With this three-way grid I could do as I did above with the tempered steel bands and produce a three-way grid of small- spherical triangles within the large spherical triangles of the icosahedron. I can put a grommet where each of these steel bands cross and run a rod through perpendicularly which would represent the radius of the Earth going into the center. Imagine the triangle in a flat or planar condition, with a great many of these bristle-like rods going perpendicular to the surface of the triangle and then pulling them all together at their free ends. The triangles of the three-way grid all form spherical triangles."

- Cite KBF, Univ, of Rhode Island, 26 Aug. '66, p. 197.

Projective Transformation Model: (III)

"We find that these rods remain perpendicular to the surface of the triangle throughout all of their transformations. It doesn't matter whether the triangle is flat or is spherical or how it is spherical or what the corner angles are. Each one of these rods will be perpendicular to its spherical triangle at its vertex of attachment just as the radii of the Earth are to the great circles. This means that when we take the

geometric data of the stars, any star that is in its zenith over the Earth at any given moment will remain in my map in this vertical position over that point on the Earth whether my map is in a planar condition or a spherical condition.' '

- Cite RBF, Univ, of Rhode Island, 26 Aug. '66, p. 197»

Proactive Transformation Model:

"The" projective "Transformation is contained entirely within a plurality of great-circle bounded triangles--- or quadrangles of constant uniform modular subdivision whose identical length '» edges--- shown as steel bands in the illustrations. . .

---permit their hinging into flat mosaic-tiled continuities at the planar phase of the transformation and thereby permit a variety of hinged-open complete flat world mosaics.**

Proof?:

"Proofs must proceed from the whole to the particular, starting from the minimum something. All geometrical and numerical values derive from fractionation of the whole."

- citation k context at Hit, as l-'adel for Quark. 3 Kay'77

Proofa:

"...The thing about proofa is that I am really operational and for me the test is: if the airplane flies. If it does fly, then that's operational. But the mathematicians... you read about them in Courant and Robbins... they have a different kind of criteria. Even though they know that a certain situation always produces predictable results every time, it's not necessarily proven.... The way they might have points on a surface but don't credit the fact that the points are also on the other side of the surface. But you know the way I start out with one point, then two points, then three points, and the insideness and outsideBess with four points.... That shows that principles can be realised independent of size."

- Cite RBF to EJA, by telephone from Phila. Office; 7 Oct'75

Proofs:

. Any individual has only limited knowledge of what the total Universe frontiering may be. The list embraces whac I know to be my own discoveries and I have no knowledge of others having made those discoveries prior to my own. I am claiming nothing. Proofs may have

been made by myself and will be made by myself. Proofs have been made by others and will be made by others. Proofs are satisfying. But many mathematical theorems are of great advantage to humanity over a long period of time before their final mathematical proofs are discovered. The whys and wherefores of what is rated as mathematical proof have been evolved by mathematicians; they are formal and esoteric affirmations from one specialist to another.'*

Proton and Neutron:

"I will give another example

Of always and only co-occurring phenomena.

Physicists today observe

That the proton and neutron

Always and only co-occur.

While they are not 'mirror' images of one another

And have different weights, They are transformable One into the other,

And are thus complexedly complementary, As are isosceles and scalene triangles. None of the angles and edges of either need be the same To produce triangles of equal area.

And the sums of the three angles of each

Will always be one hundred and eighty degrees.

ⁿThe mathematical balancing or complementation

Of the proton and neutron are analogously balanced, Each one having two small energy teammates.

The proton has its electron and its antineutrino, And the neutron has its positron and its neutrino.

And each of these little three-member teams”

- Cite BRAIN KIND, p,134 May '72

Proton and Neutron: (2)

’Constitute what the physicist calls $\hbar/2$ spin or a half-quantum.

They complement one another

And altogether comprise one unit of quantum.

We have now discovered experientially

An always and only coexisting tension and compression;

An always and only coexisting concave and convex;

And an always and only coexisting proton and neutron.”

- Cite BRAIN t MIND, pp.134-135 May '72

Proton and Neutron:

'The physicist finds

That the proton and neutron

Not only always and only co-occur, CftjteJW* are interchangeably transformable,
But also could not occur independently Any more than a triangle could occur With
only two points. . .

"We are founded on □□□*

The orderly base

Of the proton-neutron tripartite teams Of six unique energy integrity
vectors."

Citation and context at Universe, pp.156-157 Hay '72

Proton and Neutron:

"When you isolate the neutron you are isolating the concave. When
you isolate the proton you are isolating the convex."

- Citation at Convex and Coqayg

te OJA, jaOQ-Jdahi, Wash DO? 29 Fay»72

"The astrophysicists say that no matter how far things come apart,
they never come further apart fundamentally than proton and neutron
which always and only coexist. </hile one is convertible into the other,
the masses are not the same. The conversion of one into the other is
only by virtue of each having two side energy effects. In other words
the proton and the neutron have its two side energy effects. These
are like the resultant and the

reaction. And in relation to complementarity. . . The Nobel Prize
being given 16 years ago to two young men who discovered that the
complementarity was not in mirror-image, as it had been assumed up
to that time. :ie had been

assuming that all you had to do was to multiply the Universe by two. For some years it was discovered and demonstrated scientifically, physically, that the complementarity was not the mirror-image.

"I'd like to give you a way you can understand how the proton and neutron, which do not have the same mass, yet are interchangeable one with the other, are always known to coexist and are complementary to one another: how could they then do this and not be mirror-image?"

- Cite RBF at Slib, U. Mass, Amherst, 22 July '71, pp 20-11
Proton and Neutron; (B)

"For instance, you could have an isosceles triangle. And you could have a scalene triangle where all three edges are different. So the scalene and isosceles triangle quite clearly are different triangles. Yet the sums of the angles on the scalene and the isosceles are all 180° . And you could have the sums of the lengths of the edges of the scalene and the sums of the lengths of the edges of the isosceles also the same, which is exactly what we do have in the proton's and neutron's side energy effects, where we have the proton with its electron and its antineutrino; and neutron with its positron and its neutrino. Each of these teams is called one-half quantum; or one-half spin in the physics."

- Cite RBF at U.E. Mass, Amherst, 22 July '71, p. 21

"I'm simply giving you complementarity. I find that nature, with proton and neutron always and only coexisting, by virtue of which the astrophysicist of today has to say that there never could have been anything primordial, that is, something before order—that there was original chaos and disorder, out of which, surprisingly, order developed. I would say very surprisingly, because it is fundamental to anti-entropy that order inherently increases, disorder inherently decreases, and it would be completely counter probability that out of inherent disorder there would develop a beautiful human being or a lily. . . So the astrophysicist discovers that we must always have Aft

had proton and neutron, always and only coexisting: that we must always had order, iian was disorderly in his ignorance. We find that fundamental complementarity. .

- to have to have two to explain and complement one another, is not an illogical matter.”

- Cite KBF at Sims, U. iass., AAherst, 22 July *71.

Talk 12, p. 27

Proton & Neutron:

“...A basic orderliness of Universe is provided by the always coexisting proton and neutron which, though complexedly intertransformable, are not mirror images of one another, nor are of equal mass or weight.**

- Citation and context at Chaos, 13 Nov'69

"Of all the essential, harmonic, wave-frequency associable phenomena none is more compatible with all other phenomena than are the proton-neutron teams of physical energy. At the next higher level of complexity no phenomena is more universally associable than is the hydrogen atom. No physical complex is moieprolifically reproduced in Universe than is the hydrogen atom. But the proton-neutron teams and the hydrogen atoms are individually invisible to the naked eye and are aesthetically appreciated only by the scientists who deal with the invisible ranges of the great electromagnetic spectrum 'reality.' As the essential complexes first become visibly discernible as snowflakes, minuscule flower blossoms, crystals, or any other of the myriads of minutiae, they are spontaneously acclaimed by man as aesthetically pleasing.

This aesthetic pleasure includes not only all other visible phenomena ranging from small to large, from starfish to celestial star, but also ranging in biochemical, structural, mechanical, and electromagnetic complexity from the simplest algae and radiolaria to the elephant, the

giant redwood, and the human being. The spontaneous aesthetic satisfaction does not stop here but goes on to include the products of these living complexes, which in turn includes humanity's invented tools."

 Psychiatry; ^{t1)}

"I have your questions here* You asked roe first my general impressions, ideas, and experiences in psychiatry, I haven't any personal experience with psychiatry; that is, I have never been to a psychiatrist. I have known a number of psychiatrists, however, and I have talked to them. . . and I have gone back to 50 years ago here in Chicago when a friend of mine was a student of Jung. * . and I have had conversations with people for many years and I have had a number of students at the university who have been going to psychiatrists.

And I have always really questioned whether those students who were going to psychiatrists really needed to go to psychiatrists—almost all of them were students of wealthy families and we?e having troubles with their families and maybe that was the thing to do. I had a tendency to feel that these students depended too much on the psychiatrist. They were just making another parent and continuuiung with whatever the problems were and they were just not trying to figure things out on their own.

"I have been told by my friends—and particularly by my friend of 50 years ago, Dr. Douglas E., the man who was a student of Jung. . . he said that I had self-analyzed
 - Dr. Michael Bruwer

Psychiatry:

"myself and by the age of 32 I had changed my whole life pattern. . . and at that time I reviewed very truthfully *my* relationships with my family—particularly my mother—in such a way that I would be able to be very fair to her and to bring out whatever the truth really was. And this is a very important part of doing my own thinking. Whether I did or did not follow the practice of psychoanalysis according to the various theories, I did have some kind of an experience all right—enough to have had an experience that made me think about other human beings and their problems. . . and I certainly think that I got myself into that much of a cul de sac in life that I had to start very fresh and do my own thinking.

"I had been brought up in an era that was no longer operative, where the older people were utterly convinced that the younger people's thinking was completely unreliable. . . that it was something that did not firm up until they were 30 or so. And all the younger people were continually being told by the (Bolder people: 'Never mind what you think! Listen, we're trying to teach you.' And we were taught to get over our sensitivity and to give up all the things that seemed*

Psychiatry- (3)

"to be our fundamental faculties and proclivities, ... And there was a game, • . there was something called life, and that's the way life really is. , . really a game. And, knowing that my father died when I was very young, and my mother—I knew how much she loved me, that she sent me to the kind of school where she thought I would get something excellent in the way of education, but I was continually being told: 'Never mind what you thinkJ' ... So I simply made up my mind to try to give up and pay no attention to what I think ... to give up all my sensitivities and put on an act, and I actually got to be very good at it,

"I confused my realities. When I was running and high- jumping, and so forth, I was really very true to whatever I am there. I was very true to myself in a ship at sea and I did very well in the Navy, but the naval officer was a game in itself. We had to be an officer. . . and I did very well in the Navy, did very well as a mechanic—because I didn't have to make any money aboard ship. . . , I didn't have another game to be superimposed on it."

- Cite Transcript (p.2) of RBF tape with Dr, Michael Bruwer, Ritz Carlton, Chicago; 20 Feb'77

Psychiatry:

"/hen I got out of the Navy and had to come into the building world, I found that I was interested in putting up good buildings; and I was not interested in making money. I never had the slightest feeling for making money. I was really tremendously surprised and actually felt very

badly about why people wanted to play games for money with me—and this spoiled the whole thing. The money idea was obnoxious to me really fundamentally. I tried very hard to play the game and I was no good at it. I was in this cul de sac. I had made a mess of it.

"A lot of people thought I was very bright with high initiative and all, and they bet on me and so they lost all their money. I was in a real mess. And I had either thee to do away with myself, because I had a new child, and this was not just our first child, but a second child. Our first child died before her fourth birthday—and after a five-year hiatus here was this new life entrusted to us—that my wife and I were to have in Chicago. . . our families were in the East far away when we had this new child,"

- Cite transcript (pp. 2 & 3) of RBF tape with Dr. Michael Bruwer, Ritz Carlton, Chicago; 20 Feb*77

Pull:

"ProceBalon is the pull."

- Citation and context at Intereffecta. 2\$ Sep¹73

Pull:

"A chord has pull: we would probably not think about the connections unless there was some pull between them. The function of the chords is to relate. The event is the vertex. ^Ahe reaction is the chord, the pulling away."

- Citation and context at Chord. 20 Feb'73

Pull:

"The beginning of awareness of intellect is otherness, the mass attraction of another with a pull which relates it to all our system."

- Citation and context at Eternal Instantaneity. 22 Jun'72

Pull:

"In all our experiences there are relatively few principles that are operative in nature; as for instance we had the first instance when we tried to pull something as a child. We tried to pull paper apart, pull books apart, and then we began to try to pull sheets apart and we tried pulling things apart. Then we get onto a boat and someone says "Hold on to that rope," and you find you are pulling very hard. They say pull this way and then that way--- one is called a sheet and one a halyard and so forth. You have this experience on a special boat and are very excited and for many years □ you will always think about the "Primrose" and your fun sailing the *Primrose* on this special day.

You gradually get into other boats and you find there are the same kind of things to be pulled. And you find there is a general kind of thing to be pulled in contrdistinction to things that are pushed. This is what we call a generalisation We are beginning to discover patterns that persist, principles that are operative independent of whether the rope was white, or dirty, or yellow, whether it waplastic or whatever it was, you still pulled it." "Pulsation, the vector equilibrium is the nearest thing we will ever know to eternity and God: the xerophase of conceptual integrity inherent in the positive and negative asymmetries which propagate the problems of the consciousness. ..."

- Citation & context at Experience, 12 Sep*71

Pulsation:

'•One of the things we have to make clear for society is the dilemma of the Max-Planck-descended scientists, the way they do their problems, you can have either a wave or a particle, but not both simultaneously, Heisenberg has the same fault. They make the error of having a wave as a continuity, as a picture--- not as a pulsating frequency. A planar reflex causes them to think of continuous waves.**

Pulae Pattern;

"• • • Talking about edges of the three frequency vector equilibrium
where there are 92 balls on the surface. Now there would be then a
frequency of 4 three, but there are four balls to an edge going point-
to-point, with three spaces in between them. An edge of four balls
could either belong to the adjacent square or it could belong to the
triangle. It can't belong to them exclusively: it is like our bonding
where we get common edges. When I began to take the sequence of
the * wave pattern I found them running through the indigs of always
eight of the aero nine. I found some of them are characterized by not
only that one that 's plus one, plus two, plus three, plus four, minus,
plus four, plus three what am I saying?

Minus one, minus two, minus three, minus four, plus four plus three, plus two, plus one."

- Cits RBF to EJA. Tape transcript. Chez Wolf. 18 June 1971. PP-36-37.

Pulse Pattern:

"The great circles of the vector equilibrium. . . There is

one that goes through six vertexes: it has the most possible connections. Six great circles are only going through two vertexes. . . So you've got a very even amount of minus one, minus one, plus two. This is a sequence that occurs time and again. Which is, I have a ball . . . and this is no, no, yes, yes, no, no-- this is nestability of the ball in the center. It is the same as that yes, no, no, yes or yes. no, no, or minus one, minus one, plus two. It is that kind of a sequence. . . Then it goes on again yes, yes, no, yes, yes, no. Or it goes always yes, yes, yes, yes, yes. Or yes, yes, no, yes, yes, no. Or it goes yes, no, yes, no, yes, no. Or it goes yes, yes, yes, yes. There are three ways it can behave. . . . You hemispheres are the opposite of the same so it goes yes, yes, no or no, no, yes. . . Or it could go yes, no. yes, no, yes, no. Or it goes yes, yes, yes. These are all the combinations you can get. ..."

- Cite tape transcript KBF to EJA and BO'R, Chicago, Blackstone Hotel, 13 June 1971. pp. U-15.

Pulse Pattern:

"But the six 1b really the beautiful connector on the vector equilibrium side and it is the one that goes through all the six vertexes. It has the most possible connections.

? . . It * 8 a kind of double pulsation. . . It's only going to send energy when it's going through a vertex. So it does this twice in a cycle. Its energy increments between the two going: yes, yes, no; yes, yes, no; so they add up to a pulse. It goes yes, yes, no; boom, no, no; boom, no, no. •

Pulse Pattern:

"We come into some very interesting conditions of the tetrahedron where we find that a strip of paper, □□□□toe remember that we are exploring ways in which nature with a given frequency will do certain things. Remember also precession. We find resultant of forces are not at 180° and therefore there is a tendency to go off angularly. Therefore a zig-zag like this of identical length members becomes a very fundamental processional consequence of a high frequency event. ... A continuous strip like this when folded down, down, up, down, down, up, down, down, up would fold back on itself and form the tetrahedron and octahedron. . . . and the octet truss and fill all space,"

Pure Principle:

"There is nothing that the tough man can get hold of. That is really what happened during World War I and society paid no attention to it. We went off the invisible and it had been discovered by the people who deal with the invisible that there are no hard core things. If you say that the thing goes off with an awful bang, it is Just like I said to you that the water in a wave isn't going from here to there. Yet it is possible for the porgpoise to go from here to there surfboarding along with gravity pulling him down forwardly in angles, but the water isn't going from here to there. (There is some top water that gets blown

slowly from e to west, but I'm not talking about that.) The gneMBmi-
ALs moving at a very great velocity, and there is no wave of water going
there. It is moving in pure principle so it is possible for us to realize
that what we call physically pure principle of that bang, because that
porpoise can bang up on the beach pretty hard. What he is dealing in
is weightless."

Push-pull;

/~In reviewing with EJA Athena V. Lord'a manuscript of

PILOT FOR SPACESHIP EARTH, R0F came across a description of conventional stone structures held together by compression • . . "where the top stones are pushing down on the ones beneath.—/

RBF: "Nothing could be more erroneous. How could a top stone push? What would it have to push against? What happens is that gravity pulls the top stone—and all the others--against each other."

- Cite RBF to EJA, 3200 Idaho, Wash, DC.; 26 Mar*77

Push-Pull:

"The shift between spheres and spaces is accomplished precessionally, You introduce just one energy action--- push or pull--- into the field and its inertia provides the reaction to your push or pull; and the resultant propagates the sphere-to-space, space-to-sphere, transformation whose comprehensive synergatic effect in tijun propagates an omnidirectional wave. Dropping a stone in the water discloses a planar pattern of precessional wave regeneration. The curves are seen generating and regenerating and are not instantaneous."

Push-pull Limit.a:

See Ignorance, (1)

'•Minimum structural stability requires six struts, each of which is a
push-piill member. Push-pull structural members embody in one su-
perficially solid system both the axial-linear tension and compression
functions.

"Tensegrity differentiates out these axial-linears into separately
cofunctioning compression vectors and tension tensors. As in many
instances of synergetic behavior, these differentiations are some-
times subtle. For instance, there is a subtle difference between
Eulerian topology, which is polyhedrally superficial, and synergetic

topology, which is nuclear and identifies spheres with vertexes, solids with faces, and struts with edges. The subtlety lies in the topological differentiation of the relative abundance of these three fundamental aspects whereby people do not look at the four closest-packed spheres forming a tetrahedron in the same way that they look at a seemingly solid stone tetrahedron, particularly when they do not accredit Earth with providing three of the struts invisibly cohering the base ends of the camera tripod."

Dimpling Effect, (B)

Pyramid Technology;

"With starvation-provoked universal thieving they had to build a strong pyramid to guard the Pharaoh's after-life equipment. This required the invention of scaffolding technology in the present life. When successive Pharaohs passed into heaven the scaffolding technology accumulated on Earth, With a mounting technology the nobles also acquired protective entry into the after-life. As generations of Pharaohs and nobles went from this world into heaven, this world's technology multiplied. Inevitably the citizens or middle class exploited the burgeoning technology to gain entry into heaven with the Pharaohs and the nobles.

Inaugurating the Greco-Roman period of history with knowledge and technology multiplying swiftly, the Moses Buddhas, Christs, and Mohammeds proctHmed the feasibility of safe entry into heaven of everybody. This ushered in 1500 years of building cathedrals, temples, synagogues, mosques and their graveyards to secure everyone's after-life."

"We come then to Greece and the earliest of the going from Just geometry into numbers and arithmetic and we get to our friend Pythagoras. Pythagoras was a very unknown kind of a character, he's quite a mystical one; he's almost like one of the prophets. The ftrthagoreans kept thigs secret.

Pythagoras taught us many things about the second powers of numbers. He was the first to discover the arithmetical second powering and third powering. All the integration of the arithmetic with the geometry comes from Pythagoras.

"And we have Pythagoras... having experimentally tried twanging a string, what you might call a stringed instrument and finding that when it had a flat at half the length of the prime string it brought about a change in notes which we today would call on the /` ` ? J scale, exactly one octave. This is a Pythagorean discovery; and a man who was terribly interested in fundamental rates of change of number, by various operations of the numbers, one with the other, and all the powerings.

"We have him also then thirthing the end of the string and discovering that this took the tone what we call 'down,'"

- Cite tape transcript, RBF to EJA, 6hez Wolf, 18 Jun'71

Pvthap.oras: (2)

"either down or up. what we call a fifth, and what we then have is the keys of the sharps or the flats, these are the fifths up and down, the sharps being a fifth up and the flat being a fifth down; five notes in the smcale--- so that we have very interesting prime numbers halving the number two and the thirthing bringing about fifths. This would

certainly indicate quite clearly a fundamental in our relationship between wave frequencies and number behaviors of octaves. And inasmuch as I'm talking about physics and the waves of the periodic table... its unique frequencies would interact... and what the permutations would be na thematically and I found this highly suggestive that the octave with its characteristically flat resonance really governing the interactions of frequencies.

The resonances are the key to much of modern physical exploration. And I think that the very fact that the Pythagoreans were particularly secret is of importance."

"Omnitriangulation ---□ stmStural system ---> one unit of quantum
---> Lavoisier thought of the nothingness (air) under the bell jar as a plurality of somethingnesses (elements). Under these circumstances you did not have to wait long for the inevitable development of the steam engine,

"Then, Invisible electromagnetics ---□ no models. Black body radiation involves fourth-power rates of change. Therefore, they said, nature is not using models; she is just using mathematics. The scientists were flying blind on instruments; therefore there was no point in trying to look out of the windows; there is nothing to see,

"Design science employs the method of accounting employed by nature.... Suppose you need six hours to solve your problem. The XYZ coordinates only provide a four-hour clock, a positive-negative, positive-negative, 90-degree clock: perpendicularity gives you only four hours. But since you need six hours you have to resort to mathematics in which you can borrow from yesterday's or from tomorrow's clock.... But with the 60-degree hexagon you have an integral six-hour clock."

- Cite RBF to World Game Workshop, Rainey Auditorium, U. Penn., 23 Jun'75

"Scientists deal only in linear acceleration reduced to 90-degree grids. They have no model for angular acceleration. The circumferential and chordal measurements are always in terms of irrational hypotenuses. In the XYZ coordinate system the parallels never converge and the cube has no inherent nucleus: eight cubes around a common center. But the symmetrical expansion of radiation is a divergent phenomenon. Thus we see how man entered the world of nature through the attic window.

"Design science and our very way of thinking deals in terms of limit cases. We have the tetrahedron with three triangles around each vertex; the octahedron with four triangles around each vertex; and the icosahedron with five triangles around each vertex. The limit cases of a system are three (tetra) and five (icosa} A perpendicular bisector of each of the icosahedron's 20 triangles (from each of the three edges) describe 60 right triangles; actually 120 similar triangles. But in their spherical conformation the 120 spherical right triangles are not identical. There are 60 positive and 60 negative because of the convexity and concavity of spherical projection. The Babylonians were very close but they were unable to get their"

"geometry and their clock working together,

(3)

"Even the centimeter-gram-second (C.G.S.) system had not temperature in their accounting except as a superscript. C.G.S - for temperature.... The human proclivity for 'building blocks' enhanced their proclivity for cubes and cubic accounting. The stacking of regular tetrahedra leave 7 20' gaps which seemed to inhibit their allspace-filling function.

"So I saw that the vector is a specific angular direction in respect to an axis of observation. The vector is beautiful and unique because its discrete length is a product of mass and velocity. All the qualities of physical reality are present: the mass is in the discrete length and the time is in the velocity. Vectors do not go to infinity. Here is the basis for a generalized Avofqsjro system as it occurred to me 60 years ago.

"The crystals may be probably unique to our planet; they might be incandescent at a different distance from the Sun.... So the peas and toothpicks of kindergarten gave me the first model for closest packing."

23 Jun '75 **

Quantum Sequence: (4)

"You can get 20 tetrahedra around one point omnidirectionally. Frequency does not begin until you have modular subdivision. String polyhedra are like the necklace models. The cube, strung through vertexial connections, will not stand up. Only the tetrahedra, octahedron and icosahedron will stand up as string-connected polyhedra with string joints.

"Octahedron: The XYZ quadrant at the center of the octahedron complements the tetrahedron. We may disconnect alternate triangles of the surface of the octahedron and pull eight of them out for the eight-octahedra to make a cube on the octa faces. Thus 1 tetra = 8 octa (i.e. 4 × the eight eighth-octahedra on the corners.) Ergo, cube = 3,

"Two spheres in Universe ---> mass attraction ---> vector equilibrium
---> nuclear assembly. Nuclear assembly starts with an inherent volume of 20, which is the minimum model of nucleation.

"How much do I know? How do I know anything? Our firsthand knowledge of minimum limits is better than all the physics in the textbooks."
"

Quantum Sequence: (5)

"Then we have the total topological inventory of 30 minimum components. Plus two additional components in the poles of the axis of spinnability: 32.... and the ultimate 33rd is the rest of Universe.

"Octahedron: So we have the octahedron in the middle. (Between the tetra and icosahedron. It is also the second power of the only even prime number: 2^2 ` ` The octahedron is the most common form of energy associated as matter. We may consider the octahedron as a water-filled tube, pulling on a water-filled tube. The pulling will make it bulge in the middle. As we pull the gravitational embracement causes a precessional rearrangement of the vector edge whereby one tetrahedron drops out. One quantum has dropped out but, topologically, it is still an octahedron:

$6V + 8F = 12 + 2$ (Three face-bonded tetra) or (octahedron) $6V + BF - 12 + 2$, topologically there is no difference. This is the quantum leap, the quantum jump, With interference it precesses from matter to radiation; and then back again into matter. This is the lever that will bring science into further consideration of synergetics."

RbF DEFINITIONS

"In exploring the intertransformability of the primitive hierarchy of structuring-as-you-go, omnitriangularly oriented evolution and the interbonding of its evolving structural components, we soon discover that the universal interjointing of systems and their foldability permit the angularly hinged convergence into congruence of vectors, faces, and vertices, {see VE Jitterbug} each of whose multicongruences appear only as one edge, or one vertex, or one face aspects, wherefore topological accounting as presently practiced accounts each of these multicongruent topological aspects as consisting of only one of such aspects.

"Only synergetics accounts for all the congruent (doubled, tripled, fourfolded) topological aspects' presences by always accounting for the initial inventory of the comprehensive rhombic dodecahedron's tetravolumed 48-ness and the vector equilibrium's inherent tetravolume 20-ness, together with their respective initial or primitive inventories of vertices, faces, and edge lines, which are always present in all stages of the 48 — 1 convergence transformation, though often imperceptibly so."

- Cite RBF/JMiarquette poster "Deceptiveness of Topology," Phila, PA; circa 15 Dec*76 S_{ftP} SYNERGETICS 2 at W33.52+.53

RBF DEFINITIONS

"With recognition of the foregoing topological deceptiveness and always keeping account of the primitive total inventory of such aspects, we find it possible to conceptually demonstrate and prove not only the validity of Boltzman's concepts, but of all quantum phenomena, and thereby to conceptually Interlink synergetics' mathematical accounting with the operational data of physics and chemistry and their complex associabilities manifest as geology, biology, et al."

"We say that Universe is design and that design is governed exclusively by frequency ana angular modulations, wherefore the 'angle*' and `frequency' must be discretely equatable with quantum mechanics which deals always synergetically with the totality of Universe's finite energy.

"The relative acutenesses and the relative obtusenesses of the angle and frequency modulating must relate discretely to the relative mass experienciabilities of Universe.

"Quantum wave phenomena's omni-wholeness of required a priori accountability and persistent consideration is always systematically conceivable as a sphere and may be geodesically fractionated into great-circle-plane subsets for circular plane geometry considerability. Quantum waves always complete their cycles (circles). The circle can be divided into any number of arc increments as with the teeth of a circular gear--- many little teeth or a few big teeth. In quantum wave phenomena we may have a few big, or many small, differentiated events, but they will always add to the same whole."

- Cite SYNERGETICS draft at Secs. 539.01-.03, 2) Sep '73

HBF DEFINITIONS

"The rate of angular change in a big wave is very much slower than the rate of angular change in a small wave, even though they look superficially to be the same forms--- as do two circles of different size appear to be the same form. The difference in the wave that is big and the wave that is small, is always in relation to the dimensioning of the observer's own integral system and determines the discrete difference* (i.e., the •relativity') of the wave angle.

"What is 'the most economical relationship' or 'leap' between the last occurred event and the next occurring event? It is the chord (identifiable only by central angle) and the rate of the central-angle reorientation-aiming most economically toward that event, which is the angular (momentum) energy change involved in the angular and frequency modulation or all design of all pattern integrity of Universe."

Q. Do you wish to continue this communications node?

A. *1 do not wish anything. I am grateful for 'what happens.'¹ I am committed to problem solving by positive competent participation in the inexorable physical evolution's transformative stratagems. I am 78. My mail is prodigious. I cannot answer each letter. Therefore, I write books of answers to most pressing questions. Have published 12 books. If you read them all you would not have had to ask the questions that you did for most of them are answered as best I know how in those books. Please do not think that I consider myself an authority. I have been asking myself questions for my whole lifetime and, a half-century ago, challenged myself to find my own answers by experience or in the books. Instead of asking live questions of others. This did not preclude listening to others when they spoke voluntarily to me. I decided to commit my answers to paper so that I could check myself at a later date; in order by trial and error to learn how to think more adequately and incisively. I am glad that you have written to me and above all that you as a young human are interested in such important questions--- at least to me they are important."

"nephews, and nieces marry only sons and daughters of royal or noble stock, whether they be friend or foe.

"Karl Marx assumed the scientific validity of both Malthus and Darwin with their combined 'fundamental inadequacy of popular life support*' and 'survival only of the fittest.' He assumed that the working masses were the fittest because, though dumb, they instinctively understood how to cultivate agriculture, husband animals, and work the craft tools.

Wherefore the great pirates, the nobility, and the bourgeoisie who serviced the nobility, were parasites and must perish. Marx also assumed that the genetic difference between the nobility and the masses was valid; ergo his fundamental class warfare inherent in the economic inadequacy to support both. He also assumed the necessity of downgrading standards in order to stretch support systems to serve all; and he assumed minority-party rule by dogmatic adherence to nonindividualistic code, and annihilation of the treacherous 'other class.*

"For only the last ten years of human history, since 1960, have we known beyond scientific doubt that the 'mass dumbness'

FMIU-glrcMtffEMUftl. Modularity:

"Had the Greeks originally employed a universal model of x-dimensional reality as their first tool upon and within which they could further inscribe and measure with their divider, scribe, and straightedge, they would have been able to arrive at unity of circumferential as well as radial modularity. This would have been very convenient to modern physics because all the accelerations of all the constantly transforming physical events of Universe are distinguished by two fundamentally different forms of acceleration, the angular and linear accelerations,"

- Cite SYNERGETICS at Sec. 826.01, Sept'72

"The linear measurements represent the radial going-away accelerations or resultants of earlier or more remote events as well as of secondary restraints. The rigid rectilinear angularity of the 90° central angle XTZ mensuration instituted by the Greeks made impossible any unit language of direct circumferential or peripheral coordination

between angular and linear phenomena. As a consequence, only the radial and linear measurements have been available to physics. For this reason physics has been unable to make simultaneous identification of both wave and particle aspects of energy events."

- Cite SYNERGETICS at Sec. 826.04, Sept'74

Radial-Circumferential Modular Growth:

In Synergetics there is a total "correspondence of radial wave modular growth with circumferential modular frequency growth of the totally involved vectorial geometry." This means that "angular and linear accelerations are identical."

Radiations

"Radiation distributes energy systems outwardly in omnidirectional metric directions. Radiation fractionates whole systems into multidimensionally dispatched separate packages of the whole. The packaging of spherical unity is accomplished by radii-defined, central-angle partitioning of the spherical whole into a plurality of frequency-determined, simplest, central divisioning, thus producing a plurality of three-sided cornucopias formed inherently at minimum limit of volumetric accommodation by any three immediately adjacent central angles of any sphere of any omnitriangulated polyhedron. The threefold central-angle vertex surroundment constitutes the inner vertex definition of a radially amplified tetrahedral pack of energy; while the three inner faces of the package are defined by the interior radial planes (there is a great-circle plane common to any two radii) of the sphere of omnidirectional distribution; and the fourth, or outermost, face is the spherical triangle surface of the tetrahedron which always occurs at the radial distance outwardly traveled from the original source at the speed of radiation, symbolized as lower-case c."

"And we've got no help at all from the atara because they're all areas where the Universe is increasingly disorderly, giving off enormous amounts of radiation in strange kinds of Sun rays, and so forth--- great Sun spots, which we begin to find have some regularity. But you and I didn't know that regularity before because, in a sense, it was so infrequent--- whatever it might be. We didn't have observation to know there were Sun spots up to yesterday.

"Then all the physical is the visible, astronomical world where we use the optical telescope to give us the information. Optical means we're using that disorderly radiation to identify the positioning of the stars. . . So, looking around for some phase of Universe where energies are contracting and becoming increasingly orderly, we find the only example that we really know much about is our own Earth. We do know that in the last International Geophysical Year that we're collecting somewhere around 100 tons of stardust daily. And we're finding our radiation from all the stars, the cosmic radiation--- and primarily from the Sun--- is not just bouncing off our Earth at all, but being Impounded as energy. The radiation to start off with is in the Van Allen belts."

- Cite RBF to World Game, Jun-Jul'69

"Then the atmosphere bends that radiation very readily so that it gives us the red-yellow-orange-green-blue-violet colors themselves. Then when the radiation gets to the water three-quarters of the Earth being covered with water--- you see how much it is bent simply by putting a pole into the water and looking at the bending of it. . . . There's bending, bending, bending until finally the radiation is so bent it gets now impounded horizontally into the surface of the water around our Earth, and we get these horizontal moving streams such as the Gulf Stream, the great warmth. We have then the enormous impounding of the energy of the Sun in just the heating of the atmosphere, bringing about all our storms, the various low pressures and high pressures depending the heating is being impounded by large moisture concentrations or low.

"And so this enormous energy is being collected here, and this radiation then is atomizing the ocean, and then it gets dropped back again, pulled back by gravity as rain. And we find then vegetation operating; vegetation on the dry land and algae in the sea, impounding the energy of the Sun by photosynthesis,"

... Gravity is swifter than radiation, therefore, Universe collects its masses in ever tighter concentrations,

- Citation and context at Point: Outbound Point, circa 19MJ

"The complementarity of the great regenerative pattern is geometrically omnimanifest as gravity and radiation. The radiation radiates in rays, or lines, of spherical, energy-source radii. These may be cross-sectionally conceptualized as the radially packed staves of a wooden barrel that try to escape outwardly from the barrel's center. Gravity, however, like the steel bands encircling the barrel's girth, operates embracingly. The individual barrel staves, like the radii, try to go out, to disintegrate; but the finitely closed, circumferential gravity hoops operate integratively, embracingly. The 92-million miles distant Sun's rays impinge approximately in parallel on only one hemisphere of the Earth at a time, while gravity embraces our entire planet, all cosmic systems from all around being equally effective, for instance, on the shadow hemisphere of Earth. Gravity has no shadow. Gravity is uninterferable; radiation is interferable. Gravity is omnidirectional, mass interattraction, which, as Newton discovered, is directly interproportional relative to the respective mass involved, and varies as the second power relative to the interproximities of the respective bodies considered: Halving the distance between any two will fourfold their interaction.¹

- Cite "No Title," (Part II), 'JORLD Jag., p.39, 5 Jun'73

"All the Universe is in motion, and all the effect of bodies in motion on other bodies in motion are what we call 'precessional. * Precession and mass-attractive gravity convert centrifugal into orbital motion. And precession always affects the motion of other bodies in directions other than 180 degrees, not toward or away from one another but at approximately 90 degrees to the line between the most powerfully interprecessing of the bodies. Holding a string in your hand, which, like mass attraction, is fastened to a weighty object on the other end you precess this object into orbit around you by axial rotation of your body. Thus the precessional effect of the axially rotating Earth on the Koon is to make the lesser mass go into orbit around the greater.

"Mass attraction and precession cooperate synergetically to affect all of the Universe: 99.9999 percent of all entities of the Universe are in orbit around some other spinning entity, macro- or micro- cosmic in scale. And once in a while some of the entities accelerate so congruently close to one another that their inter-mass-attraction render.*- the precessional effect negligible, and the lesser body falls into the greater."

- Cite "No Title," (Part II), 'URLD Mag., p.39, 5 Jun'73

"You and I are going around the Sun at 60,000 mph. So too is the Earth, We are so close to our Earth that gravity makes us 'fall in' in orbiting company. Little children find gravity forever pulling them in toward the Earth's center; although they know nothing about gravity they feel it pulling them to the floor. All of the Earth's biological organisms respond so powerfully in a linear manner to the gravitational effect that it is much like the organisms being linearly programmed to a specialized behavioral program. Thus we fail to realize that gravity really works as circumferential embracement. We find everything operating at 90 degrees tangent while humanity fools itself into thinking

that it accelerated the object in a 180- degree direction. Because of this, humanity has come to think illogically in 180-degree, straight-line, ways. The fact is that entities are always traveling away at 90 degrees from the direction at which we are aiming.

"All the cosmic generalized principles are omniembracing-always-true. Truth, like gravity, is nonlinear; it is embracing. And of all the creatures on our planet, only humans have demonstrated the ability to discover such truth."

- Cite "No Title," (Part II), WORLD Tag., p.39, 5 Jun'73

Radiation-gravitation: Angular Functions:

"The differences between the central angles' and surface angles' functionings are identifiable with radii at tonal and gravitational functionings. Radiation identifies with central angles. Radiation is outwardly divergent. Gravity identifies with the three surface angles' convergent closure into the surface triangle's finite perimeter. Gravity is embracing and is not focusable. Gravity is Universe-conservingly effective in its circumferential coherence."

Radiation: Speed Of:

"The speed of light, at the limit case, becomes the time. The speed of radiation is the limit case, but it is the initial limit. It always comes back to itself."

Radiation: Speed Of:

"The speeds of all the known different phases of measured radiation are apparently identical despite vast differences in wavelength and frequency. Einstein's adoption of electromagnetic radiation expansion--- omnidirectionally in vacuo--- as normal speed suggests a top speed of omnidirectional entropic dftjraer increase accommodation at which radiant speed reaches its highest velocity. This highest velocity is reached when the last of the eternally regenerative Universe cyclic frequencies of multi-billions of years have been accommodated, all of which complex of nonsimultaneous transforming multivarietied frequency synchronizations is complementarily balanced to equate as zero by the sum totality of locally converging orderly and synchronously concentrating energy phases of scenario Universe's eternally pulsative, and only sum totally synchronous, disintegrative, divergent, omnidirectionally exporting and only sum totally synchronous, integrative, convergent and discretely directional individual importings."

- Cite RBF in response to a request to repeat his "brief sentence" on the sphere as a meeting of convergences. See SYNERGETICS, "Scenario Universe," Sec. 3*5*, and "Tension and Compresssion," Sec. 614.08. fl Oct'71

Radiation: Speed Of;

"The speed of light had been measured linearly in a tube--- this is the speed of light in any one direction from its source.

But radiation is called radiation

because it goes in all directions from its source unless reflectively beamed.

Uhen we double the linear dimensions of any object--- the surface of the symmetrically amplified system grows as the second power of the linear.

Science had to choose the lower-case letter c to represent the speed of the radiation linearly, to arrive at the rate at which it grew in an omnidirectional spherical way--- the rate at which the surface of the omnidirectional radius increases as \sim the second power of the radius--- or linear speed: c

Radiation: Speed Of:

"The micro animal structures, the radiolaria, if you study them, will always show that they are based on either the tetrahedron, the octahedron, or the Icosahedron. This picture (R-4-1) was drawn by English scientists almost a century ago as they looked through a microscope at these micro-sea structures.

"Today I have given you some fundamental structural principles and subsequently shown you their use by nature. I didn't, however, start by studying these structures of nature seeking to understand their logic. The picture of the radiolaria has been available for 100 years, but I didn't happen to see it until after I had produced the geodesic structures from the mathematical sequence of developments which I reviewed with you earlier. In other words I did not copy nature's structural patterns. I did not make arbitrary arrangements for superficial reasons. What really interests me therefore in all these recent geodesic tensegrity findings in nature is that they apparently confirm that I have found the coordinate mathematical system employed in nature's structuring. I began to explore structure and develop it in pure mathematical principle out of which the patterns emerged in pure"

"This is one of the geodesic radomes tested for the Arctic. They are made out of polyester fiberglass and the diamond-shaped, panedged pieces are made with bolt holes in their adjacent flanges. All the mathematics must be done very accurately to permit these pieces to be

interchangeably bolted together. We hold our spherical trigonometry calculations to an accuracy of 1/1000 of a second of circular arc. The geodesic radome structures go up in an average of 14 hours each in the Arctic.

"Our Air Force Radomes were installed in the Arctic mostly by Eskimos and others who had never seen them before. The mass production technology made assembly possible at an average rate of 14 hours each. One of these radomes was lent by the U.S.

Air Force to the Museum of Modern Art in New York City for an exhibition of my work in 1959-1960. It took regular building trades skilled labor one month to assemble the dome in New York City.

"American labor fought a great and worthy battle to win the working man's share of the synergetic productivity of industry. Labor's battle proved doubly worthwhile because it inadvertently brought about mass consumption. Without mass consumption you cannot maintain mass production. You cannot have the mass

- Cite RBF photow caption, Fig, 177, dome photos, about 1960.

` ` production of industrialization without an original investment of vast capital effort of work and that original capital came first and long ago from serfdom or outright slavery. In order to bring industrialization to benefit comprehensively emancipated man. you must have mass purchasing power, which in due course will underwrite automation, which In turn will eventually produce so much wealth as to be able to free man»s time for further education and research to increase the wealth long generated by unimpeded automation. American labor will not yield that unimpedement until it is clearly demonstrated that all men will prosper directly by doing so. American labor did bring about the vast purchasing power in industry, but in so doing it established all kinds of rules which inadvertently protected the obsolete inefficiencies of building,

"When the kind of structure which goes up in the Arctic in 14 hours takes a month in New York City, clearly there has been an inordinate shunting of social wealth in a direction in which legitimate value was not added to the product. This is an indirect, illogical, and therefore indefensible way of distributing wealth for it hides the new advantages and therefore retards the growth of those advantages as wealth generators of the"

- Cite RBF photo caption, Fig. 177, dome photos, about 1960.

"commonwealth. We must be very careful in judging the new, high production technology structural experiments so as not to have our fundamental tactical information distorted by ill conceived labor tactics. We have very real social problems which must be solved by realistic acceptance of the facts rather than deferred from realistic consideration of the inherent new wealthgenerating advantages by hiding the new technical advantage under the wing of individually conceived palliatives which are operated by old rules that do not permit the real advantages to be recognized by the labor movement's management. We are going to have to bring industrial mass purchasing ability to all of humanity. But first we are going to have to get labor rates evened up all around the world in order to have every man's raw time worth as much as any other man's time when translated into purchasing power per kilowatts or pounds of specific metal goods. Next we are going to let automation take over after we find ways to pay everyone dividends from its wealth making to keep up purchasing power at a maximum and thereby to regenerate the industrial evolution advance."

- Cite RBF photo caption, Fig. 177> dome photos, about 1960.

"A radome unit provides means for automatically excluding the weather. It must admit the widest electronic wave frequency spectrum. It requires greatest strength with minimum structure and minimum site assembly operations.

"Omnitriangulation is implicit for structural stability. Omniorientation of focal points of structure is at most symmetrical equivalence of interdistancing.

"Light (as a typical wave frequency group) obstruction is greatest where structural components converge (grid photostats' show this as stars at convergent points). A multi-axial or dynamical system cannot have only two triangles around one vertex. It can have three, four, or five equilateral triangles, but cannot have six or more equilateral triangles in a finite system.

"Touch « tex of ver-tex, i.e., converging toward touchability, meaning a' frequency-complex clustering whose frequencies interfere, or tune in, with the frequency array of the molecular complex of the atoms altogether constituting the Galaxy of"

- Cite typescript "Definitions by RBF," Pp.1*,2a,1, 29 Dec'58

"frequencies of our life cell tissues or Milky Way nebulae of locally regenerative frequency, locally recurrent through self-interference patterning.

"Mass is a word of inherently synergetic connotation. It is a behaviorist word popularly mistaken and used as a static word. Mass recognizes an inherent plurality of unique consequences resultant upon any infra- or ultra-sensorial recognizable, i.e., timable, collection of regenerative systems of precessionally self-associative energy-vector events. All the atoms and stars, as well as all the macro-remote astronomical cluster nebulas and remote micro-molecules, are such unique synergetically regenerative, infra-ultra-sensorial, unique multi-atomic mass clusters.

"A system is a man-thinkable, tune-in-able constellation of generalized experience event cluster foci. Energy-cluster foci are starts, or topological ver-texes, which are only the as-yet-nonanalyzed group phenomenon whose energetic point centers of event clustering locals are as yet too remote for the present observer's position. . . Systems are star interrelationship considerations which logically continue to return upon themselves due to the related preoccupying importance of

- Cite typescript "Definitions by RDF," p.1, 29 Dec'50

"locally doming event frequency proximities which altogether function as a fundamental, i.e., simplest or most unique, geometrical set which inherently subdivides the total Universe, The cell-time-man-experienced events fall into two main and clearly distinguishable classes:

- (1) All those relatively too large or macrocosmic events of Universe which must clearly occur outside the presently thought-considered tunable range capabilities and are therefore outside the timable system set; and
- (2) All those relatively too small, negligible, microcosmic clan which occur inherently within and infra to

the tunable frequency and relative size ranging of the considered set.

"We may define structure as a local and finite system of energy events of physical Universe consisting of a patterning of interaimed or intervectorially frequency-synchronized, associative and disassociative interferences omniprecessionally resulting as a pattern-regenerative constellation of system- inward-angled vectors, in dynamically symmetrical, precessional constellar equilibrium."

- Cite Typescript "Definitions of RBF," p.2, 29 Dec'58

"The energy proximity economy of ideal structuring as vectorially interaimed and synchronized energy, ergo energy- balanced interference patterns, comprise system complexes whose discrete angle and frequency modulations art* in turn, tunably controllable by man to provide a local energyenvironment controll means for interference. Shunting of the known, relatively-important-to-man patterning and random local event program and angle patterning of Universe into orderly, man-preferred, locally regenerative program and angle patterns: this is local energetic environment controlling by anticipatory design science.

'•Energy events of structure is a local and finite system of regenerative Universe consisting of a constellar patterning of interaimed and frequency synchronized, associative and dis- associative interferences resulting as a net set of inwardly angled, precessionally interaligned, vectorial resultants. Resultants of SMHBDBM vectorial interaimed events must be to provide a local control of discrete frequency and angle modulation to control local energy--- to be known as local energetic environment controls, i.e. radomes.

- Cite typescript "Definitions of RBF," Pp.2-3, 29 Dec»5H

"Radomes provide means for automatically excluding weather and including local warmth and dryness. They should admit the widest possible spectrum of electronic wave frequencies.

"Omnitriangulation is implicit in the requirement for greatest strength with minimum structure. Omni-orientation of focal points of structure is at the most symmetrical equivalence of interdistancing. The strucrure's vectorial components converge at the vertexes, i.e. points, of the system. The triangular relationship of all points of any system show a constant relative abundance in which, of the total number of points, two are recognized as the poles of the system.

"The principle of constant relative abundance of topological features of all omnitriangulated systems, provides:

$N - 2 \gg$ number of nonpolar vertexes;

$(N - 2)^2 \ll$ number of triangular faces

$N - 2 \approx$ number of diamond faces

tensional vectors

$(N - 2)^3 \approx$ number of edges, i.e., compressional or

- Cite typescript "Definitions of RDF," pp.2A,3, 29 Dec'58

"Whereas compressional functions of structures are inherently the most dense and obstructive of electric wave trapping, convergence should be kept at a minimum with the vector edges leaving the maximum number of wholes. Triangles are minimum

holes. We can however have triangular interconnected hex-pent holes. The frequency of triangular relationships of approximately symmetrical point systems may be elected over a wide range. Therefore we choose a layout of triangles which will provide maximum weather exclusion and nondeterioration of structures and optimal installability. This calls for low frequency tensile integrity and islanded compression with booms which are optimum to site handling gear, in respect to which pneumatic lozenges can be omni-interconnected and applied into a unitary double skin.

"Whenever or wherever compressional functions (or vectors) of structures are inherently most dense and compoundly selfimpending (sic) at second power, or relative proximities in respect to local electromagnetic wave frequency, the geodesic"

- Cite typescript "Definitions of RBF," Pp, 2A,3A,3, + 4, 29 Dec*68

"frequency design traffic should keep compressional compo-
nent and its interconvergence at minimum, i.e., in edge or vector
function leaving a maximum pattern of holes (i.e. hex-pent triangular
faces). ..."

Raft:

"The raft is tangent to the sphere at midpoint. The early navigators all knew this. They saw the islands disappearing over the horizon in the distance and they were all very conscious of a spherical world."

- Cite RBF to EJA, Michael Denny & Arthur Morey, at Belmont Stakes restaurant breakfast, NYC, 3 Apr'75

Raft:

"The origins of the raft are simple: take a man standing on the bank of a river. He falls in but he doesn't know how to swim. If he grabs a stone he will sink but if he holds on to a large enough piece of wood it will support him. Next we take a man climbing on to a floating log. He notices that it rolls so he tumbles back into the water. But if it has a big enough branch or a smaller branch that falls across another log, he will be able to stand up.

This is a basic raft. If this raft consists of two logs separated by a distance like an outrigger, the resistance is much less if the wind is blowing on the sides.

Therefore it will move in that course since everything goes in the direction of least resistance."

Railroad Tracks: Great Circle Energy Tracks on the Surface Of A Sphere:

' • The vector equilibrium railroad tracks are trans-world— like being in an airplane; you can go anywhere. But the icosahedron is stuck locally with no way to get to another continent. The vector equilibrium is how you go from one sphere to another, from Earth to Mars."

- Citation and context at Icosahedron As Local Shunting Circuit. 22 Jun'72 — Railroad Tracks; Great Circle Energy Tracks on the Surface of A Sphere;

"Now I have found that nature insists on doing things most economically. We find that energy insists on following the convex surface. It has to follow the great circles. We find the 25 great circles of symmetry of the VE have a very interesting characteristic: every one of them goes through the 12 vertexes. The 12 vertexes are made out of spheres in closest packing, packed 12-around-one. These are the points of tangency of spheres in closest packing. We have here 25 railroad tracks by which energy can go from here to there anywhere in the Universe in the shortest possible way and it is the only way it will go. These are the only possible transfers from here to there. So then if you want to go from here to there in the Universe, you have to follow these surfaces and you have to go through these contact points. So these 25 great circles represent a very special set of events because some of them, for instance the four great Circles go through six vertexes; three great circles only go through four vertexes, etc.; they have different opportunities to peel off. They require different frequencies. I think"

- Cite RBF to Verner Smythe, NYC, Reel 2, pp.8-9, 25 Feb'69

(B)

Railroad Tracks: Great Circle Energy Tracks on the Surface Of a Sphere:

"if you follow different great circles and their frequencies, incidentally, every one of the chemical elements has been identified by four different frequencies which absolutely leads to that chemical element.

"This has all the symmetries there are.

"Now the same sphere could become the icosahedron. . . It has the only great circles we have which don't go through the transfer points. Then they are not in agreement any more.

When they get into an icosahedron you can shut off the energy supply and any waves would start going through the system and vector equilibrium would go through it,"

- Cite RBF to Verner Smythe, NYC, Reel 2, p.9, 25 Feb'69

Railroad Tracks; Great Circle Energy Tracks on the Surface of a Sphere:

"The shortest distance between points on the surface of a sphere are the great circles. They are called the geodesic lines and inasmuch as there is no such thing as a straight line and we are working in some kinds of developing surfaces, the great circles are called geodesic lines. We are now getting into the axes of spin which are inherent in any system. We found that systems could be joined up /See Rubber Tires 7 and they develop axial aspects, but they don't frustrate the rest of the Universe.

"Now we are very interested in the kinds of great circles which are developed by the various spins because they must have some kind of important relationship. We saw that if we had twelve spheres in what we call closest packing--- if you wanted to go the shortest distance between points on the surface of spheres--- supposing you were an electric charge, an electron. We make great copper spheres, the old Van de Graaff generators and so forth, you could build up enormous charges of electricity on the surface of this sphere. "

- Cite Oregon Lecture 7> D. 266. 11 Jul'62
RBF DEFINITIONS (2)

Railroad Tracks: Great Circle Energy Tracks on the Surface of a Sphere:

"The charges never try to go on the concave side of this sphere. They always stay on the convex side. You run into this kind of behavior just in trying the electroplate phenomenon. You will find that you cannot plate the concave side. You automatically electroplate the convex side. The convex side goes into higher tension which means that it is actually thinner and therefore less resistant and therefore the energy tries to follow the convex surfaces. Supposing you were the kind of energy that always follows the convex kind of surfaces and yet, being energy, you always have to do it the shortest way. You want to go from sphere to sphere on the surface of the sphere so you would have to take the great circles at the points where the spheres touch one another and therefore you would take the great circles of them. Therefore those 25 great circles are very important because they are all the possible great circles that carry all the traffic between the twelve points--- they are all the possible geodesic railroads. With that kind of energy which always has to follow surfaces, these are the railroad tracks that you would have to follow. . . "

SYsreHTec- 'isx.03)

HBF DEFINITIONS

flallrQa Trafikg: Great Circle Energy Tracks on the Surface of a Sphere: Convex and Concave:

"Dr Einstein pointed out that you could be the little man in the Universe who always went from sphere to sphere and through the points of tangency. You lived inside the concave surface of a sphere and you could get to the point of tangency in the next sphere, and the next sphere, concavely, and you could go right through the Universe that

way. Or you could be the little man who lived on the outside of the sphere, and always lived convexly, and you came to the same point of tangency and you went on. This is one way of looking at Universe and the sphere is another way of looking at Universe. This is typical of not being fooled by just looking at the spheres--- or just looking at the little triangle locally on the surface of your big sphere where you had your big triangle. This is beginning to give us ways of seeing the complementarity at all times."

- Cite Oregon Lecture #7, p. 258. 11 Jul'62

Railroad Tracks: Great Circle Energy Tracks on the Surface of a Sphere: Foldability:

"This may be pure accident but I could say something to you now categorically that is really very fascinating, that is, I found that you could fold and make all the 25 and 31 great circles. There are no other circles though that I know how to fold and make any other kind of great circle patterns on spheres. They and they alone seem to be foldable into these conditions. This seems to be a very strange kind of control because if they did they all relate they are the ways of the grand central station and all the shortest, most economical railroad tracks between all the points in Universe--- flying either concave or convex."

- Cite Oregon Lecture #7, p. 271. 11 Jul'62

Railroad Tracks; Triangular Systems of Energy Networks.

"In any network high energy charges refuse to take the long way round to their opposite pole. They tend to push through, the separating space, striving to 'short.' Thus energy will automatically triangulate via a diagonal of a square, or via the triangulating diagonals of any

other polygon to which the force is applied. Triangular systems represent the shortest, most economical energy networks. . The triangle is the basic unit of energy configurations, whether occurring as free energy or as structure."

Rationalization Sequence : ₍₁₎

"Upon the premise that the sumtotal human desire to survive is dominant over the sumtotal OHB of the impulse to destroy this book is designed. It does not seek to provide a formula' to attainment. To do so would develop dogma and nullify the process of individual rationalization that is utterly essential for growth.

"Rationalization is an act similar to walking through a half-frozen, marshy, unexplored country to mark out a trail that others may eventually follow, it involves not only the familiar one-two progression of shifting the weight and balance from one foot to the other, but an unknown quantity progression of selective testing to avoid treacherous ground before putting full weight upon the forward foot.

".Rationalization is a time-word to replace 'thinking,* which is an ancient, mystically evolved word tentatively signifying an attempt to force the power of god into one's self. Rationalization connotes a constant, selective balancing of relative values, gained from experience, for the purpose of harmonious, inclusive recomposition and subsequent extension,

Rationalization Sequence; (2)

"It is central to my philosophy that everything in the Universe is constantly in motion, atomically if not visibly,

and that opposing forces throughout this kinetic picture are always in neat balance; furthermore, that everything invariably moves in the direction of least resistance.

"The history of man's creative effort is the story of his struggle to control 'direction' by the elinfoation of known resistances.

"To, the degree that the direction of least resistance is controlled by vacuumizing the advance and de-vacuumizing the wake, the course of society can be progressively better charted and eventually determinable with a high degree of certainty.

"The creative control, or streamlining*© society/tiy the scientific-minded (the right-makes-migrftst) is in direct contrasts to attempts by scheming matter-over-mindlsts (the might-makes-nghtist) to control society by increasing, instead of lessening, resistance to natural flows through such devices as laws, tariffs, prohibitions, armaments, and the cultivation of popular fear.

- Cite NiNE CHAINS TO THE KUUN, p.x, 1938

Nationalization Sequence; (3)

"By controlling direction it becomes possible , scientifically, to increase the probability that specific events will 'happen'.¹

"Preparation of the material herein set forth dates from the very beginning of my experience. Up to a point in that experience I lived by the common code of loyalty and good fellowship with all of its convincing and romantic 'tradition.' Then, through my own particular quota of important slaps in the face, it became apparent that in 'tradition' lies fallacy, and that to be guided in conduct and thought by blind adherence to tenets of tradition is, as said in slang, bravely to 'stick the neck out.' I realized that experience is the vital factor, and that, since one can think and feel consciously only in terms of experience, one can be hurt only in terms of experience. When one is hurt, then somewhere in the linkage of his experience can be discovered the parting of the strands that led to the hurt. Therefore it follows that strict adherence to rationalization. within the limits of self-experience, will

provide corrections to performance obviating not only for one's self, but for others, the pitfalls that occasion self-hurt. By cultivating the ability to rationalize in the absolute, one acquires the power of so ordering experience that truths are"

- Cite Nlttli UHAXNb TO THE LUUN, p.x, 1y38
KHF UhFIMTluNS

"clarified and susceptibility to self-hurt is diminished to the point of negligibility. Through rationalizations anyone may evolve solutions for any situations that may arise, and by the attainment of this ability through experience one obtains his license to be of service to mankind.

"nationalization alone, however, is not sufficient. It is not an end in itself, it must be carried through to an objective state and materialize into a completely depersonalized instrument--- a 'pencil'.¹ (Who knows who made the first pencil? Certainly not Eberhard Faber or 'Venus.') The pencil not only facilitates communication between men, by making thought specific and objective, but also enables men cooperatively, to plan and realize the building of a house, oxygen tent, flat iron, or an x-ray cabinet by virtue of the pencil's availability. The inventor, alive or dead, is extraneous and unimportant; it is the 'pencil' that carries over. Abstract thought dies with the thinker, but the mechanism was building for a long time before the moment of recognized invention.

"The substance of this book develops my conviction of these truths, in a final chapter 1 have recorded certain thought-

nationalization Sequence; (5)

"processes and results of abstract intuitive thinking which would be obscure without reading the preceding sections. The reason for exposing myself to possible suspicion of 'mysticism'¹ is to show how important it is to transcribe the faint thought messages coming into our personal cosmos at the time of occurrence--- sketchy and puzzling though they may be--- because time, if well served, will turn them into monkey-wrenches and gas torches.

"The title 'Nine Chains to the Moon' was chosen to encourage and stimulate the broadest attitude toward thought. Simultaneously, it emphasizes the littleness of our Universe from the mind viewpoint. A statistical cartoon would show that if, in imagination, all of the people of the world were to stand upon one another's shoulders, they would make nine complete chains between the Earth and the Moon. If it is not so far to the Moon, then it is not so far to the limits--- whatever, whenever, or wherever they may be.

"Limits are what we have feared. So much has been done to make us conscious of our infinite physical smallness that the time has come to dare to include the complete Universe in our"

Reading:

"We don't know how we retrieve information from our brain.

The conscious part does some triggering; it acts as a valve; it can be a brake or it can be an accelerator. But the conscious part is less than one-millionth of the retrieval process. The rest is subconscious. There is an automatic process. When we can't remember a name the brain doesn't forget we asked the question, although maybe we have forgotten. But the lags are variable, and therefore the feedbacks are not orderly. The only conscious part is the holding back of irrelevancies. And this is true of reading, too."

Reading: (1)

Q. "Mr. Fuller, you're quite a traveler. Where do you find the time and the places to read?"

k. "Obviously airplanes and airports are great places, as are hotel rooms very late at night. I'm convinced you can't put out if you don't put in. In other words, thinking does come from experience. Reading increases the number of experiences from which you may gradually

adduce generalized principles. I am now fairly aware of what my conscious part is in this very complex system called thinking. That conscious part, which is only one-millionth of the picture, can do some triggering, can be a brake or an accelerator, a valve that can shut off or turn off a process.

"We experience different rates of retrieval of information. Even in my vocabulary and in my reading, there are lags, and when people talk about speed reading, it's really just a means of diminishing the lag. I'm not interested in speedreading, but rather in content and understanding. But I find the subconscious is very powerful.

"During 1938-1940 I was consultant in science and technology to the editor of Fortune magazine, and my function was to emphasize the science foundations of great industry.

Reality, 4 Nov'73 —' *

Reality;

"What the mathematicians have been calling abstraction is reality. When they are inadequate in their abstraction then they are irrelevant to reality. The mathematicians feel they can do anything they want with their abstraction because they dotf't relate it to reality. And of course, they can really do anything they want with their abstractions butlike ^{0143turbat}ion, it is irrelevant to the propagation

` The only reality is the abstraction of the principles, the eternal generalised principles. . . Most people talk of reality as what are just the after-image effects--- the realization lags, which register superficially and are asymmetric and off center. (The principles themselves have different lag rates and different interferences.) When we get to reality it's absolutely eternal.

"The inherent inaccuracy is what people call the reality. Man's way of apprehending is always slow: ergo the superficial and erroneous impressions of solids and things, which can actually be explained only in principle."

TEXT CITATIONS

Reality.

6543.05

Reality as Structural Interaction of Principles:

"The relative abundances of reciprocally patterning principles everywhere constitute the so far discovered inventory of finally complex, ergo fundamentally differentiable structurally regenerative universal governance. The complex of interactively accommodating principles and their relative abundance accommodation are reality--- the only reality. What man, In his sensorially preoccupied misapprehending, has termed •abstract,* In contradistinction to sensorial, as well as that which man has designated as metaphysical in contradistinction to physical, are altogether one reality. The fact of meagerness of the experience-generated knowledge of man in respect to the omniregenerative structure of reality' and the observational facts taken in the twilight zones between the meager known and the as-yet -unexperienced, in no way alters the unitary integrity of the utter interaccomodation of complex structural interaction of the principles as so far sum totally inventoried by the faithfully reported experiences of man."

Realization:

"The new reliable understanding of meaning. . . requires the revision not only of semantics but also of their complex aspect as thought habits employed to describe experience with accuracy, such as . . . the substitution of the word 'realization' for the very inaccurate use of the verb 'to create.' Man creates naught. If he comprehends in principle, he rearranges locally in Universe by realization of the interactions of principles."

"All of us really carry on much on a really safe basis, going back again to people with swords and farming the land We go back to somebody with weapons more powerful than other people saying, 'I claim this and don't anybody say No If nobody said 'No' then you called your officers to write the deeds,.. We have our deedings going back to whoever is the sovereign of that land. The word real in Spanish is the word royal or our word real--- coming from is it valid to the king... Our real estate going back to royalty's estate. Valid to the king--- comes back to the deeds of the king. Then we have man monopolizing the physical. Fanatic laws we have protecting the land and almost no laws protecting man's ideas, the metaphysical. We protect the physical. It is the underlying financing of the building in terms of the land. This land exploitation is very dominant in the building world, making the equities of land more and more, not thinking at all about the fundamentals of how do you really serve man."

"To date, we have gained vast inventories Of trial-and-error experience

From all of which information we have developed A family of generalized scientific principles Which are weightless pattern concepts. Being weightless they are metaphysical. From the metaphysics

We have in turn designed

Rearrangements of the physical behavior constituents

Of our omnikinetic environment scenery.

We have rearranged the scenery

**In the pattern of world-around occurring power-driven tool networks
All of which teleologic process**

Has produced an ever-increasing survival advantage for humanity."

- Cite BIN * MIND, p.92 May '72

"I'd like to answer one more sort of challenge we had a little earlier, and that is that I've learned not only this grand strategy of not trying to reform the individual; to assume that the Individual can concentrate entirely on rearranging the scenery in permitted ways to make it

more favorable for life--- to demonstrate its capabilities. I have also learned that where you see things that need to be done--- you can see the scenery can be rearranged. Tour experience tells you that scenery can be rearranged to a higher advantage for man, . . And there's nobody to tell you to do it. , . You will try to do something about it, to rearrange it, and then he says, 'What have you done?' And then you explain what you've done and how it works, and then he says 'Well, that's very interesting,' but then goes right on about his regular business. Then I find that there's always an emergency, when you have to have something waiting there. So my whole strategy is--- and I've been able to live now on the frontier without anybody guaranteeing me anything, or telling me what to do--- taking the economic initiative and trying to find out what nature needs to be done."

- Cite RBF to World Game at NT Studio School 12 Jun-31 Jul'69, Saturn Film transcript, Sound 2, Part 3, pp. 68-69.

"When you can't go any further with one thing, then you look over to another one that needs attending to, and you keep shifting from one to the other. So, at any rate, I've learned how to survive there. One of the things I do is never try to persuade anybody. I don't try to sell anything. You see what needs to be done and you do it. And you wait until a man says "What is that?" and then you tell him what it is. For instance, I've learned that there's no use going around with pulmotors door-to-door like a Fuller Brush man and say 'I'd like to sell pulmotors.' But all of a sudden there's some suffocation and you have to have a pulmotor in a hurry, and then it's lucky you did it. So I find that society has its emergencies. . . So you have what I call emergence by emergency And that's what is really going on at this ta-

ble with the individuals really beginning to find out how you do do it. That's the thing, not talking about it theoretically, but just really looking at what can be done--- and more than just getting the figures. This then leads to design: 'What are the things that need designing?'

Reciprocity. (1)

"But as we come to explore for the fundamental principles of inter-potentials and interactions called atoms, we find that , despite the astronomical number of aspects and events, only a few principles of behavior pervade the whole of Universe as, for instance, 92 tendencies to self-impoundment of energy; a fundamental inwardness and

outwardness relative only to the 'system* center of observation; the corollary principles of inherent first tendencies to inward-outward pulsations and to precession, and the principles of insideouting--- convergence-divergence, spin and counterspin, torque and counter-torque tension and pressure, the biological reciprocals of Universe (and diaphragm!ng).

'Relativity leads us toward fundamental classification of our experience and observation, in the terms of a few hierarchies of dynamic interactions and principle transformations of an all-energy, continuous-discontinuous, synchronous dissynchoponus Universe tensionally cohered, precessionaj of local compressive spherical energetic collections--- as (Suns) stars or planets or moons or asteroids or meteorites; and the progression of within-ward sub-sets of events of interactions at planet crust, MR etc., and inward to "

- Cite TOTAL THINKING, Itl, pp.235-236, May*49

"the 92 common principles of atomic convergence of energy in principle, and the pervasive sets of dynamic associations by contractions, expansion, spin, orbit, torque, push, and pull, and precession. This all brings us by progressive collections of thoughts into a fundamental twoness of dynamic reciprocities which, internally paired, ultimately become one with outwardly paired principles of reciprocity.

"The becoming one of both the finity inward with the finity outward indicates a sensibility of experience preoccupying man as a superficial reality which only occurs at middling dimensions of Universe and appears schematically as a magnetic field. Its flux patterns, like two tangent balls, include every size of particle, as their hour-glass-like tangentially linked inwardness, displays both

inwardly and outwardly mingled sets of fountain and reverse fountain flows--- concurrently at both ends--- and through the middle. Periodically, the whole double-bulbed dynamic flux contracts axially, as the two bulbs of dynamic flow merge progressively, and then merge completely, and again separate axially. It is obvious that inasmuch as the whole system was always in flow, that the new bulbs of flux are of necessity

- Cite TOTAL THINKING, I&I, p.2}6, ray*49

'•new and are therefore only identifiable in principle with the previous comprehensive duality of shapes. The system has inherent yet empty twoness.

'The reality is real--- or realized--- in principle only by events of relative interaction transpiring only in principle. The whole of the above pulsive-waveful-dynamic-duality is schematic, and is in principle clarifying only, for, though it progressively groups all-energy Universe into an oscillating binary system, it must be understood that MaMHB the whole scheme cancels out by virtue of a super paradox which finds that the infinity inward and the infinity outward of an infinite plurality of centers must be identical, and one with the infinity inward, of an infinita plurality of centers, and that: in comprehensive Universe, dimension drops out and conceptual principle remains. Physical interferences of our sensibilities are alike true and real, or realizable, only in principle. Potive and negative cancel as the principle zero,

"It is discovered in principle that proballlity probing of physical Universe on a statistical basis is now becoming of"

- Cite TOTAL THINKING, I&I, PP.\$36-237, Kay»49

"necessity frustrated while, probing in empty conceptual principle could be instituted and accelerated for further advancement or fundamental information. Exploration in principle is re-rewarding,

"It is necessary that the comprehensive designer explore in principle for verification of this significance of relativity, whereby it is discovered that in the consciously realizable comprehensive binary, truth may not be dealt with as isolated, but only as relative relationships interaction governing in principles the interactions of specially non-simultaneous sets of dynamic principles. The comprehensive realizer thus will come, with acceleration, to competence in rearranging forwardly anticipated events, measured in principle, and forwardly projected, in associated principles of reciprocal interaction and juxtaposition to the anticipated energetic magnitudes of variable stresses and flows. These interactions are known as structures and mechanics.

"Thus it is discerned how the comprehensive realizer of relativity may become competent as an integrator of the until-then- threatening chaotic dissipation of common"

- Cite TOTAL THINKING, I&I, p. 2)7, J-iaay»49

"The deliberately nonstraight line of synergetics employs the mathematicians' own invention for dealing with great dilemmas: the strategy of reductio ad absurdum. Having moments of great frustration, the mathematician learned to forsake looking for local logic; he learned to go in the opposite direction and deliberately to choose the most absurd. And then, by progressively eliminating the degrees of absurdity, he could work back to the not too absurd. In hunting terms, we call this quarrying his objective. Thus he is able at least to learn where his quarry is within a small area."

- Cite SYNERGETICS text at Sec. 522.03; Nov' V

"Having demonstrated to the mathematician that his imaginary straight line gets worse and worse--- every time he gives me an example, I am going to employ the mathematician's own strategy of dealing with the great dilemmas as invented by Boole--- the reductio ad absurdum. ./here X now a deliberately Non-Straight Line j_ q.v. ./

"the mathematician having moments of great frustrations learned to forsake looking for local logic by going in the opposite direction and .choosing the most absurd, and then progressively eliminating the degrees of absurdity and working back to the not too absurd. And he is liable to be able at least to learn the quarry, where his quarry is a small area, ./hat we call quarrying is objective.

These are hunting terms."

"There is no use talking about bright ideas. Everyone has bright ideas. But there is no use talking about the artifact until we reduce it to practice, until we see whether nature permits it, whether society permits it--- including worldwide distribution,"

- Cite RBF at Penn Bell videotaping, Philadelphia, 29 Jan'75 ' 'Back in 1932 then, thinking that I would commit myself to only alterations of the environment— not to 'multidisciplines' and so forth. I must never then 'talk about' anything. Whatever ideas I have I must find out how to translate them into some effect on the environment, in principle, and I must not talk about them until I have reduced them into practice and have discovered advantage for man. And I've really been able to prove to

myself— I find that bright ideas are so profuse-- but they don't get reduced to practice, you don't really know what the interactions are with the times and other environmental events. ... So I would never talk about it until I have reduced it to practice: something physical. And somebody would say: What is that? And then I'd have the responsibility of telling them what it was. But I mustn't even ask them to look at it. I've really held very tightly to these disciplines, because I was interested in what the individual could do on behalf of his fellow man. . . . even in a very few years."

Reflection Sequence: toifi: (1)

*1 IM an, aPRlff.

"The light of the Sun is reflected from the surface of an apple, after the occurrence of the spectroscopic action of light segregation through the medium of crystals on the surface of the apple.

"Not all of the energy ray tones are reflected, however. Those that are useful to the apple are absorbed by it, while the remainder, i.e., the non-useful, or nondigestible, or, more specifically, non-chemically combinable ray tones are reflected from the surface of the apple through the air to and through the lens of the human eye, where they are analysed by the retina and telephotographed to the brain of the beholder.

"Incidentally the light that the apple gives off is a negative, that is, the opposite of the light complementary to the growth phenomenon 'apple.* It is not one of the chemical apple's actual constituents. This is something like the phenomenon of the camera film negative except that the latter is more honest than the eye's for the eye reverses light and shadow instead of properly appraising them as does the camera. In printing,"

- Cite NINE CHAINS TO THE MOON, pp.42-43, 1938

Reflection Sequence: Apple: (2)

"the black and white of the film have to be reversed in order to represent the illusion of the apple as the eye sees it. Many apples are probably blue, having taken blue from the spectrum, but the eye, taking up the rejected red, 'sees' the apple as red,

"Whether or not the eye sees a negative or a positive of the apple, light absorption and reflection are mechanical considerations because neither life nor mind activity is involved until the essence of the picture has been articulated in the 'brain*' and has been automatically referred to the memory filing department (the system of which is even more complicated than the worldwide Bertillon system of finger-print identification) for comparison with all of the apple experiences of the 'see-er.' The new picture of 'apple' is laid out on the table for comparison with the whole reference file by the executive officer 'brain,' who never sees the phantom captain although under his permanent orders to lay out the file in the captain's outer study. Then 'brain' retires through the front door, closes it behind him, and the phantom captain enters from his inner sanctum to peruse the exhibit.

- Cite NINE CHAINS TO THE MOON, p.43, 1938

Reflection Sequence; Apple:

(3)

"If interested at all--- generally he is not--- the captain considers the progression of apple phenomena®, as indicated by the pictures in the file, and decides that the latest addition is a better or worse apple, i.e., it is an apple that would, or would not be useful as fuel for his ship, in the cleansing process of his machinery, or as bait. Having decided 'yes' or 'no,' he leaves a message for 'brain' beside the exposed file and retires.*"

Reform of Environment Rather than Reform of Man:

"My discipline is to reform the environment in ways favorable to the success of all humanity with confidence that propitious environmental circumstances induce spontaneously pro-social behaviors.'*

- Citation and context at Design Science (1), 29 Jun*73

"I developed a fundamental philosophic concept in 1927 which was that it is possible, instead of trying to reform man, to reform the physical patterns--- to reform the environment in such a way as to make the physical environment patterning more favorable to the new life being born into it. It seemed possible that the new human generation, born into the streamlined environment, might quickly react by re-employing the newly designed advantages, and in so doing might establish a new level of integrity of human response to environmental stimuli whereby society might come to act in creative spontaneity to continually convert the highest knowledge born of the cumulative experience of man toward the direct enhancement of the life processes, instead of, as at present, leaving the prime social initiative for the weaponry exploiters who derive their mandate only from the negative fears born of ignorance, and the congealing inertia of that ignorant fear."

Regenerative;

"I U?e.3h u £^{erra} regenerative because in an all-mot ion universe (which Einstein posited and the physicists in due course found to be true), all the patterns of the universe are continually but non-simultaneously affecting all the other patterns of Universe in varying degrees and are continually reduplicating themselves in unique local configurations.

"These patterns may be described as constellar because their component events stand dynamically together like star groupings, and any event patternings which become locally regenerative are constellar patterns. It is a tendency for patterns either to repeat themselves locally or for their parts to separate-out to join severally or singly with other patterns or to form new constellations."

"Universe... a closed system of regenerative, that is, adequate complementary patterns that is to itself..."

- Citation and context at Chess:

Game of Universe. 9 Jul'62

Regenerative:

"Regenerative means multiorbital, cyclic, pre-cessionally concentric,

"Regenerative means the ability to display one form, then another, in a gamut of phases; each phase, however, like a tree ring, or a wave generated by a stone thrown into water, has its own orbit; and the various orbits progress outward or inward in concentric circles or shells.

"A seed is regenerative. A crystal is regenerative. Energy itself is an ever-regenerative patterning entity. Its forms are protean. It can appear as the breath of a hawk or coign of a cliff. It can cloak itself as radiation, as mass, as design, and as the wellspring of work. And since by fundamental law, energy can neither be created nor destroyed, its fate in the cosmic scheme is to meander through eternity in persistent, regenerative bliss."

Regenerative Birth:

See Duality of Universe, May*49

Regenerative Design: Uw_Of: (D

' ` The prime eternal law governing design science as thus-far accrued to that of the cosmic law of generalised design science exploration, is realizability and relative magnitude of reproducibility which might be called the law of regenerative design; which is, that the relative physical time magnitude of reproducibility is proportional to the order of magnitude of generalizability. Because the higher the order of generalization the more embracing and simple its statement, only the highest orders can embracingly satisfy the plurality of low-order inter-accommodation conditions.

"There are several corollaries to the prime law of regenerative design durability and amplitude of reproducibility. Corollary A is: The simpler, the more enduringly reproducible. Corollary B: The special-case realizations of a given design complex correlate as: the more symmetrical, the more reproducible. Corollary C: There being limit cases of optimum symmetry and simplicity, there are simplicities of conceptual realization. The most enduringly reproducible design entities of Universe are those occurring at the min-max limits of simplicity and symmetry."

Regenerative Design: Law Of: {2}

"Corollary D: There being unique minimum-maximum system limits governing the transformation of conceptual entities in Universe which differentiate the conceptually unique entities of Universe into those exceptions occurring exclusively outside the systems considered and all of the Universe inside of the conceptual entity, together with the structural pattern integrity system separating the inside from the outside, there being a minimum limited set of structural and operating principles eternally producing and reproducing recognizable pattern

integrity. And there are likewise a minimum set of principles which interact to transform already orderly patterns into other structured patterns, and there being minimum constituent patterns which involved the complex intertransformings and structural formings of symmetrical orders and various magnitudes of asymmetrical deviations tolerated by the principles complexedly involved. There are scientifically discoverable nuclear aggregates of primary design integrity as well as complex symmetrical reassociabilities of the nuclear primary integrities and deliberately employable relationships of nuclear simplexes which designedly impose a symmetrical-symmetrical pul.^{sat}iV8 periodicities

"The most Incredible thing is that in the areas where all the people are there is no power or food. » . Tou need food so everything comes back to electrical power.

These figures on the Dymaxion Airocean World Map projection , Each of the people have their hands raised and they have a number of fingers on each hand indicating how much of their time is reinvestable and how much they have to devote to survival needs. The people in this area have no time: their hands are in their fists. In the areas in the United States they have all their fingers up: they have their whole life to reinvest in the way they want to reinvest it. . .

So it begins all of a sudden . . . just thinking about mobile areas and politics, you begin to see a whole Earth at once and how man is doing on whole Earth."

"If we look at the stars and they look very random scattered throughout the sky. I will tell you then that the numbers of relationships between all the stars is always N²

- N and

this chart tells you quite clearly and simply that I am mathematically justified in doing so. This will give you a personal sense of the power of the Infinitely tiny human's mind in the presence of that vast array of stars whose distances and occurrences can only be identified in terms of millions and billions and higher numbers of years and miles away.

"This relationship analysis discloses the omniuniversal orderliness that scientific man finds to be always underlying all superficial randomness of experience. This tells us that the seeming disorder of physical entropy is only superficial and explains why metaphysical thought can always find the orderliness that engulfs the disorderliness. Disorderliness is nonthinking. Brain, which stores the memories of all specialise experiences, does not find the relationship any more than a library in itself can find or does find the interrelationships of the data that it houses. Only mind, the great metaphysical, patternseeking function, has demonstrated to us the capability to**

Relative Abundance;

"I began to play a game of looking at relative total abundances
of various patterns in various systems and looking at a daisy and
looking at a tortoise and looking at a waste basket, I find that the
relative abundance of the fundamental patterns called chemical
elements vary quite greatly. I sort of began to play a game of relative
abundance because this is a nice 100 per cent game and that is the
kind of game that the physicist learned to do so ably as a synergetic
capability because he was always dealing in 100 per cent. Remember
that when he had an unknown percentage showing in an experiment,
that is what gave him his clue to meson or whatever it might be. I
found it very interesting to look at the total pattern man.

"Observing that there is a fundamental complementarity, and that the complementations are rarely mirror images of one another, we find that the physical Universe is always locally entropic--- that is, it is always giving off energy in one way or another. Because each local system has its own orbiting, and its own frequencies and so forth, the ways in which they give them off are not synchronised with the others. Therefore, as they're given off, they're relatively disorderly. . . . And actually calculably disorderly; they're not infinitely disorderly at all. They're not something we might call chaos. It may look disorderly to you as you look at the turbulence of a waterfall, and the water's going down there, But I've become very fascinated with the fact that I'm beginning now to understand what the different turbulences are. I can begin to see what the vortex is and all the interprecessional effects.

"It's no longer looking quite as disorderly to me as it used to look. Our word 'disorder' is a relative matter: it gets to be relatively asymmetrical. Relative to the symmetry of equilibrium it gets to be relatively asymmetrical, and I find that it goes to a maximum asymmetry and then comes back"

- Cite RBF to World Game, Jun-Jul'60

"to symmetry again.

"I think this is why we might have something we call octaves in music. There are sort of octaves in our thinking. We think octavely. . . . We say the atom has its nuclear arrangement, has its own synergetics, which is how they associate to form molecules and the molecules associate to form cells and how the cells associate to form living organisms, and so forth."

Are always and only coexistent functions

Of an a priori Universe. . . ”

- Citation and context at Consciousness, p. 12, May *72

Relativity:

"... What Einstein realised has not as yet been comprehended in any important way except that of developing the atomic bomb. . . ”

"Einstein intuited from scientific observations, such as that of the Brownian Movement in water, and black body radiation, that the physical universe is always transforming complexly. Natively twisted, the geology of our Spaceship Earth's crust makes clear how severe have been the great transformings of its history."

~ UNESCO TIFLIS 1968, p. 9

RglatITAW

"The theory of functions holds for Universe itself. Universe consists at minimum of both the metaphysical and the physical. The fundamental twoness of physical Universe was embraced in Einstein's one word, 'relativity,* and in a more specific and experimental way in the physicists* concept of complementarity."

Relativity;

"Relativity leads us toward fundamental classification of our experience and observation, in terms of a few hierarchies of dynamic interactions and principle transformations of an all-energy, continuous-discontinuous, synchronous- dissynchronous Universe tensionally cohered, processional of local compressive spherical energetic collections--- as (Suns) stars or planets or moons or asteroids or meteorites; and the progression of within-ward sub-sets of events of interactions at planet crust, etc., and inward to the 92 common principles of atomic convergence of energy in principle, and the pervasive sets of dynamic associations by contraction, expansion, spin, orbit, torque, push, and pull, and precession. This all brings us by progressive collections of thoughts into a fundamental twoness of dynamic reciprocities which, internally paired, ultimately become one with outwardly paired principles of reciprocity.*

- Citation and context at Reciprocity (1) + (2), May*49

Relativity:

"The concept of relativity involves high frequency of reestablished awareness, and progressively integrating con- siderat ionMIBMtBB of the respective, and also integrated, dynamic complexities of the moving and transforming frame of reference and of the integrated dynamic complexities of the observed, as well as of the series of integrated sub-dynamic complexities, in respect to each of the major categories of the relatively moving frames of reference of the observer and the observed. It also involves constant reference of all the reciprocating sub-sets of the comprehensive totality of nonsimultaneous Universe, from which naught may be lost.'*

- Citation and context at

Dynamic Frame of Reference (5)_f May'49

Relativity;

"Relativity treats with concepts in principle; therefore, it can be treated in words as well as in mathematical phrasing. Relativity is inherently convergent, though convergent toward a plurality of centers of abstract truths. Degrees of accuracy are only degrees of refinement, and magnitude in no way affects the fundamental reliability, which refers, as directional or angular sense, toward centralized truths. Truth is a relationship."

Religion:

"I do not want to inaugurate another religion and persuade people to believe in a set of rules. I an convinced that the Alnight does not need anybody to promote God."

. Citation *it.* context at God. May'65

Religion: (1)

"...Another young lady came to me and said was I going to talk some more about these religious ideas. I really had talked a whole lot about it to you but... I had never really used the word religion. I knew what she was talking about because she spoke about some kind of faith, some confidence in an integrity and a meaning in our experience of life... The word really is `religio.* They had come out of a set of rules of

dogma, interpretations at second-, third, and fourth-handings, sometimes very remote, a thousandfold secondariness of experiences of others and thought which have occurred spontaneously to original explorers.

"I myself am quite confident that the more we know about who specifically inspired religions--- Christ, Mohamed, Buddha, and Confucius--- these may be generalized characters, but there was one or several men who at various times in history tended to have the kinds of experiences that are accounted for word by word, mouth by mouth, word of mouth. These experiences are experiences of individuals who have extreme confidence in the integrity of the invention man and the invention Universe, who in every instance find this integrity to have great power, to be a priori to human intellect."

- Cite Oregon Lecture //5, p. 160, 9 Jul'62

Rgllfian: (2)

"None of them ever account experiencing a god in the image of man. That is one thing that Einstein was talking about in his nonanthropomorphic concept of the scientists. At any rate, they are people who experience an a priori integrity, a comprehensive anticipatory intellectual integrity greater than that of man. And they have enormous confidence in it, great faith in it, and try to help others to understand the success that they have experienced through their confidence in that integrity. At any rate, apparently these people have had such success as to have excited people by various patterns of experiences that have occurred. There are many then who in their day were excited, really very blindly and superstitiously, into subscribing to what was going on. This man was a man of powers without their trying to understand what those powers were, 'When they die then there were those who do better than others and they tend to become the authorities; and while they are alive they then are asked to make various

recordings of what they think had been said and what the rules were. Gradually this gets thinner and thinner and we have official custodians of the information and interpretations and that is the way our religions have developed.*

- Cite Orgeon Lecture #5, p.161, 9 Jul*62

Religion:

"As these individual explorers of the sciences went off into their laboratory and went down with their blinders on, men of enormous integrity, they said they never found anything in that particular area that seemed to confirm any of the given religions. Therefore, atheism began to develop, not as something you profess--- but there was sort of a double life. These men tended to honor their forebears, honor the literature, honor the humanism, and they would say probably the trouble is that I am such a narrow person from being in such a narrow field, that I just don't understand your other things. But there is nothing that I am doing experimentally here that seems to tell me that what the people have said about how the Universe was put together and the way it works, particularly from a religious point* viewpoint, that really seems to be valid. I think these people over here are dear muddleheaded people, but I am just going to have to leave them alone for my own professional part. So what has been thought of as an atheism is really just an evasion. It wasn't a declaration of againstness, and was not something against religion, but there seemed to be nothing to take its place."

Repetition:

"In a recent study of the use of repetition in literature, Bruce F. Kavin observes that 'Events whose repetition is not extraordinary do not seem worth recording, in fact, hardly seem worth noticing,'¹ This statement is very close to what has been the strategy of my life. This is what it means to dare to be naive. The preoccupied search for the extraordinary pattern cannot fail to obscure the larger and more obvious ordinary patterns--- so obvious that they always seemed to be missed."

- Cite SYNERGETICS, 2nd. Ed. front matter, Author's Note on Rationale for Repetition in This Work, p.xxi, 2 Jul»75

Repetition:

"Le Corbusier told the whole story on the first page. And then he told it again in a few pages. And then he told it again in the whole book. And that's the only way people can really understand it. You have to keep retelling it. This is the way Le Corbusier did it in his book called

... and everyone loved it that way.

"This gives me another metaphor.... It is all part of the grand strategy. You know how a pole vaulter can't do it all the first time. He has to run over the same cinder path hundreds and hundreds of times before he gets to his new record. And that's the way we should tell it in the book."

- Cite RBF to EJA_t by telephone from Philadelphia, 8 Mar*75

Repetition: (1)

"It is the writer's experience that new degrees of comprehension are always and only consequent to ever-renewed review of the spontaneously rearranged inventory of significant factors. This awareness of the processes leading to new degrees of comprehension spontaneously motivates the writer to describe over and over again what---

to the careless listener or reader-- might seem to be tireless repetition, but to the successful explorer is known to be essential mustering of operational strategies from which alone new thrusts of comprehension can be successfully accomplished.

"To the careless reader seeking only entertainment the repetition will bring about swift disconnect. To those experienced with the writer and motivated by personal experience with mental discoveries--- co-experiencing comprehensive breakthroughs with the writer--- are not dismayed by the seeming necessity to start all over again inventorying the now seemingly lucidly relevant.

"Universe factors intuitively integrating to attain new perspective and effectively demonstrated logic of new degrees of comprehension-- that's the point! I have not forgotten that

Research; n)

"We must break a barrier in the kind of thinking we've been doing about the word 'research.' You have to have search before you can have research. The word research came into use in industry and business during the '20*s. They started going over the things they were throwing away. They began to apply new technologies. So you searched once and exploited your findings; then you researched what you'd done and exploited it again. It was very spottily done between 1900 and World War I; research really begins in 1929. Today it covers all kinds of things. When we talk about research in a university, that's new too. The research professor is something very new. You had large corporations paying for a chair in the chemistry department and it was really a racket because what it meant was that you had a large number of people, graduate students working for you for nothing. You had a research professor giving your company very special benefits. The ulterior motives are frequently visible.

"A researcher is always someone who goes over things again. He is a technician staying in one area to see what he can find. Research is very different from pure science exploration and invention. Research can just be processing and refining without*

"There will always be residual error to surprise man.

The integration of all possibilities of the complementary alternates, though confinable, inherently defies exact identity because the minimum is pattern and not isolated integer. All pattern has inherent plurality of viewable aspects, which are the reciprocals of pluralities of permissible viewpoints, for instance, from within or from without a system. All treatable pattern is a subdivision of Universe, and disposes, in its first generalization, of the macrocosmic and microcosmic irrelevancies. Ergo, thought identification and communication to self or others musttune in a zone® system, with inherent center-of-zone, equilibrium 'sphere,' and therefore possessed of inherent wave propagative inward-outward tendency between the unstable variable limits, or infra-ultra twilights confining the clearly tunable mean interior-exterior zone limits occurring between the ultra-tunable macrocosmos and the intra-tunable microcosmos,"

Responsible:

"We have to take the responsibility of being responsible. So far we have not been very responsible. You don't say to a new child, 'You'd better go back in there, you're not very responsible...' They're just using words--- foxes and daisies... I say: What might I do that made it logical for man not to do these things? That's what I'm caring about. That's what design science is."

- Citation and context at Spaceship (C), Feb'73

Responsibility:

'•Our history of social customs indicates that until very recently, when Freud offered evidence to the contrary, man thought of his awake self as being utterly conscious. The laws held people absolutely responsible for all their awake acts. Reality was what could be seen, smelled, touched, tasted, and heard. There was no popular awareness of sub- or ultra-visible reality. There were beliefs of invisible gods or demons playing tricks on the humans."

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, p. 149, Dec. '69
RespanaibXXXix:

"We are all equally responsible not only for the big complementary surface areas which we develop on systems by our every act. . . . We are inherently responsible for the transformation of Universe, inwardly, outwardly, and all around every system which we alter."

- Citation and context at Spherical Triangle (4), 13 Nov*69

Responsibility:

Up to the nineteenth century, or the beginning of the twentieth century, what we could smell, see, hear, and touch was what he meant by reality. I think to many in our society today that is still what you mean by reality. Freud and Keener shook society's concept of this kind of reality, because man up to this time had been saying, because that is reality, every human being knows just what he is doing. If he is of sound mind, when he is awake, then he knows just what he is doing. Therefore, he must be entirely responsible for his every act. So as we developed laws, we made man utterly responsible for his every act. But Freud and Kestner, through their hypnotism, were able to disclose behaviors of human beings for which the human being was not

responsible at all. So this shook the idea of the courts, and we have had to have psychiatrists and others come in to bring you a reconsideration of the responsibilities of human beings. Now, what has really not been paid attention to in our society, again because we are all so specialized, is that there is almost no tendency to look at the whole and to really understand the whole,"

Aug'77

Restraints:

"Nothing stands in a vacuum of Universe. Nothing can change locally without changing everything else. We have to look for conditions where there is permitted transformability and where there is some really great unanimity of degrees of freedom. We see that certain kinds of patterns accrue from certain numbers of restraints. You could see how planar things could happen as a consequence of two restraints and how linear things could happen as a consequence of three restraints. (See Sec. 401, Twelve Vectors of Restraint Define minimum System.) We see, then, that we are in a Universe where there is a

certain limited number of permitted freedoms. Synergetics discovers that whatever is rigidly related to anything else discloses 12 restraints. There are a minimum of 12 restraints in developing anything we might call a rigidly related set of events."

- Cite SYNERGETICS text at Sec. 537.01; RBF modified and deleted much of text on galley, 7 Nov'73, but EJA reinstated text to conform to manuscript of Dec*71.

Restraints: (1;

` `I've got a way of checking degrees of freedom. I said there is myself and the universe, and I see a hole in the stars. I try to shoot out through the stars. I go I wake the Pleiades; the stars get closer and closer together} I seem to be very far. All the stars in the rest of the universe are in one huddle, and I am over here. . . ` `

"I can't get away from the universe: one tension restraint. I can do as a tetherball; you hit it and make any kind of a spherical form that you want. . . I give myself now two restraints, I only had one restraint, now I have two restraints, not as if I were a ball in the middle of a music string. I can still move but I can only move in a plane. I give myself a third restraint: I am in a drumhead;

can still move, but only in a line. Then I give myself a fourth restraint and first I am pulling the drumhead in one direction and I seem to be immobilized. ... I found that even though semi-immobilized, you could put a monkey wrench on it and it would contort. . .

"I had to get each one of the four restraints; they had to be three-folded and come in tangentially, making a total of 12.

There would be six positive and six negative, corresponding
SEC Mo?-J fl+3*1 - Cite Ledge mont Lab, Lecture, p.52, 15 Oct*64
Restraints:

"to the six edges of the tetrahedron, negative and positive... They keep showing up in these models.

"You are trying to make a wire wheel. How many spokes does it take? You have to have three out this way and three out that way to keep the hub from shimmying. You have to take care of the rotation and the torque-- that way and this way--- we had six... multiply each of these VESSSSSSSB* by two... comes 12. You cannot have a wire wheel with less than 12 spokes."

- Cite Ledge mont Lab. lecture, p.53, 25 Oct*64

Restraints:

"The Platonic Solids do not stand

Emmngrtju in a vacuum of Universe. Nothing can change locally without changing everything else. We have to look for conditions where there is permitted transformability and where there is some really great unanimity and I have been looking for degrees of freedom--- ways in which this could happen, the kinds of patterns that accrue to one restraint, two restraints and so forth. You could see how linear things could happen as the consequence of three restraints and how planar things could happen as the consequence of two restraint and so forth. We then get into a Universe of a certain number of permitted freedoms and I have discovered that nothing was--- you might say--- rigidly related to anything else unless there were twelve restraints so there was a minimum of twelve restraints to develop anything we might call rigidly related set of events."

liesuitant:

"Now, up to the speed of light measurement, engineers spoke of every action as having a reaction and it was thought by the engineers--- because the public didn't understand-* that every action had a reaction. Little man is so small, and Earth is so big, he doesn't realize that when he steps this way, he's pushing the Earth the other way. But you can feel it in an automobile when it accelerates rapidly, shoving the pebbles in the opposite direction. Now with the speed of light measurements, we discover while the speed of light is very great, say 700 million miles an hour. . . . 'bible, That's very fast} it is very slow in contrast to no time at all. And the engineers have not updated their thinking since the speed of light. They hadn't realized the speed of light had anything to do with their action and reaction. But because there is now no instantaneity, no simultaneity, there is always some energy lag, and time is involved here. Therefore every action not only has a reaction but it has its resultant. and the resultant and the reaction are not the same, so we now realize that every energy event is characterized not only by a reaction but also by a resultant.

"Optimism is usually thought of as constituting a mildly unwarranted hopefulness in respect to the future. But there is a reverse projection of optimism in the nostalgigenerated myths that recall only the rare and sublime moments of yesterday. Forgetting the negative, reverse optimism overemphasizes, thus deliberately shuts its eyes to reality, and is therefore unable to see the values immediately present.

"I am convinced that we are swiftly emerging from the abysmal conformities of yesterday's illiterate, spit-punctuated profanity and monosyllabic verbalism, in which rags, filth, diseased bodies, prevalent stenches, devastating superstition, and local bias reigned supreme

Revolution:

"The revolution is not being effected by pulling the top down. It is being effected by pulling the bottom up. It is being effected by doing more with ever less in such a manner as to take care of all without taking away the functional capabilities and fundamental advantages of any. The surprise.

constantly doing vastly more with ever fewer physical resources per function--- is our legacy from the millenia-long armaments struggle to do more with less in a world where a pea-size transistor now does more than an army of yesterday and a fistful of atomic fuel takes a large ship around the Earth."

Robin Hood Sequence: (1)

"The chronofile persuaded me ten years after its inception to start my life as nearly new as is humanly possible to do. It persuaded me to dedicate my life to others instead of myself. Not on an altruistic basis but because the chronofile for the first 32 years of my life clearly

demonstrated that I was positively effective in producing wealth only when I was dedicated to others. Further chronofile observations then showed me that the larger the number for whom I worked the more positively effective I became.

"Thus it became obvious through the chronofile that if I worked for all of humanity I would be optimally effective. Setting out to start life all over again, I did not try to make myself a new, or a different, man, another man. I sought only to allow myself to articulate my own innate motivational integrity instead of trying to accommodate everyone else's prefabricated credos, educational theories, romances, and mores that had occurred in my first life.

`` One basic tenet of my new volition was that whatever was to be accomplished for anyone must never be at the cost of another. Robin Hood was a story my father read aloud to me when I was"

- Tape transcript *i/6*. Side A, p.17; RBF to Barry Farrell;

Bear Island, 10 Aug*70

Robin Hood Sequence: (2)

"very young, not long before my father died. Robin Hood became my most influential early years' mythical hero" This meant that in my first life I had improvised methods in general to effect swift moral and romantic justice for those whom I'd found in trouble or danger. Foolishly self-confident in my first life, I had often rushed thoughtlessly to assume responsibilities beyond my physical and legal means. This rashness led me into complex dilemmas, for in an attempt to keep my assumptions of responsibility legal, I inadvertently borrowed from my unwitting family dragging them into preposterous financial sacrifices

"In inaugurating my new life I took away Robin Hood's long bow and staff and gave him only scientific textbooks, microscopes, calculating machines, transits in industrialization and a network of tooling in general: I made him substitute new and inanimate forms for animate

reform. I did not allow Robin any further public relations professionals or managers or agents to promote or sell him. It seemed obvious that if the new tools that the new Robin Hood did develop could provide valid man advantage increases, they would inevitably be adopted by society in general as the inexorable emergencies which dictate the proper rate of regenerative gestation of evolution took place.

Reliability of Polyhedra:

"The more evenly faceted and the more uniform the radii of the respective polygonal members of the hierarchy of symmetrical polyhedra, the more closely they approach rollable sphericity. The four-facet tetrahedron, the six-faceted cube, and the eight-faceted octahedron are not very rollable, but the 12-faceted, one-sphere-containing rhombic dodecahedron, the 14-facted vector equilibrium, and the 14-faceted tetrakaideca- hedron are easily rollable."

- Cite RBF insert at SYNERGETICS galley, Sec. 942.70, 20 Dec'73

Rolls:

"We want to think about production and getting then films and environments under controls, separating from outside to • inside. There is no way man develops such high speed production as in rolling devices that produce sheet steel at fantastic rates coming out from those rollers--- and film which can be such barriers. And the other one is papermaking. You make a number of rollers of paper and you have two

of them coming together and .corrugated ones in between and gluing them together, making the corrugated paper board out of half paper is very good} it has a very high wet tensile strength--- doesn't bother it at all if it gets wet. But as you have something coming out of rolls, the roll going around, and you have another roll, and there's a printing press. So you can get some newspaper coming out. And so you can print information. . . Any kind of shapes you want, any picture. So I find then you can do any complex kind of work you want and print it right out on your paperboard as it comes out at fantastic high speed, and not only print it, you can put a little groove in it. You press the paper down, and that's the way you want it to fold. And paperboard domes can really be produced at a fantastic rate."

Rope:

"As recounted before,

Saying, ' Let us take a piece of rope...* To demonstrate the generalized rope concept-- I am drawing on

A multiplicity of special-case rope experiences As a brain-stored resource of that audience, Probably amounting to over a hundred experiences each: With different kinds of pieces of rope, Ergo--- I am drawing upon a memory resource Of more than one hundred thousand experiences With as many different pieces of rope, When I speak to an audience of one thousand."

- Cite BRAIN fc KIND, p.146 May <72

Rope:

"I started out our brain-mind differentiation By saying, 'I take a piece of rope.* I've done thia before many audiences, And no audience has ever said, •You don't have a piece of rope.'

But the fact is I didn't have a piece of rope Nor has anybody ever said, •Is it nylon, manila or cotton?' Or, ' What is its diameter?*

- Cite BRAIN t MIND, p.116 May *72

Rope:

"Each fiber in the rope is randomly spiral. The larger braided strands are also spiral together into three final spiral bundles which, in turn, spiral together as a piece of rope, clearly the rope is an aggregate ten-straight lines of many varieties of spiraling curvature. The design final twisting of the rope, when its ends are spliced together, will expose a unique number of profile humps. If the twist of the rope has 1/16th

inch humps per quarter-inch of rope length, and 64 profile humps per inch, and 768 per foot; then there will be 768 times 64, or 49,152 humps in its total peripheral horizon, inside or outside: that 's a great complex of wavilinear integrations,"

- Cite RBF dictation to Alexandra Snyder, Ashoka Hotel New Delhi, India, Dec. '71

Rope:

"Physicists have never discovered any straight lines in Universe. They have discovered only waves which are inherently curvilinear, that is, they are corkscrew or spiral trceries between covariable events, such as You and Me, with our relationship identified by a rope stretched between us with two reels at each end to pay out as we move independently with varying lags in the rate of the rope's response to other forces acting upon it than thos of our two independent pulls, as for instance the effect of wind on the rope; or the Earth's gravitational heated expansion of the rope; and the lag or inertia of the rope in changing the rope's shapes given it progressively by You, Me, the wind, gravity, Sun, and atoms of which the rope itself is composed, whose behaviors are very directionally discrete in order to give the rope its unique recognizability."

- Cite ROF dictation to Alexandra Snyder, Ashoka Hotel, New Delhi, Dec. *71.

Rope;

"I take a piece of rope and I tense this piece of rope ae vigorously as I know how. And the more I tense it the tauter it becomes. When it becomes taut, it means it is contracting in its girth. This means that while I am purposely tensing it in its linear axis, it is going into compression

at 90 degrees to my purposeful tensing. Compression is occurring, though I am only applying tension. You understand that? The rope is contracting, going into compression, as a consequence of my pulling it.**

Rose:

"... Packages consist of complexedly interrelated and not as-yet differentially analyzed phenomena which, as initially unit cognitions, are potentially re-experienciable. A rose for instance, grows has thorns, blossoms, and fragrance, but often is stored in the brain only under the single word --- □rose,¹

"As Korzybski, the founder of general semantics, pointed out, the consequence of its single-tagging is that the □rose¹ becomes reflexively considered by man only as a red, white, or pink device for paying tribute to a beautiful girl, a thoughtful hostess, or last night's deceased acquaintance. Thetagging if the complex biological process under the single title 'rose*' tends to detour human curiosity from further differentiation of its integral organic operations as well as consideration of its interecological functionings aboard our planet. We don't know what a rose is, nor what may be its essential and unique cosmic function. Thus for long have we inadvertently deferred potential discovery of the essential roles in Universe which are performed complementarily by many, if not most, of the phenomena we experience

Rubber Gloves

"Entropic dispersal . . . and syntropic association ... Between the two they work very much like the rubber glove. There really is an annihilation into eternity with no time and dimensioning--- these are only in our temporal relativity."

- Citation and context at Eternity (1), 23 May'72

Rubber Glove:

"The glove is seeability, experiencibility--- we go through the invisible. The annihilation is the invisible and the timeless.

"There is no geometry of space--- only of local aggregates of principles, of special cases.

"The lag is the whole of life. It is lag and aberration."

- Cite RBF to BO'R, Kent, Ohio, 23 May'72

Rubber Glove:

"If you have a rubber glove on your left hand and strip it off, it now fits your right hand. There's only one rubber glove. The left hand has been annihilated. That the way our Universe is. There are the visibles and the invisibles of the inside-outing nonsimultaneity."

Cite Museums Keynote Address Denver, p. 10. 2 Jun'71 PACITY- sec

Rubber Glove:

"The rubber glove stripped inside-outingly from off the left hand now fits only the right hand. First the left hand was conceptual and the right hand was nonconceptual. Then the process of stripping off inside-outingly seemingly annihilated the left hand and created the right hand— then vice versa as the next strip off occurred. When physics finds experimentally that a unique energy pattern— erroneously referred

to in archaic terms as a particle- is annihilated, that annihilation is only of the Yubber glove kind. The positive becomes the negative and the positive only seems to have been annihilated. We begin to realize conceptually the finite, yet nonsensorial outness! which can be converted into sensorial in-ness by the inside-outing process Kaego, Novent is the finite but nonsensorial continuumjy

Rubber Glove Sequence:

"So we find that complementarity is even more complex; that there had to be not only the keyhole, but that the keyhole had to be in something. The keyhole that was in something had to be related to the rest of the Universe. So then we had a rubber glove which was stripped off this hand, which we called the left hand, fairly ignorantly, and now it fits the other hand. So where has the other one gone? Then I strip it off here and there goes the other hand.

"Quite clearly, both were there all the time, but only one of them could we detect. So there is not only the glove, which could have a keyhole, and we could put the key in that, but it would have to be in something of the rest of the Universe as well as the system we can see by. There's always a conceptual system, and there's the rest of the Universe which is nonconceptual because it's a scenario Universe and not a single frame Universe."

Rubber Tirga;

"Miniature rubber automobile tires may be substituted for the triangles of the vector equilibrium to provide a model of reciprocating toruses. The eight wheels should be independently journaled but touching one another with sufficient friction so that when you move any one of them all of the eight will rotate reciprocally. We can also consider each rubber tire as a torus and we can see how they can involute and evolute at the same time the wheels are reciprocatingly rotating. This provide a model of what turbulence really is."

Ci^{delphia}atPA^{enn}24^ejin*75^{di}o8 videotaPln8 "aathon, Phila-

Rubber Tires: (1)

"You can make this model out of little automobile tires and you can run them.up on the shaft and use tape to act as a thrust bearing to keep them from coming outwardly. You brought- them in until each of these tires are barely touching the other tires in throe points--- so it really is a triangle.

'Remember how gears work. We have a train of gears where around any hole there are always four gears, so as this wheel goes one way the other wheel can go that way very comfortably. And since there are four we find that the trains reciprocate. There is no blocking anywhere. All of the holes are foursided so it is an even-numbered train of gears. When I rotate one wheel in this whole system all the other wheels move very neatly. They are in friction to one another. I can also hold on to one of the wheels and turn the system around it. If I do that a very-interesting thing happens. ... A rubber tire can be mounted like a torus, or can be rotated outwardly like the big atomic bomb mushroom cloud opening in the center and coming in* at the bottom. That is what we call an evoluting or involuting torus. These rubber tires could do that--- and not only could they rotate around on each other this way, but it is quite possible to make

Rubber Tires:

this wheel in such a way that it has little roller bearings along its rim and each of these roller bearings allows the rubber tire to rotate in the rim so that the tire could be involuting and evoluting. Therefore, if any one tire started to evolve all the other tires reciprocate."

- Cite Oregon Lecture #7, pp« 262-263. 11 Jul'62

Rubber Tires:

. It is quite possible to make an automobile tire and mount it in such a way that it looks triangular. That is, it gets to a very small radius on its corners. I can simply take the same rubber tire and stretch it onto a triangular frame and also have the same little roller bearings so it can involute and evolve. . . The triangular tires may pump from being the vector equilibrium into being the octahedron, the way we saw

it before, in and out again. If I were then to immobilize one part of it, if I were just holding it with one finger like this, doing this means that I won't let this one involute and evolute--- but the rest of the system, due to the rotation, is contracting to become an octahedron so it makes all the others reciprocate--- involuting and evolving so that I am able to immobilize one axis and the rest of the system can work comfortably."

- Cite Oregon Lecture #7, p. 264. 11 Jul'62

Rubber Tires:

"What we are learning here is something very fascinating and it means the following: That in an omnimotional Universe it is possible for me to take two moving systems--- if you have two systems--- which move four dimensionally comfortably, the way you see those four sets of wheels, eight wheels altogether moving perfectly comfortably, but I can fasten one vector equilibrium to another by a pair of wheels, immobilizing one of them and getting one of these axes--- the axis which is immobilized but on which the rest of the system can keep right on rolling around. By fastening one such part of the Universe literally, you don't stop the rest of the motion of Universe. That is what we are learning here.

"In all the other kinds of mechanical systems that you will ever run into on a three-dimensional basis, if anything is blocked then everything is blocked. In a four-dimensional system this is not true at all. You are able then to have one local thing occur. You can have two atoms join one another perfectly well and the rest of Universe can go right on in its motion. Nothing is frustrated but they themselves do certain polarized things in relation to one another, which begins to explain a lot of the basic joinings."

Rudder:

"The interesting thing about a rudder is that the ship has already gone by, all but the stern, and you throw the rudder over, and what you're really doing is to make a little longer distance for the water to go round; in other words you're putting a low pressure on the other side, and the low pressure pulls the whole stern over and she takes a new direction. The same in an airplane--- you have this great big rudder up there, with a little tiny trim tab on the trailing edge, and by moving that little trim tab to one side or the other you throw a low pressure that moves the whole airplane. The last thing, after the airplane has gone by.

you just move that little tab."

- Cite Calvin Tomkins, The New Yorker, 8 Jan 66, p. 64.

Ruddering: Rudder Concept:

"Order is achieved through positive and negative, magnitude and frequency-controlled alteration of the successive steering angle. We move by zigzagging control from one phase of physical universe evolution to another. The rudder concept of social law is most apt. Norbert Wiener chose the word 'cybernetics,' derived from the Greek roots of 'rudder'.¹ because Wiener, Shannon and others in communication theory were exploring human behaviors and their brain-controlled 'feedback,* and the like, as a basis for the design of computers, and it became evident that the human brain steers man through constant change."

I form in "How Little I Know." Vage_71, 1966.JZ

- Cite AAUW JOURNAL, May 1965, P. 176

"Within the grand strategy of anticipatory problem solving to be accomplished exclusively through design transformations of human ecology's physical environment apparatus, the design stratagems range from powerful to subtle. For instance, instead of attempting to push the bow of an ocean liner from one side to the other in order to steer it (as we do the front ends of automobiles, as well as of social trend fronts) inasmuch as the great seas also try to push the bows to one side or the other thus tending to throw the ship out of control, the naval architect must design in such a way that the ship's course will not tend to be diverted by heavy seas, yet will be steerable. To do this he designs a ship's hull with the hinge or pivot point of the ship occurring forwardly under the step of the bow. This makes a long lever arm aft and a very short lever arm forward of the pivot, and the long lever overpowers the short one as in a weathervane 'ship.' Thus the naval architect makes the stern of the ship (rather than the bow) swing to one side or the other of the course. The course tends to be held steadily by the bow. The stern tries to follow the bow in a straight course. The keel then makes the stern follow the"

- Cite NEW FOIt-i VS. rtbFUitES, WDSD./1, p.52, 19&3

"bow when the ship is in motion. In order to change course, the stern is deliberately swung to one side or the other.

This is done by the rudder at the stern which is so small as to be easily manipulated. The rudder, by making a small drag angle, creates a partial vacuum on the side of the rudder opposite to that of the direction in which the rudder is moved. This partial vacuum starts to pull the stern of the boat, which causes a much larger partial vacuum to build up on the stern quarter of the ship on the side toward which the

stern swings as the ship moves through the water in this askew attitude. This vacuum is built up for the same reason that the horizontal askew attitude of a wing foil in motion through the air creates the lifting vacuum on its cambered or top surface. The reason is that it is a longer distance around the cambered askew side for the parted water to reach, as suddenly displaced by the ship's motion, which makes the longer-way-reach tense the air-interspersed water molecules creating a partial vacuum. So powerful is this partial vacuum, or negative pressure, chain reaction buildup that it can, for instance, suck-pull the 30-knot speeding hull of the 85,000 ton, Empire State Building-sized Queen Mary into a new angle in respect to the directionally fixed"

- Cite NEW FORf-S VS WURMS, .VDSD Doc. #1, p.52, 1963

"momentum of her bow-pivot center, which thus hinges the Queen Mary into a new course attitude, which is fixed when the rudder is returned past 'midship' to 'meet her,' or break the vacuum buildup, and then returned to raidship position.

This principle of creating vacuums with minimum effort that will self-regenerate to build up large vacuums to govern very large pattern-transforming work is even more dramatically emphasized in the case of the giant Jet airliners where, literally, postage-stamp size trim tabs in the trailing edges of the large vertical and horizontal ruddering surfaces are all that are used by the automatic gyro-pilot servomechanisms to keep these 100-ton sky giants hurtling along at 600 miles per hour on accurate multidimensional course despite invisible atmospheric turbulences far greater in size and velocity magnitude than those of the water ocean.

"My philosophy takes primary heed of the fact that all in Universe is in constant transformative complex motion and all transform in patterns of least resistance. Therefore, philosophically, it became evident that by subtly designed"

RudderminR Sequence: (4)

"'trim-tab' site inventions we could, with least physical effort, control the least resistant directions of various fundamental transformations. This could be done by devices which would so control the angle and frequency occurrences of little vacuums and tension which could cause man's ecological patterning to evolve in preferred patterns.

Designs could also detect and discretely vitiate specific subtle vacuums chain-reacting into large xjvacuums and thereby holding certain transforming systems on socially deleterious courses.

"How much more powerful is the minuscule ship's rudder when in good order than a squadron of ships trying to move a rudderless ship in a heaving sea by attempting to push the rudderless one with their plunging bows in preferred directions as do tugs maneuver a big ship in still water when the ship is moving too slowly to have steerage way! AZo how futile are shouted words of warning and exhortations in such situations! Only the rudder and the brain that directs the rudder are effective. No wonder Norbert Wiener included the Greek name for rudder in coining his 'cybernetics' to identify the newly emergent computer's

ruddering feqce: (5)

"feedback system science. No wonder the early Egyptian and Greek shipmasters stood in the stern of their ships facing forwardly alongside the single-oar-steering slave as the crew of backwards-facing slaves tensed at the banks of vacuum fulcrumed oars. Here is the picture of society straining at its slavishly accepted work, backing up blindly into its future as an,often nearsighted, excursion captain cons the course.

"My philosophy also takes heed of the approximately unlimited ratio of length to girth of tensional controls which always tend to pull true, versus the very limited lengthXto-irth ratio of pushing devices which, when pushed, tend to tanste bend and break.

(o)TyRj "Philosophically it is clear that trim tabsn the trailing edges of trailing devices--- in the tail-end of tail-end events--- at the stern of the ship as the last event and not at the bow as the first event. The bow is important to keep the ship on a chosen course but the stern rudder puts and holds it on the chosen courses. The real steering takes place when the non-scientifically informed observer thinks

__ Cite NEW FORMS VS. REFORMS, WDSO Doc. #1

"everything is all over. But that final steering has to be done from 'on board,' Just *having the last word* from way back in the wake of the ship is futile. Scientists have often said that the most important part of their great discoveries occurred at the outset in the proper formulation of the project's objectives, forgetting that those enlightened formulations were really the afterimage inducements of tail-end events of earlier and seeming failures of experimentation."

Scan-transmission of Pattern Integrity:

Q. "What is the connection between synergetics and teleportation?"

RBF: I know of no connection between such phenomena and synergetics. Synergetics is a frame of reference for the intotransformings—I don't connect it with the metaphysical. We can identify synergetics with the electromagnetic wave propagation and that may turn out to have something to do with the physical...It's a good Question. No, since I don't use 'good' or 'bad', we'll say an interesting Question.

"We can scan. We have pattern integrities. The patterns can be recognized. You might be scannable like the Broadway electric light signs—in which each of the closest packed spheres might be a lightable light. It might scan your organisms but I wouldn't expect the physical body to be moved— Just the events."

RBF DEFINITIONS

Scenario:

"We can clarify the accurate but formidably complex definition of scenario Universe, A moving picture scenario is an aggregate of nonsimultaneous and only partially overlapping events. One single picture--one 'frame*' --- does not tell the story. The single picture of a caterpillar does not tell or imply the transformation of the creature first into the chrysalis stage and much later into the butterfly phase of its life.

"When people say of Universe, »I wonder what is outside of outside?' they are trying to conjure a unitary conception and are asking for a single picture of an infinitely transforming nonsimultaneous scenario. Therefore their question is not only unanswerable but unrealistic and indicates that they have not listened seriously to Einstein and are only disclosing their ignorance of its significance when they boastfully tell you that the speed of light is 186,000 miles per second."

- Cite WHAT QUALITY ENVIRONMENT, 24 Apr'6?

Scenario:

"An aggregate of non-simultaneous

And partially overlapping

Ever coalexedly transforming experience. Is an evolutionary sequence Which is defined as a scenario.

"The totality of experience

Which is scenario Universe

As a serially transformative cognition

Of individually different

And scenically static individual pictures, Conceptual frames,

Is inherently non-unitarily Or momentarily conceptual."

Schehoraxadfi Numborn- Declining Powers Of:

"Hie reoccurrence of the prime number two Is very frequent.

The number of operational occasions in which we need the prime number 43 is very less frequent than the occasions in which the prime numbers 2, 3, 5, and 11 occur. This Scheherazade Number provides an abundance of repowerings of the lesser prime numbers characterising the topological and vectorial aspects of synergetics' hierarchy of prime systems and their seven prime unique symmetrical aspects (see Sec. 1040) adequate to take care of all the topological and trigonometric computations and permutations governing all the associations and disassociations of the atoms."

"We find that we can get along without multi repowerings after the second repowering of the prime number 17. The prime number 17 is all that is needed to accommodate both the positive and negative octave systems and their additional zero-nineness.

You have to have the zero-nine to accommodate the noninterfered passage between octave waves by waves of the same frequency."

- Cite SYNERGETICS, 2nd. Ed. at Secs. 1238.41-.42, 22 July'75

Scheherazade Numbers: Declining Powers Of:

- Ky intuition about the declining powers of the primes factorial is that they reflect the way the patterns appear in nature. From my early hand and pencil calculations it is clear that you have to use the prime number five and the prime number three more often in your calculations than you use the higher number primes. And you use the three more than you would the five. Hence 3 to the 8th power and 5 to the 5th power to work out all the possible nuances within the 45-degree limit. This might be the pattern of reducing from Universe in a binary way.

"The higher powers for the first primes are to accommodate the very large numbers of calculations necessary to come up really sharp! You have tetra • 1; and octa □ 2; and 5 is both the vector equilibrium and the icosahedron. This relates to the rate at which the outer shells ac-

cumulate: the prime number times two plus two. By providing enough moves for each of the low number primes you should be able to work it out by biting with sharp results. Such a discrete method would be more elegant than a probability approach

- Cite RBF to EJA by telephone from Miami, 17 Mar¹75

Nunberg: Declining Powers Of:

Q: (EJA) In the factorial crimes of the Scheherazade Numbers why do you have high, but declining, powers in the first primes and no powers in the higher primes at the end of the series?

RBF: "Well the reoccurrence of the number two is very

frequent. We have to provide a lot of powers for 3, 5, and 7 to take care of all the computations and permutations.

But the number of times you need 43 is very low compared to the number of times you need the number 11. The powering really stops at 17, which is all you need to accommodate the octave system from 0 through 9. You have the zero to accommodate the waves. But 17 gives you all the primes up to Ifi which accommodates the two nines."

Science;

(1)

"The function of science is to prospect for total society by taking the universe apart, that is. resolve it into primary factors and elements by progressive Isolation and subsequently to obtain precise measurements of the behavior characteristics of the isolated events or components.

"For example, science isolated the phenomenon fire from extraneous factors, and by isolating the constituent events and the product of events discovered that fire is not in itself an element but an accelerated combining process of a newly recognised primary element, that is, oxygen, combining with carbohydrates in ever-constant arithmetical proportion. Thus the isolation of the fire caused the subsequent isolation, recognition and naming of the new elements oxygen and hydrogen, and provided behavior measurements of the latter, by which man could predict events of combustion in such a way as to make combustion an accurate tool of technical advantage.

- Cite DESIGN FOR SURVIVAL, I&I, pp.188-189, Jan'49

Science: (2)

As water and vapor are H₂O events, the comprehensive event was a precise mathematical process. This was the beginning of purposefully produced steam as a tool. The steam engine was a victory of chemical science, not of mechanics as we have popularly supposed. However the functions of science ended with the separating out of the newly discovered elements from the universal matrix and with the measurement of the unique behavior characteristics of the respective elements (it being the unique behavior that constitutes elementality). It is readily seen that the present invocation of science to put together again the world it has taken apart, is futile in principle. Summarizing, it is the essential function of science to take the Universe apart and measure the parts and sort them into usable categories. The functioning of science is exclusive.^{1}

Science: Gap Between Science and the Humanities: (2)

"we have not only discovered the comprehensive, omnirational, omni-intertransforming coordinate system most economically employed by physical energy Universe, but also that we have developed a communications relay system of high integrity with which most effectively to speed the realization by society of the advanatges accruing to the rewedding of the Sciences and Humanities which, Lord Snow agreed with me. is accomplishable by our Synergetics and its omniconceptuality.*

- Cite RBF Ltr. to Dr. Arthur Loeb, 6 Jan'67

Gap Between Science & the Humanities:

"rfith the return to valid, rationally computable conceptuality of nature's dynamic formulating, there returns to literary man the ability to re-establish the communication integrity of science and world society, ihe rate of re-establishment of conceptual comprehension of sci-

entific frontienng and its technical, ergo economic, ergo practical significance, will be painfully slow to those who now have discovered nature's sublimely rational comprehensibility, it may take a whole new generation but that is an historically short period for so vital a recovery from world society's present intellectual comprehension tail-spinning."

- Cite KEPEb, p. 01, 1965

"... There has been the thought of nonconceptuality in the area you explored and it seemed to be just purely mathematical. It didn't seem to be easy to communicate between science and the general public and the literary man has been the man who was supposed to explain what is going on to the public. He is the fellow who communicates but he couldn't understand.

The scientist said: you can't follow, and that in a sense, is what Snow is writing about --- about the real chasms that have grown up between the scientist and the people. He speaks about it in the terms of the literary man because he is a literary man and there is nothing he can explain to people of what is going on in science, I will make a prediction to you that in this next half century you will see a development of comprehension of science by everybody. Science is comprehending in the terms of conceptuality...

"In the period we speak of as the gay nineties, about that era of time, the physics was moving ahead rapidly and we are coming out of the time of Clerk Faxwell and Hertz and the development of the electromagnetic wave, the phenomenon electricity is beginning to come along, and this is the beginning of the era of dynamos, and so forth. Principles are being"

- Cite Oregon Lecture ;'-4, pp. 130-131, 6 Jul'62

"discovered that are operative in the electricity. There is electrical engineering, in the mathematic®, the the coordinate system of XYZ coordinates we had identified what we call powering, the development of dimensions that required a unique perpendicularity to a plane not already in the system.

"We had the first dimension all right, and the second and third dimension. But we couldn't seem to find any fourth dimension. The trouble was that in the gay nineties fourth power relationships were beginning to show up in the physics and in relation to electromagnetic phenomena. But you couldn't make a model of it. What the mathematicians found you could do was fairly nifty because in dealing with 90-degreeness you just think about your XTZ coordinates; you think about your 90-degree angle and you have lines going out so many units from the centers. In XIZ coordinates, they were also called the quadrants; 90- degrees four times, you might call it a clock with four hours.

"One of the things the mathematicians found you could do to accommodate the seeming phenomena that was going on in electromagnetics where physical Universe seemed to be using the fourth power--- you could handle the fourth power simply by borrowing"

- Cite Oregon Lecture #4, p.131, 6 Jul'62

**a little from the clock. You could go around the clock and borrow a little from tomorrow or you could go backwards on the clock and borrow a little from yesterday. It is kind of like going to the bank and you accommodate it on a time payment affair. This is called imaginary number, complex number, where the square root of minus one is going into yesterday one quadrant. They found they could accommodate the fourth power mathematically but they couldn't make a model of it.

"In the nineties, then, it began to happen that the scientists said: We are sorry. We have had models up to now, and you asked me to explain what we are doing in science, and there was a model but suddenly models seemed to be invalid. Mathematics could carry on so you gave up models. That is what happened in the nineties. Not everybody knew this right away. This was not such a big fashionable thing. There were no decrees along these lines but it gradually became known that the scientists were carrying on exclusively purely with mathematical notation and were getting along very well and they could handle invisible phenomena. They simply said; all this stuff that's invisible here is also noneventual. There are no models."

- Cite Oregon Lecture Pp.131-132, 6 Jul'62

"This irritated a great many other human beings, as for instance, artists who are philosophers in cry. They may not have had very much mathematics, but they are human beings--- who possibly may not have done very well in school--- but they really are full of a sense of importance of the Universe. And there were many principles to be discovered so they could persist. The artist said: I could deal in abstracts, and so they felt they could deal in principles. So we have the leaving to the nonrepresentational art. That is a move that comes along with the invalidity of models in science. It is something we call abstraction. It really wasn't very abstract; many times it was a principle.

An artist really did learn it was a principle and there would be inversions of equations and things like that. They were intuitive that conceptuality was there all the time. They had felt that there was something inadequate in the mathematics, that's all... I've found time and again that artists have very powerful intuitions. They hadn't

quite learned their way around well enough in the languages of the various sciences, but I am sure they have been::intuiting that theeee was conceptual validity so they insisted on trying to make conceptual arrangements

Science-Technology-Industry-Economics-Politics Sequence: (3)

"In turn the popularly discerned inventory of problems altogether provides the raw material to be processed by the machinery of politics. It is the purpose of politics to digest the problems and to provide adequate accounting and readjustments to the unexpected and often disconcerting changes in the patterns of technical advantage realizations. Politics must thus implement life's continually increasing sweepout and penetration of Universe with a continually changing set of operational rules and accounting conventions."

- Cite Intro, to NO MORE SECONDHAND GOD, p.x, 9 May'62

EJA COMMENT

Science-Technology-Industry-Economics-Politics Sequence;

The total sequence involved is approximately as follows:

Man's participation in evolution (individual intellect) paces design
pattern strategies for survival

Ideas pace physical design;

Self-disciplining paces structural and mechanical advantage;

Intellect paces the individual;

The individual paces science;

Science paces technology

Technology paces Industry;

Industry paces economics;

Economics paces wealth; wealth paces politics; politics paces
accounting readjustments for increasing sweepout of Universe.

See Making the World Work

See Industrial Lag. 5 Jul*62 Politics, Jan'02; Lay'28 Technology, 1960
Mutual Survival Principles, (3)

Science as a Tool:

"... Science and technology are only manipulative tools like inanimate and cut-offable hands which may be turned to structuring or destructuring. How it is to be employed is not a function of the tool but of human choice. The crisis is one of the loving and longing impulse to understand and be understood which results as informed comprehension. It is the will to structure versus ignorant yielding to fear impelled reflexive conditioning resultant to being born utterly helpless. Intellectual information accumulating processing is necessary

and anticipatory faculties to be only slowly discovered as exclusively able to overcome the ignorantly feared frustrating experiences of the past. Science must be seen as a tool of fundamental advantage for all, which Universe requires that man understand and use exclusively for the positive advantage of all humanity, or humanity itself will be discarded by Universe as a viable evolutionary agent."

scrap Sorting fc Mongering? (1)

'•We are going to have to keep track of the 92 regenerative chemical elements but not Just as elements because we have them in literally thousands of millions of compounds and different complex structures as they are used in various industrial processes. We won't be using the elements by themselves; we'll be using the various compounds. I am interested in the concentrates. And I see buildings as high and low grade. I see my 92 chemical elements rarely in the pure condition; in a more complex way th>y are in practical dissociability for further realignment.

"When we talk about all the aluminum or the bauxite some is bejow grade in the mines and some is already in use and recirculating. There are really two classes. There is a recirculating group. When they're pulling a building down there's part of the steel that's no longer in

the building holding it together, but it may not have been put on the market yet as scrap. But it's what they call high melting scrap and should go right into the furnace; it will command a much bigger price than the small stuff."

- Tape transcript #4, pp.8-9, RBF to W. Wolf; Phila. PA., 15 Jun'74

"Scrap sorting is going to be one of the great sciences now.

It is one of the typical social changes from the linear patterns of the honey-bee to the precessional circulatory patterns.

To man's old way of thinking he was going to build this building and it's going to stay there forever. All the architects are that way. It was like a one-way street. But nature found that the metal didn't get destroyed and so it resulted in the monger.

"The monger was sort of a low-grade character because everybody thought the materials had deteriorated, that the iron was all rusting and that everything would really rust and go away. But the monger was sitting in there and society found that things were not getting eaten up. Now the mongers are getting all their dung and really turning it into something. There's a scandal now in Philadelphia about their sewage and waste removal because some of these guys are beginning to turn some of this tonnage into money. They had been throwing out the dung but now they are beginning to process it and they find that it really pays them.

"One of the big changes around here is when the monger is no longer a low calling. But the mongers tend to sit on it and"

- Tape transcript #4, PP-9-10; RBF to W.Jolf, Phila. PA., 15 Jun'74 **wait f»or a good market. That keeps enormous powerful heaps of junk in sight. We don't have to have those unsightly places. This is where the government should start to take over the function of recirculation. That's what society is not doing; it's not taking care of any of its recirculation. Everybody is trying to disconnect and make their money. So one of the big functions of government is going to be changing the scrap sorting from a one-way street into the circulatory system.**

I don't think anything could be more visible from the World Game point of view.

"I am going to account for everything. There are going to be some priorities. Because there are a number of these materials that are so relatively scarce they have to be of absolutely high priority. If there is so little of it it must be used in a broad sense. I must rftf'er have helium in a retail pub; it must be in thtools that serve the tools.

"Incidentally, I see tools having a hierarchy just like our own guts: things that are glandular, there are energy secretions, there are pumping stations, and so forth. Purifying things like the lungs and livers are all big recirculatory systems:

- Tape transcript #4, pp. 10-11; RBF to W.Wolf; Phila. PA, 15 Jun»74

' 'Nature takes great pains to separate the liquid from the solid matter. When nature takes the great trouble to separate things like that it's a very expensive matter. But then we, as people, put them right back together again. It's incredible. Nature has its little dogs pissing on the tree groups that need the water and crapping over there for the fertilizer."

"Playboy: It seems a very melodramatic kind of evolution that would have man verge so close to extinction before discovering his function. Do you think that risking extinction may be part of the process of discovery?

"RBF: He's done it all the time. He kept going to sea. kept going after those fish, and his boat was inadequate and he was lost. Of all the people who have gone to sea historically, I imagine that very few returned. There was such loss in the beginning. But out of it man began gradually to learn his engineering, to learn how to anticipate the enormous stresses, the constant peril. And he began to develop beautiful fibers, better ropes, better sails, I think our breakthroughs always come to the people who were risking themselves very close to the brink."

Secrecy of the Artiat:

See Artietj May'65, Jun'66, 2 Jun`71

Secrecy: Secrecy of Mathematical Knowledge:

"I am quite confident that the early navigators knew a great deal about the Earth and that they were doing just what navigators and others were doing in my day in the Navy when the Navy instructions were when I was Commanding Officer, that if anybody was about to take my ship the first thing I would do would be to go to the rail and take all the leaded books, anything of importance was covered in lead, and throw them overboard. Men had been hiding their secrets in the sea for great ages, so I felt that many people carrying on their navigation could remember some of the principles in their head but much of the Important record could be lost."

- Cite Oregon Lecture #7, p. 2J1. 11 Jul^f62

Secrecy: Secrecy of Mathematical Knowledge: Navigation:

"I said to myself, I think that the first mathematics which related to a plurality of stars, and where you are, the first triangulation, occurred in relation to the navigators. I think then that the people who sailed into the windward, who started going into the prevailing winds westward, became the first inventors of the navigation. You cannot invent navigation unless you have something that you became familiar with. I think then that the people who invented the navigation invented the first really important kinds of mathematics dealing in triangulation, in major patterns. And so I think that mathematics and navigation developed in a very high way on the sea, and later on came up onto the land. But People who knew their way about the sea knew how to get to very important resources, and there were great premiums paid for what they could bring in a very secret kind of a mind--- and they began to guard their secret of navigation very carefully. I think that the great mathematical secrets were really very progressively hidden. When the navigators were going westward out of the Straits Settlements areas, and so forth, and finally negotiated across westward of the Indian Ocean to the eastern shores of Africa and the southern shores of

Secrecy: Secrecy of Mathematical Knowledge: Navigation : (Cont.)

Mesopotamia. And they began to memorialize their navigational capabilities upon the land. They go up on the land and using the same kind of navigational capabilities they navigate across the land to get to the Mediterranean. Then they go northward down the Nile and they come to the Mediterranean. And there they build the same kind of boats built out of the patterns they can carry in their head. And they go on with what we call this lateen sailing in the Indian Ocean and it gets into the Mediterranean. We find, then, this navigating moving westward, and the men who became the great priests are the men who are monopo

lizing this very secret information which makes it possible to do this very powerful wealth making through trade which is controlled through navigation. You can take a lot of sailors to sea with you but they don't know where they have been-- just in a lot of water. So it is very easy to keep your secret. So these navigators began to make pyramids and other forms. You will find them in India and we find in Babylon, the beginnings of our very important kind of mathematics: of the 60-degree angles, of the 360 degree concept, of the 60-minute seconds, and so forth. The first real handling of time and angles--- which are the very

Segment Secrecy of Mathematical Knowledge: Navigation: (Cont.)
 essence of the navigation. I think that these secrets were deliberately hidden by the priests and kept from the people, even possibly from the kings.

"At any rate the priests of the Roman Catholic Church began to tell me that this is a hierarchy of Heavenly Host , . • we have all kinds of legends mixed up here, but I think that this is one way that the priesthood found a way of carrying very important mathematical information."

Self-Congruence Packing:

"The openmost condition or single bonding corresponds in flexibility or mutability with the behavior of gases. The medium packed condition or double bondjfcmged hinged arrangement corresponds to the behaviors of liquid aggregates. The closest packing triple bonded fixed-end arrangement corresponds with rigid structural molecular compounds; the closest packing concept which was developed in respect to spherical aggregates only with their concave octa and vector equilibrium spaces between spheres, overlooks a much closer packed condition of energy structuree, which however had been comprehended in organic chemistry, that of quadrivalence and four-fold bonding which corresponds to outright congruence of the ectahedra or tetrahedra with themselves. When carbon transforms from its soft, pressed cake, carbon-black, powder, or charcoal arrangement to its diamond arrangement it converts from triple bonding or so-called closest arrangement to quadrivalenee. We might call this self-conzruence packing, as a single tetrahedron arrangement in contradistinction to closest packing as a neighboring group arrangement of spheres."

Q. "Which of the disciplines do you think are the most critical for our current problems?"

RDF: "The only important one of all the disciplines is

self-discipline. At the front of one of my books I have said ` Dare to be naive.* That is what we must all dare to be---to make our own choices from all the shams around us.

"Each of us must dare to go along with the truth as experience teaches us and as our own intellect realizes its significance only in relation to the welfare of all humans around their local Universe functioning as information apprehenders and articulators in relation to the integrity of eternal regeneration."

- Cite R3F to White House Fellow Anspacher; Watergate Hotel, Wash, DC: 28 Mar*77

Self-Discipline;

"Today I see many engaging in yoga. I am sympathetic with what they're trying to do, but I don't think you have to be coached by yoga or anything else to learn self-discipline. You've got to discover yourself. I don't think you can get it from somebody else. I don't think you

can get it by having somebody else psychoanalyze you. I see many of my students who go to psychoanalysts getting in more and more trouble rather than getting out of it. And the ones who don't go in for being psychoanalyzed I see learning to understand themselves and consciously disciplining themselves. Self-discipline is the key--- and we've all got it if we want to use it. ... At the time I was going through this selfdiscipline process I evolved a philosophy which assumed that most problems of humanity can be solved."

- Cite RBF quoted in HOUSE 4 GARDEN Interview by Beverly Russel, p. 199, May '72

Self-Discipline:

"The fundamental self-discipline conceptioning the only real educational process."

- Cite NEHRU SPEECH, p. 22, 1J Nov '69

Self-Discipline:

"Systematic coneptioning and recollected conceptioning both universal and local, which progressively traces, relates, and compares nonsimultaneously observable locally functioning entities, is self-disciplined."

Self-education;

"The highest priority of education should be to accommodate humanity's innate, chromosomically programmed, Intellectual appetite for comprehending the interrelationships between all the events of which their senses progressively inform them. Our schools have failed to adequately satisfy those appetites. They have failed to inspire because inspiration springs from realization of the interrelated significances....

"Alternative education provides opportunities for the spontaneous learner to apprehend the whole picture and thus to become a comprehensivist. This is what young people instinctively desire....

"One of the most Important events of the education revolution now under way is the discovery that each of us is born comprehensively competent and spontaneously coordinate, quite capable of treating large quantities of data and families of variables from the start. A child spontaneously integrates total information. It craves to understand and be understood.... For half a century I have explored self-educating ways for making the world work for everyone. It is exciting to witness groups of dedicated young people... peeling of and investing their time in alternative routes... which hold high promise for them."

KBF DEFINITIONS

Self-experience:

"...Experience is the vital factor... since one can think and feel consciously only in terms of experience, one can be hurt only in terms of experience. When one is hurt, then somewhere in the linkage of his experience can be discovered the parting of the strands that led to the hurt. Therefore it follows that strict adherence to rationalization, within the limits of self- experience, will provide corrections to performance obviating not only for one's self, but for others, the pitfalls that occasion self-hurt...

"If you use the 'area¹ of Euler it doesn't work. You have to convert the area to nothingness to arrive at the four minimum aspects of self and otherness."

- Cite RBF to EJA, Paganao Restaurant, U. Penn, 22 Jun'75

„Life, minimally described is 'awareness, ' which is inherently plural for at minimum it consists of the individual system n which becomes aware and the first minimum 'otherness' of which Uj'git is aware, the otherness being integrally or separately internal or external to the observing system's 14 integral topologically componentized subsystem: $4V + 4A + 6L$.

Together the observer and the observed constitute two points differentiated against an area of nothingness with an inherent line of 'awareness'-interrelationship running between these two points. Euler's generalised formula, which he named topology, says that the number of points plus the number of areas will always equal the number of lines

plus the number two, which Goldy finds to be at minimum $2P + 1A - 1L + 2$, which minimum set of awareness aspects of life adds to four: i.e., a J the observer: (b) the observed } (c) the line of interrelationship; and (d) the nothingness area against which the somethingness is observed. There are no experimentally demonstrably absolute maximum limits. Only the minimum limit is demonstrably absolute. The sufficiency of the encea^{kl} always a 'system--- even when it

Sensorial Identification of Reality: (1)

"From physics we learn that every fundamental behavior of Universe
Always and only coexists with a nonmirror-imaged complementary.

The nonsimultaneity and dissimilarity

Of the complementary interpatterning pulsations Integrate to
produce The complex of events We sensorially identify as reality.

Without the pulsative asymmetries and asynchronous lags The com-
plementations would cancel out one another And centralize equilib-
riously,

And there would be no sensoriality, Ermgo, no self-awareness, no life;

For we have also learned from physics

That all the positive and negative weights Of the fundamental compo-
nents of matter Balance out exactly as zero.

Life may well be a dream, A comedy and tragedy

Of errors of conceptioning Inherent in the dualistic Imaginary
assumption

Of a self differentiated From all the complex otherness

- Cite BRAIN & KIND, pp.96-97 fey '72

Sensorial Identification of Reality:

"Of reasonably conceivable Universe For it must be remembered
That no human has ever seen directly Outside himself.

What we call seeing

Is the interpretive imagining in the brain Of the significance and mean-
ing Of the nervous system reports

Of an assumed outsideness of self, All of which organic design con-
ception May be that of a great intellect Which is inventing Universe
progressively Evolving mathematically elegant Integral equations

For each conceivable challenge Including the invention You and me.

But you and I cannot escape

And are given extraordinary faculties Which we are supposed to use.

So here we go again

From right where we are Now.¹¹

*»The omni-interactions impinge on your nervous system in all
mannner of frequencies--- some so high as to appear 'solid* things,
some so slow as seeming to be 'absolute voids.'*

.Peppier Effect

- DRAFT'- "CIHV

$n^{-1}1 \ i \ q < 1 \ *| \ " \ 11 \ 1f|Jr|$

- Citation at Halo Concept. 25 Apr*71

Sensoriality:

"Sensoriality is a corporeally external phenomena---- reportedly re-
 layed inwardly to the brain and therein imaginatively scanned by the
 mind which conceptualized independently in generalized formulations
 such as the conception of a nuclear grouping around a nucleus, quite
 independently of size."

- Citation & context at Brain & Mind 11 Nov*69

Sensoriality:

"Size and intensity are sensorial comparing functions of the special
 case experiences by brain and not by mind. Mind is concerned only
 with principles that hold true independently of size yet govern the rel-
 ative size relationships."

~~—j'iii muni sprr; Ctr/“p.—re. ijNwtisr~~

• Citation at Brain and Mind, 11 Nov*69

Sensoriality:

"The word 'form' implies direct sensoriality. The word 'conformity*
 likewise implies direct seneoriality--- it means dealing only with
 forms."

~~—rttr HHTfll. r tn*~~

- Citation at Form, 10 Oct*63

Sensorial Model:

"Experience is always sensorial and so I can always get a sensorial
 base or model."

- Citation & context at Experience, 28 Apr'74

Sensorial Reflex:

"Humanity's intellect and sensorial reflexes are completely uncoordinated. We see clouds floating by, birds flying and people moving, but we can't see plants or humans growing.

We can't see the economic charts realistically: Humanity gets out of the way only when it sees the motion..."

"Like parrots, we learn to recite numbers without any sensorial appreciation of their significance. We have yielded so completely to specialization that we disregard the comprehensive significance of information."

- Citation and context at OMHB Invisible Motion. 13 Mar'73
Sensorial Spectrum:

"Apprehension means information furnished by those wave frequencies tune-in-able within man's limited sensorial spectrum."

- Citation at Apprehension, 1971

Serial Universe:

"The term 'serial Universe' was first employed by the British scientist James Dunn. It approaches my concept of Scenario universe.

Cite RBF videotaping aeealon Philadelphia, Pa., 20 Jan'75

"The difference between gravitation and radiation is analogous to the difference between parallel wiring and series wiring in electricity. Series wiring is like the lights on a Christmas tree in which circuitry if one light goes out the whole system goes out. In parallel wiring when one light goes out the other lights remain operative. This is a demonstration of integration and disintegration. Series wiring is a disintegrative system, an open system. Parallel wiring is an Integrative system, a closed system. It is not the •parallelism* that matters but the fact that the circuit is closed. The word parallel came into use only because of the diagram first used to demonstrate the principle as well as the fact that the closed circuit wire is conveniently doubled back upon itself and bound into one 'lead* for house-wiring purposes. The fact that the vectors are parallel is only a convenience of the construction industry. The same lebt/ ve£ors--ergo the same energy magnitude involvement---used correctly, can provide either function. Here we have the convergent integrations and divergent disintegration language of synergetics in the language of electricity."

SfflQEXfifi-ljadUfltri ‘

”Great corporations have not as yet ventured into this field because wind energy has not seemed to be monopolisable over a pipe or wire. However, enterprise can be rewarded, in greater magnitude than ever before, by producing and renting world-around wind-harnessing apparatus— as they already do in the computer, telephone, car rental, and hotelling service industries.”

- Citation and context at Wind Power Sequence (6), 15 May*73

SsryAcg indugtrr-

We can have an integrator calculating, designing and automatically manufacturing and putting together a geodesic dome in a giant jig, after which an automated 'sky tug helicopter will carry the dome away to install it and prepare it for human occupancy, thus providing a telephone-system type of inventing developing, installing, maintaining, relocating, and continually self-improving service industry, able to provide telephone- ordered 'instant housing,' Such a computer-controlled housing and livingry -service industry is even now feasible at one percent of the weight, time, and energy involvement per unit of volume and living equipment found in conventional high-standard suburbia or Park Avenue skyscraper technology.*

Sex:

•The metaphysical is what is very suddenly coming into prominence. These kids just really take sex. . . and how different it is now than when evolution had to reproduce itself and they had to think of their bodies as just this great baby-making machine home. Well, all that's becoming extinct and the kids don't act that way anymore and the metaphysical is emerging terribly fast."

- Citation and context at Cosmic Fish Sequence (2), 16 Oct*72

Sex:

. As . . . surprising as is the spontaneous synergetic urge of males and females to cohabit and thereby accidentally to start the synergetic formulation of another human being."

- Cite Dreyfuss Preface, "Decease of Meaning" 28 April 1971, p. 8

Sex:

"As survival rate and life sustaining capability increase, fewer births are 'required.' This may be related to our developing capacities in interchanging our physical parts, of producing mechanical organs, of having progressively fewer human organisms to replenish. The drive in humanity to reproduce as prodigally as possible decreases considerably. This may be reflected in social behaviors--- when all the girls begin to look like boys and boys and girls wear the same clothes. This may be part of a discouraging process in the idea of producing more babies.

"We shall have to stop looking askance on trends in relation to sex merely as a reproductive capability, i.e., that it is normal to make babies. Society will have to change in its assessment of what the proclivities of humanity may be. Our viewpoints on homosexuality, for example, may have to be reconsidered and more wisely adjusted,"

Ship:

"A ship of the sea is not arfiip because it is built of wood, for ships can be built of steel or aluminum or polyester fiberglass or pig skin or bark. And ships are inherently a complex oljassociative principles, and subsets of which are each in turn independBent of any local resource limitation. For example, ships' fastenings may be of rivets, nails, screws, or bolts; of bronze, steel, or monel— or welds. It is true, of course, that ships of special component chemistry may outperform others of less appropriate chemistry, but this is by obvious subsynergetic evolutionary improvement, and not by surprise."

- Cite RBF draft Ltr. to Jim (Fitzgibbon?), Raleigh, NC, 1954-59

"Throughout the documented milleniums of man's evolutionary technologies and their progressively integrated inventories, recognized environmentally as successive eras, there has been one fundamental category of technical, strategic, and economic undertakings which, of inherent necessity, transcended the going local traditions of opinion-governed expediency in treatment of physical problems and expenditures of local wealth and credit for those local ends; that is, if we except the enormous credit and physical investment of local undertakings in the most transcendental class as mystical insurance for eternal equanimity as built into the great religious edifices by the local communities, as representing the most generalized problem treatment and infinite range planning known to man's history. If Instead, we confine our selves to discerning what has been the longest-range and most generalized ca'se of the economic communities investment in equipment— simplex and complex— designed for the improved satisfaction of living needs, we will discover that ships and watercraft building in the vast majority of historic communities, who of necessity lived near water bodies, undoubtedly represents the most generalized problem treatment"

- Cite RBF draft Ltr. to Jim (Fitzgibbon?), Raleigh, NO, 1954-59

Ship:

"and longest range, time and geography wise, pattern planning. Why? Simply because a ship had to be designed to meet far more than the pattern indicated by the physical experience within the local environment of harbored confines; indeed, the more resources to be fetched for the complementation of the locally-occurring resources for integration into comprehensive capital goods wealth and higher productivity, the more extremes of climate and weather hazards, the more days and miles of possible hazards needed to be anticipated with approximate safety factors. Ships had to be designed for the generalized case of all oceans and all tasks. To accomplish all-ocean, all-task efficacy, men learned through bitter, mortal, dramatic experi-

ence that they must invest all the best of their commonwealth resources of time and physical goods inventory and cumulative • science and craft know-how into the building and management of their long-range,wealth-integrating ships.

"No arts nor knowledge of design and pattern failed to place in the undertaking. Because of the myriad conflicts of ambition of competitively lesser plan leaders and their easy expediency and shortsighted gain in recourse to piracy," - Cite RBF draft Ltr. to Jim (Fitzgibbon?), Raleigh, NC, 1954-59

Shi (3)

"those whose foresight and comprehensiveness and thoroughness of realized competence effected the actualities of history, are found to have recognized in their major strategies that secrecy and closed-mouthedness in respect to the great ventures proved most effective insurance towards the day when `our ship comes in.¹

"For this very reason the most effective strategies of men have been temporarily lost to history and historical accounting has been made in a myriad of secondary and almost irrelevant legend manufacture. As new day tools allow us to go to oceans bottom, and above all allow us greater perspective of time and distance, we have been able to reintegrate into informative pattern the outstanding historical fact that the whole concept of shipbuilding out of all the best resources to accomplish the tightest limits of schedule performance, represents not only the essence of the meaning of 'priority'¹ in access to the most effective commonwealth means, but over and above this identity to discern also that synergetic effectiveness was the very essence of the word 'wealth' itself."

- Cite RBF draft Ltr. to Jim (Fitzgibbon?), Raleigh, NC, 1954-59

Ship: "For it was the products of complex pattern integration which made the great ships do what the wood logs and the iron ore and the fibrous plants could not and would not do of themselves. The broader the integration, the higher the synergetic effectiveness, and the more unexpected, and there-' fore invisibly harvestable individually managed wealth: i.e., the accrued new greater ability to initiate even greater synergetic effects in respect to unprecedented pattern articulation by those who could see the larger patterns while the eyes of the many were fascinated and gratified by the component aspects,"

Shunting: Relative Motion Patterns: (1)

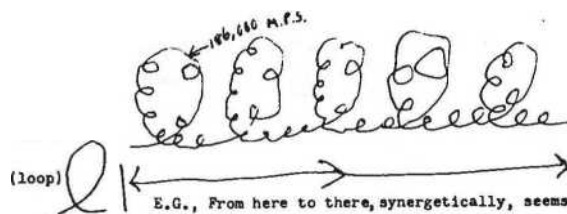

'•Synergetics discloses that the apparently different velocities, or rates of acceleration, of which the physicist speaks do not truly exist. The seemingly different velocities are a plurality of angularly precessed--- or shunted--- energy action systems regeneratively operated in respect to other systems.

'"Velocity is always 186,000 miles per second. All other relative motion patterns are the result of remotely observed, angularly precessed, 186,000 m.p.s. energy-action shunting.

'Angularly precessed shunting may divert omnidirectional energy into focused (angularly shunted) actions and reactions, of either radial or circumferential pattermings, or both.

'Frequency modulation is accomplished through precession-shunted circuit synchronizations. 'Valving* is angular shunting. Competent design is predicated upon frequency modulation by application of the precessional shunting principle."

Simultaneous:

"All dimenaions are simultaneously considerable.

- Citation at Dimension. 29 Nov'72

"The big jobs are done in tension and the small Jobs in compression. We find that the tensions, because they are always curved, never can get straight and there is no meaning to the word straight in Universe. Therefore the tension members spiraling around must always come back into themselves. They are inherently self-closing;

maybe not within simultaneous experiences--- obviously not in simultaneous experiences--- but around comes Halley's ftomet. Every 70 years around she comes again. It is not a simultaneous experience at all. Several life times may be involved, and some of them may be coming around much more slowly, but there is an integrity of the tensions as around they come again. We fin4 an idea about some kind of closed circuit.**

Sin;

"I'm the only man I know who can sin. I find everybody else really too innocent. They don't really know what they're doing. I find that people who seem to be the most offensive are fantastic innocents. They really couldn't know what they're doing because they'd be mortified at the idea of doing something so unbecoming. But I've really had enough experience, such a fantastic amount, that I really know what it is to sin. And that would be to cheat on the great accounting system of Universe, trying to take something out and hang on to it.

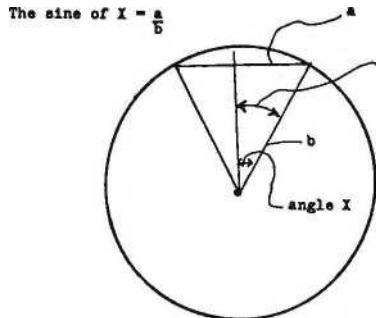

` ` I could very easily transgress. I could rest and sleep and make all kinds of money. The opportunities keep coming in all the time. But I have no desire to sin, I assure you. The point is: I know how. There are many things I did in my life that wouldbe sinful if I did them today. I still feel I'm entitled to make experiments, but once I find out--- do it again? No. That's sinful."

See Good & Evil Ininorality

"The courage to adhere to the truth as we learn it involves, then, the courage to face oneself with the clear admission of all the mistakes we have made. Mistakes are sine only When not self -admitted. Etymologically, sine means omission where admission should have occurred. An angle is a sinus, an opening, a break in a circle, a break in the integrity of the whole human individual. Trigonometrically, the sine of an angle is the ratio of the length of the chord facing the central angle considered, as ratioed to the length of the radius of the circle whose center is also the apex of the angle, or sinus, considered. The angle is the angle of error of viewpoint of the individual whose circular integrity has been violated. The relative site of the chord opposite that angle of error as proportioned to the radius (taken as unity 1) of the circle of experienced knowledge of the individual; and being the sine of the angle considered, it is also the relative magnitude of the individual's sin. (Drawing attached.)"

"In synergetics we find the difference of one whole integer frequently Manifest in our geometrical interrelationship explorations. Beyond the one additional proton and one additional electron characterising the hierarchy of the already-discovered family of 92 regenerative chemical elements and their shortlived transuranium manifestability by high-energy physics experiments, we find time and again a single integer to be associated with the positive-negative energetic pulsations in Universe.

"Because the energetic-synergetic relationships are usually generalised relationships independent of else, these single rational Integer differentials are frequently found to characterize the limit magnitudes of asymmetric deviations from the zerophase vector equilibrium.

"The minor aberrations of otherwise elegantly matching phenomena of nature, such as the micro-weight aberrations of the 92 regenerative chemical elements in respect to their atomic numbers, was not explained until Isotopes and their neutrons were discovered a few decades ago. Such discoveries numerically elucidate the whole-integer rationalization of the unique"

EJA.: "Rob Grip is worried that your new sphere is .499

and not a clean 5. Also, you are talking about three-dimensionality for the first time. I don't understand. You used to say that 'Time is not the fourth dimension.'?"

RBF: "I say .499 because that is the closest that Heisenberg is going to let us come.

"And the sphere emerges from the primitive hierarchy when it begins to spin. Spinning Is Just one of the degrees of motion freedom. Spinning and orbiting give you the sphere--- at the point where frequency comes into time-size.

"I have done a new piece for you on dimensionality in answer to your very good questions about the relationships between the six motion freedoms and the six degrees of freedom. And I have discovered that Just as there are in reality 12 degrees of freedom, so there are in reality 12 motion freedoms.

"All spheres are potential spheres. The sphere that the mathematicians have been dealing with in the primitive"

- RBF to EJA by telephone from Pacific Palisades, CA; 8 Aug'77

Six Motion Freedoms & Degrees of Freedom; (B)

"hierarchy is only three-dimensional because it is timeless and sizeless and prefrequency. Where you begin with insideness and outsideness is three-dimensional. But when the somethingness enters---when you go beyond primitive conceptuality, then you have to go beyond the primitive three-dimensionality. It was only that static three-dimensionality that the mathematicians used to talk about in their coordinate system.

"But with frequency you have time-size and you come to fourth-, fifth-, and sixth-dimensionality. It is true that I say 'Time is not the fourth dimension,' that's why I say 'time-size'."

Six totlon Freedoms *It*, Degrees of Freedom:

"You are right that what we are talking about here---in the articulation of the primitive hierarchy---is more than what we usually mean by dimensionality.

"In addition to dimension, what we are talking about is the Interaction of the degrees of freedom, the six positive and negative motions---as well as the power factoring... the identification and quantation of the full behavior potential of energetic structurings."

(MB: RBF had said that we are probably dealing with up to the 24th-dimension. when EJA objected to using dimension in this way. - eja.)

- Cite RBF to EJA, in presentation by Chris Kittrick and Rob Grip in back room at 3500 Market St.: Phila. PS; 11 Aug'77

"There are the six positive and negative exercises of the motion freedoms, but the freedoms themselves come from the fact that the minimum system in the Universe consists of six vectors: the tetrahedron. The tetrahedron has a minimum of six edges. I want you to try to think about a minimum something. A something, a substance, has an insideness and an outsideness.

You cannot have a surface without the other surface. We teach kids that in two dimensionality there is only one surface, but we're always kidding them---we do that on a piece of paper or on a blackboard when they both have more than one side: therefore we have extracted a plane very improperly.

"And we talk about a point which is dimensionless. A line was $\square\square\square\square$ * one-dimensional; a plane was two-dimensional; and a cube is three-dimensional. I say we don't have dimensionality less than four dimensionality. If we have something it is four-dimensional. It is only recently that we have had a microscope. If we took an engineer's scale we get down to 1/50th of an inch---you can really pick that off with the naked eye. You get down to 100th, you get a glass."

- Transcript P*» RBF interview with Dr. Michiel Bruwer, "You get down to 1/200th of an inch and you can't see it at all. Long before people had microscopes there was a black speck against a white background: it was too small, it was under the dimensions that you and I can differentiate. You have a speck of 200th of an inch; you can see it as a speck but you couldn't resolve anything about it as a polyhedron. This is where man invented the idea of a point. You could point to it, but it was subdimensional—he said.

"I started to see how we could make the mistake of points, and lines, and planes as something that you put together and find that you make reality. I started with my reality, and then if-there's a point to it, well, there's something there; and If I put a really powerful magnifying glass to it I'm going to find there is a crystal. It is a polyhedron and it has an insideness and an outsideness. Anything that is substantial has an insddeness and. an outsideness. Any substance has something that stands below it: sub-stance, withinness.

"I am going to take the minimum something. I take a rock and I get a child to hit the rock; you keep hitting it and"

- Cite transcript p.15, taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

"you finally get to a something, You can't get to something less than four corners. It may be kind of flat and look like a flat triangle but it has really an altitude and you find that the minimum is four corners and six edges and four faces. You cannot get a rock with less than three faces arouhd a corner. If it looks flat, it is just so many faces.

"The tetrahedron is fourfold symmetry: four minimum absolute faces. A cube has only three. The minimum something has four faces of symmetry, four vertexes of syimetry. Now that is then the minimum something, degrees of freedom. I cannot have something less than four corners and I cannot have a face of less than three edges so that the minimum something has six edges altogether. Any one face has three edges so these six edges are vectors in that structure and they really are the defining set of events and with every turn to play in Universe we always get six moves so the minimum something is a minimum play.

- Cite transcript p. 15, RUF taped interview tilth Dr. Michael Bruwer, Rltx Carlton Hotel, Chicago; 20 Feb'77

"You always get six edges. They can be at all kinds of angles so that's where the degrees of freedom are. We find in topology that all some-things have vertexes, faces, and edges, but the numbers of the edges in Universe is evenly divisible by six. These are the six degrees of freedom and they can be positive or negative and they are always there. They are not on a plane; they are omnidirectional.

"The six motion freedoms are complex consequences of the six degrees of freedom. If you want to get an instrument held in position, it takes six restraints. If I have just five restraints, then the tetrahedron will change shape. Shape requires six restraints. Six restraints are what give structure.

"A minimum system is a tetrahedron; a minimum structure has six restraints, so anything that holds its shape has a minimum of six restraints so that the system itself can spin or the system itself can orbit. The system itself can inside out. There are systems behaviors and the six degrees of freedom are internal to it."

- Cite transcript p.16 RBF taped interview with Dr. Michael Brdwer, Rits Carlton Hotel, Chiacog; 20 Feb'77

Six Motion Freedoms * Definition. Q.E., Freedom: (5)

"So there are six internals and six externals. The six system motions... will be part of the larger system in order to have them stop: they will be frozen in part of the larger system, they are going to have to lose one of those freedoms. ... we come to the six positive and the six negatives and there really are always 12 and they alternate economically.

"If he doesn't have these six degrees of internal restraints, he's going to be very unstable internally.... You see if he doesn't want to get on with the system, he spins by himself... Oscillating is ambivalence approaching and avoiding,... Inside-outing I saw as being deceptive, putting the wrong surface on themselves or the other way: giving up this game person and being a real person---when he really believes in the game so it is almost an unnatural thing....

"Precession I see as an effort I make to manipulate you, to cause you to move... because it is really at 90 degrees... you are looking this way... very inadvertent.

"I am saying that society doesn't realize that the most"

- Site transcript n.17, RBF taped interview with Dr, Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

"powerful social behavior is precessional... where my effect is inadvertent. If you are a strong psychiatrist and your patient thinks well of you, he orbits around you literally.

11 society is going in orbit in various realms...literally, the weak ones around the strong ones.

"We get such a static picture of people standing with one another in a house... we don't think of this. The mother will be in orbit about somebody else and the children will be in orbit about her.

"...Torquing is a squeeze, all right. You go through the wringer, as they say. That's torquing.

"...while oscillation is expansion and contraction: like we eat our food and then we get rid of it. So our friendship proceeds. We see so much of each other and then we stop, much as I am going to do with you. I would like to give you so much and let you have something and then you can study that and then come back for more. That's oscillating to me. You put on food and expend it---put on metaphysical fuel and exnend it."

Six-Ridge Tetrahedral Globe:

(1)

"As we take a close-up view of our little Spaceship Earth we see that the three-quarters of it which is covered with water has a greatest depth of about six miles, which is about the same as the six-mile altitude of its greatest dry land mountain peaks. We find that these ten-mile maximum variations of the spherical Spaceship Earth's 8,000-mile diameter are comparatively negligible. If we are looking at a 12-inch diameter globe, the distance between the outermost mountain peak and the innermost ocean depth is only 1/80th of an inch,

which visually is an almost undetectable amount. As we look at a 12-inch globe, the thickness of the ink with which an ocean is depicted is deeper in proportion to the globe than in the real Earth globe's ocean depth in respect to its diameter.

"Three major mountain ridges of the Spaceship Earth converge in the Antarctic continent. From the South Pole one runs northwardly in the high continental plateau of Africa, and thence into Europe culminating as the Alps. A second ridge runs northwardly under water and emerges as Australia Malaysia, and later as Indo-China. A third ridge consists of South America's Andes which runs northward through Central America to terminate"

- Cite BEAR ISLAND STUHY, galley p.6, 1968

Six-Ridge Tetrahedral Globe: (2)

"in North America's Mexican mountains.

"In the northern hemisphere, the northern ends of these three southern-hemisphere-emanating ridges are interconnected by fourth, fifth, and sixth ridges, respectively. The fourth consists of the Alps, Asia Minor's highlands and islands, and the Himalayas. This fourth ridge runs between Europe and Indo-China and interconnects the northern terminals of ridges one and two. The fifth ridge consists of the China-Kamchatka mountains, and the Aleutian and North America's Rockies, which joins the northern end of ridge two with the northern end of ridge three in Mexico. The sixth ridge runs from Mexico and the terminals of ridges three and five via El Paso, Texas, and is thereafter momentarily broken through by the Mississippi; it continues as the Ozarks and the Appalachians and reaches north-eastward as a chain via Newfoundland, Labrador, Greenland, Iceland, British isles, Scandinavia, and Urals to final juncture with ridges one and four at the Alps.

"These six main ridges have for long been seen by physical geologists and geographers to constitute the now distorted- sunken here and risen there--- six edges of a spherical tetrahedron."

- Cite BEAK ISLAND STORY, galley p.7, !yt>8

Six-Ridge Tetrahedral Globa: (3)

"The spherical tetrahedron's four spherical triangle areas are roughly to be identified as: (1) the Indian Ocean and its abutting countries; (2) the Pacific Ocean; (3) the Atlantic Ocean (including Europe); and (4) the northern portion of North America (U.S.A., Canada), the Arctic Russia and China, . • *

"The spherical tetrahedron's twisted ridges tell the evolutionary history of Spaceship Earth's contractual shrinkings and yieldings to primary force events of complex universal energy transactions. The Earth sphere's shrinking and ridge twisting is like that of cooked green peas."

SUa: (1)

"We can say an angle is an angle independent of the length of its edges. Likewise, a triangle is a triangle independent of its size. By Size we do not refer to the angle, but to the length of the edges, or magnitude of the faces or volumes, described by the linear boundaries. How long the edges are can be determined experimentally only in the terms of the repetitive multiples of some given pattern experience. The given experience module has a fundamental time consideration. All experience of size refers to the duration of the patterndescribing events. And the observer's time sense refers to any of his own afterimage consideration of one of his integral recycling organs.

"A basic time cycle is a circle or a loop back.

"Therefore an angle is subcyclic, for it is only part of a circle.

"Angles, being cyclic, are subsize, for size begins with one cycle."

- Cite RBF holograph with old Synergetics draft, circa 1970

Size:

he refers to the size aspects to other experiences.

"That he had found the linear coordinates of an XTZ- rectilinear inter-
relationship useful in

analyzing omnidimensional pattern experiences does not pre-empt
the arithmetical evaluation of alternatives in dimensioning our experiences.

"In book (SYNERGETICS) I must eliminate the words three- dimensional as meaningful, and always use omnidirectional observation of multi-dimensional characteristics, with angle and frequency of cyclic reference as the only requirements."

- Cite RBF holograph with old Synergetics Draft, circa 1970

SHe: (*)

"Concept of an experience's relationship to other experiences, defined in term of cyclic repetition of any one experimental demonstrable self-terminating or singlecycle experience. (A triangle, a tetrahedron, or a sphere, etc., is a triangle, a tetrahedron, or a sphere independent of size. An angle is an angle independent of the length of its edges. All of Plato's solids may have the same length edges because their differences are

entirely angular. An angle is inherently a subdivision of a single cycle. Therefore an angle is sub-size.)

"Size begins with one specific cycle's completion. Angles are conceptual independently of size. Size is linear. As linear size of an object is doubled, surface is fourfolded and volume is eightfolded--- ergo areas increase at a velocity of the second power and volumes at a velocity of the third power--- ergo size variation relationships are deceptive and not superficially predictable by any one experience. As we double the length of a ship its surface is fourfolded. Inasmuch as the power to drive a ship through the sea and air at a given speed is directly proportional to its surface, when we double its linear

Skinner; B.F.:

"I know and like Skinner. He is sincere and cosnitted to his theories. I observe that he does not differentiate between brain and mind. (See my book 'Intuition.') Assuming only brain, chromosomes, DNA-RNA, and that life is entirely physical it is logical for him to see everything as mechanistically behavioral and omnlexplicable by humans because he excludes from consideration an a priori, eternally inexhaustible, mysterious integrity governing Universe; only a few of those □ reliably guiding principles have thus far been discovered by humans,"

See Female, 17 Oct'72; May*65 Male & Female, 19 Dec'71

Skinning;

"When you transfer the projected data from the surface of a sphere to a plane, you have to break open the spherical akin in order to 'peel' it. There will be various angular cuts in the periphery of the akin when it is laid out flat, just as you take the akin off an animal. The openings along the edges are called sinuses. The sinuses on my map occur in the water. None of the cuts go into the land. Therefore, I am able to take all of the data off the Earth globe and make it accurately available in the flat."

- Cite RBF to Wm. Marlin, Architectural Forum, p.71, Feb»72
Sm,npAn&:

"As in skinning an animal, a fruit, or a vegetable to provide a flat skin stretch-out, the development of a flat map of the complete world involve*s arbitrary piercing of the world ball's surface map-skin, thereby making one or more holes or gashes from which W to start the stretchingout and peeling-off process of the skin until it is liftable from off its ball center. After the data has been further stretched it may be laid out as one or more flat map sections. If the skin-ning is accomplished in separate peelings and those sections have curved peripheries they may be tangentially only as 'gears' Or 'fans', which destroys the chance of forming a continuous one-surface comprehensive wbrld map.

"To provide a continuous one-surface world map--- while peeling off the sections of the globe--- the transformation must be such that the pieces have straight and matching edges when peeled off and flat-tened out."

- Cite Undated Sheet: "THE DYMaXION AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

"Typical of all the finitely conceptual objects or systems, the tiger's skin can be pierced and slotted ooen. Thereafter, by enlarging the slotted hole by gashes in various directions, the skin can be peeled off all in one piece. It can be made to lay out flat by making a lunar-gash from the skin's edge into any remaining domical area of the skin. The slitting of a paper cone from its circular edge to its apex allows the paper to be layed out as a flat •fan,' intruded by an angualr sinus. . . The surface contour of every object or system--- be it a complex creature such as crocodile, or a simple cube or a dodecahedron can thus be 'skinned' and laid out in the flat."

Sleep:

"Sleep ie the great normalizer. The brain can only do its subconscious sorting when we are asleep. It accommodates the asymmetries and restores the symmetrical."

(Above observation was a propos Arthur Clarke's contention that sleep is an intolerable waste of time.)

- Cite RBF to EJA, Pepper Tree Inn, Santa Barbara, 11 Feb'73

"I've finals learned to accept the fact that apparently nature intends us to get to a point where we're supposed to sleep. For years I managed to get by on Just two or three hours, letting myself sleep a half-hour ever four, or six or whatever it was. It worked fine, but it was a terrible inconvenience for my wife and she made me stop it. You can theorise about what sleep is, but it seems to me that each day we just get more and more asymmetrical until we have to sleep to get back into symmetry again. So I know I have to sleep and I know that if I use the reserve energies I'll have to take time to fill those reserve tanks. They're in an inconvenient position and they have small nozzles, and it takes longer to fill them. But the point of all this is that I'm so convinced of what's happening that I don't have any personal option at all. So just being tired is not enough reason to take it easy. I know that I get to the point where I'm so fuzzy-,imded that I'll mess things up more than help them, and then sleep is something I don't consider sinful."

Sleeping & Thinking: (1)

Q. "Do you practice meditation? Is there a kind of Dymaxion sleep?"

RBF: "I have never practiced it and I have never used

either of those terms. I try to comprehend what my faculties may be. I can go to sleep in 30 seconds. Animals can go to sleep and still spring instantly into action. I thought this might be a good way to make the most of your time and energy, as a runner has a second wind—drawing on his reserve tanks. But it takes much more time and piping to replenish the reserve tanks.

"So I decided to try and see if I could sleep at a higher frequency than the daily and nightly periods of the earning-a-living game. So I slept whenever I felt like it. You cannot put out unless you are putting in. After two years I found that I was sleeping only a half-hour every six hours, or getting only a total of two hours sleep a day and all the while I was Incredibly healthy.

"That may be something like the idea of meditation... we have all these messages coming in... I like to focus on some

- Cite RBF to World Game Workshop; Phila., PA; 22 Jun'77

RdF DEFINITIONS

"familiar object such as a boat I particularly like... and in 30 seconds I am asleep: that's the most I do in the way of meditation.

"But I do a great deal of thinking, trying to put events together and sort out the significance of my experiences. By employing word tools we are able to compound the experiences of total humanity. I found a lot of nonsense coming out of my mouth. So I let my wife do the talking for me for all our everyday needs as I was resolved to say nothing until I was sure what its effect would be on other human beings...

So I just kent at work... paying no attention to others.'

Slenderness Ratio:

"The Greek architects found experientially

That when a stone column's heaight Exceeds eighteen diameters of
its girth it tends to fail by buckling.

The length to diameter ratio

Of congressional columns

Is called its slenderness ratio. Steel columns are more stable Than
stone columns.

Steel columns are structurally usable rfith slenderness ratios as high
as thirty-to-one. But such columns are called long columns.

A short column is one whose slenderness ratio Is far below that of the Greek column.

Short columns tend to fail by crushing Rather than by buckling.

A twelve-to-one slenderness ratio Provides a short column.

Slides? Use of Slides in Lectures:

"A lot of people tease me about how I start to give a lecture and have someone get out the projector and then we never get around to using the slides. I am so convinced though that what I have been saying to you--- about the fact that men do not see outside themselves, they only see in here--- that I am quite sure you have the best illustrating capability in sight. If I put it on the wall here it tends to make you lazy and short circuits. Not until I am quite confident that you are constructing in here, in your head, do I feel confident that it is all right to expose you to the slides."

- Cite Oregon Lecture #4, p. 140. 6 Jul'62

Graphics vs. Words:

"I hope that I have been successful in communicating this to you conceptually without recourse to pictures. No man has ever seen outside of himself. He always sees in his brain. I think it is as easy to stimulate the brain conceptioning by words as it is by graphics. I often find

in lectures that I don't have to show the slides which I had been prepared to do because I found that people had conjured up in their own brains from my words the very picture which I had intended to show but had gone on spontaneously to describe in advance. It is my intuitive surmise that the pictures thus conjured up are more powerfully planted in the other man's brain than those resulting from the beams of light bounced off a photograph back to the human eye lenses, retina and nerve connections and after to be scanned and IMAGE-ed (imagined) in the brain.

Snow kound;

"A child, when playing in sticky snow, may make a big mound of snow and hollow it out with his hands or a shovel to make a cave. Then, looking at the hollowed mound from outside, he may discover that he has made a rough dome. He might then conclude that whatever makes that structure stand up and span space is not dependent on what was at the center because the snow has been removed from the center, 'hatever makes it stand up has to do with the circumferential interactiond of the snow crystals and their molecules and the

latter's atoms. Ke may find out bji experiment that he could put not only one hole, but many holes through the snow dome shell and it continues to stand up. It becomes apparent that it would be possible to take a pneumatic balloon, pair the molecules, and get rid of all the molecules at the cenxter that were not hitting the balloon--- for it is only the molecules that hit the balloon at high frequency of successive bounce-offs that give the balloon its shape.**

(For text immediately following see Tensegrity Geodesic Grid)

(Same text: b.exico, pp. 46-47)» 10 Oct'63

"In the case of the pneumatic bag . . . what makes the net take the shape that it does is simply the molecules that happen to hit it. The molecules that are not hitting it have nothing to do with its shape. . .

••When you were a little child, the-first time you went, out in a fairly deep snow, or the first time you were allowed to go out on your own, you tended to make a mound of the snow. It was a fascinating thing because you could push it together and it would take shapes, it had coherence.

I am sure that almost every child with mittens on builds himself a mound and then starts chipping and working away at the mound and makes a hole in it and he makes a cave. He finds that he can get in it and fam what he discovers is that the structural Integrity has nothing to do with the snow that used to be at the middlei It has something to do with the circumferential set of action of molecules there that you are accounting for. So we develop a strong intuition about this when we are very young. What I saw that might be possible was that we might hollow out the pneumatic network and we could do away with the molecules that weren*t doing the work, if we had the ones that were doing the work neatly paired."

"You'll find that energies are so distributed in Universe that the number of times large amounts of energy is available at any one point to do large things is very much less frequent than the number of times small amounts are available to do small things. The things we're talking about here, the social adjustments are very big. They're magnificent, the most marvelous part of the whole show. They don't get done overnight, but they're actually happening so fast that I can't believe it. I've seen in my lifetime rectification, rectification, rectification. And we really are getting there, I'm convinced of it."

"In the early days of the auto on a lonely road— when you saw another car coming— there was always a third coming into view or already in view. Three cars frequently come to approximately the same highway point at approximately the same time. This is not surprising because when, having first taken away the two points from the system to accommodate the axis of the observer, we always have the topologically constant relative abundance of interference crossings, areas, and lines. Edges are lines. The car paths are reality lines, traces, with universal threefoldness of energy-event trajectory vectors. Universe keeps sorting its event traces into bundles of three. The social highway experience of three cars is the W—I inexorably present tricomplementarity relationship of the little local triangle on the Earth's surface complemented by the three other great-circle triangles of the terrestrial spherical tetrahedron always produced in all system formation and transforming. Critical proximities impose three triangulations."

- Cite RBF to EJA, 3200 Idaho, 17 Feb'72 as rewritten by RBFH8 Feb •72

"In the early days of the auto on a lonely road--- when you saw another car coming--- there was always a third. Three cars always come to approximately the same point at approximately the same time. This is not surprising because when we take away the two points for the axis of the observer, you always have the constant relative abundance with its three edges. Edges are lines. The cars are really lines... They are trajectories. They are simply averaging out. Universe tends to keep sorting, then, this way.

"We are really relating the social highway experience of three cars to the complementarity of the little triangle on the Earth's surface with the other three triangles. Critical proximity imposes the generalisation. The triangle imposes the triangle."

Socialism:

". . . Disarmament is stalled in the U.S. because the country cannot keep its economy going through the 'irrigations system' now fed at the top through annual weaponry undertakings without seeming subscribing to 'socialism.' In wartime emergencies, national management of economic activity is exempt from charges of socialism, but by custom and law such centralised authority is forbidden in peacetime. To avoid this embarrassment and to keep our economy healthy, wartime emergency powers are extended to meet the threat of the next war. This extension is called 'cold war.* The U.S. knows that the world needs and wants disarmament and that its socialism-avoiding subterfuge becomes increasingly evident to the rest of the world and thus less tenable. The government find powerful Washington lobbies of the armaments contractors, supported by the labor unions, are seeking ways to keep the economic irrigation system fed from the top while also attaining progressive disarmament,"

"Now I would ask the question if this isn't of some importance this matter of fooling ourselves into thinking that we see and feel the modern when it is unfeeling and unseeable.

I should think that it would have very great significance. It could have something to do with why it is at the present moment that our technology is so developed that we could feed and make everybody technically more successful than any man has ever been before, and yet we don't have the ability socially to organize ourselves to do anything about it. We seem to be on the road to blowing ourselves up. We have more and more emergencies of higher and higher frequency, so I would say that our social capability is lagging. And I would say that much of our social disabilities have to do with our being preoccupied with certain myths. What I then intend to do in giving you the subject

"Trends to Invisibility," is to really try to examine if I can, the ways in which we have deceived ourselves, and then examining ways in which we might be able to organize ourselves towards informing ourselves more effectively regarding where we are in our Universe and what we might do about it."

"I have received your paper on 'Organizational Structure' entitled 'Mechanics of Group Dynamics'. It is splendid. I find it fascinating to observe your extension of my work into your social problems. I have intuited that they should be so extendable because of their fundamental and general nature. Colonel Lane made use of my tetrahedral coordinate system in logistical and maintenance procedures in Marine Corps Aviation. A Catholic priest, high in the councils of Rome, identified my coordinate system with the High Church's interpretation of the Heavenly Host. I myself have applied the tetrahedral coordinating system to the synergy of unique efforts of individuals of the chemical science world who themselves have discovered and verified the tetrahedral coordination of both the organic and inorganic chemical structuring. I was, therefore, aware of the extensibility of the principles but am therefore better prepared to judge and acclaim your efforts as extraordinary and representative of a major seasonal advance of the regenerative growth of our seeds.^{1*}

- Citation and context at Economics. 16 Feb*73

"Social relationships must follow the rational energy quantum laws of physics but at a complex level. Social behaviors must follow all the generalized scientific principles such as synergy and precession. Because precession imposes angles other than 180° upon all interactions of all moving systems of Universe there are no straight lines demonstrated in nature. The fundamental wave behavior of all nature is a consequence of the omni-intereffective precession. Kost of our social undertakings try to analyze subjectively and to persuade objectively individuals to move in 180 or straight- line paths. Such attempts are inherently futile, 'When society recognizes realistically that everything moves in an angular wave patterning,' society will be

able to accommodate its behavior in a more realistic and satisfactory manner. Democracy's right-left pulsations are imposed by nature's wave behavior, 'When society comprehends the omnirational isotropic vector matrix 60-degree angle coordinate system it may then be able to emulate the behavior of sailing ship masters and will learn how; to beat* which means angling first left and then right 45° off the course leading directly into the wind, in order to

- Cite NEHRU SPEECH, p.31, Nov'69

accomplish distances in the direction from which the wind moves. Society finds it easy to sail with the wind but has demonstrated a lesser capability in negotiating windward passages. To sail with the wind is to yield to evolutionary forces. To sail into the wind is to master forces."

Solid State:

"Science evolved the name 'solid state' physics when, immediately after World War 11. the partial conductors and partial resistors— later termed 'transistors'— were discovered. The phenomena were called 'solid state' because without human devising of the electronic circuitry, certain small metallic substances accidentally disclosed electromagnetic pattern-holding, shunting, route-switching, and frequency-valving regularities, assuredly produced by the invisble-to-humans. atomic complexes constituting those substances. Further experiment disclosed unique electromagnetic circuitry characteristics of various substances without any conceptual model of the

'subvisible apparatus.' Ergo, the whole development of the use of these invisible behaviors was conducted as an intelligently resourceful trial-and-error strategy in exploiting invisible and uncharted-by-humans natural behavior within the commonsensically 'solid¹ substances. The addition of the word

'state' to the word 'solid' Implied regularities in an otherwise assumedly random conglomerate, what I have discovered goes incisively and conceptually deeper than the blindfolded assumptions and strategies of solid state physics— whose transistors' solid state regularities seemingly defied discrete conceptuality and scientific generalization and kinetic omnigramming.”

Sovereignty: (1)

Q. (Sen. Percy): "What do you mean, sovereignty is dead?"

A. (RBF): "I am a student of large patterns. And as I look around I try to see what evolution is trying to do. We sometimes forget how important is the role of Universe. I have just been telling you that all the things that came in-since I was-born, automobiles, jet planes and the Queen Mary, radio, satellite communications, they were all unexpected, they were all surprises, and none of them were the result of conscious and deliberate development.

"I do not look on it policywise. I see it as a worldwide biospheric pattern of honey bees and chromosomes.

"The continental congress in Philadelphia has been so movingly described this morning, how people designed a democratic and marvelously representative government. But the congressman went back home on foot or horse. The city of Washington got one or two letters from Europe a month; and everyone knew what was said and went home and talked about it. Democracy flourished in a one-to-one correspondence of stimulation and response. With the advent of telegraph we lost all this;"

Sovereignty; (2)

"The effect of telegraphy on the news was mostly one-way, despatches from the field; by and large they provided no response. Democracy works on one-to-one correspondence, but now our communications are not working that way. In 1940 I explored the technology of communications, how if everyone voted daily would it affect the frequency of telephone use. Now we wonder if there might not be some electromagnetic patterns from the brain with all of humanity manifesting some kind of high-frequency electromagnetic, yes-or-no-field. If the satellite sensors are mapping our beef cattle, might they not also have a capability of picking up how humanity feels about a question. It's all going to be completely different from the ways of the past, you mentioned world government. There could be a sort of city management concept taking its orders from a consensus of humanity. Of course the majority might often be wrong, but with such instant communication errors would be recognized soon enough to correct them. Measuring what humanity is really thinking.

"Servomechanisms work this way. All this is technically looming into view."

Spaceship Earth:

(A)

But when I question has Spaceship Earth metaphor he becomes annoyed and distressed. "It is a spaceship. That's not an analogy. It's a fact," he says.

"But a spaceship is built by man, all the factors have been designed for a particular known purpose. The earth is an organic thing on which we live," I argue.

"The planet is designed--- superbly designed--- by a greater intellect than that of man," he says. "And it's moving through space."

"But are we passengers or an organic part of it?"

"We've got three billion and a half passengers on board."

"What about the plants, whales, horses--- are they also passengers?"

"A passenger is someone taking passage aboard a vehicle," he says with a sharp edge of impatience. "You are aboard a"

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W, NY), p.158, Feb'73

"vehicle moving at 60,000 miles an hour through the heavens and you're aboard as a passenger. I'm sorry but your objection is invalid.

So decreed Justice Fuller. I tried a different angle having, apparently, failed to make myself understood: "There's an organization just formed in San Francisco called Living Creatures Associates. It's a press agency claiming to represent other species--- whales, garter snakes, foxes--- represent them publicly on their own terms, with a right to exist on this spaceship, then, in the same way as I do. With some rights that conflict, perhaps, with those of men."

"Did the foxes invite them? Did the daisies elect them?... I have no objection to other people's doing what they do but nothing could be more remote from me," says Fuller.

"I call this a do-gooder organization, idealistic and so forth. And their effectiveness approximately zero.. I think it is

a very nice manifest of VI consciousness of man. He's beginning to think about things."

"The idea is that., we must accept the rights of other beings."

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W, NY), p.159, Feb'73

"What happened to those dragons?" he replied. "What happened to the flying creatures of a few million years ago? What happened to their rights? What about the rights of volcanoes when the whole Earth was volcanic? Who took their rights away?"

"But it's a fact that certain birds and animals are dying because of man's actions. Don't we have to take responsibility for that?"

"We have to take the responsibility of being responsible. So far we have not been very responsible. You don't say to a new child, 'You better go back in there, you're not very responsible...' They're just using words--- foxes and daisies. ... I say: What might I do that made it logical for man not to do these things? That's what I'm caring about. That's what design science is...

(See Tree. Feb'73)

He was shocked that I found fault with his Spaceship Earth analogy.

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W, NY), p. 160, Feb'73

"I invented this phrase, Spaceship Earth, a number of years ago when I was trying to get man to--- trying to help him, personally, particularly young people, to shake themselves loose of preoccupation with the powerfully conditioned reflex that there is something called Earth and something called space, this Heaven and Earth idea. I used to have students say to me 'I wonder what it would be like to be on a spaceship?*' And I'd say: *What does it feel like?*

"The relative size of things.. When you get to the size of our Earth in space, 8,000 miles' diameter--- the Sun's corona when you look at it with filters through a telescope we can actually see it--- in the larger magnification one of the flames would be about an inch. One inch of flame is often an altitude of over a hundred times the diameter of our Earth. The size of our Earth would be undetectable in one of those flames.

"The distance to the next nearest star to ur Sun takes light coming 700 million miles and hour four and two-thirds years to get here. So somewhere between that kind of distance we have a tiny invisible spot of 8,000 miles* diameter, our planet,

- Cite Rasa Gustaitis, WHOLLY ROUND, p.161, (HRAW.NY) Feb*73

"going around the Sun at 60,000 miles an hour. And the Sun itself, and the galactic system... sum totally we're making something like a million miles an hour right now."

Now usually when someone mentions a multidigit number to me , I blank out. But Fuller has led me into those interstellar spaces. That's Fuller the poet, conveying reality, not describing with words,

"So we couldn't be more of a spaceship and we couldn't be tinier and we couldn't be more beautifully designed... If we were to say that man was God, if that's what you're objecting to, that this design is so much better, then OK. But nevertheless, I call it a design... The space is a priori mystery that the space vehicle goes in. And you don't think that it's a mysterious thing that he had the capability to get there? It's all part of the same mystery."

"People who listen to me say, 'Here's a man who's selling screw-drivers. . . They don't realize how mysterious screwing is.'"

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W, NY), p. 161, Feb'73

"...I've been identified only with the physical so far.

I went through 25, 30 years of people saying: this the the bathroom man, or the automobile man--- that's all they thought about me. It's only in the last couple of years that they discover I'm a thinker. And I started as a thinker, I didn't start with bathrooms. I started off with God and my charge was to work on the physical. That's where I had the capability; that's why we're here. I accepted this. And to find myself identified, then, with just being a fishing-pole salesman!

I find this thing echoed when you say that about my analogy, 'cause I use a very good tool there. I have helped to shock man into realizing he's on board a space vehicle. He's a passenger on it and he's intimately related to it.**

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W, NY), p.162, Feb'73

"Your Senate hearing gives me a short but welcome opportunity to talk thus about all that man has learned from his two million years aboard our spaceship Earth, wherefore I wish to point out vigorously to you that we are indeed aboard an 8,000-mile-diameter spherical space vehicle. We were excited during the Christmas days when we first looked at the Earth from the Moon. But I heard our President speaking 'down to earthedly' to the astronauts about their going up to the Moon. There is no 'up' or 'down' in Universe. We find so-called practical men saying, 'Never mind that space stuff, let's get down to earth.*"

"And we retort 'Where is that? Where is 'down' and what and where is that non-space existing theory avoiding Earth?'

"Despite their ignorant urging of 'Never mind that space stuff, let's get down to earth,' we find that our little 8,000-mile-diameter planet Earth, together with the Moon, is flying formation at 60,000-miles-per-hour around the Sun."

- Cite HBF at Senate Hearings, p. 9, 4 Mar'69

"Earth is a beautifully designed spaceship equipped and provisioned to support and regenerate life aboard it for hundreds of millions of years, even until the time when so much energy of Universe has been collected aboard Earth as to qualify it to become a radiant star, shortly before which man will have anticipatorially resituated himself on other planets at nonincineratable distance® from the Earth nova."

- Cite RBF at Senate Hearings, * p.9, 4 Mar'69

"I just say to all of you: 'Hullo, astronauts,' You're all astronauts. I'm sure you're not thinking of yourselves as astronauts or you wouldn't have the word for somebody else. But you're all astronauts, you never have been anything else. You've just got to catch on that you're all

astronauts. It's a very small little ship we've got here; it's superbly equipped and every part of it is reciprocal; there are no labels on it which say anything belongs to anybody. Everything that's there is to regenerate all of life."

- Cite RBF in "The Listener" transcript by John Donat, 26 Sep'68

"Once upon a time and aboard a spaceship there were almost four billion passengers, each so small and the ship so large that the passengers wandering about on its spherical deck, pulled feetward toward its center of gravity, could see only about one two-millionth of the ship's total deck surface at any one time. Usually they told, only a millionth

of it in their entire lifetime. As a consequence they did not realize that the only locally irregular surface on which they walked did not stretch away as a plane to infinity and was in fact a finite or closed spherical surface system.

"That spaceship had been given the name 'Earth' by its passengers, this name being descriptive of its hard-packed dust, dirt, and rock-surfaced deck stretching away surrounded by water seemingly to infinity. So impressed have the passengers been with that stationary, egocentric, two-dimensional content that they have for long, and as yet, begin their children's education with plane geometry--- its surfaces and lines--- stretching away to infinity. , , .

"Three-quarters of Spaceship Earth's surface Is covered with water and only about half of the dry one-quarter is both

- Cite DEAR ISLAND bTURY, galley pp.2-3, 1968

"habitable and suitable for providing vital support of the passengers. This meager ten percent of the spaceship's surface with its vitally hospitable damp surface is divided into many small fractions scattered so remotely from one another around the Earth's sphere and with such

vast and formidable waters, mountains, deserts, and ice Intervening, that as a result each of the local groups of inhabitants of the various areas--- for 99 percent of the period of their known presence on Earth--- have been unaware of the other groups' existence or whereabouts aboard the spaceship.

"Equipped materially to take care of its passengers for millions of celestial travel years, but needing additional energy to produce, maintain, and regenerate its complex, interchemically exchanging, life-support system, it was designed by the conceivor of the vast, ever and everywhere nonsimultaneously transforming Universe, that the additional and vital energy W^* constantly transmitted to the spaceship by the electromagnetic radiations emanating from enormous, fiery, unmanned, automated mother spaceships traveling in company with, but at great distances from, the little Spaceship Earth."

- Cite BEAR ISLAND STORY, galley pp.3, 1968 "And to make things even more challenging and intelligence-invoking for the passengers, no instruction book on identification of the parts and what they do and how to operate them came with the spaceship. Because some of the red berries were healthily sustaining while other red berries were poisonous, the passengers were forced to learn by trial and error about the myriad of life-advantaging principles that have been secretly built into the integral metabolics of Spaceship Earth and that spaceship's complementary universal environment, which is ever energetically transforming and evolving. This was made possible by the apparently ample tolerance for their many errors which was included in the design of the ship and the celestial support system. Though often obvious for millions of years, most of these vital advantage-giving principles long have remained unrecognized for what they are and can do; it would seem to be a part of the designed scheme of Universe that— for the nonce, anyway— nothing is quite so invisible to Spaceship Earth's passengers as the obvious. ...

"As all of the Spaceship Earth's passengers see all their experiences only by image-ination in their brains, we too may imagine ourseleves aboard the little spherical, 8,000-mile

- Cite BEAR ISLAND STORY, galley p.3, 1968

Spaceship Earth: (d)

"diameter Spaceship Earth with its then atmospheric, ionic, and radiation-shielding Van Allen mantles, speeding integrally at 17 miles per second in a vast elliptical orbit around our 92-million-miles distant, fully automated energy supply ship--- the Star Sun--- in the presence of our 10-trillion- miles further distant, next nearest star.

"These two stars are our Spaceship Earth's nearest prime energy, life-giving and life-sustaining, regenerating supply ships. As do also the myriad® of even further away supply ships, these two stars 'fly formation' with our Spaceship Earth in the vast inconceivable ocean of time. The energy supply ships are flown at a distance sufficient tp prevent their heat and radiation from drying up and incinerating the many forms of life aboard Spaceship Earth.

"Large though 8,000 miles may seem to the human passengers, who are only one-thousandth of a mile tall Spaceship Earth's diameter as seen from another planet is only a tiny pinpoint of Sun-reflected light similar in appearance to the Spaceship Mars or Venus as seen from Spaceship Earth."

- Cite BEAR ISLAND STORY, galley p.4, 1968

` ` After at least two million years of experience aboard it, many of the almost four billion amateur astronauts aboard Spaceship Earth have become theoretically well Informed regarding a few behavioral characteristics of a meager fraction of the celestial phenomena. But

none of them--- excluding possibly the Russian and U.S.A, professional spacemen /the three bears. Goldilocks, and her father_7-- as yet consciously and realistically sense that their own planet is a spaceship and see and feel themselves zooming through Universe upon that spherical ship. ...

/~See Up and Down Sequence (A) - (B) *J*

` ` Because the Spaceship Earth is also spinning equatorially at 1,000 miles per hour as it orbits the Sun at 60,000 miles per hour, when we launch a tiny, two- or three-man-carrying, capsule by rocket from our Earth Spaceship, we must give the capsule an additional acceleration boost of approximately 16,000 miles per hour in order to break out of Earth's gravitational, pull.' This means that we on our big mother Spaceship Earth must give our small space 'launches' a local space speed of 76,000 mph., or 16,000 mph. faster than Spaceship Earth's"

- Cite BEAR ISLAND STONY, galley pp.4-5, 1968

"Sun-orbiting speed. Aboard Earth we are accustomed to the idea of big ships carrying small lifeboats; launches, tenders, and gigs. 'We must now think of our space-rocketed capsules as small boats launched outwardly from our bigger spaceship.

"But these speed variations of our spaceship and its launches become minuscule and negligible in comparison to the speed of Spaceship Earth as a solar system component as that solar system itself orbits within our galactic nebula's even greater perimeter motion and our galactic nebula's collective motion in respect to the other nebulae."

"In fact, I can think of only one way of expressing the degree to which interdependence and community have become the destiny of modern man. I borrow the comparison from Professor Buckminster Fuller, who, more clearly than most scientists and innovators, has grasped the implications of our revolutionary technology. The most rational way of considering the whole human race today is to see it as the ship's crew of a single spaceship on which all of us, with a remarkable combination of security and vulnerability, are making our pilgrimage through infinity. Our planet is not much more than the capsule within which we have to live as human beings if we are to survive the vast space voyage upon which we have been engaged for hundreds of milenia--- but without yet noticing our condition. This space voyage is totally precarious. We depend upon a little envelope of soil and a rather larger envelope of atmosphere for life itself. And both can be contaminated and destroyed. Think what could happen if somebody were to get mad or drunk in a submarine and run for the controls. If some member of the human race gets dead drunk on board our spaceship, we are all in trouble. This is how we have to think of ourselves. We are a ship's company on a small ship. Rational behavior is the condition of survival."

- Cite Barbara Ward, SPACESHIP EARTH, Columbia Univ. Press, NT, 1966, P.15.

"For at least 2,000,000 years men have been reproducing and multiplying on a little automated spaceship called Earth, in an automated Universe in which the entire process is so successfully predesigned that men did not even know that they were automated, regenerative passengers on a spaceship and were so naive as to think they had invented their own success as they lived egocentrically on a seemingly static Earth.**

At Hugh Kenner's house in Baltimore, in response to an inquiry from the Baltimore SUN, RBF said that to the best of his recollection this citation was his earliest reference to spaceship Earth in print. --- 3 Oct'73. J

"In contrast to the hone arts let us look at the space rocketry world. At the present moment we have the enormous, major governments subsidised weaponry race into space undertaken by both Russia and the United States. In order to be able to put a man in space--- to stay in space, not to make a few orbits--- in order to give man, in effect, live continuously in outer space for weeks and months and possibly years, we have to solve scientifically the problem of mastering the ecological pattern of the human being and the metabolic pattern of the human being. We have to realise that the energy events that take place metabolically in supporting man ecologically on Earth involve energy transforming functions of trees, worms, water, sunlight, the slowly forming topsoil, et. al. The delicately balanced pressure and heat of energy exchanges and chemical transformations involve very large ecological domains to complete the cycles of a man-supporting environment process on Earth. We are going to have to compress the total ecological domain of man from approximately a one-mile radius process into a ten-foot radius process. We are going to reduce the total volume of energy transformation patterning several millionfold. In order to be able to send that man off into"

"space, we have to scientifically anticipate and effectively service all his processes and psychological reflex requirements. In order to be able to do that we are, in effect, building a little house---* a little space house. We had been using the word 'capsule,' which has hidden from the fact that what science is really working on is a little house; not much room to move around in, no garden of roses outside, but nonetheless, a little house with a six billion dollar mortgage,

"In this strange battle of man to anticipate offensivedefensive weaponry battles in the cold warring, the battle to attain the moon, or protracted living upon a platform in space, has brought about a race in capital funding initiatives between Russia and the United States specifically in relation to this little house, amounting to six billion dollars. This staggering amount is now appropriated to hire scientists to go to work to design and produce one little sky house, the first scientific human dwelling in history. It must be capable of sustaining man as a metabolic success anywhere in Universe. It won't be a very charming little house. It won't be 'good architecture' by the tradional a-la-mode"

"aesthetics. Above all I want you architects at this Seventh World Congress of the I.U.A. to realize that what the space scientists are working on is in fact the design of a house: that is architecture. The scientists are in your business competing with you in the solution of all the problems that a house for regenerative man involves. It involves every one of the fundamental principles ever discovered by man in Universe. The scientists are attending to the dwelling problems that you have failed to attend to or have left to someone el»se to solve, as for instance, the plumbers, ./hen the prototype moon dwelling and its space autonomy mechanics are developed, and it has been satisfactorily test orbited for 100 days, and that house has finally taken man

successfully to the moon, or to a space platform, there to dwell for months, then we will have history's first scientific semi-autonomous dwelling. In that sky dwelling we will have the energy exchange processes, internal and external to man's ecology, becoming locally regenerative.

"This process and its scientific tooling and instrumentation must become locally regenerative on an extraordinarily satisfactory basis before we shoot man to the moon or in'* - Cite MEXICO >63, pp.11-12, 10 Oct '63 "to protracted space orbiting. We are not going to pick the finest, healthiest world specimens, the best coordinated human specimens we have, and send them off to space to live in some highly inadequate and swiftly deteriorating condition. All the world will be hooked up by TV to observe the details of man's first home life in the sky. The technology will have to be performed superlatively before we shoot man to the moon or sky platform. This means that the problems will be solved on Earth and not in the sky. The mechanics of solution will be produced here on Earth. The establishment of this capability here on Earth also is going to make possible a very different kind of dwelling technology right here on Earth. We will no longer have to have water pipes and sewer systems. Mankind will suddenly start mass-producing the space house prototype's pipeless, wireless, trackless ability to deploy man around the Earth's surface as well as in space. Man will be able to take position anywhere on the face of the Earth, as an eagle takes firm, safe poise on his beautiful mountain peak vantage. with many able to readily reach such points by rotoflight and able to survive at' such remote spectacular points at very high living standards, comfort, and low cost with swift ability to'

"reconvene in cultural centers, etc. • .

"For the first time in the history of man on Earth we are actually applying the highest scientific capability to that extraterrestrial space dwelling, underwritten inadvertently and exclusively by weaponry supremacy ambitions for celestial control of world fire power. This celestial supremacy involves, however, an unprecedented weaponry system requirement: that of making man a successfully semi-autonomous biological intelligence system remote from Earth where he will be unable to survive normally by himself, as detached reconnaissance soldiers have been able to do in all previous history. A surprise event thus entered into the age-old weaponry system evolution, the significance of which has not as yet been publicly nor politically apprehended or comprehended.

"All weaponry up to this moment in history has been designed primarily to kill men with maximum scientific skill. Here we discover the as-yet uncomprehended surprise. Now for the first time in history the space weaponry race has forced the weaponry system directors inadvertently to design a"

"integratively upon the generalized problem of converting man's combined ecological and metabolic patterning in Universe from a random matrix of happenstance interferences, of unknown miles of overall dimension, into a compacted metabolic coordinate system of high certitude of controllability ergo a local ecological success under approximately any conditions other than those of falling into the Sun or other stars. The sky house man must be trade capable of taking position at will, either by interior or remote control, approxirately anywhere in the dynamic intercoordination of physical Universe. Yet, by virtue of entropy, that is of inherent local loss of energy of all local systems in Universe, the sky house may not be perpetually independent and self-regenerative. It is ultimately dependent upon the good will replenishment of that local and remote ecological system by the organized energetic activities of other men acting both as individuals and as vast teams, coordinated under the predominant will of organizations of men on Earth.*

"Now there is, in the universe, a vast order. It never lets you down. I throw a coin in the air and it returns and hits the floor every time. Nature is never at a loss what to do when she takes over after you and I sign off. Nature never vacillates in her decisions.

The rolling oceans cover three-fourths of the Earth. Along the beaches, the surf is continually pounding on the shore. No two successive local surf poundings have ever been the same, nor will they ever be the same. They typify the infinitude of individualism of every special-case event in the universe. While there is great music

in the pounding of the surf, as the infinite creative integrity of the universe is manifest, I cannot identify man, who hears this music, as the creator. I therefore do not use the word 'creativity' in man's employment of a priori infinite variety."

COOCFTVAUTY - *CASE* •

"Weightless, abstract human mind reviews and from time to time discovers mathematically reliable and abstractly statable interrelationships existing between and amongst, but not 'in*' or 'of,' any of the special-case experience components of the relationship.

"When a long-term record of testing proves the relationship to persist without exception, it is rated as a scientifically generalized principle. Whenever human mini discovers a generalized principle to exist amongst the special-case experience sets, the discovery event itself becomes a new special-case experience to be stored in the brain bank and recalled when appropriate. Amongst a plurality of brain-stored, newly understood experiences, mind has, from time to time, discovered greater and more significant understandings, which in their turn as discoveries, which are 'experiences,' constitute further very special-case experiences to be stored in the recallable and reconsiderable brain bank's wealth of special-case experiences."

I Borikidth One Eve and a MicroBCope:

"I find it surprising that society thinks of specialisation as logical, necessary, desirable, if not inevitable. I observe that when nature wants to make a specialist she's very good at it, whereas she seems to have designed man to be a very generally adaptable creature--- by far the most adaptable creature we know of. If nature had wanted man to be a specialist, I am sure she would have grown him with one eye and a microscope on it. She has designed no such creatures. I observe that every child demonstrates a comprehensive curiosity. Children are interested in everything and are forever embarrassing their specialized parents by the wholeness of their interests.

Children demonstrate right from the beginning that their genes are organized to help them to apprehend, comprehend, coordinate, and employ--- in all directions.^h

Specialization: p j

"Whitehead pointed out that the men going into those graduate schools and then going into a very specialized area instead of having a broad focus were getting down to a very narrow focus and within that very narrow focus would become specialists themselves so they would be professors of specialization within specialization. The specialists would then become so linear, instead of comprehensive--- instead of being broadcast, they would be narrowly beamed--- and being very bright ones they would make great speed in their linear acceleration. It would mean that they would speed outwardly through the Universe and would become very bright stars in the firmament, but as stars, very remote from one another.

"He pointed out then that because the specialists had been very carefully picked as individuals of high intellectual capability and, of course, intellectual integrity would be implicit. Their own integrity would make clear to them how little anyone outside their specialization could possibly know about their area of inquiry. They wouldn't feel any pride about it--- it would just be a fact that no one else in the public would tend to know anything about what they were talking about. Because they would - Cite Oregon Lecture-#2, pp.39-40, 2 Jul'62

"tend to recognize that to be a fact in their own experience, they would also not presume to go into any other specialists' laboratory and assume what the significance was of the work going on there. They would be the first to say: I can't talk about that. So these specialists would tend to talk to each other about football or tennis, and would not have much that they would feel they could converse about."

Sphere:

"No sphere large enough for a flat surface to occur is imaginable. This is verified by modern physics experimentally induced abandonment of the Greeks' definition of a sphere which absolutely divided the Universe into all the Universe outside and all the Universe inside the sphere with an absolute surface closure permitting no traffic between the two and making inside self-perpetuating to infinity complex, ergo the first locally perpetual motion machine completely contradicting entropy. Since physics has found no solids or impervious continuums or surfaces, and has found only finitely separate energy quanta, we are compelled operationally to redefine the spheric experience as an aggregate of events approximately equidistant in a high-frequency aggregate in almost all directions from one only approximate event. Since nature always interrelates in the most economical manner,

and since great circles are the shortest distances between points on spheres, and since chords are shorter distances than arcs, then nature must interrelate the spheric aggregated events by the chords, and chords always emerge to converge, ergo converge convexly around each spheric system vertex, ergo the sums of the angles around the vertexes of spheric system never add to 3600."

Sphere:

Every system is always losing energy. But they always have imports as well as exports. And physics has found no solids. Physics has found no continuums. So our only way of defining a spherical experience in modern scientific terms is an aggregate of events approximately equidistant in approximately all directions from one approximate event. That's the nearest we can come. It is then a Galaxy of very approximate event points. There being no continuum, these energy events have relationships. And the most economical relationships between circular or spherically arrayed points are not the arcs, but the chords. I've come to discovering how very powerful all this is as its going on in geodesic domes which is simply what I'm talking about: an array of points approximately equidistant from one point and making all the most economical chordal interrelationships which makes them always triangulated."

Sphere:

"The greeks defined a sphere as 'A surface equidistant in all directions from a point.' As defined there could be no holes in the sphere* because if there were any holes the surface would be turning Inwardly around the holes rim, and radius would change and the holes would leave areas within them where radius would not be equal in all directions. The Greeks' definition inferred that there is some kind of continuous and impervious continuum which absolutely subdivides all the universe which is outside the sphere forever, from all the universe which is inside the sphere. Were there no holes in the sphere, there could be no possible energy traffic inbound or outbiund-- therefore entropy. Entropy-- the second law of thermodynamics showsthat every local energy system in physical universe is always losing or emitting energy. The minimum set of all energy transactions and transformation is physical universe itself. Therefore only universe as an aggregate of non-simultaneous energy event transformings is the only possible perpetual motion system. If we could have a local perpetual motion machine we could throw away the rest of universe. Therefore the sphere, as defined by

Spherical Barrel;

' 'This whole spherical barrel system is non-redundant because of the triangular 'three-point' contacts of each of the three interfaces of the truncated cork star octahedra, but would be redundant with the trapezoidal interfaces of simply truncated tetrahedra formed inwardly on each and every geodesic sphere¹'s omnitriangular grid."

- Cite Ltr. to Shoji Sadao, 15 Feb '66, p. 4

Spherical Barrel: Kumasi Dome: (1)

"In this particular experiment the triangular 'corks,* (l.e., octahedral were small enough to render this 2.005 aluminum_/ foil of structural effectiveness. ...

' 'What is unique about this Kumasi dome is that the octa corks had their triangular radial great-circle plane surfaces mathematically guide! together only by two control holes in each of their abutting triangular great-circle plane faces ... to tentatively guide the approach of these surfaces toward one another and thereafter to cohere the whole spherical system in a loose manner. . . . Wire bands described all 31 of the basic great circles of the icosahedron's symmetrical subdivisions.. Fifteen of these great circles lie alternately along the edge of the icosahedron and then act as vertical bisectors of the next two icosahedronal major triangles. Of the 31 , the remaining ten and six great circles interact with the 15 great circles in such a manner

that they form approximately uniform tensional triangles overlying a six-frequency truncatable icosahedronal pattern, with the wires crossing over all the vertexes as well as the mid-faces of the system to impinge vertically on the edges opposite each of the verticals."

- Cite Ltr to Shoji Sadao, 15 Feb '66, p.2

Spherical Barrel: Kumasi Dome: (2)

"Thus it is found that 11 great circles act as the most effective 'spherical barrel' bands (where a 6 - 12 frequency, truncatable, icosahedronal pattern is employed) for each of the wires runs over the external surface centers of each of the octa-cork's triangular faces, thrusting each 'cork' inwardly toward the center of the system in such a manner that the tightening of the bands brings about a universal contraction of the sphere.

"As the tensional great circle bands were contracted progressively at Kumasi, it was found most practical to first tighten the set of six great circles. This left the sphere with a set of 12 'dodecahedronal*' 'mountain' bulges. We next contracted the 15 great circles. This brought the sphere into greater symmetry which was totally effective when the 10 great circles were also tightened.

"Where the great circle wire bindings crossed, they had to be tied together but not tightly, i.e., they were run through rings. They didn't need to be tied tightly together, merely guided."

- Cite Ltr. to Shoji Sadao, 15 Feb '66, p. 3

Spherical Barrel: Sphere as Complex Unity: Triangle as Simplex Unity;

- ` Everything I have said here adds up to the fact that the sphere is 'complex unity' and the triangle 'simplex unity.* Here and here alone lie the principles governing finite solution of all structural and general systems theory problems. Local isolations of infinite open-ended plane and linear edged (seemingly 'flat' and infinite) segments of what are "in reality vast spherical systems--- when taken out of context--- are hopelessly special-cased indeterminate situations.

"Unfortunately engineering has coirrnnitted itself in the past exclusively to these locally infinite and inherently indeterminate systems and have had to rely essentially on the test-ptoven local behaviors of small systems such as columns, beams, levers, et..al.. opinionatedly fortified with 'safely guesstimated' complex predictions. Not until we have universal finite omnitriangulated nonredundant structural system comprehension can we enjoy the advantage of powerful physical generalizations concisely describing all structural behaviors."

Spherical Barrel: Fail-Safe Advantage:

"It should elucidate also the increased fail-safe advantage accomplished with each increase of frequency of triangular module subdivisions of the sphere's unitary surface; i.e., failure of one triangular cork in an omnitriangulated spherical grid leaves a triangular hole which is utterly innocuous.

Failure of one stave in a simple curvature barrel and the whole thing collapses.

"Failure of two adjacent triangular corks in a spherical system leaves a diamond-arched opening which is stable and innocuous; likewise the failure of five or six triangles leaves a completely arched pent or hex opening which is circumferentially corked and innocuous. Failure of one spherical tension member likewise leaves an only slightly relaxed, two-way detoured, i.e., diamonded relaying of the throughway tensional continuity.

Considerable relaxing of the spherical triangulated cork barrel system by many local tension failures can occur without freeing the corks to dangerously loosened local rotatability. The higher the frequency and the deeper the inter-trussing, the safer this type of spherical structure."

Spherical Field:

"Physics' discovery of universally-multifrequenced, periodlc- event-discontinuity outness (in complementation to equally frequenced, event-occurrence in-ness) is Inherent in the always- experientially-verifiable, wave-duration frequency, photonquantum phenomena; wherefore synergetics had to redefine both volumes and surfaces in terms of dense (high-frequency) aggregates of only pointally-positionable, energy events' geometrical formulations, with spherical 'surfaces' being in operational reality a dense, outermost, single-photon-thlck, •cloud' layer, everywhere approximately equidistant in all directions from one approximately-locatable event center. For this reason the second-power exponential rate of area gain is not to be identified as a continuum, i.e., with a continuous system, but oqly with the high-frequency outermost layer population aggregate of energy-event points, 'ith numbers of photons and wave frequency per primitive volume, the relative concentration of given masses are determinable."

".Ve can take an icosahedron and put a sphere congruent to each of
the 12 vertexes and if we place a light inside and project the shadows
of the chords out on to the sphere, the result is a spherical icosaha-
edron. The 20 equilateral triangles of the planar icosahedron can be

symmetrically subdivided into six small right triangles by perpendicularly bisecting each angle. The angles of each small triangle are 90° , 60° and 30° and therefore each of the sides is different in length. In the spherical icosahedron, however, the angles are 90° , 60° and 36° with the last angle 60° more than the corresponding angle in the planar icosahedron.

This is due to spherical excess."

"Each of any three great circles of a sphere not having common polar crossing# must cross each other twice in a symmetrical manner in which the six crossings must produce either two similar polar triangles and six similar equatorial triangles, or must produce eight equilateral and equiangular triangles all cases of which are spherical octahedra, regular or irregular."

- Cite SET X, p.10, Aug'72

"When two force vectors operating in great circle paths Inside a sphere impinge on each other at any happenstance angle, that angle has no amplitude stability. But when a third force vector operating in a great circle path crosses the other two spherical great circles, a great-circle-edged triangle is formed with its inherent 180° mirror-image triangle. With successive inside surface caromings and angular intervector impingements, the dynamic symmetry imposed by a sphere tends to equalise the angular interrelationship of all those triangle-forming sets of three great circles which, shunting automatically, tend averagingly to reproduce spheric «1 ly closed symmetrical systems of omnisimilar triangles exactly reproduced in their opposite hemisphere, quarter-spheres, and octa-spheres. This means that if there were only three great circles they would tend swiftly to interstabilize comprehensively as the spherical octahedron all of whose surface angles and arcs (central angles} average as 90°.ⁿ

- Cite SET X, p.12, Aug»72

"Here we have a spherical octahedron made out of the three great circles. But you cannot make them by folding up three great circles. It is impossible to fold it and have it come out. But you can fold six great circles.

Tou can bring those six together and they will hone make the spherical octahedron, but it is all doubled up. Now that ought not to surprise you because you remember that when we took the vector equilibrium and collapsed it, it became the. octahedron and all the vectors were doubled, so this is fairly logical. This is six great circles but the first that I could make. I couldn't make it with one. or two, or three, but I can make it with four. This is of six." "This is a very peculiar kind of folding . . . they never duplicate each other and never double up except in the one case where the octahedron made out of six are all doubled.

Spherical Thinking:

See Sphere, (p.85) Jun'66*

"What you and I have been brought up on as a triangle is the most extreme case of the most local aspect of what is inherently a spherical triangle. Even if we imagine it, it is still special case. And when we make it conceptual the brain immediately makes it special case. The brain is designed for special case.

"I say to a child: Draw a triangle. And he says: Where? And I say: Draw a triangle. And he draws it on the ground. The triangle divides the whole Earth into two areas: the complementary very big triangle and the local little triangle. Concave and convex are not the same:

ergo, we have inherently four triangles. And the four triangles mean the manifestation of our friend the tetrahedron which is always there for the accountability. There is nothing you can do without the tetrahedron being there.

"A plane triangle is just an extremely limited case of the spherical. If you learn the spherical the plane geometry is included, but not the reverse. It is starting with wholes. Plane trigonometry is an abstract ratio of edges to angles but spherical trigonometry is all ratios of angles to angles, which is much simpler."

HI spherical Triangle:

, Spherical trigonometry is a very different kind of trigonometry from the plane. I want you to get familiar with it because there is no plane flat surface on Earth. So therefore there are no plane triangles and we are always dealing in systems. Systems are characterised by triangles which are spherical triangles, these are the kinds of triangles which control our fundamental transformations."

- Cite OREGON Lecture #6, pp. 205-6, 10 Jul'62

"No surface is conceivable without its inherent sphere as a truly flat Universe reaching outwards laterally in all directions to infinity, though illusionarily accepted as 'obvious' by historical humanity, is contradictory to experience. The surface of any system must return to itself in all directions and is most economically successful in

doing so as an approximate true sphere which contains the most volume with the least surface. Nature always seeks the most economical solutions, ergo the sphere is normal to all systems experience and to all experiential, i.e., operational consideration and formulation. The construction of a triangle involves a surface and a curved surface is most economical and experimentally satisfactory. A sphere is a closed surface, a unitary finite surface. Planes are never finite. Once a triangle is constructed on the surface of a sphere— because a triangle is a boundary line closed upon itself— the finitely closed boundary lines of the triangle automatically divide the unit surface of the sphere into two separate surface areas. Both are bounded by the same three great circle arcs and their three vertexial links: which is the description of a triangle. Therefore both areas are true triangles, yet with common edge”

- Cite SYNERGETICS text at Sec. 1106.12, 26 Jan'73

"boundaries. It is impossible to construct one triangle alone. In fact, four triangles are inherent to the oversimplified concept of the construction of 'one' triangle. In addition to the two complementary convex surface triangles appropriate to them and occupying the reverse, or inside, of the spherical surface. Inasmuch as convex and concave are opposites, they cannot be the same. Therefore, a minimum of four triangles is always induced when any one triangle is constructed, and which one is the initiator or inducer of the others is irrelevant. The triangle initiator is an inadvertent but inherent tetrahedron producer; it might be on the inside constructing its triangle on some cosmic sphere, or vice versa.

"It might be argued that inside and outside are the same, but not so. While there are an infinity of insides in Experience Universe there is only one outside comprehensive to all insides. So they are not the same; and the mathematical fact remains that four is the aiminimum of realizable triangles that may be constructed if any are constructed. But that is not all, for it is also experimentally disclosed that not only does the construction of one triangle on the surface of the"

"sphere divide the total surface into two finite areas each of which are bound by three edges and three angles, ergo by two triangles, but these triangles are on the surface of a system whose unity of volume was thereby divided into centrally angled tetrahedra because the shortest lines on sphere surfaces are great circles and great circles are always `formed 9 on the surface of a sphere by planes going through the center of the sphere, which planes of the three-great-circle-edged triangle drawn on the surface automatically divide the whole sphere internally into two spherical tetrahedra--- each of which has its four triangles, ergo inscribing one triangle"gets you Eight,* like it or not. And each of those eight triangles has its inside and outside, wherefore inscribing one triangle, which is the minimum polygon, like `Open Sesame,' inadvertently gets you 16 triangles. And that is not all: the sphere on which you scribed is a system and not the whole Universe, and your scribing a triangle on it SB to stake out your 'little area on Earth' not only begat 16 terrestrial triangles but also induced the remainder of Universe outside the system and inside the system to manifest their invisible or nonunitarily conceptual 'minimum inventorying' of 'the rest of Universe other than Earth'*

"I spoke to you earlier today about our teacher at the school giving us some arithmetic and then saying she was going to teach us a little bit about plane geometry. She said, 'Don't worry, it's just plane geometry.' Then she taught us about the triangle as an area bound by closed lines: three edges and three angles. A circle is an area bound by a closed line of equal radius from a point. A square is an area bound by a closed line of four equal edges and four equal angles. Everything we learned about geometry were areas bound by closed lines. And then we learned about logic within those closed lines about that area. Reliability and understandability was all on one side of the line. A very nice small tight package, but it couldn't tell us anything about the other side of the line. Why? Because it is plane geometry and goes to infinity so the other side of the line is un- finable. What do you mean by infinity? It's infinite, therefore it can't be defined. So that we start the children off with this extraordinary prejudice that only on one side of the line is there reliability.

"Your family is very reliable. The next family over there is"

- Cite SIMS Address, U.Mass, Amherst, Talk 13, p.15, 22 Jul'71 "questionable now. As for those foreigners, well, they're awful. They're very unreliable. Now I want you to see how we really build prejudice, how easy it is in terms of the superficial assumption of the reality of this great plane— that this is a safe place to start children off. Now I want you to realize that when we made that closed line we did it on a blackboard and I did it with a piece of crayon, and this blackboard ends and goes around to the other side. It has another side here /He knocks on it.____7 and it has edgesw on it. It is a system. This blackboard I can take it off herew. and I find that it is a system. It has insideness and outsideness and is fairly thick— about a quarter of an inch. And I'm still inside it. So it is a system even though it's an asymmetrical

system. When I take a unit system it has a unit surface. When I draw a closed line on a system which is a unit surface I divide the whole area of that system, the whole surface area, into two areas. There is the rest of the board here that is an area bound by this closed line of three edges and three angles.

"So this is white inside here and all the rest is green."

- Cite SIMS Address, U.Mass., Amherst, Talk 13, p.16, 22 Jul*71

"I'll paint this green all around, a green area which is bound by a closed line of three edges and three angles. You say it doesn't look like a triangle to me. And I say it /"the outside green area— EJA note.7 must be; that's your definition of a triangle, an area bound by a closed line of three edges and three angles. Now the board being asymmetrical makes it more difficult for you for the moment, but I want you to think about our Earth. We had a circle which was an area bound by a closed line with equal radius from a point. Well, taking our Earth, I'm now going to make a closed line on it and it happens to be 90 degrees from each of the poles and you would call it the equator. It's a closed line on the surface and it divides the Earth into a southern hemisphere and a northern hemisphere. You credit both sides of the line. Now I'm going to take you up to 80 degrees north latitude and draw a lesser circle. It divides the surface of the Earth into two areas: a very large southern one and a very small northern. We can just call it the Arctic circle and the rest of the Earth. But you don't negate the rest of the Earth and you do recognise both sides of the line."

- Cite SINS Address, U.Mass., Amherst, Talk 13, p.17, 22 Jul'71

"Now instead of drawing a circle on the Earth I'm just simply going to draw a triangle. Now I divide the whole surface of the Earth into two areas, a very large southern and a very small northern and they both are triangles so they're both bound by a closed line with three edges and three angles. And you say, 'Oh Mister, you're wrong, because I see 60 degree corners to that triangle, and this must be 300

degree'outside the corner "and this must be 300 and this must be 300 and the sum of the angles of triangles are always 180 degrees.' You say can that really be so. And I say yes it is so and let me demonstrate that to you.

"Take, for instance, what we call a great circle. A great circle is a line formed on a sphere by a plane going through the center of the sphere. The equator is such a great circle. The meridians of longitude are just such great circles and they go through the center. 80 degrees north latitude is a lesser circle: it does not go through the center of the sphere. Now great circles are the shortest distances between points on the surface of a sphere. If you would like to demonstrate that we'll simply go up to 85 degrees north latitude--- it's really a very small little circle here--- and take the radius"

- Cite SIMS Address, U.Mass., Amherst, Talk 13, p.17, 22 Jul*71

"of it in my dividers and I'll superimpose it on the equator. And, of course, the equator is A and S. And quite clearly it's a much shorter distance between A and B if you stay on the equator than it is to take this detour over 90 degrees, like this, and come back 90 degrees again.

"So great circles are called geodesics. The word geodesic is old but it was revived by both Einstein and the Indian Riemann /sic/, and it means the most economical relationship between events in the Universe, and they are never straight lines. If, for instance, we see two airplanes in flight. They're independent of the surface of the Earth. They are steerable planets if you will. Photographs were taken at night of airplanes fighting during WWII at night with tracer bullets. Both were using machine guns with tracer bullets, and you'll see one of them hit the other and it goes inward to the Earth. You see the tracery is an absolute corkscrew. If you want are for instance wanting to

faire at a bird, which I hope you don't want to fire at one, but if you did want to fire at a bird you wouldn't hit it if you aim at whwere it is. You'd have to aim at where you think it's going to be. And gravity is going to start affecting it, even though it's a shortn

- Cite SIMS Address, U.Mass., Amherst, Talk 13, p-18, 22 Jul'71 “distance and going through the atmosphere there's always a spin that's brought about by rotation. There is as a result pressure drafts on one side, and there's air in motion-- wind— and all your traceries are always going to be corkscrew. But they are the most economical relationships and they are geodesics.

‘` So geodesics are curved lines. And I've given you the most prominent geodesics like the great circles, the

most economical relationships between events on the surface

of our Earth. Now, understanding that, you will understand that our spherical trigonometry is always done with great circles. You were brought up with your plane geometry where a straight line is the shortest distance between two points. Now I gave you earlier today the non-straight line, . .

"Here then is our Earth. I'm going to the north pole and I'm going to take a meridian which is a great circle and it's going to impinge on the equator at 90 degrees. So this meridian comes and impinges on it and here's the center of our Earth. It would go like that. And now, having impinged 6n the equator at 90 degrees, I'm going to leave the meridian and"

- Cite SIMS Address, U.Mass., Amherst, Talk 13, p.19, 22 Jul»71 ‘’travel on the equator. I’m going to go one-quarter way around the Earth. Then I’m going to take another meridian and r ide up to the north pole again. And because I went a quarter way around the Earth, and then I left the equator at 90 degrees, looking

down on top of what I've done, I went like this, and therefore the angle at the north pole must also be 90 degrees. So here's a spherical triangle of 90°, 90°, and 90°, adding up to 270° in its corners. These are the triangles we really do deal with in our Universe.

"If we were to bisect the edges of that triangle with great circles, interconnecting them, the angles would be about 73° at each corner. If I bisect them again and interconnect them with much smaller triangles, the corners are around 63°. Then if I get a smaller one here that 60 degrees and some minutes, or maybe 60 degrees and some seconds--- but they never get down to exactly 60° in each corner. That is, it will always be a little more than 180 degrees. So the smaller the triangle, the more you approach the iBO-degreeness which you never arrive at. But the amount the triangles at the corners add up to more than 180 degrees we call the spherical excess, which you must always calculate when you're doing"

- Cite SINS Address, U.Mass., Amherst, Talk 13, p.19, 22 Jul«?1

"your spherical trigonometry.

"Now if I made another triangle bigger still, in which the 90 corners were 120° angles ... that's exactly what you get with a spherical tetrahedron. If I put a tetrahedron inside of a sphere with the light I had last night, and have the shadows cast outwardly from the light at the center of the sphere, it would show you this 120 degree interaction at four vertexes. So there would be a triangle where each of the corners would be 120° and it would add up to 360°. Now I'll simply say to you then, that when you draw a triangle on our Earth, even though it's very local-- and you draw a little tiny triangle here locally--- you divide the total surface of the Earth into two areas. And one is a very large triangle with corners of about 300° each, and there are these little local ones of about 60 each if you try to make it equilateral. The boy

said. 'But I didn't mean to draw the big triangle.' I said, 'That's just the trouble. We keep drawing these big triangles and don't realize we are.' We've been thinking what's been called realistic. Let's get down to Earth, never mind that space stuff, but when we're all the time just a tiny little speck in space. It's nothing but a space program, which we'd better catch on to pretty quickly." - Cite SIHS Address, U.Mass., Amherst, Talk 13, p.20, 22 Jul'71 "All this comes because man starts with the idea of oversimplifying. , . what seems to be reality. The Earth at that time seemed to be a plane going to infinity. So you were dealing in a plane. So you start your geometry with plane geometry. You start trigonometry with plane trigonometry. ffit in due course you discovered that it wasn't a plane, it was a sphere. A Closed system, not an open system. And you found that you were only defining 6n one side of the line because the other side went on to infinity. So you learned about the triangle, and the circle, and all these areas bound by closed lines. And you learned that all logic and reliability is one one side of a line: the area bound. On the other side of the line--- you couldn't define it because it went to infinity--- therefore it is undefinable. So as geometry is taught to you, and trigonometry is taught to you, you can only deal with one side of the line.

"But if you are operational, the way Einstein is, and say I've got to take into account all the conditions that obtain at the time of the experience, you can say that in drawing a line on a blackboard that the blackboard does not go on to infinity. It comes to its edge and the edge is a slate,"

- Cite RBF tape Transcript, Carbondale Dome, pp.18-20, 1 Kay'71

"or whatever it is, and you go around, its mild thickness, you go around its back. And whether you like it or not you have divided the surface of the blackboard into two areas. Anything that comes back into itself is a closed system. And all systems, in fact thinkability, does that. What we call thinking is trying to find out how it does return upon itself: What is the outline of that man? What is going on? What is on the other side of the Moon? I have got to get all the sides in order to understand it,

"I think this Moon thing is typical of seeming to be a plane. You didn't have to think about the other side of it. This is typical of yesterday's way of thinking. Things were just a disc. But even if it was a disc you could have another side. As a coin does. Now, once you are operational, you realise that if you take the unit surface of any system, whether it is symmetrical, a nice regular thing like a sphere, or whether it is a blackboard with very thin edges but nonetheless it has surfaces and it has backs. It might be a triangular blackboard, a broken piece of slate, but it has this back. And when you then draw any closed line coming back on itself, whether it is a triangle or a circle,"

- Cite RBF Tape Transcript, Carbondale Dome, pp.20-22, 1 Kay'71

"automatically that closed line divides the total surface of the system into two areas, both of which are bound by that line. And you have only been looking at what is on one side of that line.

"A bathing cap stretches around and you have the opening of the bathing cap where the little snap rests--- stretched around it. Packaged. Now, if it were a sphere you could see it a little better. I am going to draw a closed line on a sphere. It happens to be the equator. It divided the Earth into two areas, you say, the southern and northern hemispheres, and you can be perfectly happy about that.

If I go to 85° north latitude and draw a latitude, a lesser circle. I divide the whole Earth into a very large southern and a very small northern. Now I am perfectly clear at this point that dividing surfaces you have to credit both sides. So if I drew a triangle on the Earth locally I divide the whole surface of the Earth into two areas, both of which are bound by my closed line, the three edges and three angles. And the boy said, 'Well. I drew a 60° angle here . . . ' and so I learned the sums of the angles of the triangles only "

- Cite RBF Tape Transcript, Carbondale Dome, pp.22-24, 1 May'71

"add up to 180°, so each of the other corners. . . seems to be 300 30 it adds up to 900°. Well you have been taught the wrong way because the sums of the angles never add up to 180°, because you cannot make an absolutely flat plane.

There is always something a little more. And this is a case where you really see how much more.

"If you have a very big triangle, for instance, going to the north pole, taking a meridian to the equator, impinging on the equator at 90°; go one-quarter of the way back around the Earth and take a meridian back to the north pole; it leaves the equator at 90° and comes back where the two come together and the angle at the top will be 90°. So 90°, 90°, 90 is 270°--- that is the typical spherical triangle. And the sums of the angles of spherical triangles are approximately never the same. If I make a smaller triangle just inside of the one that I just talked about where there is 90°, 90°, 90°, the sums of the angles are going to be a little less. It approaches, but never gets down to 60°, 60°, 60°. It is always a little more. So the smaller they are, the more they approach 180°. And so in all our surveying around our Earth, doing geodesy, we are always dealing with what we call spherical excess,"

- Cite RBF Tape Transcript, Carbondale Dome, pp. 24-26, 1 May'71
- ' • How much more do the angles add up to more than 180° .

'All the great circles are the shortest distance between two points on spheres. Great circle triangles give simply what we say. There is a triangle there literally of 300° in each corner, 300° minus; and (60,60,60) 180° plus,

"If I started you off with reality operationally, like Einstein, I couldn't ever start you off with a plane, but I would start you on a sphere. Once you do that you realize that what we call the edges of a triangle--- or arc--- is simply the central angle. You are dealing in central angles and surface angles. You are dealing all in angles and you have no incompatibility for your fractions. This is where we should have started all of our arithmetic and all of our geometry. We sTTiould have started with whole systems,"

- Cite RBF Tape Transcript, Carbondale Dome, pp.24-27, 1 May'71

"If we draw a closed line such as a circle around our Earth it must divide its total unit surface into two areas as does the equator divide our Earth into southern and northern hemispheres. If we draw a lesser sized circle on the Earth such as the circle of north latitude 70 degrees, it divides our Earth's total surface into a very large southern area and a relatively small northern area. If we go outdoors and draw a circle on the ground it will divide the whole area of our planet Earth into two areas and one will be very small and the other very large. If our little circle has an area of one square foot, the big circle has an area of approximately five quadrillion square feet, because our eight-thousand mile diameter Earth has an approximately 200 million-square-mile surface and each square resile has approximately 25 million square feet which, multiplied, gives a five followed by fifteen zeros— 5,000,000,000,000.000 square feet. This is written by the scientists as 5×10^{15} square feet which, while compact, tends ifie deliberately

to disconnect from our senses. Scientists have been forced to disconnect from our senses due to the errors of our senses which we are now able to rectify. As we reconnect ourselves with the reality of Universe, we begin to regain competent thinking by humane'*

- Cite NEHRU SPEECH, p.19, 13 Nov'69 S^eC- 8'3

"and thereby possibly their continuance in Universe as competently functioning team members--- members of the varsity or University team of Universe. If, Instead of drawing a little one-square-foot circle on the ground--- which means on the surface of the spherical Earth--- we were to draw a square one foot on each side, this would give us the same size local area as before: one square foot.

"A square as defined by Euclid is 'an area bound by a closed line of four equal length edges and four equal and identical angles.' By this definition our little square, one foot to a side, which we have drawn on the ground is a closed line of four equal edges and equal angles. But this divides all the Earth's surface into two areas both of which are equally bound by four equal length edges and four equal angles. Therefore, we have two squares: one little local one and one enormous one. And the little one's corners are approximately 90 degrees each, which makes the big square's corners 270 degrees each. While you are not familiar with such thinking, you are confronted with a physical experiment's results which have informed you that you have been laboring under many debilitating illusions."

Spherical Triangle: Equator As Square: (3)

` ` If you make your small square a little bigger and your bigger one a little smaller by increasing the little one's edges to one mile each, you will have a local one square mile--- a customary unit of western United States' ranches--- and the big square will be approximately 24,999,999 square miles. As you do so, using great circle lines, which are the shortest distances on a sphere between any two points, to draw the squares' edges, you will find the small square's corner angles are increasing and the big one's corners are decreasing. If you now make your square so that it's area is one-half that of Earth 25 million square miles, in order to have all your edges the same and all your angles the same, you will find that each of your edges is approximately six thousand miles long and that each of the corners of both squares are 180 degrees each. That is to say that the edges of both squares lie along the Earth's equator so that the areas of both are approximately 12,500,000 square miles.

"And so it would go with a triangle, a pentagon, an octagon, or any other equi-edged, closed line figure which you may draw on any system's surface. The closed line surface figure will always and only divide the whole area into two complementary areas."

- Cite NEHRU SPEECH, pp.20-21, 13 '

Spherical Triangle: (4)

"That each human thus discovering this experimentally says spontaneously, 'I didn't mean to make the big triangle,' or 'the big square,' or indeed the big mess of pollution, in no way alters these truths of Universe. We are all equally responsible not only for the big complementary surface areas which we develop on systems by our every act, but also for the finite, complementary outward tetrahedron automati-

cally complementing and enclosing each system which we devise. We are inherently responsible for the complementary transformation of Universe., inwardly, outwardly, and all around every system which we alter."

"A triangle drawn on the earth's surface is actually « spherical triangle bounded by great circle arcs. If the triangle is drawn large enough, it is evident that the arcs divide the surface of the sphere into two triangles enclosed by common edges. The are apparently 'outside' one triangle is seen to be 'inside'¹ the other. Because every spherical surface has two aspects--- convex if viewed from outside; concave if viewed from within--- each of these triangles is, in itself, two triangles. Thus one triangle becomes four when the total complex is understood."

RBF DEFINITIONS

Spherical TriangleSequence:

(A)

"I often ask a young student to draw a triangle and, when he says. 'Where shall I draw it?' I say, 'Draw it on the ground.' So he scratches a triangle and I say, • You have drawn four triangles: When you draw on the Earth you must recognize that the Earth is a great sphere. As a sphere it is a closed or finite surface in contrast to the infinity of the plane. You will agree with me when I make a closed line around the middle of the Earth (that is, I delineate the equator) that this will divide the Earth into two finite and equally valid areas, a northern and a southern hemisphere. If I made a lesser circle north of the equator it would still run around and close back on itself and divide the Earth's surface into two unequal areas, a smaller northerly and

a larger southerly area simply because I have divided the total unitary and finite surface of the sphere into two sub-areas.' So when a student draws a triangle for me on the unitary, closed finite surface of our spherical planet, he divides the our sphere into two sub-areas, one very very small, both triangular.

"Now we begin

total area of large and one

the slide projections and as you will discover" Address, pp.2J-24, Kay 4-6*67

"looking at my first picture that your eye does not want to see the bigger triangular area.

"I find this biased concept very important because ftk it plays such a big part in how competently or incompetently we conceive of and think about our environment.

"Those are what we call spherical triangles and you probably are not familiar with spherical triangles because you have been educated to start with planar triangles wherein the sum of the angles ... is always 180 degrees.

"In a spherical triangle the angles never add up to 160°.

To comprehend that fact let us go to the north pole and follow south along a meridian to impinge perpendicularly upon the equator, i.e., at 90° and go along the equator a quarter of the way around the Earth. Then take a meridian back to the north pole. Taking the north-bound meridian we leave the equator at 90° and, since we went a quarter of the way around the Earth, the two meridians followed--- first southbound and then northbound--- will form another 90° angle at the north pole. {Figure 1) Therefore we have"

- Cite BEIRUT Address, p.24, 4-6 May6£

"traveled a triangular course with three right angles, which means that this particular spherical triangle's angles do not add up to 180° . In fact, they add up to 270° .

"This is a typical spherical triangle. The spherical triangle's angles add up to a variety of sums other than 180° . The amount that the spherical triangle's angles add up to more than 180° is called the spherical excess. The excess may vary all the way from 720° to 1° .

"Now if we make the triangle bigger (Figure 2). we can go, for instance, to the regular spherical tetrahedron each of whose four spherical surface triangles has three corners consisting of 120° each. Its spherical excess is then 360° minus 180° , which is an excess of 180° . If we draw one spherical triangle on the Earth's surface with each of its corners having 120° angles, it will divide the total spherical surface of the Earth into two areas each of which is bound by a closed line of three angles and three edges."

- Cite BEIRUT Address, p.24, 4-6 May'67

Spherical Triangle Sequence: (D)

` ` This means then that the bigger of the two spherical triangles which subdivide the total closed surface of the Earth, has three corners of 240° each.

"In this next picture we see two spherical triangles which subdivide the sphere into two equal areas--- two hemispheres (Figure 3). Here each of the corner angles of the two complementary triangles covering together the whole sphere have 180° at each corner. This shows us that the equator of the Earth is the boundary between two spherical triangles, each with each of its three corners being 180° ."

"In this next picture what« was originally the little spherical triangle at the top of the spherical-space model has become the big triangle, and what was the big spherical triangle has now become the little one. If you put those four pictures successively into the projector and then reverse the order and accelerate their sequential reappearance, you will begin to see both the triangles all the time and see the otherwise 'invisible' space sphere.

"Now I must explain that because the sphere is concave as"

Triangle Sequence:

(a')

"I have a hypothetical sphere here now and you are looking at one spherical triangle on the sphere and these are the three radii to it. . . . Whereas in plane geometry, in the regular geometrical triangles of the Greeks, the sums of the angles were always 180 degrees in the inside of a triangle. In a spherical triangle the sum of the angles of the triangle are never 180 degrees, so that spherical geometry is a very different kind of geometry from the plane. I want you to get familiar with it because there is no plane flat surface on Earth and so therefore there are no plane triangles and we are dealing always in systems and the systems are characterised by triangles which are spherical triangles and these are the * kinds of triangles which control our fundamental transformations.

- Cite OREGON Lecture *ffb*, p. 205-6, 10 Jul'62

. This is now a spherical triangle in which the angles are 120 degrees each. . . Now this other spherical triangle has angles of 120 degrees each: what we call a circle turns out to be a spherical triangle. Remember there is a hemisphere up there and one down here; and quite clearly that is the equator. . . Here we have the spherical triangle of 120 degree angles in the northern hemisphere of the sphere— which you don't tend to see, simply because you tend to look at the smaller one. There is a tendency of man to look at the smaller one. In fact, I will draw a triangle on the board and one of the problems when I put two triangles together and got four, you remember, was because they turned out to be complementary triangles. I draw a triangle on the board here and you are used to the Greek way of just looking at the area bound by the three sides. In fact, the Greeks defined a triangle as an area bound by three lines turning upon themselves, a closed line of three increments. It happens, however, that I have divided the surface of the blackboard into an area on this side of the line and an area on the other side of the line and every time I put in a line it actually divides something. We have a tendency to be extremely biased and only to look at an area on one side of the line."

- Cite OrtEGuN Lecture j/6, p. 206, 10 Jul'62

Spherical Triangle/Sequence:

"If I draw a triangle on the Earth . . . and I asked a student to do that . . . and I said all right, I see four triangles. And he said, I see only one. There is the little area, the area he has defined quite clearly. He has divided the surface of the Earth (which was unit before he drew the triangle) into two areas, the areas on either side of the line. The little local triangle and the big spherical triangle goes clear around the Earth. It is a closed area bound by a line of three increments. It was such a big one he didn't see it. And it is very typical of us to miss it. One of the most typical tricks I have found in humanity is to see the little www small one and miss the big one and the big one is the one that counts. Then I told him he drew four triangles and he said how did that happen. Well, they are ppherical triangles and there is a concave little and a concave big as viewed from inside and there is a convex little and a convex big as viewed from outside. Convex and concave are not the same, so there are inherently four. In fact you will always find there are four there. Four is the minimum; and when we get to any kind of system, there is always four there. You will get used to that fourness and get used to not allowing yourself to become over confined and looking at the little ones."

Spherical TriAnglelseguenC-e: (d *)

"When we get to the middle /of the sphere/ you are more or less willing to concede both hemispheres, and then you get caught on to the fact that those were 180 degreb triangles.

. . . What had been the big one is now becoming the little one, and what had been the little one is becoming the big one ... We get down finally to triangles where the angles are approaching 70 degrees, and they finally get down nearer to sixty degrees and so many minutes. They will never get to 60. Even the most local one will never be 60 degrees. So spherical triangles then do have a great variety of sums of their angles."

Spin:

"When other scientists seemed to have language more valid than my own I accepted their terminology. But I held to my own terminology when I found it to be warranted, and when other claimants could not be justified. For example, quantum mechanics came many years after I did to employ the term spin. The physicists assured me that their use of the word did not involve any phenomena which truly spun. Spin was only a convenient word for accounting certain unique energy behaviors and investments. My use of the term was to describe a direct investment of experimentally demonstrable

unique magnitude of rotation, an actually spinning phenomenon. This was a case when I held to my own terms. In mist recent years it is beginning to be realised by the physicists as an actually spinning phenomenon— as I had demonstrated it as actually occurring almost half a century ago. . . . In recent years I found the term spin being adopted by others; sometimes with the same meaning, sometimes with other meanings. But from the viewpoint of half a century there appears to be an increasing convergence of scientific explorations, eptemology, and semantics with my own evolutionary develppment

Spinach-

"Copper taken directly by humane is toxic. When spinach grows in the presence of copper as in those great fields in Northern Michigan (near the copper deposits I got to know at Phelps Dodge), the spinach takes in the copper in a way that is structurally and mechanically geared with the metabolic gears of humans. Copper is all right and fills in a deficiency if it fits properly. Spinach accomplishes the gearing. A gear is designed to mesh with other gears. But one loose gear put into the machinery will strip all the others. When it is on the right pinion it meshes with the other gears and can bridge a gear-train gap. That's exactly what happens to copper and spinach. Henry Schroeder worked with the trace elements. He showed that one Chromium atom is the difference between a diabetic and a nondiabetic. The word diet makes for great confusion. It's not undernourishment, it's just getting the right deficiency chemistry into the brain which may be lacking certain gears."

- Cite RBF to EJA, Pepper Tree Inn, Santa Barbara, 11 Feb'73

Spinach:

'•Copper if it is present in the soil where you are growing spinach--- spinach tends to inhibit the copper as a pattern and spinach that has inhibited copper also will inhibit some gold and silver and then the human being can Inhibit the gold, silver and the copper in very small percentages, but they are literally inhibitable and apparently measurably to the advantage of the human being. Copper taken in other ways than being Inhibited first by spinach can poison a man; it can be lethal. We find that copper taken in the right way can be beneficial and in the wrong way makes trouble. Remeber now that we are dealing not in a thing but in a pattern. . . "

"Apparently the human being can inhibit all the chemical elements if they come in at the right sequence, so as part of spinach, as part of that pattern, then it is tightening you up /~ see Monkey wrench_7 in a better way. . .

"All around the world there are large squatter settlements, as for instance in Puerto Rico, Caracas, and Bombay, These squatter settlements may increase by as many as a million people a year. These settlements are referred to formally as 'self-help' groups because they improvise something to sleep under that sheds off the rain, whether it's high wet-strength, three-ply, corrugated paper-board or rusty corrugated iron. These squatters are on land that by sovereignly-originated deeds of law 'belongs' to somebody else. The squatters are continually approached by racketeers who tell them (secretly) that the police are going to show up and evict them, but if the head of the family or the individual will give the racketeer some money, he knows the owners and will arrange that they be allowed to remain,

"In order to cope with this phenomenon, the UN Vancouver Conference passed a very extraordinarily wise and humanly considerate resolution. In travelling around the world and visiting such squatter settlements, I have observed their beautiful community life. People in trouble cooperate in a thoughtful and loving way. Their way of life is so beautiful that I have always said that if I ever have to retire I will"

Squatters:

"only retire into one of those squatter's settlements."

"It was also observed by the majority of the UN delegates that the people coming to squat are very ingenious in the way they employ the materials to keep the rain off. * Therefore, one of the first resolution passed by the Vancouver conference... recommended that all nations decree by law that all the land which these squatters occupy be made public lands on which the people are allowed to continue. It was part of the same motion that the squatters be given much better materials with which to accomplish their environmental controlling."

On the Bifurcation of the Struts in the Minimum Structural Systems ---Sec 411. of the T.C. «
segment

Stabilized Cube:

A vectorial-edged cube collapses. The cube's corner flexibility can be frustrated only by triangulation. Each of the four corners of the cube's six faces could be structurally stabilized with small triangular gussets, of which there would be 24, with the long edge structurals acting as powerful levers against the small triangles. The complete standard stabilization of the cube can be accomplished with a minimum of six additional members in the form of six structural struts

placed diagonally, corner to corner, in each of the six square faces, with four of the cube's eight corner vertexes so interconnected. These six, end-interconnected diagonals are the six edges of a tetrahedron. The most efficient stabilized cubical form is accomplished with the prime structural system of Universe: the tetrahedron."

"You will recall that I had started with a cube. Recognising that there are two sizes of cubes composited with spheres that we had come to. The first one had been the consequence of precessing together the two one-eighth octahedra, and they had a total of fourteen balls. Then we came to the next cube which occurred in a stable manner in which the vector equilibrium appeared when we knocked off those one-eighth octahedron corners. We saw in the cubical form those really open spaces that are unstable and we found that the whole thing was stabilized internally by being entirely in closest packing of omnitriangulation."

Stable Systems and Unstable Systems:

"Unstable systems are conceptual as momentary positional relationships of unstructured-component event aggregates. For example, amongst the stars comprising the Big Dipper--- in Ursa Major--- the second and third stars in the dipper's handle are, respectively, 100- and 200-light-years away from Earth and, though seemingly to us in the same plane, are not all so; and they are both moving in opposite directions and so in due course they will no longer seem to be in the same constellation. In the same way, four airplanes flying in different directions may be within visible range of one another, but are far too remote for mass-interattraction to become critical and pull them into one another. Stable systems are conceptual as structured, which means componently omni-intertriangulated, critical-proximity, interrelevant, coordinate, constellar, event aggregates," "If the only

momentary and optically illusory system consideration proves to be unstable, it does not manifest generalized principle. If systems are stable, they are inherent in and accommodate all generalized principles."

Cube & VE as Wave Propagation Model, 23 Feb*72

Vector Equilibrium Involvement Domain, 11 Dec*75

"The vector equilibrium may not be referred to as a stabilized structure except when six struts are inserted as diagonal triangulators in its six square faces, wherefore the topological description of the vector equilibrium always must be 12 vertexes, 20 (triangular) faces, and 30 linear struts, which is also the topological description of the

icosahedron, which is exactly what the six triangulating diagonals that have hypotenusal diagonal vectors longer than the square edge vectors bring about when their greater force shrinks them to equi-length with the other 24 edge struts. This interlinkage transforms the vector equilibrium's complex symmetry of six squares and eight equiangled triangles into the simplex symmetry of the icosahedron."

Star Events:

"The regerative patterns . » . of structures . . . may be described as constellar because their component events stand dynamically together like star groupings, and any event patternings which become locally regenerative are constellar patterns.

"All the forces operative in universe result in a complex progression of most comfortable (i.e., least effort) arrangements in which the macro-medio-micro star events stand together here and there as locally regenerative patterns."

- Citation <t context at Structure Sequence (1)(2), 1965 --C&E KKPKS, p.66,1965'

Star Events:

"... The minimum set that may form a system to divide universe into micro and macro cosms is a set of four items of consideration. Between the four stars that form the vertexes of the tetrahedron, which is the simplest system in universe, there are six edges that constitute all the possible relationships between these four stars. When we have found all the relationships between the number of items of our consideration we have what we speak of as 'understanding.' The word 'consider' derives from the Latin words for 'together' and 'stars.' When we understand, we have all the fundamental connections between the star events of our consideration."

- Cite SUMMARY VISION 65, p. 139, Oct'65

Star Events:

'Thinking is the consideration of different experiences, inherently separate sets of events, and trying to find out what their relatedness is. Each one is a star. How many stars does it take to develop a geometry of outwardness and inwardness? //hat is the minimum number of stars to divide the universe into outwardness and inwardness? I find it takes a minimum of four. You can't do it with three. Four very clearly has an outsideness and an insideness. This is what we call the tetrahedron which has these four stars and these six sets of interrelatedness. This comes in very interestingly in mathematics with the generalization that you don't have to worry too much about the shape, but the four stars are the minimum which we can really have for an important thought. If I discover only three stars in a thought, there must be at least a fourth star lurking somewhere in the constellation. In fact. I discover that all the number of

stars that could possibly be related are always subdivisible by four. The mathematics shows this up very clearly as complexes of tetrahedra. Tetrahedron becomes the minimum thinkable set, the minimum reconsiderable set, and it turns out to be the fundamental increment out of which all thoughts are constructed."

Stars: Implosive Forces of the Stars:

"Now, in the most recent inventory of what we're learning about our physical Universe in a comprehensive manner, usually on the part of the astrophysicists having discovered the isotopes of the different chemical elements and discovering a pattern of relative abundance of those chemical elements, and discovering then that the behavior of the chemical elements is to work from the high number elements down towards the low number. The fact that we do have high numbers such as Uranium means there must be some part of the Universe where high number chemical elements are compounded, where they come together, `./hereas, in their presence on Earth, they tend to be coming apart, they tend to be working towards the lower number.

"So there's the working assumption that in the implosive forces of the stars we may be developing the high number chemical elements. But the astrophysicist says that no matter how far things come apart, they never come further apart fundamentally than proton and neutron which always and only coexist."

\$^{tar} Tetrahedron:

"The Star Tetrahedron is a structure--- but It is a compound structure. The fifth tetrahedron, which is the original one, accommodates the pulsations of the outer four. Its outward pulsings are free and its inward pulsings are repulsive--- that's why it's a star. The four ecternal pulsations are unrestrained and the'External pulsations are compressionally repulsed. Leonardo called it the Star Tetrahedron not because it has points/but because he sensed intuitively that it gives off radiati/bn like a star."

RBF DEFINITION:.

Star Tetrahedron:

"The name of this dynamic vector-equilibrium complementary tetrahedron is the star tetrahedron. The star tetrahedron is . ne in which the vectors are no longer equilibrious and no longer omnidirectionally •nd regeneratively extensible. This star tetrahedron name was given it by Leonardo da Vinci.

"The star tetrahedron consists of five equal tetrahedra, four external and one internal. Because its external edges are not 180° angles it has 15 instead of six external edges and is a compound structure. . .

- Cite RDF i-xrginalis on SYKuRG./fCL draft Oct. *71

"There is a syntropic pulsation receptivity and an outward pulsation in dynamic symmetry of the star tetrahedron. As an energy radiator it is entropic. It does not regenerate itself internally, i.e. gravitationally, as does the isotropic-vector- matrix's vector equilibrium. The star tetrahedron's entropy may be the basis of irreversible radiation, whereas the syntropic vector equilibrium's reversibility— inwardly-outwardly is the basis for the gravitationally maintained integrity of Universe. The vector equilibrium produces conservation of omnidynamic Universe despite many entropic local energy dissipations of star tetrahedra. The star tetrahedron is in balance with the vector equilibrium-- pumpable, irreversible, like the electron in behavior. It has the capability of self-positionability by converting its energy receipts to unique refraction sequences, which could change output actions to other dynamic, distances-keeping orbits, in re: pect to the— also only remotely existent and operating— icosahedron, and its 15 unique , greatcircle self-dichotomizing; which icosahedra can only associate with other icosahedra in either linear-beam export or octahedral orbital hover-arounds in respect to any vector equilibrium, nuclear group."

"Energy cluster foci are starts, or topological ver-texes, which are only the as-yet-nonanalyzed group phenomenon whose energetic point centers of event clustering locals are as yet too remote for the present observer's position. . .

- Citation and context at System, 29 Dec*58

"I don't like the word 'fundamental' because it's just the wrong way to start out thinking. We may use the word 'primitive' to describe the initial self-starting condition of divergence. Thus the primitive., is quite different from the 'fundamental particles' game of the high-energy research physicists.

"Infinity is like frequency; it is a subdividing. Because synergetics has conceptuality independent of size it permits conceptuality before you start subdividing. There is no a priori size; size commences only with subdivision.

"Instead of 'three-dimensional' we may say insideness-and- outside-ness, or we may say four-dimensional, referring to the four planes of the tetrahedron.

"The vector equilibrium is inherently prefrequency with an a priori volume of 20 tetravolumes. The vector equilibrium is... a priori fourth powering."

- Cite HBF to EJA. national Airport, 'Washington, DC; 19 Feb'73>

Starting with the Minimum:

See Proofs, 8 Aug'73?

"Since humanity started with parallel lines, planes, and cubes, it also adopted the edge line of the square and cube as the prime unit of measurement. This inaugurated geomathematical exploration and analysis with a part of the whole, in contradistinction to synergetics' Inauguration of exploration and analysis with total Universe, within which it discovers whole conceptual systems, within which it identifies subentities always dealing with experimentally discovered and experimentally verifiable information.

"Though life started with whole Universe, humans happened to pick one part--- the line, which was so short a section of Earth arc (and the Earth's diameter so relatively great) that they assumed the Earth-scratched-surface line to be straight. The particular line of geometrical reference humans picked happened not to be the line of most interattractive integrity. It was neither the radial line of radiation nor the radial line of gravity of spherical Earth. From this nonradial line of nature's event field, humans developed their formulas for calculating areas and volumes of the circle and the sphere only in relation to the cube-edge lines, developing empirically the 'transcendently irrational,' ergo, incommensurable, number π {If } , 3.14159... ad infinitum, which provided practically tolerable approximations of the dimensions of circles and spheres."

Starting with Universe:

"Our definition of Universe provides for the undiscovered and for the yet-to-be-discovered. Do not worry about that furthestmost star which is yet to be consciously apprehended by any human being. Do not think that we have not provided for those physical or chemical phenomena as yet not observed and recorded by human or mechanical sensing devices. The existence of such phenomena may not have even been postulated but they can all be accommodated by our definition of Universe.

"Because we start with whole Universe we have left nothing out: there is no multiplication by addition; there is only

multiplication by division. The furthestmost star and the most unfamiliar physical phenomena are accommodated by further arithmetical subdividing of our aggregate of overlapping experiences. Nothing could have been left out when you start with whole Universe."

'>tfhat is your opinion of Noam Chomsky's Structuralism?

Q.

RBF: "'S' is a vary structural sound in any language:

Stop, start, arrest. 'S' is an abrupt change.... Snakes."

- Cite RBF videotaping session Philadelphia, Pa., 1 Feb*75

Structural Sequence: (A)

"Speaking in terms of generalised law, structure is the consequence of a complex of six energy events, three dominantly tensive and three dominantly compressive, interacting in a complementary way to produce a seIf-regeneratively stabilised pattern. Contrary to common misconceptioning, even that of engineers, structures are omnidynamic---never static. All special case structural realisations have specific longevities. All structures are entropic, i.e., they give off energy. The energies are often syntropically replaceable. Any and all of what humans identify as substance of any and all structure consists entirely of atoms.

"Atoms are not things. They are energy events occurring in pure principle. Physic® has found no solids, no things. All substances consist of atoms: x-illions of atoms interarranged in inherently coherent patterns, inherent because governed synergetically by generalised pattern integrity relationships. Each and every experimentally evidenced atom is a complex of unique system interrelationships, both internal and external, which reappear as unique special case energy investments manifesting generalised tt.'' pattern integrity principles"

in unique special case scenario continuities."

- Cite RBF Intro, to H. Kenner, "Geodesic Math," p.11, B Sep»75

Structural Sequence: (B)

"Atoms consist of a plurality of unique energy events always occurring as self-interarranging, inherently coherent, persistently regenerative pattern integrity complexes. Physics has no experimental evidence of either the creation or the decreation of energy. Apparently, energetic Universe is eternally regenerative and is ever intertransforming between its syntropic- ally associative and entropically disassociative phases, being either gravitationally dr e stromagnetically cohered as matter, or being convertingly disassociated as radiation, with the dis- associative components being separately particularised in both objectively- and nonobjectively-identifiable components,

"The nonobjectively-identifiables are sometimes only inferenti- ally identifiable as being consistently present at a consistent fractional magnitude. All the intertransformings and conversions are nonsimultaneous and occur at a plurality of unique rates and magnitudes of intensity, duration, and synergetic behavioral proclivities, the sum total of which nonsimultaneous and only partially overlapping transforma-

tions or conversion durations are inherently nonunitarily conceptual and together produce what we have described as scenario Universe, which has neither an inherent beginning nor ending, in contradistinction to any"

- Cite RBF Intro, to H, Kenner, "Geodesic Math," p.12, *ft Sep*»75

Structural Sequence: (0)

"one unitarily conceptual, static, single-frame, terminate picture in a moving picture film strip. Human astrophysicists have ample evidence of the scenario Universe having been in full dramatic operation 10 billion Earthian-Sun-orbit years ago. Anthropologists have evidence of human presence on our planet over three million years ago, which is only 1/3000th of the known-to-be-in-operation scenario.

"Humans have only an 8,000-year-long humanly inscribed record of the human continuity portion of the cosmic scenario, which is only one one-millionth of the known-to-have-been-in- continual-operation cosmic scenario. Humans can make highly probable, exquisitely detailed and accurate million-year astronomical and nucleonomical behavior predictions. Humans cannot make even mildly probable detailed predictions regarding socio-economic Earthian affairs. However, humans can make highly probable half-century-duration engineering predictions regarding humanly contrivable physical structures.

"Human mind can speculate regarding the possible synetgetical significance of the whole cosmic scenario, but human sight and brain can sense only one momentary special case picture at a time

- Cite RBF Intro, to H. Kenner "Geodesic Math," p. 12, 8 Sep'75

Structural Sequence: (D)

"Universe is synergetic. Universe is synergetically consequent to all the generalized principles known or unknown. Universe is not a structure. Universe/filgbraces all structures and more. While a plurality of generalizations governs all structures, realized structuring is always special case. Structures are synergetic consequences of the intimate Interaction of a complex of special case factors. Superficially, structures are unitarily conceptual.

"Scenario Universe embraces all the nonsimultaneous, only local-in-time-and-place structurings, destructurings, unstructurings, and restructurings. All the soraethingnesses are structures. All the nothingness is unstructure. All the somethingnesses are special case. All the nothingness Is generalized.

"Everything we call structure is synergetic and exists only as a consequence of interactions between divergent (compressional) and convergent (tensional) forces."

Structure:

"Physics and engineering have never defined the word structure."

- Clta RBF to EJA, 3200 Idaho, Wash., DC; 23 Jan'76

Structure:

"Everybody thinks they know the meaning of the word 'structure.* They point to a stone wall, bridge, or barn, saying 'that's a structure.' But what is really meant by the word structure? What is common to a steel bridge, a wooden bam, a jumbo jet, an iceberg, a starfish, a star ,a fern, a diamond jewel, an elephant, a cloud, and a human baby? They are al¹ structures. Some are more versatile. Some last longer than others. Why? Why does the stone, wood, and steel cohere at all?

"Understanding a little more about structure could lead to a better understanding of the economic and political dilemmas of our time. Political and economic systems are structures, often so ill-conceived as to require constant local patching and mending. Even structural engineering has, as yet, failed to adequately comprehend, define, and cope with structure."

"And we use the word structure a great deal. I want it to have real meaning when I use the word structure. This consists of six independent parts, three flexible angles and three rigid edges. Push-pull members, they're called. A structure is a complex of events which interacts in such a manner as to produce a stable pattern. And this triangle--- and a triangle alone--- will produce these conditions, in other words, when I use the word structure, it turns out to be uniquely the triangle. Everything you say you recognize, means that you recognize a pattern. The recognizability of the pattern must go back to some triangles.

structure Sequence; (1)

"What do we mean by the word structure? I have pondered on it a great deal and have decided to define 'structure' literally from a descriptive consideration of its natural occurrence--- for instance, its occurrence in chemical elements--- for the family of chemical elements and their most complex agglomerations as super star galaxies are alike fundamental structures. It is clear in the results of modern scientific experiment that structures are not things.

"We might define structures descriptively as patterns of inherently regenerative constellar associations of energy events. That sounds intricate and obscure at first so perhaps I had better explain what I mean by each of the terms.. For instance, by inherent I mean behavior principles discovered by man always to be reliably operative in Universe under a given set of circumstances. I use the term regenerative because in an all-motion Universe (which Einstein posited and the physicists in due course found to hold true), all the patterns of the Universe are continually but nonsimultaneously affecting all the other patterns of Universe in varying degrees and are continually reduplicating themselves in unique local configurations-**

(2)

"Patterns. These patterns may be described (Fig, 1) as constellar because their component events stand dynamically together like star groupings, and any event patternings which become locally regenerative are constellar patterns. It is a tendency of patterns either to repeat themselves locally or for their parts to separate-out to join severally or singly with other patterns or to form new constellations.

"All the forces operative in Universe result in a complex progression of most comfortable (i.e., least effort) arrangements in which the macro-medio-micro star events stand together here and there as locally regenerative patterns. I call these spontaneously regenerative local constellations basic structures since they appear to be universally and inherently recurrent. This definition of structure holds true all the way from whole nonsimultaneous Universe through all the lesser local and inherently regenerative pattern differentiations down to the atom and its nuclear subassemblies."

Structure Sequence; (3)

"Now you know what I mean by structures as the inherently regenerative local constellar subpatternings of Universe, Since by my own definition Universe is the historically synchronous aggregate of all men's consciously apprehended and communicated (to self or others) experiences, and since the experiences are each finite but nonsimultaneous, Universe is a nonsimultaneous yet dynamically synchronous structure, which is unitarily nonconceptual as of any one moment, yet as an aggregate of finites is sum-totally finite. Thus we realize that finite structures are mostly nonconceptual in any momentary sense , though certain local structures in Universe are momentarily conceptual, such for instance as the continually transforming historical aggregate of men's experiences packaged together in the words "Planet Earth." This may be a difficult introduction to the subject of structures but it sets the stage for further thought searching on a subject

whose heretofore illusory 'static solidness' has completely misled human thought and occasioned the last century's discoveries of science to be perversely surprising information seemingly to be dealt with only by geniuses."

Studying:

Subconscious:

"Subconscious: All I know is that without my subconscious— extraordinarily reliable phenomenon—that I say what is the name of that man? or the name of something? and this feedback suddenly comes back, the searching capability is really very magnificent.

"I tell myself that I want to wake up at such and such a time or second. I will do that. Much of my experience of Inventing and exploring physical problems comes to a terminal condition on a given day but I know what it is that I need to discover. I'm very liable to wake up with the answer because the subconscious goes right on processing. So the subconscious is something very impressive. I think we are very much misapprehended of the magnitude of the subconscious and conscious. I think we are probably 99.999 percent subconsciously operative. With no awareness of / ? If I had to consciously take care of all the self-replacing of myself and my fingers, etcetera we would have no down time at all. I have processed over 1000 tons of air, food, and water that became temporarily a part of the organism."

Subconscious Coordinate Functioning:

'To such an extent does man belittle in man's importance that he doesn't realize that he is himself almost completely automated, that he is subconsciously coordinated and motivated and also part of an immensely evolving totally new era gestation process to be realized in magnitude beyond man's conception."

- Cite AAUW JOURNAL, May 1965, P. 174

"By my calculations there is mathematical probability that progressive mastery by man of the physical coordinates of nature and their progressive subordination by man as separate categories, and subordination to total abstract concepts, may indeed be trending historically to permit the integral being of the child to remain unfractionated throughout the total life span. For instance, we are unaware of our own tongues until we bite them. When in health and 'good form' the total myriad component functions of our physical organic being are entirely subordinated to subconscious coordinate functioning. commanded by the integrity of the individual life, When life has departed, the full physical inventory remains--- useless, reminiscent, but that is all. That is the way I see things, I am convinced that creativity is a priori to the integrity of universe and that life is regenerative and conformity meaningless."

Subfrequency:

"Frequency and size are the same phenomena. Subfrequency prime tetra, prime octa, and prime icosahedron are each constituted of only one edge module per each triangular facet. While generalizably conceptual the prime structural systems and their prime domains, linear, areal, and volumetric, are inherently subfrequency, ergo independent of time and size.*

l-tz]

- Cite SYNERGETICS draft at Sec. 101117 Feb'73

Subfrequency: (1)

"The vector equilibrium is an interesting kind of geometry because, just looking at it as a model we see a square, a square, a triangle, etc., starting at a common center all the vertexes are equidistant from the same center in a one-frequency system. The word frequency would never relate to the word one, incidentally, because frequency involves some plurality of events. Therefore, frequency would begin at two, so sub-frequency and what I spoke about yesterday, a sub-size, we begin to have frequencies for size. Therefore, vector equilibrium is really subsize. It doesn't have size, if it looked like this and every edge were divided into two and interconnected, then it would be a two-frequency system and all the radii would have two increments. It is a single system and yet it has a tetrahedral volume of 20, whereas the cube, when the edge module is one, the volume is one. When the edge module of a cube is two, then the volume is eight. So looking at vector equilibrium as unity— as all the domain of a point, and so forth, we find that it has a volume of . . . I developed an intuitive feeling long, long ago that the word unity was inherently plural. How could you have unity in the singular? That concept changed quantum in wave mechanics. . . I am giving you a way that you have to look at unity as being tetrahedra of 20; and if I am

Subfrequency: "talking about A and 8 particles, I have to talk about unity as 480. Unity starts as 480,"

"In the Babylonian, Egyptian, and Ionian era# of ways of looking at, thinking about, and formulating, there evolved a concept of a 'first family' of geometrical 'solids,' in which each member was characterised by all of its faces being identical and all of its edges being one length only. Humans were then unaware of what physics was only much later to discover experimentally: that nature discloses no evidence of a continuum. Experiment discloses only aggregates of separate, finitely closed events. Ergo, there are no solids.'

Success:

"...It is technically feasible, with the resources we now have—the knowledge we now have— to actually take care of all humanity at the highest standard of living anybody has ever known. I see no excuse whatsoever for the rtyerty class. We must take our highest capability and, instead of applying it to the weaponry—how do we kill?—applying it to how do we really make those people successful.

"We're in for a very great reorientation. We're learning our lessons. Fortunately all of humanity is in on this. We're on the air. All of humanity is on the air today. And we are learning. But we are going to have to really learn to really take our highest capabilities and apply them directly to making man a success.

"That's why I find this very educational... and the people who are here have qferreat responsibility... and I see earnestness everywhere. But we are Just preoccupied with reform, which really doesn't work."

- Cite RBF to "Town Meeting of the Air," Wash., DC; 10 Sep'75

Success: "Nature is really trying very hard to make man a success."

- Citation & context at Intuition as Remote Cosmic Transmutation, 29 Jan'75

Success:

Again and again,

Step by step,

Intuition opens the doors That lead to man's designing Of more advantageous rearrangements Of the physical complex of events Which we speak of as the environment, Whose evolutionary transition ever leads Toward the physical and metaphysical success Of all humanity."

- Citation at Intuition. May'72

- CITH TMTHTTN ,_p.5grMay~~>72

Success:

"I don't, think the Universe is a failure. And the reason I don't think so is that as far as we can see Universe is the minimum eternally self-regenerative system, so we can only think of it as a complete success. It includes everything we experience, and all of it has logical and really sublime integrity."

- Citation & context at Tragedy. Feb'72

Success:

"That humanity is indeed destined To be as comprehensively successful As is the hydrogen atom

And that humanity is now directly geared-in

With the inexhaustible

Physical and metaphysical wealth of the Universe

And can afford not only to do whatever it needs to do--- And right now

But in fact can afford
Nothing else but success. Right now!
The alternative is 'curtains'
For the little crew of humans

Aboard this approximately inconsequential Celestial vehicle, Earth."

Success:

"Design science regenerations will induce . . . , spontaneous and
economically successful industrial proliferation by world-around
services' managements . . . which . . . will both permit and induce all
humanity to realize full lasting economic and physical success pluss
enjoyment of all the Earth without one Individual interfering with or
being advantaged at the expense of another,"

” «^{onte} « at aiUSEi-1: MaHiAa Trying To Do.

< Mar'08

SUCCBBB:

"...How vain we are when man thinks of himself as being responsible
for his extraordinary success. We talk in the Americas of being very
worthy and that we've won our way to the top of the world, and that
other people over here are not so worthy. I don't think that man has
had much to do with the relative success.

"In the first place, the success starts with the fact that we are extraordinarily chemically balanced and there is some power in the Universe where the energy conditions are such that we exist at all. That we happened to be here--- we had nothing to do with that!

"Men have been taught that there is not enough to go around and that it is you or me. I do observe the struggling going on, not only in politics but in Universities: who is going to come out on top? And I would say that essentially men have been working against other men. If they are successful it is not because they have been working together. From time to time they have meetings, and they say, 'Let's work together.' and this is fairly specious."

- Cite Oregon Lecture fl, pp.28-29, 1 Jul'62

Success: (2)

"So I say the success we have had so far is essentially due to a pattern of evolution which is beyond the control of man... and I would really like to try to find out all we can about what is going on."

Suicide?

"Suicide cannot be justified because it is a waste of accumulated human experience."

- Cite RBF videotaping transcript. Penn Bell Studios, Philadelphia, 27 Jan'75

"In 1961 scientists successfully demonstrated to one another that overspecialization was the cause of extinction of all the biological species and of all the human tribes, which now have vanished from the planet Earth. With the world politicians whooping up the education-for-specialization system for all their people, world man was training swiftly for total suicide of humanity. He developed the means of self-destruction by many means-- the atomic bomb, gas and microbe warfare, pollution of his water and air, exhaustion of his energy wealth without having the comprehensive world will and means to stop himself. . . .

"Humanity has been only inadvertently saved from extinction. . . . The new fall-out technology which displaced man as a specialist (professional scientist or craftsman) is the new computer-monitored automation industry.

Super-Atomics Sequence: (1)

"Those subsequently isolated dienicl elements beyond the 92
prime self-regenerative chemical elements constitute superatomics.
They are the non-self-regenerative chemical elements of negative
Universe.

"Netive Universe is the complementary but invisible Universe, To demonstrate netive Universe, we take one rubber glove with an external green surface and an internal red surface. On the green surface a series of 92 numbers are patterned; and on the red surface a continuance of 93, 94, through to 184, with number 184 at the inside end of the pinky--- each of the inner surface numbers being the inner pole of the outer pole point number positionings, The positions of the numbers on the inside correspond to positions of the numbers on the outside. The numbering starts with the position of the five fingernails, then their successive first joints, and then their successive second joints from the tips: 5, 10, 15, and 20 numbers accommodated by the digits. The other 62 members are arranged in four rows of 12 each around the back and front of the palm of the hand. There is a final row of 14 at the terminal edge of the glove opening: this makes a total of 92. Now we can see"

- Cite SYNERGETICS corrected galley at Secs. 419.01+.02, 5 Nov'73

Super-Atomicp Sequence: (2)

"why the 92 numbers on the outside were discoverable in a random manner requiring very little physical effort. It was just a matter of which part of your gloved hand you happened to be looking. But if we become curious about hwat may be on the inside of the glove we discover that the glove is powerfully resilient. It takes a great deal of effort to roll back the open edge--- and it takes increasing amounts of power to cope with the increasing thickness of the rubber that rolls up as the glove opens. The elements from 93 on are revealed progressively by the numbers.

"The discovery of the first 92 self-regenerative chemical elements was not by the successive numbers starting with one, but in a completely random sequence. In the super-atomics, beyond uranium, number 92, the split-second-lived chemical elements have been discovered in a succession that corresponds to their atomic number; for example, the 94th discovery had the atomic weight of 94; the 100th was atomic weight 100, etc.

"This orderly revelation is in fundamental contrast to the discoveries of the 92 self-regenerative elements and their"

superatomic Sequence: (A)

"If one sphere is completely surrounded by other spheres equal in size and packed as closely together as possible, exactly 12 spheres, no more no less, make up the surrounding layer.

"If a second layer, or shell, be formed around the first, 42 spheres will be required to complete the shell.

"To form a third layer, or shell, 92 spheres are required.

This structure... suggests analogies with the 92 unique regenerative atomic systems which make up the total number of chemical elements found in nature; and with the nuclear energy pattern of Uranium, the 92nd element in the atomic table... if we add together the 12, 42, And 92, the numbers of spheres in the first three layers, we get the sum, 146 the number of neutrons in Uranium.

Since it is assumed that every layer of a finite system has both an interior, concave associability and an exterior, convex associability potential... the outer layer of an atom system always has an additional, full number, unemployed associability count.

"It follows that an additional 92 is to be added to the 146— " - Cite MARKS, p.40, 1960

"the sum of numbers of the spheres in the first three shells. The total is 238, the number of nucleons /~sic_7 in Uranium, whose atomic weight is 238. ' '

"Four of the nucleons on one of the square faces of the vector equilibrium's closest-packed aggregation of nucleons, may be separated out, without impairing the structural stability integrity of the balance of the aggregate. This leaves a residue of 234 nucleons, which is the fissionable state of Uranium--- which must go on chain-reacting due to its symmetry."

Superstition:

"The dubious meanings for untenable superstition and propaganda first become ragged, foggy" and then deteriorate into obsolescence."

- Citation and context at World-Around Language (3), circa 1955
&u?jarBUtlc>n:

"Vanity and superstition constitute the plus and minus springs of ignorance, the expansive and contractive 'raison d'etre*' of boast and fear. The boasts and fears of ignorance may be maintained spontaneously only when there is no obviously periodic contradiction in physical experience.

- Citation and context at Ignorance (1), May'49
Superstition;

"Superstition is another important all-time force, but it was derisively dismissed by the technocrats as mystic pish posh, allowing man to fall into the piteous pathologic condition that they sneeringly considered engulfed by many men, 1-Iany worldwide superstitions, however, are scientifically rationalizable and sustainable as of high Importance.

"The superstition that singing too early in the morning is a forerunner of tears in the evening is universally current in primitives and among supposedly highly developed, socially cultured people. The superstition is actually--- in view of the wave phenomenon and unit of energy output clearly measured and charted in emotional attitudes--- an indication of man's ultimate anticipation of the necessary balancing of lows and highs. In it, therefore, is a distinctly scientific proclivity. Yet emotion, so essential to selective growth and survival was denied by technocracy as a social factor."

- Cite Nihil CHAINS TO THE NOUN, p.89, 1938
Superstition of Social Superiority:

"Individuality goes far deeper than these surface manifestations with which people have sought to deceive one another as to the relative importance of their status and the bitter struggle to validate one's right to live. Those who were powerful but ugly and lousy paid for fine clothes and fine surface architecture, and a superstition has persisted that people who could afford to pay must be superior individuals.

"The powerful have whipped the weak for centuries on end to instill that superstition. As long as might excelled over right that superstition had to continue. Now that we propose housing to be produced by an industry in which right makes might at less than a pound per horsepower the superstition is obsolete."

Pure principles are useable. They are reducible from theory to practice. For instance, we have these waves on the water. You may do surfboarding yourself, but at any rate it is very interesting. It is like skiing except you have a very interesting condition where the mountain keeps moving along and so as fast as you go down the mountain, the mountain is going up as fast as you slide down it, and you never get down it. It keeps coming up for you very nicely so you are continually using gravity. If you are coming down it too fast you can start using that angular descent, and you can angle so you don't come down so fast and you can wait until the wave comes up to you again. You begin to discover you can stay up on that wave by angling yourself--- and keep going on and on and on. This is what the porpoises do. They go right around the world riding a wave without any effort at all. It is a very good way to go around the world on pure principle."

Survival Sequence: Love;

(1)

"Q: --- What do you see man's immediate future to be? From all sides we hear that we are on the precipice of disaster. You seem to have a very optimistic outlook on the future of man. What are your views on man's immediate future?"

"»*•>. Fuller:--- I certainly would say in the first place that it is very complex. I feel that man aboard our planet is in a very critical condition, evolutionarily. As to whether he is really evolving into whatever his function may be in the total scheme of the Universe--- whether he is really making good--- he is very much on trial. I can, as a student and experimenter, and an actual doer, aware of the technical ways in

which it is highly feasible for all of humanity to survive at a higher standard of living than anyone has ever known. . • But I am also aware of the inertia and the conditioned reflexes which are permissible, and the small ways we seem to be preoccupied, and the shortsightedness of our preoccupation with today. So that the question whether man can make it or not: I would not presume to make any prognostication at all. All I can do is to try to find the factors which would tend to wave in one direction or the other, positive or negative."

- Cite RBF at £113, U. Kase., Amherst, 22 July »71, Talk 12, p. 15

"To me by far the most positive factor is all the children who used to die who no longer die; and that every child is

born with faculties--- with ears, eyes, nose, and mouth and the child says that is what I smell, that is what I see.

You don't have to teach a child to say what it is that he

sees; he tells you spontaneously. In other words, truth is spontaneous, and the lying has been taught to the children by those who are afraid that the child's truthfulness will put them into trouble. So the fact that truth is spontaneous is equally mysterious as the fact of mass attraction and gravity cohering our Universe; as is the phenomenon love. we experience so much of it we tend to take it very much for granted.

"I am going to try to give you a little bit of a shock way of understanding how extraordinary is the love. That man would really understand, cohere, and want to understand. For instance, in order to have man regenerate himself on our planet--- assuming he has an important function to be performed in the Universe-- to be sure that he would live for many, many generations until he was able to develop enough knowledge, enough competence to be able to perform that function: having him regenerate himself."

- Cite 311.11 (Cont.)

"I would like just to ask you to think a little about how much you take for granted about your own physical being. People talk about technology as something formidable, whereas Universe is nothing but technology. If you stand in front of the mirror and stick your tongue way out, and take a good look at it. . . If a salesman came along and said •I'd like to sell you one of those,' and stuck his own tongue out, I don't think you'd buy it. In order to be able to regenerate man has also to have a liver, and a kidney, and a stomach, and a heart. If you went to a supermarket and saw kidneys, and stomachs, and hearts hanging up, I don't think you'd buy yourself. It is an extraordinary matter--- in order to be able to bring about this complex technology of becoming reproductive and procreative. It would be very difficult to think of a liver hanging up there falling in love with another liver. So nature developed this fantastically beautiful packaging and put all these things out of sight. And it developed such coordination that the whole thing is operating subconsciously with your brain having a quadrillion times a quadrillion atoms in superb coordination by which you and I can communicate at this extraordinary moment."

* Cite 311.11 (Cont.)

"I would say then to beware that this man would really have the drive to go after the knowledge and to really understand, he was given this most extraordinary of all faculties, love. And when I take the young world being born in the presence of greater, more reliable information and a little less misinformation. . . , he's being made aware of total man in seconds, and he is spontaneously truthful, and has spontaneous love. These are the ingredients I think, about how we are going to come through."

SHMMI Sweepout in Scientific Exploration;

"Individual specialists tend to go off and get themselves into finer and finer focus, to a one degree focus and then a half-degree focus and then to minutes and seconds of fineness of focus. However, something happens in the area of specialization, as you get more and more men into microbiology, for instance, with each one of them taking a specialty there are enough of them so they began to make ^a sweep-out sum totally and together they began to sweep out a fairly large sector. With one specialty, the total number crowding one another in order to be specialists, began to

use a little larger angle. . . . Men didn't have very large microscopes or telescopes yesterday so when they were specialists they stayed within the area they could see; and this must have taken them into very different parts of the Universe and they were far apart."

- Cite Oregon Lecture #4, pp. 120-121. 6 Jul'62

I am making a prise working assumption that man has a function and that nan is here for his metaphysical capability, nit his physical. His muscle is less than that of a donkey...

- The energies in the Universe are just incredible and they get to a billion galaxies with 100 billion stars each. Anything man has physically is absolutely nothing. But little man on our planet, learning about the principles of optics, learning about the principles of refraction of light, and able then to develop beautiful lenses to magnify, to make a great reflector such as Mt. Palomar and discover that there are a billion galaxies with about 100 billion stars each, 99 percent of which are not visible to the naked eye.

- For man learned scientifically and synergetically as a series of events that prisms do reflect light and break the light up into red, orange, yellow, green, blue, violet; and he discovered accidentally that the light coming from an incandescent chemical element going through the prism produced another color that you and I can't see but that the chemical emulsion could see in the earner a photograph. And thus we discovered that every one of"

"the chemical elements has its unique frequencies. • all the colors you can't see, the invisible colors.

"With Mt. Palomar man has been able to make this sweepout of 11i billion light years; with each light year 6J trillion miles, and we have 11J billion of those... that distance of the Universe where you and I can't see with the naked eye... all the light coming from all those stars... where you can't see him alongside of a big ocean wave let alone a mountain, and you're coming in from space... looking through the clouds you see the blue of the water and the ground, but you can't see the mountains. Human beings are absolutely invisible there...

"Little human beings that are invisible on Earth have still been able to take this data and discover the inventory of the relative abundance of all the chemical elements and its 22J billion-light-year-diameter spherical sweepout of information in the sky. We have this kind of capability on board our planet; We have this capacity to monitor local Universe. And that's exactly what we're here for. Let's have no more nonsense about muscle still running our Earth. What is our muscle doing in this kind of picture?"

Synchronization:

"There is an octave pattern in every system and every time we come to nine--- whether it be $3 + 6$, $2+7$, of $8 + 1$ --- it is zero. Waves are octave and one reason they do not interfere with one another is because of the zero. If we apply the phenomenon of radiowaves and

other high frequencies--- waves passing through seeming solids--- or low frequency waves, we can imagine that the lack of Interference could be explained through the crossing of the high frequency waves through the much lower frequency waves at the zero point.

""If we construct a model with balls we may be able to see this more clearly. If I make an X configuration with one ball in the center common to both triangles of the X, the ball at the intersection common to both represents the zero or the place where the waves cross and pass through each other. The zero always accommodates when two waves come together. We know that atoms close pack in this manner and we know how wave phenomena such as radio waves behave. And now we have a model to explain why they do not interfere."

- Cite SYNERGETICS, "Numerology," pp. 11-12. Oct. '71.

Synchronization?

"By designedly synchronized frequency of reoccurrence of their constituent event patternings, a machine gun's bullets may be projected through a given point in the rotational patterning of an airplane's propeller blades. Such purposeful synchronization of a succession of alternate occupations at a point, first by a bullet and then by a discretely angled propeller blade, and repeat, is called angle and frequency modulation; together, they avoid interferences. All physical phenomena, from the largest to the smallest, are describable as frequencies of discrete angular reoccurrence of intimately contiguous but physically discontinuous events. All physical phenomena are subject to either use or nonuse of angular- and frequency-modulating interference capabilities."

- Cite SYNERGETICS text at Sec. 516.03; draft of Apr'71

"I think that very probably then in the light we will be able to have synchronization of the corpuscles as not touching one another and yet have two beams going what had seemed continuous away, but really tensionally, and therefore really not have any problem of interference."

"I am deeply aware of the vast ranges of unexploited geometry that is of importance, however, is an awareness of the generalised, comprehensively coordinate, arithmetical, geometrical, and factorial system employed by nature in all her energetic-synergetic transformative transactions. There is also a fundamental hierarchy of these events. These also coincide, and integrate, with topology, quantum mechanics, and chemistry--- and, amplify all the latter subjects."

- Cite RBF Ltr. to Steve Baer, 19 Apr¹66

Synergetic Hierarchy: (1)

"I have broken through to the almost unbelievable frontier where, clearly and elegantly treatable, exist the generalized fundamental relationships of nature's integrated formulations--- hitherto treatable only in the plurality of unique languages of the respective exact sciences. The unique and separate languages required awkward translation through the function of the abstract interpreters known as the 'constants.* Energetic and Synergetic Geometry now embraces the comprehensive family of behavioral relationships within one language. This integration has been precipitated by the challenge of reconciliation with

— Gibbs' Phase Rule;

— Pauli's Exclusion Principle;

- the Laws of Thermodynamics;

- the Field Equations;

-- the Einstein Energy Equation;

- the structural associations and disassociations of

Linus Pauling's` chemistry;

— Avogadro's Law of Gases;

--- T.N. Whitehead's treatment of the six fundamental degrees of freedom;

--- Lancelot Law Whyte's compendium of point system treatments;

gynerfietl? Hierarchy:

(2)

— Brewer's fixed point theorem;

--- Bohr's fundamental complementarity, and most importantly of all from the viewpoint of

--- Percival Bridgman's Operational Procedures,

--- the comprehensive family of associative-disassociative reciprocal and transformative behaviors and values discovered by first hand exploration

and first hand reexamination of the total circumstance surrounding every structural discovery.

Synergetics "is based on the discovery of the relative energy investment values of nature's geometrical hierarchy of cosmically primitive structurings and intertransformings. It is the geometry of general systems. All of its lines are vectors, that is, they exist only as energetic phenomena. A vector always represents the product of mass and the velocity of a given energy entity operating in a given angular direction in respect to a given axis of observational reference. Synergetics discloses by physical models the orderly ways in which nature intertransforms, propagates, and pulsates, sometimes visibly and sometimes invisibly, yet is always demonstrably operative by 'tuning in' and 'tuning out.'"

Synergistics:

"The increasingly vast, comprehensive, and rational order of arithmetical, geometrical, and vectorial coordination that we recognize as synergetics can reduce the dichotomy, the chasm between the sciences and the humanities, which occurred in the mid-nineteenth century when science gave up models because the generalized

case of exclusively three-dimensional models did not seem to accommodate the scientists' energy-experiment discoveries. Now we suddenly find elegant field modelability and conceptuality returning. We have learned that all local systems are conceptual. Because science had a fixation on the 'square,' the 'cube,' and the 90-degree angle as the exclusive forms of 'unity,' most of its constants are irrational. This is only because they entered nature's structural system by the wrong portal. If we use the cube as volumetric unity, the tetrahedron and octahedron have irrational number volumes."

- Cite SYNEfifTICS text at Sec, 990.05; RBF rewrite of 30 Dec'73
SyncretUB; H)

"In the synergetics' four-dimensionally coordinate system's operational field the linear increment modulatability is the isotropic vector matrix's vector, with which the edges of the co-occurring tetrahedra and octahedra are omnicongruent; while only the face diagonals--- and not the edges--- of the inherently co-occurring cubes are congruent with the matrix vectors.

"Synergetics' exploratory coordination inherently commences integrally, i.e., with whole systems consideration.

"Consider the one-dimensional linear values derived from the initially-stated whole system, four-dimensional, omnirational unity; any linear value therefrom derived can be wholistically attuned by unlimited frequency and one-to-one, coordinated, wavelength modulatability.

"To convert the XYZ system's cubical values to the synergetics' values the mathematical constants are linearly derived from the mathematical ratios existing between the tetrahedron's edges and the cube's corner-to-opposite-corner distance relationships; while the planar area relationships are derived*

"Synergetics is an omnirational, arithmetical, geometrical, vectorial coordinate system apparently employed by energetic nature., which incidentally permits fourth- and fifth-power models of modular-volume, symmetrical aggregations around single points in an omnidirectional, symmetrical, allspacefilling radial growth of those same modular-volume components, i.e., the tetrahedron, in such a manner as to disclose omnipersist ent, one-to-one correspondence of radial wave modular growth with circumferential modular frequency growth of the totally involved vectorial geometry. (This means that angular and linear accelerations are identical.)

"Synergetics makes possible the return to omniconceptual modelling of all physical intertransformations and energyvalue transactions, as exclusively expressed only in

algebraic abstractions throughout the last century. Synergetics does not contradict but complements the exclusively abstract algebraic expressions of physical Universe relationships which commenced approximately one century ago with the electromagnetic wave discoveries of Hertz and Maxwell, whose electrical apparatus"

Synergy?

Q. "The only other word I am interested in right now is hfilifllB. ¹ think J.C. Smtta may have coined it. I know he wrote the book 'Holism and Evolution.' How does the concept of holism compare with your concept of synergy?"

RBF; "My word synergy has really a very specific meaning. Synergy means behaviors of wholes, whole systems unpredicted by behaviors of any of the system's components considered separately---which is the same as the mind; the mind is always synergetic. There are relationships existing between but not of any of the special cases con-

sidered by themselves; so there is always a relationship. The word holistic is not necessarily that? it can mean all the parts without any of the behavior between them. Say you have a holistic human body and there it is---but life is not there. So I try to avoid that word."

- Cite transcript p.13, RBF taped Interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

Synergy:

"I first developed the concept of synergy, the behavior of whole systems unpredicted by the behavior of the parts considered separately, which automatically identifies the unique behavior of the whole as resulting from the interrelationships existing between but not in any of the parts."

- Citation context at Generalised Dichotomy: Grand Strategy

Synergy:

"...Even the name we give that unexplained behavior The name gravity

The name does not explain the mystery

For gravity

Like all scientifically generalised principles

Is inherently synergetic

And synergy means the unique behaviors manifest only by whole systems Consisting at minimum Of two independent variables Whose unique system behaviors Are entirely unpredicted By any behaviors or characteristics Of any of the system's components a'hen each is considered only separately."

"We know the codes but we do not know the 'how cose' of their producing an elephant. The complementarity of the holifitcness of these special-case individuals balances out. Elephants are successful designs. We have no evidence of biological species which are inherently uncompleted designs. In the hierarchy of hierarchies of synergies, Universe is the unpredicted behavior of any of its sublevel synergetics. We must start our synergetic analysis at the level of Universe and thereafter with the known behavior of the greatest whole and the known behavior of some of its parts, proceed as permitted mathematically to discover its unknown parts. We have the Greek triangle

- with its known 180 degrees of angle which it compounded with the knowledge of the magnitude of any two sides and their included angle, or of any two angles and their included side, etc., will permit discovery of the magnitude of the balance of the triangle's six parts. Or, using trigonometwry if we know the magnitude of any two parts, we can ferret out the others."

- Cite SYNERGETICS draft at Sec. 1050.05, April '72 as vastly amplified from RBF Chicago tape, 31 May *71.

"Universe apparently is omnisynergetic. No single part or experience will ever be able to explain the behavior of the whole. The more experience one has, the more opportunity there is to discover the synergetic effects, such, for instance, as to be able to discern a generalized principle. Then discovery of a plurality of generalized principles permits the discovery of the synergetic effects of their complex interactions. The synergetic effect produced by the interaction of the known family of generalized principles is probably what is spoken of as Wisdom."

System;

"In addition to possessing inherent insideness and outsideness a system is inherently concave and convex, complex and finite. A system may be either symmetrical or asymmetrical. A system may consist of a plurality of subsystems. Oneness, twoness, and threeness cannot constitute a system, as they inherently lack insideness and outsideness. Twoness constitutes a wavelinear relatedness. Threeness constitutes planar relatedness, which is inherently triangular. Three triangular planes alone cannot differentiate, distinguish, or constitute a system. At minimum, it takes four triangular planes having inherent fourness of vertexes to constitute a differential withinness and withoutness. Fourness of geometrically contiguous and synchronous event foci and their coincidentally defined four triangular planes, along with their six common edges provided by the six wavelinear vectors connecting the four event foci, altogether inherently differentiate, distinguish, initially institute, and constitute prime or minimum withinness and withoutness."

- Cite SYNERGETICS text at Sec. 400.0?, 27 May*72

System:

"Unit means system integrity. Organic means regenerative system integrity. As minimum or prime systems consist of four event foci and their always and only coexisting fourness of triangularly defined planar facets, and sixness of wavelinearly defined minimum set of unique componentation relatedness, unity is inherently plural. Unity is plural.

A system is a local phenomenon in the Universe. Each of the conceivable or imaginable awareness or thinkability entities or phenomena inducing or producing onenesses of twonesses are subvisible and potentially further subdivisible, or as-yet unresolved, ergo unrecognized systems. Functions always and only co-occur as subsystem relativis-

tics, characteristics, inherencies, and proclivities. Functions occur only as parts of systems. The Universe is constituted of a complex plurality of nonsimultaneous and only partially overlappingly occurring systems, not one system."

SYSTEM-XFC Too-H

"A system is the first subdivision of Universe. It divides all the Universe into three parts;; --- firstly--- all of the Universe outside the system; secondly--- all $\square\square$ of the Universe within the system; and thirdly--- the small remainder of Universe components which constitute the system considered.

"A system is an enclosure consisting of a conceptual aggregate of recalled experience items, or events, having inherent insideness and outsideness. A system is the antithesis of nonsystem, which latter lacks omnidirectional definition. Nonsystems, such as theoretical planes or straight lines cannot be found experimentally. We are scientifically bound to experimentally demonstrable systems thinking. All systems are subject to comprehension and can be coped with systematically.

"General systems theory treats wifyj phenomena which are holistically comprehensible. The objects of our experience are finite systems. Their superficial outline closes back on Itself multidirectionally as a systematic continuity of relevantly contiguous events. They are thus separable from other systems. There are systems comprised of systems."

"We can state that the number of vertices of any system (including a 'sphere' which must, geodesically in universal energy conservation, be a polyhedron of vertices) minus two times $j60^\circ$ equals the sum of the angles around all of the vertices of the system."

Cite OMNIDIRECTIONAL HALO, p. 152, 1860

System;

"A system is a patterning of force that returns upon Itself in all directions--- that is, a closed configuration of vectors.

"Insofar as a system loops back on itself, its dimensions are limited; hence the system is finite. It has an inside and an outside: 'within-nese*' and 'withoutness.' Every system consequently divides the universe into two parts; that which is within the system, and that which is external. A plane (as defined by Euclid) can not constitute a system, because a plane is conceived to be a surface without limit. It extends on an on, to infinity, never returning on itself, never developing inwardness or outwardness,

"It is characteristic of a system that the angles around its vertexes must be concave or convex with respect to the position from which they are viewed--- concave if looked at from the interior space, convex when viewed from outside.

SysTrM- STc.

U)

"It is significant, however, that the angles surrounding a vertex cannot add up to 360° , for it is a condition of a system that it be finite; which is to say that it should curve back on itself from all directions. If the angles around any vertex add up to 360° , they would initiate an infinite plane. And since a plane has infinite extension and does not close back on itself, this condition violates the requirement of finiteness---the essential property of a system."

- Cite MARKS, pp.42-43, 1960

System:

"A system is a man-thinkable, tune-in-able constellation of generalized experience event cluster foci. Energy cluster foci are starts, or topological ver-texes, which are only the as-yet-nonanalyzed group phenomenon whose energetic point centers of event clustering locals are as yet too remote for the present observer's position. □ • Systems are star interrelationship considerations which logically continue to return upon themselves due to the related preoccupying importance of locally dominant event frequency proximities which altogether function as a fundamental, i.e., simplest or most unique.

feometrical set which inherently subdivides the total Universe, the cell-time-man-experienced events fall into two main and clearly distinguishable classes:

(1) All those relatively too large or macrocosmic events of Universe which must clearly occur outside the presently thought-considered tunable range capabilities and are therefore outside the timable system set; and

(2) All those relatively too small, negligible, micro- cosmic clan which occur inherently within and infra to the tunable frequency and relative size ranging of the considered set."

- Citation and context at Radome Sequence (2)0), 29 Dec'58

System:

"A system is a min-max tunable, ergo, a primary definable subdivision of Universe. As such a definable set, it separates and dismisses, inwardly and outwardly of its tuned finite pattern all that is mic»cosmically and macrocismically irrelevant and untimely. Systems have, therefore, time, and direction inwardness and outwardness, and polarity, thus identifying the hitherto seemingly abstract two-ness of Euler's topological formula: 'Faces plus vertexes equal edges plus twoness,'"

System Totality:

"The reverse magnitudes of the surface vs. volume hierarchy is completely logical in the case of the total surface subdivision starting with system totality. On the other hand we begin the volumetric quantation hierarchy with the tetrahedron as the volumetric quantum (unit) and in so doing we build from the most common to the least common omnismmetrical systems of Universe. In this system of biggest systems built of smaller systems the tetrahedron is the smallest, ergo most universal. Speaking holistically, the tetrahedron is predominant; all of which is analagous to the smallest chemical element, Hydrogen, being the most universally present and plentiful, constituting 90 percent of the relative abundance of chemical elements in Universe.

"The tetrahedron can be considered as a whole system or as a constituent of systems in particular. It is the particulate

Tactile:

"Tactile: preponderantly sensing the crystalline and triple-bonded atom and molecule state, which includes all the exclusively infraoptical frequency ranges of the electromagnetic spectrum's human receptivity from cold 'solids' through to the limit degrees of heat which are safely (i.e., nonburningly) touchable by human flesh."

Tactile:

"The tactile is very unreliable; it has little meaning.

- Citation and context at Thinkable You (2), 22 Nov'73

Tactile;

"The real emphasis of Judgement of life is on the tactile, the thing you can touch. . . . Reflect on some of the things it does, like making you want to get your hands on the money or the real estate, whatever it is."

Cite Oregon Lecture p. 95. 5 Jul*62

Tactile?

"• . . What we call dead is strictly a tactile thing. I put the touchable thing in the ground but I can't put the thinkable you in the ground. . . The tactile is a very unreliable thing. It has very, very little meaning."

- Ctte Oregon Leet we-#3, pp_r 99 100,—Jul'6a
- Citation and context at Thinkable Ynu_r, 5 Jul'62

"Because the human's tactile sense has been operative months before birth as the only communication means between the pregnant mother and the live child she is bearing, the tactile sense becomes the comparative base for all the post- natally and successively acquired sensibilities. . » "

"Because primitive sensBing is tactile, man measures his distances horizontally in feet, vertically in hands. .

. Kan not only thinks he sees objects outside himself, but also identifies the external objects by their tactile surfaces. Thus men tend to think of one another in the form of their tactile modeling."

- Citation and context at Brain's TV Studio. (1) +(2), 6 Jun'69

` ` And you and I have reviewed together how it is, due to the fact that our first apprehending capability inside the womb is where we have tactile communication with our mother for eight months. Then we're born. Tou can put your finger in a child's hand and already have communicated absolutely beautifully, tactiLeely.

"Therefore, all of our sensing about our life is always measured primarily in the tactile and everything else is referred to it. Distances are in feet and hands, our verticals in hands, and everything else we refer back to tactile. And you see me only when you say, 'I can touch you.'¹

You're not saying, 'You're where I hear you.' You're not saying, 'You're where I think you,' or 'Where I understand you.' This is where I really am. There's absolutely nothing going on in this room except where you and I understand each other. That we really can see a touchable group--- which is the very lowest order of apprehending of "the Universe--- and we make such emphasis of it. It was all so important for a human being because he weighs in as life utterly helpless and with no information so far; though he has extraordinary"

- Cite RBF to World Game, Jun-Jul'69

` ` information collecting, identifying, and retrieving capability but he hasn't anything put in there yet. It is very important, then, for us to recognize that in that helplessness that had to be taken care of, and it is not surprising that the first apprehension is tactile. Kan, like the physical part of all systems which is entropic, and therefore it has to break down and therefore it has to be regenerated.

"In order to be sure that life regenerates itself you have to give it a drive such as hunger, so as to be sure it takes up fuel and takes on energy. You have to give it a drive first so as to be sure to get the right chemical combining. You can have a hunger for air; that's the one it really has to have the most of. So you put in a pumping system so it really isn't even conscious of breathing. And then you give it the drive to reproduce itself, because many of them are going to break down and not work out. You've got to be sure--- because of man's function in Universe--- that life is going along in order to carry out that function.

"If you and I had to go out and buy ourselves, if you went to"

- Cite RBF to World Game, Jun-Jul'69

rasUls Sttmjuigj: (3)

"the supermarket and had to buy your own heart and your own guts and your own lungs and your own kidneys and liver, and so forth, I«m sure most of you people would leave most of it out, and we would not be very attracted to them.

"In order to get this extraordinary complex of regeneration reproducing itself, you have to really skin it in. In a very important kind of a way, you have to make it somehow a very attractive matter--- this warmth here, and so forth, as something very attractive to make them like to get together again. And so the built-in drive to reproduce, to be sure that life is there, is very intimately tied up with the touch part and getting back in the womb, and so forth, that new life will come along then. So it's very hard for man to separate the physical in his thinking from the tactile or from the really metaphysical. It's awfully hard for him. I don't want to give up that something nice in me; that regenerative drive, something that's fascinating all the time; I really can't relinquish that and say that man is really, as far as life goes, metaphysical. But so far as I can see, that really is the fact."

- Cite RBF to World Game, Jun-Jul(69

"This is by way of really identifying that we are not the physical. We have an integral phyaicalness and we have an externalized physicalness, and I can call you on the telephone and there you are, and you're not the telephone and I»m not the telephone. But what we really are has nothing to do with the physical, yet it is so intimately associated, so emphatically, due to the fact that we see and feel in these touching things. Only in this century did we learn about the speed of light. Therefore we thought that things were instant: it was instant when, of course you were the touchable.

"But if--- with no instant, then this is no longer true, and you and I are seen, we even see each other, here-- I don't see out there anyway. I'm checking up on a communications system by touching here, but I'm seeing-here in my television set."

Tala s Taliny:

See Story Telling, 18 Jul'72

"...In the talented individual there is relatively no tug-of-war for dominance on the part of the life cells, for talent has been found to be born of two parents of almost similar life cell characteristics. This talent in human beings is similar to a specific trait on which, and for which, breeders of horses or dogs continually concentrate and inbreed; for instance, 'speed' in the horse, a special head in the dog, which requires parenthood as closely identical as possible. The product, 'colt,' may be said to have a talent for speed. The word talent as applied to persons is derived from talentum, the name for a coin of varying value, or a measure of money. Its application to persons was intended to indicate, in a rate sense, persons of a special measure, not persons of a generally inclusive, average rate ability of performance.

**In contrast to genius, talent has not the two or more viewpoints of genius, but has a 'single track' visualisation. The absence of a time-and-space measuring ability limits the sight to a single nonworldly view--- *non-worldly' because, as we pointed out in our interpretation of Einstein's formula, the conscious 'world' is in fact energy radiantly manifest"

- Cite NINE CHAINS TO THE MOON, p.97, 1938

Talyft! (2)

"at relative rates of retarded speed, rate being the inseparable relationship of time and space.

"The harmonious concord inherent in this characteristic of the solitary talented personality of genius enables the talented individual calmly to preoccupy himself with the exquisite refinement of, or better rendition of, the compositions of genius, in all special articulation fields.

"There is no implication in this discussion of talent and genius of a greater importance for either proclivity.

"The function of genius is to provide new instruments and the process-means for the progressive growth of man; talent's function is the precise and harmonious popularisation of the otherwise popularly undetectable, and therefore otherwise nonuseful products of genius. What is often mistermmed as 'plagiarism*' is more precisely 'talent.' 'Plagiarism' is an ethical offshoot label of the false property illusion..."

Technocracy:

"I am not talking about the engineer# or scientist# becoming politicians. That was tried in 1930 in Technocracy wherein the engineer-scientists were to muster a host of disgruntled engineers and, taking guns, seize the post offices. They proposed gaining their end# by reverting to the ohyoical power tactics of the pirates and their politicians. But the scientists and engineers enlisted were too honest to be good politicians. Technocracy failed before it got going. So the prospect is that we are going to have to follow the medical scientists'

successful precedent of minding everybody's physical success business while avoiding any interference whatsoever from the clients or WMHBO interference with the clients' metaphysical freedoms, -e are going to have to do so by holding ourselves exclusively to reforming the inanimate environment.to make it able to supportfall men without ever resorting to the politicians policy of would-be reformation of the human beings--- their thought processes, their initiatives, and their wills,"

- Cite NASA SPccCH, p. 17. Jun'66

Technocracy:

The "natural evolution of intellectual accomplishment for the many by the few is the antithesis of such reverse gear schemes as Technocracy which sought to establish an autocracy of engineers schematically similar in aim to national socialism. Technocracy sought to convert the engineer * to the role of politician.

But the engineer proved no more effective

than the most ignorant and slothful in the ballot box gam®, and much too forthright by training to be g good politician.

Superficially saleable as an inviting scheme

Technocracy failed as an 'out' for society primarily because the engineer must vacate his creative and causal function for a negative and restraining function,"

Technology:

"I want you to think of yourself— as a grand strategysaying: I just have this one life and I really have to do my own thinking. One of the things that impresses me very much is that we are operating in an era where there is a great deal of technology that has arrived. The phenomenon industry is operative.

"We were trying to account all the new technology in the terms of the agricultural accounting. I saw then that in the industrial equation, where you're really dealing with the cumulative know-how of all of humanity, there is no such annual accounting season and this is forcing man to be shortsighted. Society was now dealing in new kinds of magnitudes of undertakings that should be thought of in very much larger blocks of years.

**In the industrial equation you might be at a machine making bolts but you couldn't put bolts in your pocket and go and swap them for hamburgers. You found then that what really happened was that you came to a river that yesterday you couldn't cross. There was a very great current; but suddenly there's a bridge there—and there were some of your bolts.

I saw that the payoffs were very different and indirect in the new kind of technology that was coming upon us.”

- Cite RBF to Harvard Law School Forum, 10 Dec'73 ”And I thought that technology itself was, even back in 1927, being identified with exploitation, with ways of making money, rather than being thought of as some evolutionary event of humanity-- some increases in artifacts and transformations of artifacts.

' • So I'll give you quite quickly my way in which I came to identify industrialization and you'll find it quite different from the business viewpoint, or from the legal viewpoint*

I said: Alterations of the environment produce artifacts— like bird's nests— that are essential to the survival of the species. You can call it an extracorporeal artifact; but it is a tool.

I saw these in terms of solving functions. Human beings were not at all the only tool makers.”

Technology¹ Enchantment vs. Disenchantment.: (4)

^{wy}e now have a new lawyer-kind of capitalism where wealth no longer consists of property and they are beginning to put the control of know-how in the books, into the accounting... And the multinational corporations are getting out from under all of the sovereignties. A_nd the managers don't seem to have much to do with it. The lawyers saw that the nurpose of the corporation was to cut down the responsibil-

ity of the individual---limited liability. The bankers have had no more control than the postmasters handling the mail, but they end up with more of the peoples' money than they have kept to themselves... the banks and the government.

"The \$80 billion spent for the first A-bomb project would cost out at worth about \$3 trillion now. And the banks all persuaded President Eisenhower to turn it all over to private industry as a present. Now while it is true that freedom of initiative is essential to human progress, here it was just being selfishly exploited in the name of 'free enterprise,' an example of a really noble idea being selfishly corrupted.

"And we're also up against \$53 billion a year of advertising,"

- Cite RUF to World Game Workshop; Phila., PA: 22 Jun'77

Technology: Enchantment vs. Disenchantment: (5)

trying to persuade us to buy things we don't need. The big companies don't even want the little individuals to latch on to the wind with wind-mills. But Hans Keyer persuaded the public utilities to accept excess wind power into the main grid. He did it by more efficient conversion from DC to AC and by introducing more sensitive meters. There is a 10 percent loss of efficiency if you feed direct current into storage batteries; therefore the solution was to feed it into the power grid---selling it at wholesale and buying it back at retail prices. This is how you can impound Sun radiation for society without going against the system.*,

"taking sense and making money are mutually exclusive. I have nothing against regenerative economic sustenance; I'm just against the people who want to get in on the right stocks to make a killing.¹

"I'm confident of bringing science and the humanities together with another book. I hope to make science comprehensible to mankind. My lifelong work is 'Synergetics.' This describes the comprehensive mathematical, rational coordinate system apparently employed by nature.

"Much of the dilemma of our time is that 99 percent of the people who are not scientists have no sense of what is going on. The teaching of science is playing such a part in life today that you can say we have reached the point of a new revolution when man defeats himself by his own knowledge."

Teleological Schedule of Universal Design Requirements:

See Environment Events Hierarchy

Universal Requirements of a Dwelling Advantage

"One of the things I never ask myself is how are people going to like it. I would say: What is the Universe trying to do? How and why are we here? I am assuming that we do not know. I am not assuming that we have the competence to judge. I do not look at things in terms of being an elite with Universe disclosing to us some of her recirculatory capabilities, particularly in eternally regenerative Universe, 'When I ask what are we here for I get into the function of man as the local monitor of problem-solving with reference to capabilities of a generalized sort that no other phenomenon has. We are here then for that function and not for our personal satisfaction — or the satisfaction of local political bodies— or proving any ideological system to be great. Those are transitory and unnecessary to the development of man. But we are coming out of this shell— and this is qll in the metabilical cord. The trick is not knowing that it is going to break our legs. You never know who is going to be using those legs. I think that all of humanity is in exactly that position today. We are going to have a very different orientation of humanity to Universe. The younger they are the more they feel it."

"Teleology embraces

The theory of communication.

Though as yet having special-case limitations.

It is an hypothetical

Approach to a pure, abstract generalisation

To say that teleology

Is only intuitively initiated by humans."

- Cite HOrf LITTLE, p. 30. Oct'66

Teleology:

"Teleology means the intuitive conversion by brain and mind of special-case subjective experiences into generalized principles and their subsequent objective employment in special-case undertakings.

"The discovered principles governing the inter- transformative structuring of .universe permit the subconsciously teleological and conscious design-initiating individual to reform the environment in such a manner as to provide ultimately higher advantage for men and in such a manner as to regenerate in other individuals the drive to further transform the environment to even higher advantage for all. The design may increase the degrees of freedom of individuals by reducing environmental interferences or it may decrease freedoms as with traps and prisons."

Teleology:

"A name for the process of observing consciously, or absorbing sub-consciously, from the outside inward so that one may do from the inside outward is teleology. When finally solving from the inside out, the teleologic perspective will be universal, and the equation of performance will be:

'Degree of Satisfaction - Degree of Factor
Encompassment inclusion.'''

- Cite NINE CHAINS, p. 42, 1938

1919: (1)

"The words 'telegraph' and 'telephone' have quite naturally been derived from teleology. The process they represent mechanically abstracts the original, with the minds of operators interpolating at abstract stages to produce an ultimately sensorial result. ('Telefacture' may well supplant 'manufacture.')

"To illustrate the process in 'telegraph' let us suppose an original phenomenon such as death of Uncle John.

"A telegram is sent to a florist by someone, the message being transmitted as a dot-and-dash interruption on an electrical circuit. The dot-and-dash symbols are converted at the receiving end of the wire into ink symbols, codified with the dot-and-dash system, on a piece of yellow paper. This piece of paper is transmitted to a florist who sends flowers to 37 Bond Street--flowers but that morning growing in a field only to be suddenly severed from their roots, covered with waxed paper, packed in a receptacle of water standing next to a black box in which has been deposited a discarded human machine. The telegram sender, rueful or*

- Cite NINE CHAINS TO THE FLOOD; p.46, 1930

Teleology: (2)

"death, caused further death to be a paying business, an odd result from the original cause.

"The means of provoking the effect by the cause was not merely a mechanico-electrical process; more important were the phantom captains who performed the function of 'interpolation' at the various receiving instruments by transforming the dots and dashes not only into ink symbols but into further botanical death.

"The essence of this phenomenon is that the interpolating function is one that no machine will ever perform. The art of teleologic design is, then, one of delicacy of attunement in the interpolation of every seemingly casual event of life into non-haphazard objective Instruments--- whether written words, medical prescriptions, or pencils, the function of the instrument being, in turn, the harmonic abetment of the trends intuitively to be detected by the teleologist through the keyhole of his 'own' phantom captain's study. Teleology will have more and more significance as the teleologist carries on the vast task of exploring and including all factors making up man's "

IlflflPlQgy:

"universal status quo.

"The consumption and digestion of facts and statistics is somewhat like eating and chewing hay and thistles. Their is nourishment in them in their raw state, to be sure, but a cow is needed to convert them into milk. Likewise the average human mind needs an intermediary---a teleologist--- to convert vital factors into digestiblea for his objective use.

"To the student of teleologic design, particularly as applied to shelter service, we offer a 'coving* of the vital factors of man's estate at this moment of ken. Only by awareness of this estate can the teleologist interpolate therefrom an adequate industrial design of world-encompassing shelter service, which will be so utilitarianly adequate and harmonic as to insure man's irrepressible appetite for such shelter service's industrial reproduction."

Teleology: PQW Tjy SytaX:

Telephone:

"The Bell System could have focused on the instrument instead of the service. They could have had telephone architects like so much napalm and voodoo."

- Cite RBF at Bell Studios videotaping, Phils. PA., 26 Jan*75

Telephone: (1)

"The design scientist deals in comprehensive artifacts to alter the environment; he also deals in how do you produce the artifacts, what are the relative efficiencies, what are the alternates, and what are the options, of how it mixes the structural and mechanical, the electrical and the chemical. The design scientist has to know about all these aspects and be responsible for not only designing the end product, but How do you produce it? Having produced it, How do you get it where it needs to be? And he designs the economics of it; so he shows that it will be working much better being rented as a service industry like the telephone than being sold. If you sold all the telephones then people would hang on to their old ones. (They have brought in some classical modern designs or a modern rock designed telephone instrument; and they're really no good.)

"The most extraordinary thing is that the telephone makes its money by frequency of use of the telephone. They've found that everytime they've taken the phones away and given them back a better telephone that's clearer or easier to talk over, people use it much more. So they have found that by improving and"

IfllflllXen:

"Television is important, not that it has a name, but because it is a way in which man individually has been able--- as a young child--- to get information from around the whole world. The parents used to bring home all the news, Daddy and Mommy. They don't bring home the news now. They come home and the kids tell them what the news is because television is giving it from around the world. And the people who get their jobs in television--- like yourself--- get it by virtue of your diction and your vocabulary and your versatility in using it. So that the authority for the news--- what's going on--- is coming to the young world over the television or the radio, and coming with better diction and vocabulary than the parents usually have. So the child then emulates the communication pattern of those who give him the most reliable information. So it's not a matter of the parents not loving their children or children not loving their parents, but children are now really peeling off and saying intuitively: I see that man can do

anything he needs to do; our parents are locally preoccupied, they have apologies and say we can't afford to do that. We see that man can't afford to do anything else but make his world work. That's the spirit of the young people."

Feb - Cite RBF in Edward Newman TV Interview, transcript pp. 38-39, 73

"... Even the seemingly most steady population is not steady at all, it is all drifting. We have mobilizing world man, he is not vagrant at all, and the degrees of freedom of man have been increasing and his capabilities have been increasing-- he knows about his whole world and each child that is born is born in the presence of less misinformation and in the presence of more reliable information. Particularly the young world with the television, are told about the whole world on the hour, right in their own home. And they hear much more from their third parent (which is what I call the television) than they do from their own parents. Their parents talk about the local things--- local and visual--- and the third parent tells them about the whole world and all the problems of all the world, and is the first to tell them about the inventions, what man can do. Everything extraordinary that man can do, the third parent tells them about that, so they go to the third parent and they find that he has good diction, so we find the young world thinking 'world,' it is the first generation of man to think 'world.'"

- Cite RBF Address THE HADITABlx. CITY, 14 Oct. '69

"Approximately everything man thought he understood will be useless within the next decade. We are going to develop an environment in which the new generation is so protected from the lovingly administered nonsense of grownups that it can develop naturally just in time to save man from self-annihilation. What I call the third parent, TV,

brings the babies half-hourly world news as well as much grownup-authored and discredited nonsense. The student in revolt in California are the first generation of TV-reared babies. They insist on social justice the world around. Imminent change is inexorable."

- Cite RBF in AAUW Journal, p. 174, May '65

"Children looking at TV today see it quite differently from the way we do. It begins to be very much a part of their lives and they accredit it the way we accredit what we get out of our eyes regularly. I am sure that when they are looking at a baseball game, if they are interested in baseball, they are right there in the field. I am now giving you an omnidirectional TV set and there is no way for you

to escape it. That is all we have ever lived in. You have been in an omnidirectional TV set all this time and you have gotten so use to the reliability of the Information that you now have projected yourself into the field. You insist that you see me out here but you don't. We are all working back here in TV sets."

Temperature:

"Temperature should be thought of as relative heat concentrations or dissipations."

- Citation and context at Cold k Vacuum. (6), 1946

Temperature of the Human Body: (A)

"For an Instance, the heating of the hydrosphere Involves the fact that water takes on heat and loses it At the slowest known rate of all substances.

As a consequence the temperature of the watery mantle
Covering three-quarters of Earth
Vary between such close limits
That the world average temperatures throughout the years
Have varied less than one degree Fahrenheit
Over all the years in which temperatures
Have been recorded around the world.

Within these exquisitely stable electro, thermal, chemical limits The
metabolic regeneration of humans is sustained As the apparently ultimate focal formulation Of the metabolic interchangings and intertransformings

Of the total evolution of bio-ecological intercomplementation.”

- Cite RBF rewrite of BRAIN & MIND AT p. 11J, July'72

Temperature of the Human Body:

"So delicate are the microclimatic-ecological balances That, humans at all times manifest

An internally permeative organic operating temperature Of 9th 6 degrees Fahrenheit No matter what their age, Their geographical location, Or their clothing may be. Manifest Number Seven Of Earth's cosmic functioning Is its progressive geological submerging Of the hydrocarbon energy residue concentrates Buried ever more deeply and at increasing pressures Either within the Earth's crust, or its hydrosphere, Whereby those biological residues are chemically transformed Into rigid, liquid, or gaseous fossil fuels."

- Cite RBF rewrite of BRAIN & MIND at p.114, July'72

Temperature of the Human Body:

(1)

"A Sixth Manifest of Earth¹ s

Unique celestial scheme functioning

Is discoverable as the impoundment

Of star energy radiation

In both the Earth's atmosphere

And in its hydrosphere,

./hich provides the weather and ocean currents

And which maintains the critical temperatures

Within which the biological proliferation of metabolic formulations
And feedback chemical process exchangings must occur.

For an instance, the heating of the hydrosphere

Involves the fact that water takes on heat and loses it

At the slowest rate of all known substances.
The water temperatures of the Earth
Vary between such close limits

Tensegrity:

"Then I had also one day gone into the faithfulness of our experience where I said you could not have two actions going through the same point at the same time and we had come to the discovery of the tensegrity structures which had not been the kind of structures that men had tended to think of in the early days. We saw that they had come to a concept of a solid Earth, a solid brick and brick on brick as apriori-- and from time to time MB they might help hold things together by throwing in a little tension, maybe bind the things together in tension as a barrel is a tensional thing and they put some hoops around it to hold it together, but primarily you start with the compressional interrelationship, compressional mass helped by the staves in tension--- tension is secondary. Then we found when we tried to differentiate tension and compression in thinking of structures in Universe that apparently the macrocosm and microcosm were something that you might call tensionally cohered. They were at least discontinuous compression. The compression members did not touch one another and the Earth did not ball-bearing around on Mars and this was true in the nucleus. We came to a really different kind of a structure in which the tensegrity principles seemed to coincide with the structuring of Universe--- "

" I have given you some of these measurements where we looked at tetrahedra and octahedra and so forth as if the edges were coming discretely together at one point in the Platonic way of looking at a solid. We have also realised that if we looked at any of these microscopically that the ends are pretty well twisted and we discovered that we could make all the same figures with the tensegrities and we realize that the gap in the tensegrities can be visual. As I began to show by further experiment we get to the point where they go below resolution by the ever remembering human eye which can only go down to resolving distances to about one-hundredth of an inch bantam and below that we don't see the distances between them. We don't see the distances between the points any more. We see a set of black points on a white field, and when they get below a certain point they run together. That

is what the printers learned with the Benday screen--- you can develop what seemed to be continuous form, continuous surface, and so the colors, grays and various colors we speak of as color, but we can't see the intervals between the waves or the occurrence of frequency of their components. I saw then that the tensegrity structures did go down into nonvisible gaps. .

Tensegrity • Basic Tensegrity Structures: Three and Only: "Now you see these same six members as they transform in relation to each other. They go from the tensegrity icosahedron through the tensegrity octahedron phase and finally become the tensegrity tetrahedron. The same six members can transform from containing one volume to containing 18.51 volumes. The same six members transform through the full range of the three and only fundamental structures of nature. What I am showing you here are the principles actively operative in atomic nucleus behavior in visual intertransformations. There are very extraordinary qualities in these structures. The tensegrity tetrahedron and tensegrity octahedron are volumetrically complementary and together will fill all space, but the tensegrity icosahedron refuses to complement the tetrahedron or octahedron but Isolates Itself in space or goes on to make up triple-bondedly into large octahedra which may then complement tetrahedra to fill all space."

- MEXICO Address, 10 Oct '63, p. 35 (Illustration D-1-123)

Tensegrity: Basic Tensegrity Structures: Three and Only:

See Prime Structural Systems

"Surprising behaviors are found in tensegrity structures. The illustration shows a house and a tree and a clothesline. The line hangs low between the house and the tree. To raise the line so that the clothes to be dried will not sweep the ground, the line is elevated by a pole that has one end thrust against the ground and the other end pushed outwardly against the line. The line tightens with the pole's outer end at the vertex of an angle stretched into the line. The line's angle shows that the line is yielding in the direction away from the thrusting pole.

"As the clothesline tightens and bends, it always yields away from the pushing strut. In spherical tensegrity structures the isolated compression struts pull the tension lines to angle toward the strut ends.

"When we release a compression member from a tensegrity sphere, one end does not thrust by the tension member to which it was fastened in a circumferential direction. It was not fastened in thrust or sheer. It was not pushing circumferentially. It resists being compressed, and like a cork in*

Clothesline?

- 'Here we are looking down from the air onto a house

and there is a tree by the house and here is the clothesline. And in order to keep the clothes line off the ground, you put a couple of struts against the clothesline sag. So you put a strut this way and one that way. That is the natural shape it takes. That is what you expect it to take. It can't take anything else, but the tensegrity structure here is a red strut, and you think it ought to push the line the way this one does. Not at all; it pulls on the line and the one coming the other way pulls on the line so in a tensegrity structure tension members yield to the compression members. The compression members were trying to fly apart like bricks, they are pulling the tension members and not puffing them" This is one of the most interesting characteristics of a tensegrity structure."

Tensegrity: Depolarized Orientation of Tensegrity-Octahedron Universal Joint: (1)

"I had been ransacking the tensegrity concepts using the multiple-rimmed, parallel or concentric wire-wheel phases of tensegrity since 1927, in the multi-decked 4-D mast structures and the Dymaxion house. . . . Despite the fact that I called it the 4-D house--- for fourth dimensionality--- was a polarized, i.e., single-axis system of three dimensionality, with equatorial and latitudinal compressional atolls, isolated from one another in parallel in the comprehensive triangulated tensional network." But "I had been unable to integrate" synergetic geometry "and three-dimensional tensegrity.. . . thus

to discover multi-dimensional four, five, and six axes symmetrical tensegrity. I had realized that the two-axis universal joint, long known to man and often employed by mechanics as a flexible membrane--- sandwiched between two diametrically opposed yoke-ended shafts, with yoke planes symmetrically oriented at ninety degrees to one another-- constituted an octahedronal tensegrity. but its shafted axes tended to make it appear as a single axis system similar to the hexagonal-wheeled Dymaxion house."

Tensegrity: Depolarized Orientation of Tensegrity-Octahedron Universal Joint: (2)

"In 1948 Kenneth Snelson showed me a sculptural construct embodying a cantilevered strut of octahedra, accomplished with tensegrity applied to the mechanics' universal joint octahedra, re-oriented from their shaft axes to a parallel plane alignment. Though Snelson thought of this only as a unique art form and was apprehensive to my aversion to VI artistic exploitation of energetic geometry (I have shunned the daily recurrent opportunities to exploit the energetic-synergetic geometry either as toys or objets d'art), he was eager for me to witness his discovery of a novel and exciting structure. His depolarized orientation of the tensegrity-octahedron universal joint catalyzed my comprehensive integration of the whole hierarchy of mathematical interrelationships of my tensegrity structures with my energetic-synergetic geometry and its multi-dimensional, multi-axial symmetry."

Tensegrity: Depolarized Orientation of Tensegrity-Octahedron Universal Joint: (3)

"My initial harvest of mathematical structures produced by this new conceptual tool was a family of four tensegrity masts characterized by vertical side-faces of three, four, five, and six each, respectively. The three and four sided masts consisted of discontinuous compression islands of tetra- hedronal strut groups mounted only in tension one above the other, while the five and six sided masts consisted of local islands of icosahedronal and octahedronal strut groups mounted vertically above one another, again only by tensional connectors."

"That is also exactly what happens in a three-way grid tensegrity geodesic spherical grid. In the balloon we get paths of these positively and negatively paired, kinetic molecules reacting from one another in a random set of directions. If they went into one path only they would make a single circle which would push the balloon outwardly only at its equator making a disc and allowing the poles to collapse. If they made a two-way stack of parallel lesser circles as a cylinder, the cylinder would contract axially into a disc. A two-way grid would make only unstable squares and diamonds which would elongate into a tubular snake. But once we have three or more sets of angularly independent circularly continued push-pull paths, they must inherently triangulate by push-pull stabilization of opposite angles. Triangulation means self-stabilizing; which creates omnidirectional symmetry; which makes an inherent three-way spherical symmetry grid; which is the geodesic structure."

Spherical Grid

Three-way Great Circling: Three-way Grid

"We have in the geodesic tensegrity the ability to assemble unprecedentedly large clear-span structures whose overall diameter dimensions are limited only by the relative alloyed coherence of the associated metallic atoms therein involved, whose improving coherences

are in swiftly multiplying metallurgical evolution augmentation. We can go therefore into the same magnitudes of clear-spanning dimensions as our largest suspension bridges. As these bridges demonstrate the continually improving tensile capabilities of constantly improving alloys, one could now be made twice the size of the Golden Gate Bridge. We may, therefore, consider clearspan geodesic tensegrity spheres in the magnitude of two miles diameter as now realizable for use as satellite environment controls,' or as hemispherical, or other spherical segment, Earth contacting enclosures (in which the Earth completes the sphere) e.g.. for arctic city environment controls or as water floatable enclosures."

"Suspension bridge cables are parallel to one another, and therefore give one another no more anti-rhombic structural stability aid than do the parallel tension wires of a barrel. In geodesic tensegrities all the tension members cross one another in great-circled chorded triangulations, thus providing .highest possible dimensional stability. For several well-known reasons there are ways in which geodesic tensegrity spheres can be made to provide diameters way in excess of the currently greatest suspension bridge span:

(1) We know that the progressive subdivision of a given metal fiber into a plurality of fibers, provides tensile capabilities of the smaller fibers at increased magnitudes up to hundreds and thousandsfold that of the unit section. This is because of the increased surface-to-mass ratios and because all tensile capability is apparently invested in the surfaces.

(2) The geodesic tensegrity spheres are capable of mathematical treatment in such a manner as to multiply the frequency of triangular modular subdivision in an orderly second power progression and formulaic control."

- Cite "Tensegrity."¹¹ POr.TFPIJO. ART n, 121 Drli. LSI—

"We now have the ability to introduce the above orderly mathematics into the computer, which permits of practical calculation and engineering feasibility previously nonexistent. This ability, combined with the fact that the higher the frequency the smaller the tensional sectional area (yet the higher the tensional capability, and the smaller the local islands of compression) allows us to state that the higher the frequency, the more ephemeral the tensegrity complex becomes. Also, then, the total weight of the structure required per given level of performance grows smaller, and the whole structure becomes less vulnerable to total violations by any, or many, inwardly or outwardly originating impinging forces."

J,1. r, 7

- Cite "Tensegrity," PORTFOLIO + ART ULH\$, p.123, Dec '61 **"When we introduce the tensegrity structure and its many surprises, we see that we have broken through to a structural knowledge and technique which permits a progressively decreasing relative weight of structure as proportioned to the linear gain. This is to say. the gain of weight in structures, as ratioed to basic linear dimensions, is as one is to one minus 1/x weight ratio as the same structure is multiplied in relative size.**

In the above progression, as frequencies go up, the sizes of the islands of compression diminish. Islands of compression are the only residual 'solids' and their diminishing size diminishes their relative weights at a cube root progression of advantage. Halving the size of a solid spar reduces its relative weight by eight. Halving the size of a hollow spar reduces weight by a factor of approximately four."

Tf,r i7/-/7zj

- Cite "Tensegrity," PORTFOLIO + ART NEWS, p. 124, Dec. »61

'The higher the frequency the greater the proportion of the structure which is invested in tensional components. Tensional components are unlimited in length as proportioned to section ratios. As we increase the frequency, each tension member is parted into a plurality of fibers, each of whose strength is multiplied many-fold per unit of weight and section. If we increase the frequency many times, the relative overall weight of structures rapidly diminishes, as ratioed to any given linear increase, or even to any fixed linear increase, in overall dimension of structure. The only limit to frequency increase is the logistic practicality of more functions to be serviced, but the bigger the structure, the easier the local treatability of high-frequency components. In contrast to all previous structural experience, the law of diminishing return is operative in the direction of decreasing size of geodesic tensegrity structures and increasing return in the direction of their increasing dimensions."

Tensegrity: Unlimited Frequency of Geodesic lenserrities: (7}

'•In the case of geodesic tensegrity structures no overcrowding of interior gas molecules, imprisoned

within a submolecular mesh net, is necessary to thrust the net's structure outward from its spherical geometric center, because the comprersional struts, locally islanded, as outward thrusting struts at both their ends, push the spherical net outwardly at every vertexial advantage of network convergence. Geodesic tensegrities are then 'hollowed-out* balloons, discarding their redundantly 'solid¹ air core.

'The geodesic tensegrity is a hollowed out balloon in which those specific molecules of gas which happen to be imninging from within against the skin at any one moment (thus pushing it outwardly) are replaced by the islanded geodesic struts. It is possible then to sew pockets on the inside surface of a balloon skin corresponding in pattern to the islanded geodesic struts, and to insert stiff battens into those pockets which cause the otherwise limp balloon bag to take spherical shape as it would if filled with a pressured-in gas.

- Cite "Tensegrity " PORTFOLIO+ ART NE./b, p. 125, Dec. '61 *TtSECS tSS.X3*

flsA

"Local stiffeners of skin suitable to preferred activities, at any structural focus, can be had by increasing the inwardoutward angular strut depths and the local surface frequency patternings as well as by multi-layerings of surface truss frequency--- thus thickening the truss depth without weight penalties. Here we have nature's own trick of local stiffening as accomplished by the higher frequency 'closest packing*' pattern of isotropically moduled, local cartilages and even higher frequency local bone structuring, as ratioed to the frequency of tissue cells of animal flesh.

"If we employ hydraulic pressure within the local islands of compression for dimensional stability, and gas molecules between the liquid molecules for local compressibility, ergo, flexibility, we will find that our geodesic tensegrity structures will, in every way, have taken advantage of the same structural strategy principles employed by nature in all her sizes of biological formulations."

- Cite "Tensegrity," PORTFOLIO+ART NE.7S, p. 125, Dec. *61

"Geodesic tensegrities are true pneumatic structures in purest designed frequency principle without the disadvantage of the randomness and redundance accruing to the inert (sic) designer-ignorances (which have only just happened to be successful), when depending on subvisible chemical structure' behaviors through the separation of all the components into two majorly opposed magnitude classes, of all the outward bound things that are too large to pass through all the inward-bound net holes that are in the class that are too small. This is the same kind of redundancy that occurs in reinforced concrete which, if drilled out wherever redundant components exist, would disclose an orderly four-prime magnitude-complex, octahedron-tetrahedron truss network disencumbered of

more than 50 percent of weight. Tensegrity geodesic spheroids have none of the portal pressurelock problems of 'solid-oozing* pneumatic balloons. The pressure is discretely localized and locked in place by the tension net, ergo cannot escape. Tensegrity geodesic spheroids may have several frequencies simultaneously--- a low frequency major web and a high frequency minor local web.- If they are of sufficiently high frequency of secondary or minor webbing to exclude atmospheric molecules, they may be partially vacuumized, ergo made air-floatable.*

Tensegrity Icosahedron; (1)

"The six-strut tensegrity icosahedron consists of three sets of parallels with their ends held together in tension.

If a pair of three-strut tensegrity octahedra are mildly reorganized in asymmetrical form, they may be combined in two sets of three struts each to form the tensegrity icosahedron. There are 12 terminals of the six struts (the two octahedra combines--- each with three struts of six ends) and when 12 terminals are connected up, the 12 vertexes of the icosahedron appear. There are 20 equilateral triangles of the icosahedron clearly described by the tension members connecting the 12 vertexes in the most economical omnitriangulated pattern."

- Cite Synergetics Illustration ;/82, caption. 1967

- sec. tfl.vd

Tensegrity Icosahedron: (2)

"There are six tension members which join parallel struts to each other. If these tension members are removed from the icosahedron, only eight triangles remain from the original 20. These eight triangles are the eight transforming triangles of the 'jitterbug.' Consequently this 'incomplete' icosahedron demonstrates an expansion-contraction behavior similar to the 'jitterbug' although more restricted.

"If two opposite and parallel struts are pushed or pulled upon, all six members will move inwardly or outwardly causing the icosahedron to contract or expand in a symmetrical fashion. When this structure is fully expanded it is the regular icosahedron and it becomes, in its contracted state, an icosahedron bounded by eight equilateral triangles and 12 isosceles triangles (when the missing six tension members are replaced). All the 12 vertexes may recede from the common center in perfect symmetry of expansion, or, if a concentrated load is applied from without, the whole system contracts symmetrically, i.e., all the vertexes move toward their common center at the same rate."

- Cite Synergetics Illustration #82, caption. 1967

Tensegrity Icosahedron; (3)

"This is not the behavior we are used to in structures of our previous experiences. These compression members do not behave like conventional engineering beams. Ordinary beams deflect locally or, if fastened terminally in tension to their building, tend to contract their buildings in axial asymmetry. The tensegrity 'beam' does not act independently but acts only in concert with 'the whole building,' which contracts only symmetrically when beam is loaded. The tensegrity system is synergetic: a behavior of the whole unpredicted by the behavior of the parts. Old stone-age columns and lintels are energetic and only interact locally with whole buildings. The whole tensegrity

icosahedron system, when loaded, contracts symmetrically, and because of this its parts get symmetrically closer to one another; therefore gravity increases as of the second power and the whole system gets uniformly stronger. This is the way atoms behave."

r. Cite Synergetics Illustration #82, caption. 1967

"A six-strut tensegrity tetrahedron can be transformed by changing the distribution and relative lengths of its tension members to the six-strut icosahedron.

"A theoretical three-way coordinate expansion can be envisioned with three parallel pairs of constant length struts in which a stretching of tension members is permitted as the struts move outwardly from a common center. Starting with a six-strut octahedron the structure expands outwardly going through the icosahedron phase to the vector equilibrium phase. When the structure expands beyond the vector equilibrium, the six struts become the edges of the figure; they consequently lose their structural function (assuming the original distribution of tension and compression members remains unchanged). As the tension members become substantially longer than the struts, the struts tend to approach relative zero and the overall shape of the structure approaches a super octahedron."

Tensegrity Icosahedron: Volumetric Comparison of Tetra + Octa:

"In the first of the fairly large geodesic spheres which were built by the tensegrity principle we used the spherical icosahedrons because they provide by far the most volume with the least structural effort of the three basic structural systems. The tetrahedron has the least volume with the most surface; the octahedron is in the middle; and the icosahedron gives the most with the least.

"Six vector struts make one unit of quantum corresponding to the six edges of the tetrahedron.

"In the icosahedron five units of quanta give 20 units of enclosed volume which means four units of volume for each unit of energy quantum invested in the enclosing structure, whereas in the tetrahedron one unit of quantum will structurally enclose only one unit of volume. The octahedron gives you two units of volume for each quantum unit. The icosahedron gives four units of volume for each unit of quantum enclosing the structure. Therefore, the icosahedron gives you the most for the least effort."

HMHHHMM Tensegrity: Miniature Tensegrity Masts:

"Going back to these spheres of the 270 struts and the 90 struts, looking at any of those struts you can see that you could substitute for it one of the tensegrity masts. There is nothing to keep you from doing that. It is simply that each of the members are smaller, each of the struts get smaller. Then as you look at each strut in the tensegrity mast you can make a little miniature tensegrity mast to replace it. So now it is going to be getting pretty small with these struts but you look at it and you make a very beautiful miniature miniature. Every time you see a strut you make a miniature tensegrity mast and substitute it for the previous one. Finally by substitution you get down

to the size of the atom and this is perfectly compatible, because this is the discontinuity; this is the structuring of the atoms. There you are in the discontinuous compression, continuous tensions where you are simply in the energy islands in sign concentration of tensional coherences. Finally this kind of structuring becomes completely explicable by the atom and yet we have

TiTK/rerxirr- Secs. >0

Tensegrity: Miniature Tensegrity Masts:

"It was obvious that each of the seemingly 'solid' compression struts in these island complexes could be replaced by miniature tensegrity masts (of any of these four types) and for the miniature struts in the miniature tensegrity masts, subminiature tensegrity masts could also be substituted.

By such process of progressive substitutions in diminishing order of sizes, a final sub-subminiature stage of tensegrity mast would be substituted for the last stage of seemingly 'solid' struts, i.e., at a size magnitude of a single atom's structural diameter. At this stage of local miniaturization, the inherent discontinuous-compression, tensional integrity of the non-solid atomic structures themselves would coincide with the overall structuring principle of the whole series of masts-within-masts complex. This eliminates any further requirement of the now utterly obsolete conception of 'solid' anything--- as intervening in the man-tuned sensorial ranges between macro- and micro world of ultra- and infra-sensorial tensegrity. My demonstration of the stable structural supporting capability of such man-witnessable tensegrity masts thus eliminated any further requirement of any 'solid*' conception whatsoever."

illite "Tensegrity," PUHTbULIO + ART KWL, p.122. Dec *61 TeuSfrY-
Tensegrity: Miniature Masts: Positive and Negative:

"These were now demonstrable as consisting of both positive and negative tensegrities, simultaneously employed, './hereas either the positive or the negative tensegrity mast would independently provide the same overall compressional strut capability as did MM the two together, obviously either the positive or the negative tensegrity within the 'solid' combination must be doing all the 'strut* work at any one time--- the other is entirely superfluous, ergo redundant.

Their alternate capabilities, being approximately equal, would alternately tend to exchange the loading task, thus generating an oscillating interaction of positive vs. negative load transferral which would expend the energies of their respective structural integrities, thus tending to self-interdeterioration (crystallization) of their combined alternating strut functioning longevity of structural capability."

"Pushing on one individual pole of a tensegrity geodesic sphere is the same as pushing on two poles, because you only have to push at one point for the Inertia of the system to react against your pushing. This point produces a spherical wave set that if uninterfered with, will

travel encirclingly around the sphere from any one MBM starting point to its 160-degree antipodes. It is like dropping a pebble into the water: the crest is the expanded phase of Universe, and the trough is the contracted phase of Universe. Looking at the ripples, we see that they are the locally initiated, expanding-contracting of whole Universe as a consequence of local energy-event inputs. This is why tensegrity and pneumatic balls bounce. Contracting as they contact, their equally violent expansion impels them away from the--- relative to them--- inert body of contact."

Cited from *TMCS gallery at 2005_11*, as rewritten by RBF,

"A basic tensegrity sphere can be constituted of six equatorial plane pentagons, each of which consists of five independent and noninter-touching compression struts, totaling 30 separate nonintertouching compression struts in all. This six-pentagon equated tensegrity sphere interafyss in a self-balanced system resulting in six polar axes each perpendicular to one of its six equatorial pentagonal planes. It also results in 20 triangular interweavings, which structuring stabilizes the system.

"*Instead of having cables connecting the ends of the struts to the ends of the next adjacent struts in the six-axes-of- symmetry tensegrity structure, 60 short cables lead from the ends of each prestressed strut either to the midpoint of the next adjacent strut or to the midpoint of tension lines running from one end to the other of each compression strut. Each of the two ends of the 30 spherical chord compression struts emerges as an energy action, out over the center of action-and-reaction effort vectors of the next adjacent strut, at which midpoint the impinging strut's effort is angularly precessed to its adjacent struts. Thus each strut precessionally transfers its effort and relayed interloadings to the next two"

- Cite SYNERGETICS draft at Sec. 726.01+02, 15 Oct'72

'adjacent struts. This produces a dynamically regenerative self-interweaving basketry in which each compression strut is precessed symmetrically outwardly from the others while simultaneously precessing the force efforts of all the tensional network inwardly.

"In this pattern of six separate, five-strut-membered pentagons, the six pentagonal unsubstanced but imaginable, planes cut across each other equiangularly at the spheric center. In such a structure we witness the cosmic principles enabling the recurrence of locally regenerative structural patterns. We are witnessing here the principles and regenerating the atoms. The struts are simple, dynamic, energy-event vectors which derive their regenerative energies by an eternally

symmetrical interplay of inbound-outbound forces of systems which interfere with one another to maintain critical fall-in, shunt-out, proximities to one another."

Tensegrity Sphere: Six Pentagonals:

•'Tony Pugh at S.I.U. tells me that the version of the tensegrity sphere on which I based my exposition--- same one you have on your office floor--- is, in fact, degenerate because it imposes loads on the struts: as it does. In the pure tensegrities the tension network is continuous and the struts merely float in it. holding its nodes apart and undergoing no stress except axial (end-to-end)."

- Cit Hugh Kenner Ltr. to EJA, 14 Sept'72

Tensegrity Sphere: Six Pentagonals:

"Instead of having these cables going from end to end and the struts impinging on those cables, we have, from the end of the strut, a single cable going to the middle of the member. Here we have a very interesting pattern of the atom. You see a pattern here of a pentagon: five members. . . . six planes of pentagons cutting across each other. One energy action as it emerges here comes over the middle of the center of mass of energy there and it is angularly precessed. Then its own middle becomes the processor for the next two. You find this weaving around; this basketry, in which each one is precessing the other ones inwardly. You begin to see how there is a regenerative local pattern in Universe. I am quite confident that we are witnessing the principle by which the atoms cohere. These are dynamic events. These are vectors and they are strictly a tremendous energy event. . . . as it comes over the other end it gets its maximum concentration of energy at its center of energy, and then we get the precessional effect, and get into the critical proximities,"

Tensegrity: Stability Requires Six Struts:

"It is a synergetic characteristic of minimum structural systems (tetra) that the system is not stable until the last strut is introduced. Redundancy cannot be determined by energetic observation of behaviors of single struts (beams or columns) or any chain-linkage of same which are less than six in number, or less than tetrahedron,"

TtMSEiA. ry set. tSZ.

. From the end of a compression member there is a little tension member going to the mid-part of the next compressional strut unit. The end tension members from two adjacent struts make a V-shape, We are used to fastening things into buildings in shear where structural members push. The members in tensegrity structures pull apart as the V of tension shows. Tensegrity structures are not fastened in shear. If I tighten up a turnbuckle it will tighten up the whole tension V-shape and therefore the structure will get bigger and not smaller when tensed more tightly. Each of the tension V's get a little flatter. These structural behaviors are very typical of the energy interference patterns which structurally cohere all atoms. A strut is comparable to a vector energy action and its end is pulled by the center of mass of the next vector strut. Pulling the end of the vector strut changes its direction toward the center of the whole system. Thus each of the vectors is continually steered to encircle the same center. In the same way energy self-interference patterns result in locally regenerative structural systems as atoms,"

- Cite RBF in Tel Aviv Address, December 1967. (Zodiac 19).

"The aggregate of all the inter-great-circlings resolve themselves typically into a regular pattern of 12 pentagons and 20 triangles; or sometimes more complexedly, into 12 pentagons. 30 hexagons, and 80 triangles described by 240 great circle chords.

"This is the pattern of the geodesic tensegrity sphere. The numbers of hexagons and triangles and chords can be multiplied in regular arithmetical-geometrical series, but the J2 pentagons. and only 12, will persist as constants; as will also the number of triangles occur in multiples of 20; and the number of edges will always be multiples of six."

Tensegrity: Vertexial Connections: (1)

"The turbinig, tensionally interlaced joints of the tensegrity geodesic spheroids decrease the star-like vertexial interference patterns.

"./hen a photostat is made of a plurality of lines crossing through approximately one point, it is seen that there is a blurring or running together of the lines near the point, causing a web-like shadow between the converging lines even though the lines had been clearly drawn. This is caused by a refractive light-wave bending. When the masses of the physically consisted lines converge to critical proximity, the relative impedance of light-wave passage in the neighborhood of the point increases as of the second power of the relative proximities as multiplied by a factor of the relative mass-density. The tensegrity geodesic spherical structures eliminate the heavy sections of compression members in direct contact at their terminals, ergo keep the heavy mass of respective compressions beyond critical proximities."

Tensegrity: Vertexial Connections: (2)

"As the vertexial connections are entirely tensional, the section mass is reduced to a minimum, and frequency increase provides a cube-root rate of reduction of section in respect to each doubling frequency. Thus very large or small tensegrity geodesic spheroids may be designed with approximate elimination of all microwave interferences--- without in any way impairing the structural dimensional stability."

- Cite "Tensegrity," PORTFOLIO + ART NEWS, p.128, Dec, '61
Tensegrity: Vertexial Connections: Locked Kiss:

• 'As we increase the frequency of triangular module subdivisions of the sphere, and thus increase the numbers of compression struts, the struts get progressively halved in length, while their volumes and weights shrink eightfold. At the same time the arc altitude between the smaller arcs and chords of the sphere decreases, and finally we get to the condition where the compression members get closer and closer to the adjacent compression members which they cross. Finally we get to the point where the space between them is the same dimension as the girth diameter of the struts. We can then let them •kiss' touch, we may then lock them tensionally together in their 'kiss,' but when we do so remember that they were not pushing one another when they kissed and we locked them in that position of nonstructural coincidence. They are therefore not fastened in shear even though their 'locked kiss' gives a superficially 'solid' appearance.'*

'•I found that nature was not using that primarily structural logic. In our solar system the Earth is not touching and ball-bearing around on the Moon's surface. They cohere gravitationally and remotely. And in the atoms the energy components are equally remote from one another. I found that nature is using what I call continuous tension and discontinuous, islanded compression. Man's first discovery of that was when he made the wire wheel with a compressional hub as the counterpart of Earth with rim corresponding to the Moon's encirclement of the Earth with the spokes corresponding to the gravity which coheres the two islands of compression only by tension.

"I find then that it is possible to make structural units which are only held together by tension. I call these clearly differentiated tension-compression structural tensional integrities, or tensegrity structures."

"Now I am going to give you an analogy. It's actually a model in our processes of thinking. Say you were a kid and your mother said, 'I would like you to go out and hang something on the clothesline'--- so you had a clothesline.

Later on you are getting on a boat and somebody says, You have never been in a boat before. Now this is called a "sheet." It's like the sheet on your bed. I want you to pull in on this jib sheet.' And then you find that there are halyards and other kinds of lines, then you pull on those and you get used to all kinds of lines. Then you are pulling on the anchor rope.

"So then the clothesline and the different pieces of line you have handled on your boat rotted and you get in someone else's boat and you see ropes again. They have ropes nowadays with better cordage, of nylon, and dacron, and mylar. In the sum total you have a great many

experiences with tension, but every one is a special case. Then you begin to draw from all those special cases certain generalized principles about tension, rthen you pull on a rope it tends to straighten out."

- Cite RBF to Verner Smythe, NffC, Reel 1, p.9, 11 Mar'69

Tension; (2)

"When you push the two ends it begins to coil; the radius gets shorter, the radius gets longer. You begin to generalize.

' 'Now let's get out to a very high-frequency radius from a given sphere center of a great matrix of the closest- packed spheres. I will go out to the one-hundredth layer and at the one hundredth layer I would have--- we know our frequency is 100--- so our frequency to the second power, 100×100 is 10,000, to the second power times 10. so it makes it now 1,000,000, plus 2. So it's 1,000,002. I know the number of balls now in the one hundredth layer is 1,000,002. Very interesting.

"Now you and I and all the people who have had any rope experiences have had 1,000.002 experiences. More than enough to remember all the special experiences, and out of that we generalize certain experiences of tension. We call it 'tension.* We don't just call it a different piece of rope--- it's now no longer the main sheet, and so forth, it's just tension. And this generalization works in to some layers"

- Cite RBF to Verner Smythe, NYC, Reel 1, pp.8-9, 11 Mar'69

"inside. In other words, we have special-case experiences originally and out of those special-case experiences we resolve generalized principles. And I find what I call a generalization of a generalization, so that brings us into a layer further still. It could be that our generalizations come again close toward center and we finally get to the center one which is called the Universe and that involves them all. This is pretty much the way our thought processes work, We begin to have a whole lot of experiences with tears and so forth, and gradually with experiences we get wiser and

we see generalized principles. You really resolve something out of that and as you get older and older you resolve more and more generalized principles. And the reason you get quite full of equanimity and confidence is because you have generalized so many that you can handle any special case. I think these balls schematically are really the way our thought processes work. We are trying to identify what we do here. It is like the brain. This is the way the brain handles... We have discovered that the difference between the brain and the mind is that the |>rain

- Cite RBF to Verner Smythe, NYC, Reel 1, pp.10-11, 11 Mar'69 "is simply a storing and retrieving system for all the special-case experiences. But once you and I have resolved it, and the mind resolves the generalised principle... but once the mind has discovered the generalised principle, then it deposits it in the brain as another kind of special case. Generalization becomes storable in the special case words, because we do it in words, we do it in concepts— that gets to be storable. It's quite a different kind of storage from the original special case. I think there are a great many people who Just really live in the special case and don't really tend to generalize as much. What they have are some rules. Those are special cases because they remeber that their minister told them always to do this— Raise your hat going by church.. Those are conditioned reflexes.

"I think we really have given you the prime entry here."

Tepee-Tripod:

"Best picture of what happens locally is the following: The three sides of a tepee-tripod, composed first of three vertical triangles rising from a fourth ground triangle and subsequently rocking toward one another until their respective apexes and edges are congruent and the three triangles plus the one on the ground constitute as minimum system, for it has minimum 'withinness.' Any one edge of our tepee, acting alone, as a pole with an universal joint base, would fall over into a horizontal position, two edge of the tepee acting alone form a triangle with the ground and act as a hinge with no way to oppose rotation toward horizontal position, except when prevented from falling by interference with a third edge pole, falling toward and into congruence with the two other poles' common vertex."

Tetrahedron:

"1'ia thematically. there are some very important concepts about the tetrahedron. It is made up of four triangles.

The angles of each are interstabilized. Each of the separate angles, originally amorphous, becomes stable. The triangle is the fundamental structure, but it takes two functions--- the positive and the negative--- to make a structure. The tetrahedron is the simplest known structure."

- Cite RBF to Vta. I'arlin, Architectural Forum, p.77, Feb'72

Tetrahedron:

"In the conceptual process of developing the disciplines for carrying on the process of consideration, the process of temporarily putting aside the irrelevancies and working more closely for the relationships between the components that are considered relevant, we find that a geometry of configuration emerges from our awareness of the minimum considered components.

"A minimum constellation emerges from our preoccupation with getting rid of the irrelevancies. The geometry appears out of pure conceptuality. We dismiss the irrelevancies in the search for understanding, and we finally come down to the minimum set that may form a system to divide Universe into macrocosm and microcosm, which is a set of four items of consideration. The minimum consideration is a four-star affair that is tetrahedral. Between the four stars that form the vertexes of the tetrahedron, which is the simplest system in Universe, there are six edges that constitute all the possible relationships between those four stars."

Tetrahedron:

"I am just going to give you tetrahedron. Around any one vertex in the tetrahedron there are three planes. You can see them going around. Looking down on the top of a tetrahedron you see three planes and three edges. You see three faces and three edges around any one vertex. That seems very symmetrical and nice. You say that is logical. How can it be anything else. If you think about it any more it is rather strange because it is M H M H H I three edges and three faces out of an inventory of four faces and six edges. They are not the same Inventories. It is interesting that you could come out with symmetry around each of these points out of a dissimilar inventory."

Tetrahedron:

"At all times we are seeking how it can be that nature can develop a virus and billions of beautiful bubbles in the wake of the ship. How does she formulate these lovely geometries so rapidly. She must have some fundamental pure simple way of developing these extraordinary life cells at the rate she develops them. When we get down to something as simple as finding the tetrahedron was the minimum thinkable set that subdivided the Universe, and had relatedness that

we could really establish--- and to find that the organic chemist from an entirely different viewpoint came down to tetrahedron as apparently controlling-- the tetrahedron in this case would join vertex to vertex--- and then the metallurgist half a century later discovering the tetrahedron, but they were not interrelated vertex to vertex but they were interlinked edge to edge. So all the chemists found all the structuring of nature to be tetrahedrally contrived, the minimum system, and we find our thought going that way and it is again a comfortable experience."

- Cite Oregon Lecture #3, pp.90-91. 5 Jul'62

Tetrahedron:

"Organic chemistry and inorganic chemistry are both tetrahedrally coordinate. This relates to the thinking process where the fundamental configuration came out a tetrahedron. Nature's formulations here are a very, very high frequency thing-- nature makes viruses and things in split seconds. Whatever she does has very high frequency and certain simultaneous acts, sort of fundamental relationships, occur. We come to tetrahedron as the first spontaneous aggregate of the experiences.

We discover that nature is using tetrahedron in her fundamental formulation of the organic and inorganic chemistry. All structures are tetrahedrally based and we find our thoughts resolving themselves spontaneously into the tetrahedron so it should come to us as something very interesting when we begin to get what we might call generalization of these special cases which are the physics or the chemistry.'"

"Now combining van't Hoff and Pauling and our own experimental explorations, we may dare to guess that because experimental chemistry has as yet found no contradiction to tetrahedral linkage, despite vast probing, all the structuring of nature is probably done by rational tetrahedral increment coordination in which the XYZ coordinates also may be employed to describe the arrangements but only in awkward irrationality because of the cube edges' inherent irrationality in respect to their cubic face diagonals' hypotenuse values, which hypotenuses are the edges of the tetrahedra in the omnidirectional matrix of vectors in the natural structuring itself. The contemporary development of giant electronic computers makes the handling of the XYZ awkwardness a practical matter but serves to obscure the significance of my discovery of nature's own rational, nonsimultaneous, vectorial coordinate system oriented to the tetrahedron-octahedron lattice and its importance to fundamental clarity of thinking in a democratically- coagulating world bewildered by a 'foreign-hieroglyphicking' science,"

Tetrahedron:

Coordinate Symmetry:

(A)

"The tetrahedron in contradistinction to any other Platonic symmetrical solid, can be sliced (like a cheese) parallel to Any one of its faces and retain its original symmetry and identity. It gets Smaller but never loses its coordinate symmetry. The tetrahedron can be altered in respect to any one of its four faces asymmetrically. As we press any one face towards its opposite vertex, the tetrahedron gets smaller and smaller.

"So there are three different aspects of size: linear, aerial and volumetric and each one has a different velocity. Now as you move one of the tetrahedron's faces towards its opposite vertex, you get smaller and smaller with these three different velocities operative. But it always remains a tetrahedron so it always has six edges, four vertexes and four faces. So the symmetry is not lost and these fundamental topological aspects, the 60-degree-ness, never changes. As they move in finally, when they become congruent to the opposite vertex, all these velocities come to zero at the same time. But because the 60-degree-ness the six edges, and the four faces and symmetry were never being altered,

"Let me then take a tetrahedron of cheese and I aa going to press in on one of the faces Instead of slicing it. It remains symmetrical all right. But. I aa going to pull out on a second face at the sane rate that I pushed in on the first face; so now it remains the same size. It is still symmetrical but the pushing of the first face made it get a little smaller, but pulling out on the second face made it get larger. By pushing and pulling at the same rate it remains the same size, but its center of gravity has to change because the tetrahedron moves. As a consequence, then, of the teterahedron

moving it receives a couple of Iterations. It receives one positive and one negative alteration, remains symmetrical and the same size, and apparently moves. I have only used up two of the four faces, so I am going to push in on the third face at a rate different from the couple that are already operating, and I am going to pull out on the fourth face at the rate I was pushing in on the third face. I am making another completely different rate of change: one being very fast and the other slow; one very hard and the other quite soft. These completely different rates are coupled, and so it remains symmetrical and the same size, but now it has to change its position to satisfy two — alterations to the center of gravity and so it is moving

in a kind of helix « is one our precessional resultants.”

"Now it is also possible for me to push in on the face of the tetrahedron and so it gets smaller. I am pushing the face towards its opposite face and it gets smaller. When it is getting smaller, what do I mean? I mean its edges are getting shorter, the areas of its surfaces are decreasing, but they decrease at a very much higher rate than that at which the lines become shorter. The lines are shortening at the rate of the first power and the areas are shortening at the rate of the second power. The volume

is getting smaller at the third power rate— a very much higher velocity, so you have three rates of change in the phenomenon called size. Symmetry is still there. There is nothing to do with symmetry and nothing to do with the fact that it has four vertexes, nothing to do with its six edges, nothing to do with its 60-degree angles, 60-degreeness, fourness of vertex, fourness of face, sixness of edge and symmetry are all constants and they are in no way altered by the change in size. Size is simply three different things: linear, areal and volumetric rates of change.

"Let me then move this face of the tetrahedron. I am pushing the face' towards the opposite vertex. Now it has no size at all. The product of the first power, second power and third \ - Cite Oregon Lecture ., ^l6_t p.209, 10 Jul'62

"power came to zero by pure coincidence so we have zero size, but symmetry, sixness, fourness of vertex, and so forth. Those were constants and were not being altered by the change so they have not disappeared and have nothing to do with the size.

"So the fact is that size allows me now tetrahedron conceptually independent of size. I can move this face beyond congruence with the opposite vertex. And now the tetrahedron turns inside- out, so we can have an inside-out tetrahedron which is conceptual and of no known size."

Tetrahedron;

Inside-Outing of Tetrahedron;

(3)

"This is an Interesting model of a tetrahedron which you could make yourself by taking a heavy steel rod triangle, take three to rubber bands, run them from the three vertexes into the center of gravity of the triangle and tie them together. Take ahold of the three rubber bands where they come together at the center of gravity and yank it suddenly like this, and the inertia of the steel triangle will make the rubber bands stretch and the triangle becomes a tetrahedron--- but then they begin to contract and the triangle lifts. You will be able to

take such a triangle hanging in the air by the three stretched rubber bands and you can plunge your hand through the triangle, and pull it back, and you can have the triangle oscillating by pulling your hand back and forth and making a positive and negative tetrahedron. As a tetrahedron becomes positive or negative, pumping its vertex through the opposite face (the case I had before was pumping the opposite faces through the vertexes, and I just wanted to get the idea across that you can do it either way.) This kind of an oscillating pump is typical of some of the atom behaviors and this is what they call one of the prime atom clocks. It is just such an oscillation between a

_____ . positive and negative tetrahedron.”

/ - Cite Oregon Lecture #6, p. 211. 10 Jul*62

Tetrahedron: Inside-out Tetrahedron Begins to Grow:

"Remember that when we took a tetrahedron and moved any of its faces around their opposite vertexes (i.e., contract their center-of-gravity lines--- from di\gters of area of faces to opposite vertexes); that the faces are reduced symmetrically while the angles are (changed ?) . Finally the opposite face coincides with the vertex and the face planes are (co ?) existant with a common convergent point and no volume. If this is moved an inside-out tetrahedron begins to grow. So I see that energetic geometry is one up on the topologists because it understands the dynamic significance of the implicit 2 and the inherent spin."

Vertexes:

Because each tetrahedron has both four vertexes and four subtending nonvertex voids, we can identify those four diametrically complementary sets of all minimal cosmic structural systems as the four visible vertex and four nonvisible non*ertexes i.e., the triangularly symmetrical, peripheral voids.

"The tetrahedron thus introduces experientially the cosmic principle of the visible and invisible pairs or couples; with the nonvisible vertex as the inside-out vertex, which nonvertex is a nonconvergence of events; whereas the vertexes are visible event convergences."

"Energy bounces around in triangles working toward the narrowest vertex, where the impossibility of more than one line going through any one point at any one time imposes a twist vertex exit at the corners of all polyhedra. Therefore, all triangles and tetrahedra 'leak' energy but when doing so between two similar corresponding vertexes-interconnected tetrahedra, the leaks from one become the filling of the other."

Tetrahedroning: "You have the tetrahedron as one, octahedron is four and cube is three. A cube as three is not what people have been thinking. They have been thinking that a cube was one. But I am using unity where a tetrahedron is one, and then a cube takes three times as much space. If I am trying to appraise all space with cubes I am

going to have to use up three times as much space to get congruence with my arithmetic, so I find that the cube is not an economical kind of measure, A tetrahedron is by far the most economical measure I can use to subdivide all space."

TetraEdronInK! (²>

"Here is one tetrahedron (A), Here I have three tetrahedra and one octahedron (B). This is the plateau of an equilateral triangle. It is a truncated tetrahedron. If I take the sum of the volumes here, three tetrahedra plus four for the octahedron, the volume is seven.

"I am now going to make the next level of equilateral triangles (C): we add a row of three tetrahedra and we add two octahedra between them. We must also add an upside-down tetrahedron to go in the middle between the octahedra. The accounting is now six tetrahedra and each tetra has a volume of one: three octahedra and each octa has a volume of four ($3 \times 4 = 12$).

So $6+12=18$, plus one inverted tetrahedron - 19, which is the volume of this group. It has a truncated top which is a 2-module triangle.

"Here is the next bigger triangle (D) with a row of four additional tetrahedra, three additional octahedra, and two additional upside-down tetrahedra to go between the two new octahedra. The accounting of this aggregation is 10 tetrahedra"

- Cite Oregon Lecture //6, p.217, 10 Jul'62

"with points up (10); plus six octahedra ($6 \times 4 = 24$); plus three upside-down tetrahedra (3). So $10 + 24 + 3 = 37$, which is the volume of this group.

"We are then going to superimpose the first tetrahedron and the truncated sections in sequence. We add (A) and (B) with a combined value of 8, to (C) 19 for a combined value of 27.

We can do this because B8s module of two sits on a module-of-two base. Combining the whole stack with a base module of three, we can sit it on the base module of three of the plateau (D). resulting in a large tetrahedron whose edge module is four all the way through. The Volume of A-B-C was 27 and the D group was 37 for a combined volume of 64.

"So we discover that eight is the third power of module two; 27 is the third power of the module-three pyramid; and 64 is the volume of the module four. In other words, 8, 27, and 64 are simply the third powers of 2, 3, and 4. Therefore, instead of saying 'cubing,' we say tetrahedroning."

- Cite Oregon Lecture #6, pp.217-218, 10 Jul*62

"If we are tetrahedroning, we discover that a cube has the volume of three. If you were doing your accounting in cubes you were simply wasting two-thirds of your space. Remembering that the physicist discovered that nature was always most economical, we see that nature would not traffic in doing things with cubes if she could do it with tetrahedra. And she has.

This is not unrelated to what Linus Pauling found for the inorganic chemistry and to what Van't Hoff found for the organic chemistry. We suddenly find that all structuring by nature is done tetrahedronally. it comes out in these beautiful even numbers and why when we were trying to explain things in the XYZ coordinate system we were always coming out with transcendental irrationals."

Cite OREGON ecture #6, p. 21a , 10 Jul *62

"Because the tetrahedron uses only one-third as much basic energy quanta as do cubes to account for all energy transformations . . . tetrahedrons are three times more economical than cubes. In structural systems the tetrahedron uniquely articulates the prime number 1, and is therefore logically to be identified as the most economic quantation unit in universal energy accounting."

Tetrahelix:

"Here are three such columns of tetrahedra which cycle around each other ten tetrahedra. This is a very interesting kind of number: ten to cycle. When Dr. Watson and Crick made their famous model of the DNA, the deoxyribonucleic acid, they made a chemists' reconstruction from the information they were receiving but not as a microscopic photograph at all. It wasn't a photograph through a camera, but simply a typical chemist's reconstruction of the data they were receiving of the associating and disassociating and they found a helix was developing. They found there were 36 degrees to each increment of the helix and the 36 degrees broke into ten increments in every cycle and the increments were the same as our tetrahedra we give here. Now there has been no identification of this tetrahedral column with the Watson-Crick model, but the number is extremely interesting. Then we find that these columns of tetrahedra--- there has been an identification made by some of the molecular biologists when I gave them this tetrahelix column and they have found that it is of the structure used by some of the muscle fibers of man, the fundamental muscle fibers in nature, but it could also have some identification with the DNA. We don't know whether it does; we don't know whether it doesn't. . . .ⁿ

"Exploring the multifurcations of spontaneously regenerative reangulations and triangulations, we introduce upon a continuous ribbon a 60-degree-patterned, progressively alternating, angular bounce-off inward from first one side and then the other side of the ribbon, which produces a wave pattern whose length is the interval along any one side between successive bounce-offs which, being at 60 degrees in this case, produces a series of equiangular triangles along the strip. As seen from one side, the equiangular triangles

are alternately oriented as peak away, then base away, then peak away again, etc. This is the patterning of the only equilbrlous, never realised, angular field state, in contradistinction to its sine-curve wave, periodic realisations of progressively accumulative, disequilibriumous aberrations, whose peaks and valleys may also be patterned between the same length wave intervals along the sides of the ribbon as that of the equilbrlous periodicity."

6. Nov'73

"Now I came a little while ago to discovering that

any thinkable set that I'm considering is a set in which the sums of the angles around all these vertexes is always 720 degrees less than the numbers of the vertexes times 360. 720: that's the sum of the angles of one tetrahedron. So I find the difference between this global thinkable set and 60 degrees, which would seemingly go to infinity, wouldn't it?-- be a plane-- if there are }60 degrees around every point it really goes into a plane, then. So the difference between— we'll see what it looks

to you and me, feels like— infinity, or a plane. Take a piece of paper. I have to take out some angle to make it come back on itself. I find the amount of angle. If you strip off the skin of an animal, of a q-codile, or a giraffe, all in one piece. In order to be able to lay it out flat you have to keep cutting sinuses to keep it going out flat. You'll find that the number of the angles will always be 720 degrees. When you put it back together again you take out the 720 degrees-- close them up. So I find that the difference between what seems to be infinity of a plane and a local conceptual set is one tetrahedron.

"Now in our experience we have something we call size. But I"

- Cite Tel Aviv Address, p.11, 16 Jun'72 **"point out to you that an angle is an angle independent of the length of its edges, I can take three angles and get a triangle. A triangle is a triangle quite independent of size. In other words, there's conceptuality independent of size. Therefore when I say tetrahedron the tetrahedron could be any size to accommodate what we're talking about— the rest of Universe and what I am considering.**

"So I have something very interesting here. Because, again Einstein, talking about the physical Universe and the physical Universe has all these nonsimultaneous and only partially overlapping events. I point out that the individual events themselves are finite. So I then saw that we could say that Universe, both physical and metaphysical, all of our experiences, are each finite. Every one begins and ends. That's one of the most important kind of characteristics we can observe from all of our physical experimentation. All energy quanta, individual packages, an individual package being finite then, an aggregate of finites is finite. So we have a Universe,

"Now what man used to call infinite, I call finite but"

- Cite Tel Aviv Address, p.11, 16 Jun'72

"nonunitarily conceptual. What, he used to call finite I call de-finite, definable, and conceptual--- and Universe, which is finite, but nonconceptual--- turns out to be one tetrahedron. Now There's also a concave and convex tetrahedron, so it turns out to be two. There's an inward and an outward one, okay?"

- Cite Tel Aviv Address, p.11, 16 Jun'72

"The difference between nonconceptual nonsimultaneous Universe and Thinkability is always two tetrahedra as (i-acro) to complete the convex localness outside the system--- and one tetrahedron as (f-icro) to complete the concave localness inside of the system, to add up to finite but nonconceptual Universe. Thus the thinkable system take-out from Universe has a left out outside tetrahedron and a left out inside tetrahedron."

Fourfold Twonees, 10 Nov*74

"What is really important, however, about you or me is the thinkable you or the thinkable me, the abstract metaphysical you or me, what we have done with these images, the relatedness we have found, what communications we have made with one another. We begin to realize that the dimensions of the thinkable you are phenomenal: when you hear Mozart on the radio, that is, \square the metaphysical--- only intellectually identifiable--- eternal Mozart who will always be there to any who hear his music.

When we say 'atom' or think 'atom' we are intellect-to-intellect with livingly thinkable Democritus, who first conceived and named the invisible phenomenon 'atom.' Were exclusively tactile Democritus to be sitting next to you, surely you would not recognize him nor accredit him as you do the only-thinkable Democritus and what he thought about the atom.

"You say to me: 'I see you sitting there.' And all you see is a little of my pink face and hands and my shoes and my clothing, and you can't see me, which is entirely the thinking, abstract, metaphysical me. It becomes shocking to think that we recognize one another only as the touchable, nonthinking biological organism and its clothed ensemble."

- Cite RBF insert to SYNERGETICS galley at Sec. 801.23, 22 Nov'73

"Reconsidered in these significant identification terms, there is quite a different significance in what we term 'dead' as a strictly tactile 'thing,' in contrast to the exclusively 'thinking' you or me. We can put the touchable things in the ground, but we can't put the thinking and thinkable you in the ground. The fact that I see you only as the touchable you keeps shocking me. The baby's spontaneous touching becomes the dominant sense measure, wherefore we insist on measuring the inches or the feet. We talk this way even though these are not the right increments. My exclusively tactile seeing inadequacy becomes a kind of warning, despite my only theoretical knowledge of the error of seeing you only as the touchable you. I keep spontaneously seeing the tactile living you. The tactile is very unreliable; it has little meaning. Though you knew they are gentle, sweet children, when they put on Halloween monster masks they 'look' like monsters. It was precisely in this manner that human beings came to err in identifying life only with the touchable physical, which is exactly what life isn't."

- Cite RBF insert to SYNERGETICS galley at Sec. 801.24, 22 Nov'73

Thinkable Ton:

"I began to realise the dimensions of the thinkable you are phenomenal when I hear the radio and hear Mozart. In

these kinds of dimensions there is quite a different relationship to what we call dead, which is strictly a tactile thing, I put the touchable thing in the ground but I can't put the thinkable you in the ground. I find this all very extraordinary and the fact then that I see you as the touchable you keeps shocking me. . . This baby thing of touching became all the dominant measure and we insist on doing things in inches and feet. « . The tactile is a very unreliable thing. It has very, very little meaning.'*

Thinking:

"In 1927 I said, 'I'm deeply concerned with thought--- the fact that man has the capability to think and remember, a capability it is very clear that animals don't have, I was very aware of yoga. Very aware of Indian cults.

Thinkers. People who spend all their time in meditation, thinking... But to be able to sit and think you also ought to have some fuel coming in, otherwise you can think for only about thirty days and then you'll fall over.

"So somebody had to be producing something. So people who were sitting around thinking usually belonged to some religious sect and they had some peasants out there. They'd say: 'We'll do the thinking for you and you raise the vegetables.' That's what happened to most of the churches, most of the cults. I'm very interested in how you grow the food that people who are going to do the thinking eat, and I began to say--- these people talked with great pride of their mystical capabilities, getting through to greater presence and greater ecstasies--- I said: 'What moves me is that we were given the ability to think. What also moves me very much is that we were also given limited Capabilities. We don't have any manifestation of being able to get on without the rest of the Universe. So "

- Cite Rasa Gustaitis, WHODLY ROUND (HK&W, NY), p.157, Feb'73

"that I cannot get on without food or air, I cannot get on without the balance going on between vegetation and mammals— it is perfectly clear to me I could not. I could not get on without anything in Universe that is in Universe. It's a very complex and beautiful piece of design there, and the fact that I wake up and go to sleep, that people are born and die, that we get our information in packages and we articulate in packages— no continuum at all about it— so, the fact that I'm given the capability to think is very extraordinary. And to remember. And to be able to formulate. To take advantage of earlier experience. To have a mind and be able to think of alternate ways of carrying on which other species don't have. •

"So I said, 'I think what IBM going to do is to accept the wisdom and brilliance of the design of the Universe itself which is a priori to me, in which design it is apparently clearly designed that I would have limitation... And all these people who sit, then, trying to use the thinking thing to break through limits of thinking that are not permitted--- and waste their thinking capability trying to think about ways not allowed"

RBF DEFINITIONS

Thinking::

"• • • Closest packing begins with * two balls cooing together rather than omnidirectionally. Two balls coming together is where thought begins. • • it is a wedding thing. . . and it isvegr beautiful thing the way the two balls reoccur at each wave outwardly."

- Citation at Omnidirectional, 19 Jun'7¹

Thinking:

"The individual has an enormous advantage over any great private or public bureacracy because the Individual can simply start to think. And there are no space or time or resource limits to thinking. You can think outside of your state and outside of your passport. You can think in terms of the Universe. Then, if you are interested in what your thought discloses to you in the way of principles which seem to be operative in our Universe which do not seem to be properly heeded by man, then you can undertake to learn how to employ those principles, and reduce them into some kihd of rearrangement of the physical environment that will induce evolutionarily positive and universally considerate behaviors of humans." ` Cits Donver Ku!,<,™s Address, ²

Thinking;

''.That we call thinking is putting aside irrelevancies-- to dismiss the irrelevancies in order to contemplate the set of consideration. *!*

”There are lags in the rate of recallability.

Kames don't have meaning. Therefore it is harder for our mental retrieval system to remember them.

` ` Irrelevancies are of two kinds: those too infrequent and those too frequent (high Frequency)

Thinking:

"Thinking is the disciplined deferment of irrelevancies.

- Cite Peter PEARCE, Inventory of Concepts, June 1967

Thinking: (A)

"Thinking is a very special kind of conscious self-disciplining of the awarenesses emerging from the subconscious, that is the spontaneous--- originally programmed--- brain processes' handling of its myriad experience data in respect to its brain-integrated digest of its moment-to-moment new experiences and the progressive strategic choices of action or nonactions taken in respect to them.

"When I 'think,' I observe by careful reconsideration of the experience that I don't suddenly move or inject a bright light into an empty-milk-bottle type of brain chamber--- as the expression 'He had a bright idea,' implies.

"I discover that what I call thinking is my concerned preoccupation with a special set of separate experiences between which I have not as yet found the connections and interrelationships. So I find that what goes on is what we all know as feedback, the word which Norbert Wiener gave us as he carefully reconsidered his own brain's behavior.

"We have all experienced saying, 'What's our mutual friend's"

- Cite NASA Speech, p.38, Jun'66

Thinking: (B)

"name? 'I/e both know it well!¹ And tomorrow you recall it about the same time that I recall it. The process was subconscious. Our feedbacks have lags. They are not instantaneous. But we find that the time lags of our feedbacks vary greatly.

"We ask ourselves questions all day long--- sometimes very minor questions--- and our feedback, unbeknownst to our consciousness, goes right off searching our subconsciously stored, specialcase experience® files for the answers. So when you lie down and want to go to sleep you are often bothered by many thoughts. These are simply feedbacks to questions you asked earlier and have forgotten that you asked.

"The thinking self-discipline is accomplished by keeping all the feedback messengers in the waiting room while you discover and consider the interrelationships of one particular set of experiences."

- Cite NASA speech, p.39, Jun'66

Thinking:

"We see that what we do when we think is to momentarily dismiss all the irrelevant thoughts as we would part the grass to right and left in order to find the path. So thinking is high frequency interception and very temporary diversion to a local holding pattern outside our consideration of all the irrelevant inbound feedback--- just as inbound airplanes are 'stacked up' in the sky near airports by the ground control when too many come in at about the same time. Having isolated

a finite set of experiences--- spontaneously grouped for comprehensive consideration-- by dismissing the □ irrelevancies, we may proceed to comprehend the isolated/system by applying the theory of 'bits,* which breaks up finite wholes into finite parts."

- Cite NASA Speech, pp 39,40, Jun*66

Thinking;

"Thinking is a momentary dismissal of irrelevant: ies.

. . . There is a twilight zone of tantalisingly almost relevant. There are two such twilight sones--- the macro and the micro--- tantalisingly almost relevant. Between them there is always a set of extraordinarily lucid items of relevant."

RBF DiFIhITluKS

Thinking; (a)

"If we can't think about the whole universe at one time then what is thinking? We said that thinking was treating with some subdivision of universe. There is apparently a thinking set because we think. Our thoughts are then increments of the total experience, our retreatments, reconsiderations of the local increments in the total experience and what we are interested in from time to time is the interconnectedness of these local increments which we can only think about one experience at a time. We apparently can think about two fairly contiguous things and that is how we are trying to find the relationships.

That is the way we find our way. It is extremely interesting to find that this is the way we are designed. We apparently are not designed to think about the totality. And yet we can treat with it and we can collect something like the dictionary which has all the words developed by all men in attempting to communicate all their experiences. We can look at all that collection and we can carry the dictionary around, but we can't read all the words at once. We are continually reminded of the fact that we are able to deal with increments, and • then we get big patterns, and we are

"Continually sweeping and reviewing interrelatednesses. Y/e discover our way by overlapping interrelated

nesses."

- Cite Oregon Lecture #3, p.83, 5 Jul'62

"What do we do when we think? The scientific inquiry into the thought processes is spoken of as epistemology, so we are now making an epistemological inquiry. Thinking is a subsequential phenomenon. It is an interesting preoccupation. It is an inherently

spontaneously self-interesting preoccupation. You won't go on with it unless you want to and if it isn't prolonged it really isn't thinking. . . . One of the characteristics of thinking is a continuity relatedness, r/hen I stand up and think out loud with you, you will not * stay in the room with me long if I don't have a continuity relatedness. Thinking is then dealing with a set of experiences that might be called recollected experiences.

I recollect and then discover some generalized patterns that are inherent in special cases."

- Cite OREGON Lecture 2 - p, 59> 2 Jul'62

RBF D&FINITIUNS

fIMMB Thinking:

"So we have come to structure and we have come to pattern. Pattern has emerged first from our preoccupation with getting rid of the irrelevances and out of it® hae emerged a mbimum constellation, a minimum consideration and it is a four-star affair. It is tetrahedral. It is very amazing to have a geometry just appear out of our just considering what is thought. We have come to some conceptjttlity and this conceptuality is essential to this thinking process. When we say, 'I understand' there is some conceptuality finally developed."

- Citation at Tetrahedron. 2 Jul*62

Thinking:

"Thinking is the consideration of different experiences, inherently separate sets of events, and trying to find out what their relatedness is. Each one is a star....

"But the four stars are the minimum which we can really have for an important thought. If I discover only three stars in a thought, there must be at least a fourth star lurking somewhere in the constellation. In fact, I discover that all the stars that could possibly be related are always subdivisible by four."

- Citation <k context at Star Events. 2 Jul'62

Thinking;

"Now I have discovered that this thinking process is one in which by holding out and getting rid of the irrelevancies we definitely developed for the first time a conceivable geometry. The geometry of the Universe was not conceivable because it was nonsimultaneous. In the first place I found that this is a very important and satisfying kind of discovery and it stopped me from having to know where the ball ends. It is not a ball, but thought begins to develop the first geometry with a dismissal outwardly and a dismissal inwardly which leaves a spherical zone of irrelevancy. The thinking is omnidirectional."

- Cite Oregon Lecture #2, pp. 66-67* 2 Jul'62

Thinking:

"We discover that we divide Universe into an outwardness and inwardness so thinking is the first subdivision of Universe, because Universe we discovered was finite. One of the most important observations about our thought is that the experiences are nonsimultaneous. Therefore nonsimultaneity is a fundamental characteristic and if they are nonsimultaneous you cannot have simultaneous consideration."

- Cite Oregon Lecture #2, p. 65. 2 Jul*62

Thinking:

"Once I had discovered that thinking is not an inserting of an idea, but the putting aside of other ideas, so that the ones already there can hold the image longer, for you to look at, I made a very powerful discovery in so general a strategy of thinking which is, that time and again once I have got a good definition of what it is that I am doing then there are some very surprising results.¹¹

- Cite OREGON Lecture #2 - p. 62_a 2 Jul'62

Thinking;

"Thinking consists of a self-disciplined deferment of conscious consideration of any incoming information traffic other than that which is lucidly relevant to the experience intuited quest for comprehension of the significance of the emergent pattern under immediate priority of consideration.

"Thinking is a putting-aside, rather than a putting-in discipline, e.g. putting aside the tall grasses in order to isolate the trail into informative viewability. Thinking is FM--- frequency modulation--- for it results in tuning out of irrelevancies as a result of definitive resolution of the exclusively tuned-in or accepted feed-back messages' pattern differentiability."

"Considering just that which is thinkable or any convergence of events that is think-aboutable, if you are dealing with what you would call substance then you must be dealing with insideness and outslideness. The insideness and outsideness divides the macrocosmic and the microcosmic. Two points do not have insideness. Three points do not have insideness. One point defines a point. Two points define a line. Three points define a plane. Four points define volume: an insideness and outsideness.

"So we come to a system that consists of a number of irreducible aspects. The four points have six lines connecting them and there are four triangular windows and 12 angles. This gives you a total of four points plus six edges plus four windows, that makes 14; plus 12 angles, makes 26; plus a concave and a convex, which is 28; and there is also the outsideness and the insideness, for a total of 30. I find that there are 30 irreducible aspects of anything. If you come to anything it has a 30-foldedness. This is quite exciting.

'Now I have said that there is only one word that I can find that gives me an operational definition of what we call life--- what I am experiencing---and it is 'awareness.' And I've said"

- Cite RBF i Hugh Kenner, Phila., PA, tape transcript, p.6;

8 Jun'75

"No otherness no awareness. But a physicist has told me that there are philosophers who will not go along with me on that proposition of self and otherness because you can also be aware of yourself. So then I say you can be aware of yourself as a system. You have your insideness and your outsideness and there is your otherness right there. Any one aspect of the minimum system aspects may be observing the others. There is always otherness because the system (which includes the self as system) is a complex of JO-fold irreducible aspects.

"You can be either a system looking at another system or you can be a system looking at yourself. But that is otherness. Unity is plural and at minimum 30. Isn't that nice? I used to talk about unity as plural and at minimum two, but if you want to separate out, then there is really an inherent 30.

"That is really so incontrovertible. This is how the mind starts... Those are the edges of an icosahedron. They are aspects. So I see that is the otherness, the other system. The electron is the icosahedron, that 30-otherness lurking around there that refuses to compound with the otherness. You cannot add the Icosa to the VE; you can add it to itself and it comes back and makes an octahedron again."

- Cite RBF to Hugh Kenner, Phila. PA, transcript p.6; B Jun'75

Thirty Minimum Topological Characteristics: (1 j

^{tt}A system divides all the Universe into six parts: all the Universe outside the system--- the macrocosm: all the Universe inside the system--- the microcosm; and the four star-events ABCD which do the dividing.

"The separation of insideness and outsideness begins only with completion of the interrelationship lines of the four separate entity-producing events. The four star events ABCD have six separate, unique, and most economical interrelationship lines. AB, AC, AD, BC, BD, CD. These six lines and their four interconnected star-corners inadvertently produce four triangular facets of the minimum polyhedron, which four facets completely enclose the system to exclude the macrocosm and include the microcosm.

"A system consists at minimum of four nonsimultaneous but co-occurring, because overlapping, yet dissimilar, beginning and enduring star-entity events of six interrelationship lines and four nonadjacent window-facets, plus 12 unique, intercovariant vertex angles-- 26 conceptual, topological components of a system, to which must be added the multiplicative, ultraviolet ' "

Thrtc-W Grftftt Circling: Three-way Grid?

"The nonpolar points are not fixable or structurally stabilized until occurring at the crossings of a three-way- great-circled-triangular-spherical-surface-grid, generated symmetrically in respect to the polar axis of the system.

- CITE RBF rewrite of SYNERGETICS at Sec. 527.24, (galleys), 7 Nov* 73

"Gravitation is omni-embracing. In the barrel hoops gravity operates only in single and parallelly separate planes. Omnitriangulated geodesic spheres consisting exclusively of three-way interacting great circles are realizations of gravitational field patterns. Events are forced to bounce in spherically contained circles because they seek the largest possible interior circumference patterns. All great circles cross each other twice. Three or more noncongruent great circles are automatically inter-self-triangulating in their repetitive searching for the 'most comfortable' interactions which always resolve their three-way-great-circle patterning into regular spherical icosahedra. octahedra. or tetrahedra. The gravitational field will ultimately be disclosed as ultra high-frequency tensegrity geodesic spheres. Nothing else."

- Cite SYNERGETICS draft at Sec. 1009.®, 8 Mar'73

"The nonpolar point is not fixable or structurally stabilized until it is three-way great circled."

- Citation at Nonpolar Points, 29 Nov'72

"A social experience of three cars: they make a triangle changing from scalene to equilateral to scalene. The triangles are where the cars don't hit. (These are simply the windows.) But you can't draw less than four triangles. The complementarity of the three triangles makes the spherical tetrahedron--- which makes the three-way grid...

"Such dynamically defined Earth triangulation is not a static grid because the lines do not go through the same point at the same time; lines--- which are always action trajectories--- never do. All we have is patterning integrity of critical proximities. There is always a non-violated intervening boundary condition. This is all that nature ever has.*

- Citationa nd context at PiWfrllltY Qi Thrtt Cftfg CD a Highway (3), 26 Sep'73

Three-.. 'ay Great Circling; Three-Jay Grid:

' 'But you can't draw less than four triangles. The comle- mentarity of the three triangles make the spherical tetrahedron--- which makes the three-way grid. The little windows are 15' --- or 15 miles on the Earth's surface. It is really not a grid because the lines don't really go through the same point at the same time. All we have is critical proximities. There is always a boundary layer condition. This is all that nature has ever done. The probability and the degrees of freedom--- which leads to the tensegrity sphere; which leads to the pneumatic bag; which is the same kind of reality as the theee automobiles. It all avergaes out to be 60 degrees. That is probability because you are in 1 closed system. Probability is not lin-ar nor planar, but it is following the laws of spnericity or whole systems. It ties up with the three-way grid and with the constant relative abundance of points, areas, and lines, as disclosed by synergetics."

- Cite KBF to LJA, 3200 Idaho, DC, 17 Feb '72

"The discovery of the mathematically regular three-way great circle spherical coordinate cartographic grid of an infinite frequency series of progressive modular subdivisions, with the spherical radii which are perpendicular to the enclosing spherical field remaining vertical

to the corresponding planar surface points of cartographic projection; and the commensurate identification of this same great circle triangulation capability with the icosahedron and vector equilibrium , as well as with the octahedron and the tetrahedron."

- Cite SYNERGETICS, Sec. 251.20, April '72, incorporating Rbf rewriting of same at Kennedy Airport, NY 1 Apr »72.

"The synergetics discovery of the identification of the surface points of the system with second powering accommodates quantum mechanics' discrete energy packaging of photons and elucidates Einstein's equation, $E = Mc^2$, where the omnidirectional velocity of radiation to the second power--- c^2 --- identifies the rate of the rational order growth of the discrete energy quantation. This also explains synergetics' discovery of the point-fate external growth of systems. It also elucidates and identifies the second power factoring of Newson's gravitational law."

Three-Way Great Circling:

'I found to my amazement mathematicians making statements that you could not make three-way grids of great circles. . . , And so I did find that nature is using three-way triangulation. This gave me then the realization that. . . You can take a flat piece of paper and it has no structural strength whatsoever--- it will crumple. But if I make it into a cylinder, a simple curvature, I now can use it as a column. . . that is where all the lines are parallel to each other like a barrel!, but I saw that if I could make a three-way interaction of great circles, it would give me extraordinary stability. And that is really what compound curvature is."

- Cite RBF in Hans Meyer Interview, Dome Book Two, p. 90. Dec'70 rcHSEgKirr
-sex. tsra.

"While great circles are the shortest distances around spheres, a single great circle band around a sphere will readily slide off. Because there are an infinity of great circles through any two points on a sphere 180° apart, two great-circle bands--- automatically self-polarizing--- on a sphere can also rotate equatorially and approach congruency thereafter to act as one meridian and therefore slide off. Not until we have three-great circle bands as in a spherical octahedron providing omnitriangulation, do we have the great circles acting structurally to interstabilize their respective positions by closing finitely to provide triangulatrly fixed points less than 180° apart. Between the latter the single great circles--- or shortest distances between two points not 180° apart--- are thereafter spontaneously sought by the 'spherical barrel' bandings."

- Cite Ltr. to Shoji Sadao, 15 Feb. '66., p. 3

Three-Way Great Circling: Three-Way Grid: Spontaneity: 'The greater the further subtriangulation of the sphere, the greater the spontaneity and facility of the mutual positional interstabilization. This spontaneity is brought about by the shortest-distance-seeking of the less than 180° arcs of great circles and the latter's respective tension bands."

- Cite KBF Ltr. to Shoji Sadao, 15 Feb* *66., p. 3.

- *sec. 'LS6~Z£*

"It is probable that this three-way grid of great circles had retrained undiscovered--- alike by mathematicians and explorers of the machine tool's potentials--- because the great circle connectors do not have common axes (poles.) That is to say, they are not a 'family of great circles,' but a randomly occurring, split-into-pairs set, whose properties are first discoverable only by intuitively initiated empirical exploration."

- Cite Noah's Ark, 1950. p.1.

"The three-way great circle grids result from uniform boundary scale subdivision of the edges of the equiside- and-angle triangles, and the great-circle joining of the respective points of uniform subdivision of the edges of the triangles in such a manner that (reading from any of the primary vertexes along the respective diverging edges from the primary vertex} the connecting great circle lines should always connect the subdivision points between one unit of interval with two units of interval of the respectively diverging edges.

RBF DEFINITIONS

Tidal;

"Tension and compression are inseparable and coordinate functions of structural systems, but one may be at high tide aspect, i.e., most prominent phase, while the other is at low tide, or least prominent aspect or phase, e.g., a visibly tensioned rope is compressively contracted in almost invisible increment of its girth dimensions everywhere along its length. This low-tide aspect of compression occurs

in planes perpendicular to its compressed axis. Columns which are visibly loaded only by weights applied to their respective top ends, are easily seen to also have their vertical axis in compression, but invisibly the horizontal girths of these columns are also in tension as the result of a cigar-shaped swelling pattern of forces acting in the column at right angle to its loaded axis, which tends invisibly to transform toward the shape of a squash or a banana. As a result of the visible, or high- tide. vertical compressioning aspect of such axial loading of the column's system, this swelling force imperceptibly stretches, or tenses, the column's girth as a low-tide reciprocal function of the overall structural integrity reciprocity.

Time;

"Asymmetry is a consequence of the phenomenon time and time a consequence of the phenomenon we call afterimage, or *double take,' or reconsideration, with inherent lags of recallability rates in respect to various types of special-case experiences.

" Infrequently used names take longer to recall than do familiar actions. So the very consequence of only 'dawning' and evolving (never instantaneous) awareness is to impose the phenomenon time upon an otherwise timeless, ergo eternal Universe. Awareness itself is in all these asymmetries, and the pulsations are all the consequences of just thought itself: the ability of Universe to consider itself, and to reconsider itself."

"I work on metabolics. the distribution of eneijy processes* We have
internal metabolics and we have etrnally regenerative Universe; we
have big and little, different kinds of creatures in energy magnitudes.
So what we are really studying in economics are these energy ex-
changes and times and cessation rates.

"So there really is a logical accounting system. It was very logical to have agriculture paced to the annual system when you could only last 30 days without food or you were going to starve; and so the fiscal year was an annual year. But when we get into an industrial system it's quite different; but they proceeded to try to encompass the whole industrial pattern into a completely inappropriate agricultural pattern.

"The point is that from the very beginning I've been working on time-energy economics. Time-energy economics is called cosmic accounting. It views the total system in interaction with the celestial system, 'Where is our energy income? Where is our energy? What is our inventory? What is the planetary inventory? The biosphere inventory? There is a point at which there is just so much and you're not going to get any more."

Time 4 Fourth Dimension:

Time Is Not the Fourth Dimension

RBF DEFINITIONS

Time is Not the Fourth Dimension;

"Time is in our dimensioning because our geometry is vectorial. Every vector \square mass x velocity and time is a function of velocity. . . Time and heat and longevity and weight are inherent in every dimension. Ergo, time is no more the fourth dimension than it is the first, second, or third dimensions. No time: No dimension. . . It was the failure of the exclusive three-dimensionality of the XYZ interperpendicular coordination that gave rise to the concept that the fourth dimension must be a mysterious state which might be spoken of casually as a 'time dimension,' because the XYZ coordinates in themselves, as heretofore adopted by man, has seeming validity only in its linear and spatial characteristics independent of time and physical reality."

 Time-Sizing:

"Multiplying wavelength by frequency equals the speed of light. We have two experimentally demonstrable radiational variables. We have to do whatever we do against time. Whatever we may be, each we has only so much commonly experienciabale time in scenario Urd-verse within which to articulate thus and so. Therefore the vector equilibrium's radiant or gravitational "realizations" are always inherently geared or tuned-in with the fundamental time-sizing of 186,000mps., which unique time-size-length increments of available time can be divided into any desirable frequency. One second is a desirable, commonly experienciabale, increment to use and within each unit of it we can reach 35186,000 miles in any nonfrequency-interfered-with direction."

- Cite SYNERGETICS draft at Sec. 426JU, 30 Nov'72

"Time and Dimension: Synergetic geometry embraces all the qualities of experience, all aspects of being. Measurements of width, breadth, and height are awkward, inadequate descriptions that are only parts of the picture. Without weight, you do not exist physically; nor do you

exist without a specific temperature. You can convert the velocity-times- mass into heat. Vectors are not abstractions, they are resolutions. Time and heat and length and weight are inherent in every dimension. Ergo time is no more the fourth dimension than it is the first, second or third dimension."

- Cite SYNERGETICS text at Sec. 962.40, as rewritten by RBF,
30 Oct'72 '

Time & Size:

"Distance is measured in time. Time increments are calculated in respect to a variety of cyclic regularities manifest in our environmental experiences. Experimentally demonstrable cyclic regularities, such as the frequencies of the reoccurrence of radiation emissions of various atomic isotopes, becomes the fundamental time-increment references of relative size measurement of elemental phenomena,**

- Cite SYNEKGETICS text at Sec. 529.02; Nov*71

We may think independently of else in respect to tetrahedra, which consist of 12 separate angles. Triangles and tetrahedra and all varieties of polyhedra are thinkable independently of size. The cyclic-module measurement of the time of experiencing or generating the length of the edge of any triangulated special-case system can represent the basic 'standard' of relative size-comparisioning to other object experiences. Each cyclic 'sizing' increment is one unit of frequency and each cyclic increment inherently constitutes one unit of experienced physical energy."

Timeless;

- Citation & context at Time. 27 Dec'73

Timeless:

' 'The timeless and the changeless are intercomplementary aspects of ideal synergetics.

"There is conceptual insideness and outsideness, yet timeless and sizeless. Like the corp of God as mind. There are conceptual integrities which are inherently differentiable, ergo, inherently realizable as something we call life.

The ideal eternal conceptuality which we are discovering in synergetics is so true as to become real because part of the conceptuality is the lags which bring in the six degrees of freedom. It takes time to go back from there to over here. So you invent time. The conceptuality of different degrees of apartness is fundamental to a plurality of degrees of freedom, which induces the real-ization of time."

Toilet:

"In the kitchen-bathing dome... they had a toilet which converted human waste into high-grade fertiliser. The heat necessary for this odorless process was provided alternat- ingly by electricity from the windmill hookup or by heat from the solar panel water-heating device. The toilet system produced fertiliser as a rich, dry, manured, loamlike substance which needed to be taken out of the system only once a year."

__ Citation &. context at Now House. (4); 20 Sep*76

Toilet;

"And I'm also carrying a number of other developments, for instance, a waterless toilet, just a packaging machine. Nothing has been really bringing about more contamination for human beings than the splash- ing of toilets and wet plumbing. And this is very valuable chemistry. We are using 50 volumes of water to get rid of one volume of human waste. Just think of it. And it isn't waste at all! And we take all that beautiful rain coming down the mountainside, and take 50 volumes of water just to carry off that waste and mix it up with the other water! . . . V/hen we really need it separated as very valuable chemistry, both fertilizerwise and as actual energy content--- high methane."

Tolerance: Measurement Tolerance:

"Mechanics introduced the word tolerance, not the scientists. The measuring df the mechanics, i.e., the engineers, was far more accurate."

- Cite RBF to EJA, Royal Scots Restaurant, N.I. 14 Sept. 1971

"We've discovered that while you can't be exact, you can progressively reduce error, and that's exactly what mechanics and technology are doing. As we went, for instance, from building a man's house, where an eighth of an inch is a close enough tolerance to make the house stand up, to a hundredth or a thousandth of an inch automobile tolerances; and you couldn't fly unless you held the tolerances

finer--- to ten thousandths of an inch. Then in rocketry we're getting into millionths of an inch, which is all that we'll allow for error. The space program has a fantastic record so far of not having lost a single man in space--- coming out of the extraordinary reduction of tolerance of error. I find that what we will tolerate in the way of errors is very important in the hierarchy of events."

Tools:

"Man has learned how to externalize his own functions

and to leave them behind. . . There are no tools that man has developed that are not extensions of the original integral functions ..."

- Cite COMMITMENT TO HUMANITY, p. 31, May'70

KBF DEFINITIONS

Tools:

"Toolmaking is the externalization in discrete ways aiding the evolutionary process and the regeneration of the species.

"Man is not unique as a toolmaker at all. but he is unique in the degree to which this capacity is extended by virtue of his mind and his ability to understand those generalized principles. And he is the only one to really alter those tools, change those tools, and try to get better tools."

- Cite COMMITMENT TO HUMANITY, p. 32. May'70

Tool:

"That's what I mean by a tool: an orderly alteration of the environment to complement' the integral organic process."

- Citation and context at Bird's Nest as A Tool (1)_t 12 Jun*69

Tools:

Pan "has developed a very large use of what I call the extensions of life, the industrial development of tools that make tools, that make other tools. The spider makes a web and that is a tool. And the bird makes his nest which is a tool. We find that all life carries on some kind of external environment altering operation which when importantly persistent and specific become multifold alterations, one or more of which we identify as tools with which the living species effect much greater and repetitive alterations of other aspects of the environmental processes.

"For example, a man takes part of a tree and shapes it into an axe handle with which he chops down trees in order to concentrate lumber from those trees so densely as to shed him from the rain. But man has developed this tool making capability to far greater degree than the other biological species."

- Citation at Bird's Nest as a Tool. 4-6 May*67

R3F DEFINITIONS

Tools:

"In the great history of technology the materials that can be turned into tools are relatively scarce. Man had to seek them. The number of minds which knew how to deal with them were very few. Their experience was very limited. The tools to work the resources with were very scarce. What we might call the best organizable capabilities of men were very scarce; they have been historically scarce."

- cite OREGU-N UNIVERSITY Lecture #1 , p. U, 1 Jul'62

Craft Tools;

- Cite RBF quoted by William Kuhns in "Post-Industrial Prophets" (Harper- Colophon), p.235. 1971

"I spoke to you earlier about man's developing tools. Just as my own personal strategy I found that I could divide all tools into two main classes--- craft tools and industrial tools. By craft tools I mean those that could be invented? produced, and operated by one man starting nakedly in the wilderness where he could pick up a stick, for example, and use it as a spear. This category includes all kinds of tools for working stone and so forth. All the great artifact heaps that we find around the world are tools that could be and probably were invented by some one man, starting from nothing in the wilderness with no information from anybody and using just his own experience, which taught him that this thing just might work. He tried it and it did work.

"By industrial tools I mean the ones that couldn't be produced by one man. That's a simple enough cleavage. The first industrial tool was the spoken word. You can't invent a word without two people. So, as the Bible says: 'In the beginning was the Word.' I'll say; 'In the beginning of industrialisation was the word.' This is the beginning of relaying information and experiences from one man to another. Because men were able"

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970

Tools: Craft Tools and Industrial Tools: (2)

"to relay information both in terms of overlapping lives and also travel, they began to consolidate all kinds of information. And we get then to the industrial tools that clearly fit my definition; for instance, the steamship 'Queen Mary.' obviously a tool that could not possibly have been produced by one man, or run by one man, or used by one man. The telephone system, a roadway system, great blast furnaces, and so forth— all these industrial tools are very extraordinary things that can accommodate you and me. They are the consequence of all the information from all the history of man about all resources everywhere, and their superiority over the craft tool is very, very great. They involve discovery in the scenery around us: whether in that rock there is something called beryllium and that beryllium can make you a coil spring that won't fatigue or spout; or that there are such things as chrome and nickel, the addition of which to iron produces a steel with a tensile strength of a thousand times that of the tensile strength of iron alone. These are the kinds of things that man found. And because of discovering that you could do more with less and less, a given cross section could have greater and greater tensile strength."

- Cite RBF in Franklin Address, Auburn, Ala, 1970

Tools : Craft Tools ft. Industrial Tools:

"By craft tools I refer to all the tools that can be produced by one man starting nakedly in the wilderness without any information or aid from anybody else. So the stone becomes a tool; the stick becomes a tool.

Then man makes a spear and it is even more effective--- and he keeps modifying. These things the individual can develop out of his own personal experience, and he is prone to do so out of his own personal experience. • • .

"With craft tools you have a very limited man, limited to where his own feet will take him, limited by his unevenly distributed resources. He is very limited in total experience and in time and capability. The industrial is quite the other way: it represents the integrated information of all men and all time."

- Cite COKhU'U.ENT TO HUMANITY, p. 32 , *May*'70

Tools: Craft Toole: & Industrial Tools:

"Our tooled extensions of man breaks down into two very definite classes: I call one class the craft tools and the other I call the Industrial tools. Under craft tools I include all the tools that can be invented by one man starting nakedly in the wilderness, with no advice nor informatimmve accounts of their experiences from anybody else. All the great heaps of artifacts discovered around the world by archaeologists and anthropologists are filled with tools that could be made by one man starting nakedly in the wilderness and developed by him only from his personal experience.

"The industrial tools I define as all the tools that cannot be produced by one man. I'll give you as an example the large ocean steamship such as the Queen Lary. The idea of one man producing it or operating it would be preposterous. . . The first industrial tool was the spoken word. . . The craft tools are related only ti single human beings and their very local and personal experience, their short lives and the particular area of resources into which they happen to be born. The industrial tools relate to our compounding of all experiences of all men anywhere, and all the finite resources of our total Suaceship Earth."

- Cite BEIRUT 67, p. 10, 5 May'67

"All tools are externalizations of originally integral functions of humans. I divide all tools into two main classes, craft tools and industrial tools. The craft tools consist of all the tools that can be invented and produced by one man starting and operating alone naked in the wilderness. I define the industrial tools as all the tools which cannot be produced by one man.

- Cite DOXIADIS, p. 323 , 20 Jun'66

"In relation to the computer-tool-hookups of automation, it is to be noted that all tools are externalisations of originally integral functions of human organisms. But externalised functions such as that of the cupped hand to hold water are capable, when translated into ceramic cups, of holding hotter or more acid liquids than the human hand could. This is to say that the limits of capability of the externalised functioning are extended but are not unique in principle. Whereas the craft tools developed by man operated independently, the industrial tools develop interdependently. The machine lathe requires the blast furnace and vice versa. Individual craft tools are the externalised counterpart of the individual's separate functions, while industrial tools are the organic externalisation of man's integral metabolic regeneration."

Tooling of Domes:

"In regard to the blueprint---what you request is really difficult because, unlike the conventional architectural world, we do not make drawings for contractors to interpret in the field. What we do, is develop the mathematical information and schedule schematic controls for industrial production of dies, jigs, and tools, which latter will in turn produce the final parts. This is to say that the designer designs tools, the mechanics produce the tools, and the tools produce the end-product---tools often produce larger or more tools which later produce the end parts. It is here that the primary misunderstanding of industry, by the older world, occurs,

"In Italy, and elsewhere, we still see the artist, scientist, mechanic embracing all of these functions, turning out a beautiful end-product such as a racing automobile. His product can never be amplified beyond his own personal capacity, either in number of pieces produced nor in exquisiteness of production of the parts. It is when the tools are employed to produce dimensions and effects in the end- product, beyond the sensorial ability of the artist-"

- ` mechanic to coordinate, that we have the really important improvement in scientific industrial mass production.

"In producing the parts for my geodesic dome for the Ford Motor Company's Rotunda Building in Detroit, Michigan, the 'Class A' Ford tooling maintained a tolerance in the positioning of the rivet holes, and in the diameter of those holes, of .005 inch. This is an invisible increment to the unaided human eye. Maintaining this tolerance produce a structure whose end-fixity strength was twice what it would have been had the tolerance been slackened, to dimensional variations of .01 inch---which is the limit of human sensorial perceptivity. This is to say that by taking advantage of the tool's capability

to operate at subvisible tolerances, double the strength was attained and therefore the dome weighed one-half as much as would a dome of equal strength, if the dimensioning had been accomplished within the limit of human visibility and hand-indexed coordination.

"It is a corollary of the above that structures produced by the most advanced capabilities of scientific industry no"

- Cite RBF Ltr. to Mr. Brattinga, 24 Jan'58

'longer demonstrate sensorial architectural adherence to Sullivan's axiom: 'form follows function.' Here both the form and the functions are invisible. You can't see the difference between alloys of steel or aluminum that may be twice the strength of other alloys of the same metals. If the function is to be strong, that function is Invisible---which is to say it has no aesthetic form.

"The forms we see in geodesic structures are synergetic, which is to say that they are visible in mathematical principle only, and only as the interaction of a complex of functions. No one industrial function is visible. Any one member, in a geodesic structure, may be at one time operative essentially in tension and at another time essentially in compression.

These are exact opposites and none of these alternating operative behaviors would be visible to an observer of m a geodesic dome as the latter remained poised, apparently serene, in a hurricane. Geodesic domes are then designed as synergetic complexes of events which maintain a superficial ultra-high-frequency integrity of constellar patterning."

"The early Greek geometers and their Egyptian and Babylonian predecessors pursued the science of geometry with three basic tools: the dividers, the straightedge, and the scribe. They established the rule that they could not introduce information into their exploration unless it was acquired empirically by the use of those tools. With the progressive interactive use of these three tools they produced modular areas, angles, and linear spaces.

"The basic flaw in their game was that they failed to identify and define as a tool the surface on which the inscribed.

In absolute reality this surface constituted a fourth tool absolutely essential to their demonstration. The absolute error of this oversight was missed at the time due to the minuscule size of man in relation to his planet Earth. While there were a few who conceived of the Earth as a sphere, they assumed that a local planar condition existed--- which the vast majority of humans assumed to be extended to infinity, with a four-cornered Earth plane surrounded by the plane of water that went to infinity."

- Cite RBF dictation at SYNERGETICS Secs. 821.01+02, Sept'71

"•They assumed the complementary tool to be a plane. Because the plane went to infinity in all planar directions it could not be defined and therefore was spontaneously overlooked as a tool essential to their empirical demonstrating. What they could not define, yet obviously needed, they identified by the ineffable title 'axiomatic,' meaning 'Everybody knows that.' Had they recognized the essentiality of defining the fourth tool upon which they inscribed, and had they recognized that our Earth was spherical; ergo, finite; ergo, definite; they could and probably would have employed completely different strategies than that of their initiation of geometry with the exclusive use of the plane. But to the Eastern Mediterranean world there lay the plane of the Earth at their feet on which to scratch with a scribe,"

Topology;

"It was discovered and developed by the mathematician Euler. He discovered that all patterns can be reduced to three prime conceptual characteristics: to lines: points where two lines cross or the same line crosses itself; and *raas. bound by lines. He found that there is a constant relative abundance of these three fundamentally unique and no further reducible aspects of all patterning

This reads: the number of points plus the number of areas always equals the number of lines plus the number constant two. There are times when one area happens to coincide with others. When the faces of polyhedra coincide illusionarily the congruently hidden faces must be accounted arithmetically in formula"

` ` Synergetics topology integrates the geometrical angle laws with the conceptual regularities of Euler's point-area-line relative abundance laws, all of which synergetic integration of topology with angular regularities of geometrical transformabilities is conceptually generalizable independent of specialcase, time-space-sixing realizations."

- Cite SYNERGETICS, 2nd. Ed., at Sec. 202.03, 16 Nov'74

Topology; Synergetics & Eulerian: (1)

"I am dealing with the Universe: the difference between conceptual thought and nonunitarily conceptual Universe. You cannot make a model of that, but you can show it as one conceptual system which is tetrahedral... plus a convex and concave teVahedron and that equals Universe,

"Euler opened up about 150 years ago the great new field of mathematics which is topology. He discovered that all visual experiences could be treated as conceptual. (But he did not explain it in those words.)....

"Topology is Euler's saying that all visual experience can be resolved into three fundamental and irreducible aspects: vertexes, faces and lines. (or, as we say in synergetics: crossings, openings, and trajectories.) We have something we call a line, but it doesn't have to be a straight line; it is a tracery. But to trace its course you get a fix, which is not to be confused in any way with a nodal crossing. You have a plurality of these traces and you get areas. When any tracteries come back upon themselves, then we get the areae."

- Cite tape transcript, pp. 25-26; RBF to B. Brooks, 2 Jun '74

Topology: Synergetics vs Eulerian: (2)

"The areas, the traces, and the crossings are never to be confused with one another: all visual experiences are resolved into these three.

"You just look at any picture and you have to say: What is that part? That's an area, or it's a line, or it's a crossing. The coincidences are a little more, because they are loci. To account for the whole picture you can elect to call it an area... mark it A... a line, which is an L; and V is for a vertex, a convergence. You mark every one of them, many times. And the number of vertexes plus the number of areas will always equal the number of lines plus the number one.

"But I saw that you cannot have a plane except as a facet.

Because I am experiential I must say that a line is a consequence of energy, an event... a tracery, anyway. So it must be some kind of polyhedron. If you are dealing with a polyhedron, it is separate from Universe having an inside and an outside--- a picture in a frame, or whatever it is. The number of vertices or crossings is always equal to the number of lines plus two.

Or you can put a hole through it: if you do that, you find that $V + F - L$

- Cite tape transcript, pp. 26-27; RBF to B. Brooks, 2 Jun'74

Topology: Synergetics vs Eulerian: (3)

"Now somebody did not realize that in putting the hole through it you had removed the poles, the axis. Two points must always be involved in every system.

"Another very powerful mathematician was Brouwer. In his theorem, if we have a number of points and we continually mix them up we find that after all the stirring one of them didn't move relative to the others. Each one is always in the center of the total movement, each of those points.

"But the mathematicians oversimplified the plane. In synergetics the plane has to be the surface of a system that is obverse and inverse. Therefore, there must also be another point on the other side that does not move. Every system has two points that do not move. The system always has a neutral axis. Every object has a neutral axis, two points that serve as the poles of the system. Synergetics extracts those two points for its topological inventorying.

"Every system has two vertexes which must be a sign, a function, of being an axis of the system. Synergetics has the axis in reality what physics has as the spin and quanta in theory."

- Cite tape transcript, pp.27ff; RBF to B. Brooks, 2 Jun*74

Is DSLQitft Synergetics Topology vs Eulerian Topology:

"Synergetics topology integrates laws of angle and volume regularities with Euler's point, area, and line abundance laws."

(For RBF rewrite of above see same caption, 16 Nov'74)

- Citation at Synergetics, 28 Oct'73

I2£fil2gx: Smergtlc Topolorv? k Eularlun Topology:

"Ab in sfiny instances of synergetic behavior, . . • different!a ations are sometimes subtle. For instance, there is a subtle difference between Eulerian topology, which is polyhedrally superficial, and synergetic topology, which is nuclear and identifies spheres with vertexes, solids with faces, and struts with edges. The subtlety lies in the topological differentiation of the relative abundance offcheee three fundamental aspects whereby people do not look at the four closest-paeked spheres forming a tetrahedron in the same way that they look at a seemingly solid stone tetrahedron, and quite differently again from their observation of the six strut edges of a tetrahedron, particularly when they do not accredit Earth with providing three of the struts invisibly cohering the base ends of the camera tripod."

HBF DEFINITIONS

Torque at Center of Convergence:

"We also have learned that a plurality of lines cannot go through the same point at the same time. Therefore the eight perpendiculars to the centers of area of the triangle faces and the 12 lines that led to their 12 common outer vertexes, like the tetrahedra's volumes and areas, have come to common zero time-space size and can no longer interfere with one another. We find, operationally, however, that there never was any paradoxical problem such 'never completable approach' concept for we have learned of the fundamental torque or twist always present in all experientially explored system realization and we find that as each team of opposite triangles apprehended the other just upon their nearing the center each is whirled 180°, or is 'half spun' about, with its three corners never completely converging. 'Whereafter they diverge.'

RBF DEFINITIONS

Tragedy

` ` I take the word tragedy to mean poor little man being born ignorant and helpless and not having any idea of what is going on in the Universe. If for one instant we could really come to understand our Universe and could perceive ourselves as really one with Universe, we wouldn't have to consider such a word as 'tragedy.* We would see that there is absolute immortality. 'Tragedy,' I think is where everything just comesfout wrong, and nothing works and the Universe is a failure. But I don't think the Universe is

a failure. And the reason I don't think so is that as far as we can see Universe is the minimum eternally self- regenerative system, so we can only think of it as a complete success. It includes everything we experience and all of it has logical and/sublime integrity.¹

''There quite clearly is a capability operating that is much greater than the capability of man. The discovery that man has really been bumbling around in a very ignorant way in an extraordinarily well organized affair, where things are so well invented that he really couldn't fail despite his ignorance and despite his propensity for eliminating the other fellow. I am going -to say that I am sure this next half-century will be one of a comprehensive discovery of the leaders of men as the most trusted, most reliable intellectual explorers and, in fact, of everybody. It is going to be a first-hand affair, and not something that happens by virtue of somebody telling you about it. I would say there is going to be a discovery and a developing of individual convictions of the leaders of world society of a comprehensive anticipatory integrity of the highest intellectual order and it has no shape at all. It is not a thing thing. It is completely transcendental to anything

that could be called thingness. There is no idolatry involved here. I would say there was going to develop something instead of, in lieu of, Just a faith in the wisdom of your parents, or other fine people who said: young man, I really urge you to believe this is the

Transformation:

"Nature is ceaselessly transforming. Every event has six equieconomical alternatives. Eternal transformation is inexorable

- Citation & context at Artifacts (1), 30 Apr'74

Transformation:

"In dealing with the physicists and mathematicians who are working with the molecular biologists, one of the mental blocks I began to find on the part of the mathematicians were their tendency to still think of these Platonic geometries as individual integrities, as not having interrelationship. It took me quite some time to get them to give me enough time to let me show them the transformation of one of these into the other. They, as physicists and mathematicians, were very useful to transformation but transformations had no conceptual imagery at all. They were simply done by symbols. Just as you can make a transformation from two sides of an equation if you choose to take the positive and negative from one side to another and you will have to know which way it goes, but you can transform the equation without knowing what is in the equation. It does not have to stand for any particular given material called empty sets so you are used to mathematical transformability and empty sets.. The mathematicians were so used to that, that they had not expected to see or actually witness an affair where there are the complementaries."

- Cite Oregon Lecture #8, p. 281. 12 Jul*62

Transformation:

"Gradually now I am making you think about not only the withinness and the withoutness, but we even have a definition of a finite Universe even though nonsimultaneous. It is one in which we are dealing always in finiteness and is always adding up in their complementary transformations and the transformations are changing the rest. Something you are looking at locally is changing and it is changing the things around it. It has to do so."

Transnational:

We are now entering a transnational period of world evolvement quite apart from national frontiers. The world corporations are not so much exporting products as know-how and technology and these do not require the protection of sea power. So the companies are not saying to the governments that your military has to protect me locally."

- Cite RBF to American Enterprise Institute, Washington, DC, 2b Nov'72

"There were no building industry exhibits, no manifests of 'National Association of Real Estate Boards,' nor of home builders associations, nor building labor unions"... at the UN Habitat Conference in Vancouver.

"Conspicuous by the old banking world's absence, it became quite clear that the world bankers, confronted with escalating building costs which had passed the point of no return, as well as with exhaustion of the USA's---and all other major capitalist-system nations'---building mortgage guaranteeing creditability, had withdrawn all support of real estate exploiters and of obsolete building technology in general.

"The big money of the world... has gone entirely transnational... had found that whereas 'you can't take it with you' into the next world, you also can't take it with you around the world--ergo, ownership has now become onerous. Big money has left all the sovereignly locked-in, local-property- game players holding the unmovable bags of real estate. Machinery becomes obsolete almost overnight, ergo is unattractive as a continuing property and must be written'*

- Cite ACCORDING TO THE HUMAN UNSETTLEMENT, p.6; 20 Sep'76 "off the books in five years. But machinery can be melted and reworked to ever higher earning effectiveness only by ever improving know-how.

' 'Know-how has become the apple of 1976 transnational capitalism¹ s eye....

"All the great American corporations of yesterday have now moved out of America and their prime operations have become transnational and conglomerate and are essentially concerned with the game of selling their corporations' very complete technical, managerial, and vast credit-handling and moneymaking know-how. For this reason they are not interested in the older kind of properties. This set of unpredicted changes of volition explained the lack of concern of transnational conglomerate capitalism and their lack of opposition to the UN Vancouver Conference's preoccupation with human settlements---peanuts....

"The new transnational capitalism's grand strategies are primarily formulated... to keep governmental power widely deployed, ergo 'conquered.' The media it employs to aim and focus humanity's attention on what capitalism would like" - Cite ACCORDING TO THE HUMAN UNSETTLEMENT, pp.7-8; 20 Sep'76

"the human beings to think about and buy. Much of their media news has been smoke-screen news diverting humanity's attention from what the supranational capitalism itself has been doing. For instance, all the while the world news was spot-lighted on the Korean and Vietnam warring, the great USA corporations and banks were conglomerating and moving out of America into a world theater of operation."

- Cite ACCOMMODATING HUI AN
UNSETTLEEENT, p.8; 20 Sep'76
Transnationalism: vs. Colonialism; p j

"Probably the most prominent of the economic trends prognosticating evolutionary events is that of the supranational corporation. The 200 -largest industrial and financial corporations originally developed within the United States have now expanded to become world corporations with the preponderance of their operation and income derived from outside the United States. It has been quite feasible for these abstract organizations to obtain a world passport, but not so for human individuals.

Transnationalism is very different from colonialism. Colonialism was primarily characterized by the most powerful sovereignties in Europe going to nonindustrialized countries around the world where a few unique chemical element resources existed unused in the local arts---crafts, hunting, and fishing economies--- and extracting those chemical element resources whose significance was unrecognized by the local peoples. They progressively separated the chemical element resources from the ore bodies, refining and importing them to the European (and sometimes American) economies where these chemical elements became essential ingeddients of tools or end products of mass production tools in the modern industrial evolution of ever higher performance technology per units of resource input."

- Cite 'The Evening of the World's Power Structures,' pp.30-31, 10 AprH
RBF D&F1NITIONL

"In due course the same chemical elements, as ingredients of the modern technology, were exported around the world thus to return from time to time to the countries from which the raw materials originated. This brought a great mark-up of the price of their original materials to the buyers in the countries of raw origin. Because of their meager money-producing economies, the balance of annual trade was always unfavorable to the 'colonies' and always favorable to the European or American sovereignties.

"In contradistinction to colonialism, which took resources away from people, the new corporate transnationalism brings resources to the lesser sovereign powers.

"In the early 1920's Mexico effected a historical shutout of colonialism while conceptualizing and inaugurating hospitality - for transnationalism. Shortly after World War I Mexico successfully expropriated the petroleum lands and the drilling, pumping, and refining equipment of all the oil companies which had invaded Mexico without any official permission other than corruptly obtained 'licenses.'

'With the U.S. population alarmed by its World War I 'saving of democracy,' American big business was unable to excite American democracy's resentment for their plight and thereby protection of their 'rights' by intervention of USA armed might as in the past patterns of colonialism. Historically, colonialism's democratic ideals camouflaged their exploiters might-enforced, special-interest-advantaging, economic stratagems, moreover, Mexico said to America and Europe: 'Stop dumping your worn-out automobiles in our country. We will not accept imports of either your new or secondhand automobiles or other products. We would be glad to have your Buick, Ford and Mercedes, but you will have to set up

manufacturing plants of your products in Mexico and do so entirely at your own expense. You will have to give Mexico and Mexicans stock interest in your enterprise. In effect, your plant machinery, being immovably on Mexican territory, it will belong to us. As long as you're manufacturing those cars in our country on a successful basis, and are paying us dividends, using our resources, giving us excellent transportation (or other end-products or services) we will be glad to have you profit by your portion of your enterprise shares. But you, General Motors, Ford, Mercedes-Benz, et al., will have to"

- Cited in 'Evening of the World's Power Structures' p.32, 10 Apr'74
Transnationalism vs. Colonialism: 14)

"obtain the chemical element resources necessary to your manufacturing which are not available in our country and will have to bring them to us from wherever they may be. You will have to use the physical resources of Mexico whenever and wherever they exist and above all, you will have to bring world import and export advantage to us."

"General Motors and Ford suddenly found this highly profitable, as had also, long years earlier, Singer Sewing Machine and others.

"This is the major pattern of transnational industrialization. Thus the transnationalized corporation no longer needs Army or Navy from its country of origin to protect its on-foreign-soil interests because wealth has been brought to the small country, wherefore the small country inherently protects the transnational corporation. Transnationalism is not being participated in by the communist countries as well as the industrial majors. The net of all this is that colonialism took physical wealth away from the weaker country and left people in ignorance while transnationalism brings both physical and metaphysical 'know-how' wealth to the weaker country, thus increasing the minor nations' wealth and literacy quite independently of ideological factors."

- Cite "Evening of the World's Power Structures," p.33, 10 Apr*74

KBF DEFINITIONS

"Colonialism took away the physical and returned the physical in re-arranged ways. Transnationalism trades in metaphysical know-how.

"Along with its integration of world industrialization, transnationalism has also developed its own world-around intramural economic accounting facility which overflies the local, national controls and their respective currencies and tariffs. Vast, computer-facilitated, omni-world-operation accounting of the major transnational industrials is now being accommodated in a major way by the great American and European banking corporations themselves going transnational. In effect, American banks have taken American depositors' funds to expand themselves into world organizations and, together with the transnational corporations' financial managers, have used American dollars around the world to buy the world's gold in the world markets outside the United States as permitted by the recent U.S. presidential rescinding of a 40-year-long federal law that monetary gold could not be privately owned.... Altogether this flight of gold and its acquisition by the new transnationalism and the Arabs, who finally wrote the death warrant of petro-colonialism, has resulted in the world's international import-export trade balance being divested of any serious meaning."

- Cite "Evening of the World's Power Structures," p.34, 10 Apr'74 "With the largest amount of the world's petroleum energy supply in Arabia, and with the Arabs' conversion of their paper dollars to gold, there came about a natural marriage of interests of the oil capitalism and the transnational managerial capitalism. The oil is inherently exhaustible but the know-how of management can only increase.

"While all this was accomplished by self-survival astuteness of the banks and transnational corporations, retrospectively it constitutes the greatest economic upheaval in history. It amounts to taking away from the sovereignly-locked-in world's humans all their life-support equity chips and transferring that wealth to the transnational corporations and Arabs for a total heist which is equal to 18 trillion of the USA's present Nix- dollars."

Seo Flight, Oct*73

"Nature designs the most efficient (ergo beautiful) structures, for instance, great trees. Let us examine the structural effectiveness of nature's tree design. Make an experiment.

Take a suitcase in each hand, each weighing about 50 pounds. Try to hold them out horizontally at arm's length. It's easy for our arms to hang them vertically from our shoulders; but the more horizontal, the more difficult. It is almost impossible to hold MB 50 pounds out horizontally.

"let look at a tree's shoulders where the branches are attached. Look at the branch of a tree with the same girth as that of your shoulder when your arm is extended and muscles flexed.

Such a tree branch may weigh 500 pounds--- 10 times what you can hold out horizontally.

"Wing root" is the aeronautical engineering term for 'shoulder, for example, the wing root between the fuselage of an airplane's airframe and the jet-pod-carrying aluminum wing structures, which wing roots contain the mainspar. These air transport wing roots accomplish almost incredible tasks with incredibly low weight ratios. However, holding five and more ton branches"

- Cite RBF Intro, to H. Kenner's "Geodesic Math," p«20, 8 Sep'75

"out horizontally, while yielding streamlinedly and flexing gracefully without breaking in great winds as do the trees in a design accomplishment unparalleled by aeronautical engineering even in the wing roots of jumbo jets and supersonic

fighters. How can a tree do that? Biological structures cope hydraulically with all compressional loadings....

"The paramount function of trees is to expose as much leafage as possible under varying wind conditions in order to photosynthetically impound the Sun radiation, with which by a complex of relationships with other biologicals to support life on our planet, since few of the mammals can directly convert Sun-energy into life support. Since the function of trees requires maximum leafage exposure, its progeny will prosper most when planted outside the shadow of its parent. Each tree seed is a beautiful flying machine designed to ride the wind until reaching propitious soil. Because few seeds will find propitious sites in this random distribution system, the tree launches many thousands of seeds. These seeds contain the geometric design instructions for associating the locally available resources of air, water, and the locally available"

- Cite RBF Intro, to H.Kenner's 'Geodesic Math' p.25, & Sep'75

"soil and rock chemistries* atoms in the environs of the seed-landing. The seeds contain coded programs for associating local atoms in triple-bonded, ergo high-tensile capability crystal structures, which when triple-bonded with others, produce the long overlapping fibrous sacs to be filled with local water and air derivatives*

"These close-packed, liquid-filled, fibrous sacs compound to produce first the tree's root 'wood.* What nature ships in the seeds are the DNA-RNA coded instructions on how to utilise the resources of locally occurring water, gases, and chemical elements at the seed-planting site. These high tensile fiber sacs are filled with liquid sap, developed from water brought in through the roots by osmosis and one-way capillary valving of the hydrogen and oxygen-laden water out of the ground to combine with the carbon- and oxygen-laden gases of

the atmosphere as produced by mammals and other biological organisms, and by the photosynthesis of Sun radiation, whereby the tree's leaves combine the hydrogen and carbon atoms to produce the hydrocarbon, cell-built cells of the tree, while giving off the oxygen atoms to the atmosphere, with which the mammals' growth"

- Cite RBF Intro, to H. Kenner's "Geodesic Math," p.26, Sep'75
- 'will be respiratorially sustained.

"Enormous amounts of water are continuously elevated through the one-way, antigravity, capillary flMMB valving system: the tree feeds the rain-forming atmosphere by leaking atomised water out through its leaves, while all the same time sucking in fresh water through its roots. The tree's high tensile, fiber cell sacs are everywhere full of liquid. Liquids are noncompressible, yet distribute their local stress loadings evenly in all directions to all the enclosing high tensile fibrous sacs. The hydraulic compression function fills out firmly the predesigned overall high tensile fiber shaping of the tree. In between the liquid molecules nature inserts tiny gaseous molecules which are highly compressible and absorb the tree's high shock loadings, such as those from hurricane gusts.

The branches can wave wildly, but rarely break off unless dehydratively dying, which means losing their hydraulic, noncompressible, load distribution's integrity. Sometimes in an ice storm the tree freezes, the liquids cannot distribute their loads, and the branches break off and fall to the ground."

- Cite RBF Intro, to H. Kenner's "Geodesic Math," p.26, & Sep'75
- Trees:

"With the liquids distributing loads and the gases absorbing shocks, and the predesigned (DNA-RNA) overall high tension crystalline tension fiber network (like a football skin) controlling the overall tree (or other biological) shapes to be produced (when filled out with the liquids), we find the system transmitting its hydraulic load distribution impulses through each liquid-filled cell's contacts with adjacent liquid-loaded sacs.

"Starting with one tetrahedral bud shoot, the tree grows as a series of concentric tetrahedral cones--- revolved tetrahedra generate cones. Constant reorienting of the direction from which the Sun radiation is coming, and the frequent shift in wind direction and consequent drag forces on the tetra-tree, produce a conic revolution effect on the tree growth. Each year a new cambium-layer cone grows over the entire outside of the previous year's tetra-cone. Each branch of the tree also starts as a tetrahedral-shoulder-cone sprouted out from the main cone.

"This high-tension sac's web design with its hydraulic-compression coping and pneumatic shock absorbing is much the same structural system nature employs in the design of humans."

- Cite RBF Intro, to H, Kenner's "Geodesic Math," p.27, 8 Sep'75

Trees: (!)

"To be sure, the liquid does not freeze under average environmental conditions: nature creates a »good health* temperature control of 95.6° F for all its humans. Instead of the progressively larger tetra-cone form over which the tree builds from the roots outward into successive live layers, nature introduced th?

skeleton in the mobile mammals, all around which their hydraulically-actuated muscles and cushioning cells are crystallinely grown as scheduled by the DNA-RNA program thereafter to be automatically operated by genetic coding."

- Cite RBF Intro to "Geodesic Math," H. Kenner, p. 27, 8 Sep»75

"Whereas man builds all of his buildings with compressional strategies and all engineering analysis is in terms of compressional continuity of the old stone-on-stone, nature doesn't do any of her compression work with crystallines or solids. She uses them only in tension because the crystalline has the most bonding, therefore the best in tension...

"Nature does all of her compression just as in a tree. You take a beautiful but fairly small tree--- with its branches out--- and its wing root would be Just about the same size as your shoulder. You will find that whereas you can only hold possibly 30 to 40 pounds out horizontally, this tree is holding out a thousand pounds. And we get to a big tree with many tons out there, holding this thing out with all the great winds and the hurricanes: How can it do such an extraordinary task?

"It goes back to the tetrahedron, the simplest structural system in Universe. Where you associate tetrahedra just corner-to- corner there is a mass interattraction occurring, but they are free to move as in a universal joint. Tetrahedra fastened corner-to-corner would fill a whole lot of space, but with enormous spaces in between them. Because there is so much"

- Cite RBF to DSI Meeting, Phila., transcript p.3, 22 Mar'74

Trees: '•space they are so flexible and you can really fold the mass back into its own self. This is the way gases are: the simplest bond you could get. They are the least coherent this way and highly compressible because of the flexible joints and the way they could be folded back on themselves. The flexible joints illustrate pneumatics where all the loads are very evenly distributed.

"Then we come to the same tetrahedra, but with two bonds. They can be edge-bonded, or hinged. In engineering you call that hinging and the loads are still flexibly distributed. And if you put all the tetrahedra together edge-to-edge you suddenly find that you have what we call the octahedron-tetrahedron truss. The interstices between the tetrahedra will be octahedra and they are structural systems. They are

eight triangles. And so they do not flex. They are noncompressible; and they are like the liquids, being hinge-jointed and the loads are distributed with all the characteristics of liquids.

"Then we get to three Joints and suddenly we have the crystalline and there is no flexibility in here at all and so no loads are'*

- Cite RBF to DSI Meeting, Phila., transcript p.3, 22 Mar¹⁷⁴

RUF DEFINITIONS

"being distributed. This is very good because the three bonds are tensionally much stronger than two bonds. One bond to pull apart in the pneumatics; two bonds to pull apart in the hydraulics; and three to pull apart in the crystallines.

'So we find nature-- in designing a tree--- sending a seed bouncing into the sky. Because the tree is rooted and can't move, it has to get that seed out from underneath its shadow so the seeds can function as radiation impounders. And what goes into the seed is the strict instruction for the crystalline development. And crystals do grow; so the crystal]ines build the fibers--- and everything that is crystalline in the tree is the fibers to enclose the liquids, which are doing all the compression. And the liquid sac continuities are valved by osmosis. Water can only go one way, so it keeps being pulled in by the roots, keeping it hydraulically pumped up. Then the waters get going out at the top a little less rapidly that they're coming in at the bottom, so it

keeps the pressure up. So we have the crystallines acting in tension as a sac and in between them we get water molecules which act as the springs to take the shock loads. So you see then how this beautiful great tree is able to"

- Cite RBF to DSI Meeting, Phila., transcript p.4, 22 Kar'74

Trees: (d)

'take enormous wind shock loads. They gases are contained but yet they distribute the loads. The minute you freeze the tree up--- off goes the branch! Because it can't distribute its loads.

"This is very much the way nature has designed you and me... using this water to distribute the loads. And that's why we have to have this 98.6 degrees so we're not going to freeze up. And there are very limited conditions where the humans and the trees really can operate, but nature is able to do it on board of our planet within the biosphere. Hydraulics are a very good way... they are incredible!

"Whereas man--- in the Stone Age--- would go through millions of years in compression. Even though masonry has an ultimate, or limit, compressive strength of about 50,000 pounds a square inch, while masonry in tension is only about- 50; so it's been built 1000 times stronger to resist in compression than in tension. And that's the way man learned to pile that stone up....

"So I began to see that this hydraulics and pneumatics--- the crystallines--- had never been in the building arts at all. And so I've gotten into tension continuities with tensegrity structures"

- Cite RBF to DSI Meeting, Phlla. transcript p.5, 22 Mar*74

Tree:

"A tree is a fantastic design. It has roots to get the water out of the ground in a one-way osmosis system that gets the water back in the sky so it can rain again and water the roots.

- Cite RBF quoted by Tina Jeffrey in Newport News Daily Press, 1 Apr'73

Tree;

"Seen in their sky-returning functioning as recirculators of water, the ecological patterning of the trees is very much like a slow-motion tornado: an evolving-involuting pattern fountaining into the sky, reaching outwardly, downwardly, and inwardly again once more to recirculate and once more aiin--- like the pattern of atomic bombs or electromagnetic lines of force. The magnetic field relates to this polarization as visually witnessed in the Aurora Borealis."

- Citation and context at Ecology Sequence (2)(3), 16 Feb'73

Tree:

"I looked on a tree as beautiful when i jwas a little child. .Now I can see why that tree is designed the way it is. As a comprehensive anticipatory design scientist I understand why that tree is there, what its relation to me is. I really feel it too. It's not something superficial to draw a picture of. I really feel how it's handling the wind and the rain and what it's doing. It's a beautiful mechanism. Fantastic technology. You try to pick up a bucket of water, hold it out at arm's length. Suppose it weighs 50 pounds. You can't hold 50 pounds horizontally. And this tree is holding out a branch that weighs five tons--- horizontally. And it's able to handle a hurricane and not get into trouble, and with all those leaves. Quite a piece of design. And I know exactly how it's done. I began to design like that."

- Cite Rasa Gustatitis quoting RBF, in WHOLLY ROUND, (H,R&W, NY), p. 160, Feb'73

Trees: (A)

'Nature employs the three phases of association--- as liquids, crystals, and gases--- to very great account, assuming their low distributing capability. Nature wanted to build something very extraordinary such as a tree. Then the trees have a function: transforming energy for you and me; being rooted and pulling water through it... The impounding ends of you me have no roots. Trees and vegetation have roots so they can be watered. We have this enormous amount of water being pulled through them by osmosis all the time... And I give you the tree having to have its own young out from under its shadow. Launching all those seeds, hoping they would land in a favorable place. When sending off the seeds Nature counts on there being local gases, which amounts to air, and liquids available. She sends only the tensile blueprint in the seed. And part of this is crystals and crystals we know will grow. So the crystals are going to grow and give you more local tensiles.

'You have all tried picking up great weights and holding it vertically. It's easy to carry this way, but you try to hold that sijn case out horizontally and it's approximately impossible.

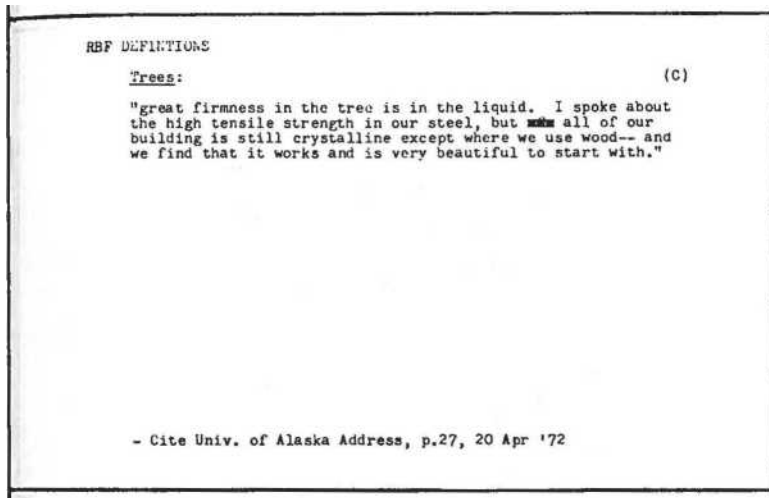

- Cite Univ. of Alaska Address, p.23 + 26, 20 Apr '72

"We see a great tree with its beautiful limbs going out horizontally and the wing root is really pretty small. You weigh one of those branches, sometimes they go up to five tons. You find you have trouble holding 50 pounds out like that. Jus try holding five tons out like that. You've got quite some structure all in a relatively small amount of space.

And nature does that. And when a great storm comes along she is able to sway and yield and not break. If you have a great ice storm then off comes a branch. Nature then sends that crystalline seed and the crystal increases, making more and more of the fibers. And they are triple-bonded; therefore, they have a high tensile strength. And

th crystals give all the tensile strength and it encases the hydraulic. The hydraulics have flexibility; they distribute the load so beautifully. But they are noncompressible. Between the molecules of the liquids are molecules of gases; and they are compressible and they take the shock load. So the great branch holding out its load does not deform, due to hydraulics being noncompressible. It's distributing its load superbly. And it's held together in the most high tensity we have-- which is the triple-bonding of the crystals. And then when the wind blows and the gas molecules in there yield to allow it to do this, despite the noncompressibility of the liquid. So the

"Now it is time for me to say something about wood's lessons to us as they relate to the design science revolution which, through invention, can increase capabilities and efficiencies to the point that will guarantee success to all men. If we really try to do more with less then nature has some extraordinary things to teach us when we study the structure of the tree.

"First, let me say there is nothing in nature but structure. Still. I find in engineering and architectural schools with all or their specialisation that there are always courses in materials. In these courses it is taught that buildings are built out of materials, but I find from my experience that this is not the case. What we in fact do is to build visible module structures out of invisible module structures. We have nothing but structures. We have microstructure and macrostructure, but there is nothing but structure. If we look carefully and see what nature is actually doing, what is her patterning, what is her structuring, then we can begin to develop very high capabilities."

Trees:

"I find that man has thought structurally in what I would call compressional logic, whereby he piles stone upon stone to make a building. In that kind of building you find that tension was only a secondary helper and compression was the primary logic employed. This is to say that I find many thinking spontaneously in compressions!--- might makes right--- logic. I found that nature was not using that logic. In our solar system the Earth is not touching and ball-bearing around the Moon's surface. And in the atoms the energy components are equally remote from one another. In the atom the electron is as remote from the proton in the microstructure as the Earth is from the Moon in our planetary macrostructure. In terms of relative diameters, we still have the same kind of celestial attraction that we have in the microcosm. There are no ¹ solids,' just as there are no 'materials,¹ but there are sufficient relative proximities of these masses which are

enough to cohere; just as the earth's mass is enough to have it held to the Sun even though they are 92 million miles distant. I find that nature is here using continuous tension and discontinuous islanded compression."

- Cite Syracuse Address, Pp. 5-56. 7 Nov '67

"These are clearly differentiated tension-compression structures which I call tensional integrities, or tensegrity, structure®. This, as we shall see, is exactly the structure of the tree.

"Tension and compression are complementary functions of structure. Therefore, as functions they only coexist. . . .

"The tree has an excellent structural lesson to teach us in the efficiency of its tensegrity structure's clearly differentiated tension and compression patternings. . .

Ancient man, wanting a spanning procedure used wood. Wood has 100 times stone's ultimate tensile strength, or about 5,000 p.s.i. But the wood beams eventually rotted out or burned, which is why today we find only the vertical stone compressive elements of antique man's great building ventures. . . . Clearly • we see that compressive capability has to be augmented to match our high tensile ability.

"It is the tree that can teach us this for nature has a very great trick in relation to all of these structural strategies."

- Cite Syracuse Address, P.57-59, 7 Nov '67 **"In 1885 the scientist, van't Hoff, demonstrated to organic chemists that all organic chemistry is tetrahedrally configured. Consider molecules as tetrahedra® and those tetrahedra joined vertex to vertex. A constellation of tetrahedra linked together entirely by such line vertex or universal jointing, which is called single-bonded, uses lots of space and is very characteristic of the gases. . . . Tetrahedra joined by two vertexes line up to what engineers call a 'hinge,' . . . When tetrahedra are attached to one another by three vertexes they are triple-bonded. . . ."**

"How does the tree do its extraordinary work? The tree has to impound all that Sun's energy with all of those leaves. It has to expose an enormous amount of leaf structure in order to be able to do so and still not dry up. To do this nature has the tree water-cooled, sending its roots deep into the ground to find the water to pump through its cooling system. These deep roots also give the tree its great stability to resist the forces of its great branches and leaves waving around in the wind. If you take a 50 pound load, such as a bucket of water, you are able to hold"

- Syracuse Address, Pn. 59-60, 7 Nov '67

"it vertically at the end of your arm, but if you try to elevate the bucket toward the horizontal it becomes more and more difficult. You can't really hold it out there. Because your arm is a pretty good size this makes you appreciate what the tree is doing with what is called the branch root into the trunk, Although relatively small, this area is sometimes sustaining a branch eight or more than two tons, compared with the 50 pounds with which you were struggling. And the tree is able to do this in winds of hurricane velocity and wave those tons around and still • not have the branch break off. In the airplane we call that joint the 'wing root' at the point where the wing comes to the fuselage. The greatest stresses experienced by flying a plane are at the wing root. Some of the great tree branches are cantilevered out from their branch roots as much as 40 feet. How can you possibly make such a structure as that?"

"The tree uses extraordinary structural strategies both in the tension and compression of its tensegrity patterning."

- Cite Syracuse Address, Pn. 60, 7 Nov '67

"The tension is entirely in continuous sheathing of compression-resisting liquids and shock-absorbing gases. The tension strength in the sheathing fibres comes from getting those masses of atoms closer and closer each other and thus exerting greater and greater attraction to each other. As they get closer the fibre gets stronger. If examined under a microscope those overlapping fibres are exactly analogous to the Milky Way. One Milky Way approaches another Milky Way and the attractions between their masses becomes enormous. The series of fibres actually overlaps so closely as to act as one great fibre. . . .

- 'In compression, liquids are completely noncompressible, and because they are also completely flexible, they distribute the load evenly all over the system.

"This is just what the tree does. She does all of her compression in hydraulics, and in between the hydraulic or liquid molecules, are little gas molecules. They are single-bonded tetrahedra and therefore highly compressible. The gas molecules give springiness and absorb shock. They are smaller than the liquid elements and fill the tiny"

- Cite Syracuse Address, Pp. 10-61, 7 Nov '67

Trees:

"spaces between them. An effective analogy would be oranges in a pile in closest packing. Think then of the hydraulic molecules as the oranges with the gas molecules filling in the tiny corners between them. So the shock loads on the tree are taken in the gases and the hydraulics give it its firmness and its strength. I would say that we're probably going to see an age of high hydraulic-compressive capabilities coming in to balance man's advantages of already high tensile capabilities.

"I just point out to you that our tree is the greatest structure I know. That's why if man continues to use wood in a dried state, we shall continue to lose its greatest strength. Incidentally, in order to have more trees regenerated, there cannot be a tree underneath another tree because the new tree wouldn't get enough Sun to sustain it. So nature has the tree produce seeds and the tree ships a pattern in the seed which goes off by the wind and the waters to get implanted where there will be available the new life's regenerative needs. Trees are regenerative. Man can actually profitably cut them down and replant them,"

- Cite Syracuse Address, Pp. 61-61, 7 Nov '67

Trees:

"These new structures are part of Planet Earth's income, and I think we're going to have to learn to live on income."

KBF DEFINITIONS

"Now let me discuss ways in which we might think about nature's logistical strategy in an accomplishment of most economical world-around structuring as disclosed to us within the narrow limits of immediately visible nature. Let us use the tree as an example. Trees are substantial organic structures, and they frequently last for many years more than do men or birds or fish or the contrived dwellings or nests of men or other mobile life. Some trees stand for more than a thousand years against great storms and earthquakes. While man and birds and fish are positionally mobile, trees are not. Trees are only locally flexible.

And yet trees spread their population around the world. The way they do this is by means of their seeds which they place in beautiful little flying machines. The maple tree's seeds, for example, float around in the winds and come fluttering down like little helicopters. The winds carry these seeds so that by successive generations trees are able to go airborne into new locations around the world. Thus are accomplished the world's pine tree belt, and other worldgirdling tree belts."

- Cite r.EPES, pp. 04-85. 1965

Trees : (2 1

"Let us consider the logistics nature uses in building and distributing such a lasting structure as a tree. We find that in the seed nature provides a blueprint pattern tightly folded up in a triangular tension grid."

- Cite KEPES, p. 35.1965

rtBF DEFINITIONS

"So nature, in arranging for one tree to build another tree, Bakes up a folded, tight blueprint in a tension network grid and folds it into a tight package: a seed. When the seed cones to rest, nature then provides the means for expanding the tree pattern by means of locally available compression components developed from the local water and air. Water is highly noncompressible--- our powerful hydraulic pumps exploit this--- so when nature hui Ids a tree, she takes the blueprint of the seed and begins to pump it up, full of locally available water, bhe then develops regenerative patterns, using the inhibition of more and more local waters. Lore water is needed because so much keeps leaking out, through the process known as osmosis.

"It is the noncompressibility of the water which makes for that great sturdy stiffness of a tree also permitting a tree trunk to hold out a branch weighing from ten to 25 tons to be waved flexibly in the wind. How can it wave in the wind? Because in between the molecules of non-compressible water, nature pushes in little packages of air, little spheroids. Air is highly compressible (as in

- Cite KEPES, pp.85-86, 1965

JXm: (4)

"pneumatic tires), so the little molecules of air compress like an automobile tire, allowing the branch to wave.

"Nature's great trick in making trees is to distribute tensional blueprints which regenerate the pattern locally, employing the compressions of local gases and local waters, enclosing them in beautiful tensional skins of the molecules themselves. This is nature's major strategy of efficient energy utilization in the distribution of structures."

"Number one consideration on the part of the design scientists is the question:

What can and may the individual human do on behalf of other humans that will not trespass on any humans nor frustrate any of the regenerative integrity of the omniecology? What do I have the right to do that is going to affect other people?

"When I can see, but you don't, that something is going to fall on your head and I jump to pull you out of the way just as the thing crashes on the floor, I don't think I am trespassing on you.

You might say:

"Well, I wanted to die."

And I reply:

"That has to be your option.

You didn't know that there was such an option;

I did, and had no time to tell you of it.

If you want to jump out the window that's your option."

- Cite Universal Requirements for a Dwelling Advantage, J1 May'74

"The point is that if I see something

that is going to be fatal or damaging to you

**or on the other hand might be of great advantage to you if acted upon
in time**

of which your experience has not made you aware,

then as a design scientist I have the cosmic responsibility

to prevent those debilitating conditions

and to realize on your behalf the advantageous potential

which could no longer have been realized IMB

when you too learned that there had been such a potential.

"There are many advantages for you

I or others can secure on your behalf that you don't know about.

"I must always be sure

I am increasing your elective freedoms.

Your life can be capitalized

as the number of hours you will probably live.

How many of those hours are really free?

You will find that a great many are preoccupied

In the chemical process you and I;

there are a great many involvements in this process and"

"relatively few of them that we can actually direct. So I must--- as a design scientist--- increase the proportion of your total life that is at your disposal.

I must reduce the restraints.

I must reduce the number of negative restraints set upon you by circumstances and increase the number of your favorable electives. For instance, if you would like to speak with someone at a great distance away, If I design and install a telephone where you may be you now have the option to communicate without spending much time in getting from here to there.

You don't have to use the telephone; but if you want, it's there.

I will make available, then artifacts that make it possible for you to do what you want or need to do and try continually to increase the magnitude of your effectiveness while always reducing the restraints upon you and saving you hours.

` ` All environment controls deal with the locally convergent events of Universe

which impinge upon you from outside you
and all the events which impinge upon you from Inside.
There are all kinds of magnitudes and frequencies.

The biggest ones are least frequent and the lesser ones more frequent. They are on a quantum wave basis of absolute regularities.

I want to be able to provide what you want when you want it.

"I don't try to insulate;

I provide automatic means of intercepting and shunting angularly into holding patterns for further usability;

The intercepted energy or materials to be valved by you into your presence in the magnitudes and frequencies most favorable to you while being effectively considerate of all the ecological sustaining contingencies.

"Environment controlling artifacts consist essentially of"

- Cite Universal Requirements for a Dwelling Advantage, 31 May*74

"structures and machinery."

Mechanical advantaging environment controls consist of lever complexes.

Gear trains and turbines are lever complexes.

"there are optimally efficient structural strategies for providing the most advantageous environment control.

We must be able to let whatever we want in from any direction.

We must think of our controls as omnidirectional.

We must be able to get in and out in any direction with least effort

We must be free to go in any direction we want.

We need an omnidirectional shutterable sieve

where we can increase or reduce the magnitudes of our omnidirectional environment valve openings.

"Since we wish to be able to see in any direction and likewise to be able to obscure in any direction, we recognize that it is difficult to make an opaque wall transparent but it is very easy to opaque a transparent wall by curtaining and shuttering.

"Our structures must be considerate

frttMlliW Not Triwudw (A)

"I think th* first thing I ought to do then. thinking about ths environmental events that are going to impinge on human beings* . . and also sotting up another discipline which was related to it: Whatever I must do on behalf of my fellow man must never trespass on my fellow man. That is, I must never increase restraints on him; I must reduce flfr restraints on him. I must free more of his time of his life to his own decisions.

"I could say: What do you mean by 'not trespassing'? . . . And I could get that pretty well defined. So I said: there's this man and you didn't know him, so I Just jump over here and quick react. I saw that something was falling from the ceiling and was going to hit you in the head. And you'd be killed. And I didn't have time to say anything. So I just went likethat to grab you and knock you over to get you out of the way. And you say: I wish you hadn't done that. And I sav: Why? And you say: Well, I wanted to die. And I say: Well, you've got to make that decision. I do not think I'm trespassing on you when I give you the decision whether you're going to die. Clearly I'm not trespassing if I see something's going to kill you that you don't know about and I do something"

- Cite RBF lecture at Wistar Inst, EJA transcript, p.9, 19 FeB'73

"about it. I do not consider that as trespassing. And then I went from there on and it was quite easy to find out how and what you could do. And also that you would have to be considerate a of the complex ecological balances all the time. You must not be a deliberate changer of the fundamental balance. You don't know enough about it. You must be responsible about the recirculations."

- Cite RBF lecture at Wistar Inst, EJA transcript p.10, 19 Feb'73

Trespassing: Not Trespassing; (1)

"I've got to know what I can do on behalf of my fellow man as a designer without trespassing on my fellow man. These seem to be very fundamental kind of questions.

"For instance, I said. I see--- you didn't see it--- but there was a stone that's falling there and it's going to hit you in the head and I Jump up that way and deflect it. And if I didn't you'd be killed. And you might say to me: I wish you hadn't done that, I want to die. And then I say: You didn't know that the stone was falling. That option has to be yours. If I saw that the falling stone was going to kill you and I don't act--- quickly like that--- then I would consider that I am a murderer because I have allowed you to be killed when you needn't be killed. Okay. So I said, I don't think I'm trespassing then when I intercept on behalf of my fellow man and divert. So we can't really insulate anything. You can't stop Universe. It's inexorable. But what we can do is take all the events impinging upon man and we can divert them in preferred ways.

"We all need water, but you can't drink all the rain when it rains. But what we can do is to shunt it angularly into a"

Cite Tel Aviv Address, 16 Jun'72, p.14

"into a holding operation to be valved into your presence at the magnitudes and the frequencies that your frequency of regeneration requires.

"So I found then what we must do with all the events impinging upon man from outside, macrocosmically; and all the events impinging upon him from microcosm-- and they impinge at different rates and at different frequencies and different magnitudes. So I said what we can really do on behalf of one another is to begin to understand about those and learn how we can shunt those into holding positions to be useful to man. But we must be completely considerate of the total ecological Interactions at all times."

Triangle:

(a)

"A triangle's three-vector parts constitute a basic event. Each triangle consists of three interlinked vectors. In the picture, we are going to add one triangle to the other. (See illustration 511.10.J In conventional arithmetic, one triangle plus one triangle equals two triangles. The two triangles represent two basic events operating in Universe. But experientially triangles do not occur in planes. They are always omnidimensional positive or negative helixes. You may say that we do not have any right to break the triangles' three-sided rims open in order to add them together, but the answer is that the triangles were never closed, because no line can ever come completely back 'into*' or 'through' itself. Two lines cannot be passed through a given point at the same time. One will be superimposed on the other. Therefore, the superimposition of one end of a triangular closure upon another end produces a spiral--a very flat spiral, indeed, but openly superimposed at each of its three corners, the opening magnitude being within the critical limit of mass attraction's 180-degree 'falling-in' effect. The triangle's open-ended ends are within critical proximity and mass-attractively intercohered, as are each and all of the separate atoms in"

"... A triangle is a boundary line closed upon itself.,'* the finitely closed boundary lines of the triangle automatically divide the unit surface of the sphere into two separate surface areas. Both are bounded by the same three great circle arcs and their three vertexial links: which is the description of a triangle. . . It is impossible to construct one triangle alone."

- Cite Spherical Triangle Sequence (i), 26 Jan*73

Triangle:

"The word 'structure' means a complex of events which Interact to produce omniangular interstability. Three points constitute a triangle. A triangle consists of three vector edges and three tension angles. A triangle is the only polygon whose vector edges stabilize their own opposite angles. Each rigid edge vector of a triangle seizes the ends of its two adjacent vector edges whose other ends are tied together and act as a pair of shears or levers. Thus the third rigid vector edge of a triangle controls the size of the opposite angle and does so with minimum effort because it holds on to the ends of the two edge levers and therefore stabilizes the opposite angle with minimum effort. The triangle is not only structure but it is the only structure inTUniver s e."

Triangle;

"Triangles are inherently open. As one positive event and one negative event, the two triangles arrange themselves together as an interference of the two events. The actions and resultants of each run into the actions and resultants of the other. They always impinge at the ends of the action as two interfering events. As a tetrahedron, they are fundamental: a structural system. It is a tetrahedron. It is structural because it is omnitriangulated. It is a system becauseAA it divides Universe into an outsideness and an insideness---into a macrocosm and a microcosm.

"A triangle is a triangle independent of its edge-sizing.

"Each of the angles of a triangle is interstabilized. Each of the angles was originally amorphous---i.e., unstable---but they become stable because each edge of a triangle is a lever. With minimum effort, the ends of the levers control the opposite angles with a push-pull, opposite-edge vector. A triangle is the means by which each side stabilizes the opposite angle with minimum effort."

- Cite SYNERGETICS text at See. 614.02-.04; No»'1

HBF DEFINITIONS

Triangle:

A triangle is symmetrical in a plane, but in respect to a pole of omnidirectional symmetry, we find that the symmetry of the triangle lies only in the equatorial plane.*

- Cite RBF SYNERGETICS Draft, 7 Oct. 1971 (Dictated to EJA.) "Antitetrahedron," p. 1.

Triangle:

"The three angles of one 'face' of a planar triangle always add up to 180° as a phenomenon independent of the relative dimensional size of the triangles. One-half of the definitive cycle unity is 180° . Every triangle has two faces--- its obverse and reverse. Unity is two. So we note that the angles of both faces of a triangle add up to 360° . Externally, the sum of the angles around each of the triangle's three vertexes is 120° , of which 60° is on the obverse side of each vertex; for a triangle, like a line, if it exists, is an isolatable system always having positive and negative aspects. So the sum of the vertexes around a triangle (three) times 360 equals 1080° . The remainder of 360° from 1080° leaves 720° , or one tetrahedron. Q.E.D."

Triangle: (A)

"The triangle is the fundamental component of structure but each triangle has two component functions: the edges (vectors) and the angles. The edges synergetically interact--- synergetically because there is naught in the characteristics of a single linear vector, per se, that predicts the co-existence of an angle. No angle can exist until two vectors co-exist and interact in critically significant proximity to permit an observed crossing of their action paths to form an angular aspect. Then it takes three angles and three vectors to constitute an 'event.' Two events of two angles and three edges each constitute a tetrahedron: thus two events constitute two event functions, the positive and the negative, to make a minimum structural system. The tetrahedron is the simplest structure known--- experimentally and metaphysically--- to man. The triangle exists operationally only as a positive or negative function of a polyhedron. Of all the polygons only triangles are structurally stable. Try a square with rubber joints: it folds up. Try another rubber-jointed polygon--- it will fold up. Try a rubber- jointed triangle--- it won't fold up: It is stable. Stability relates to the angular behavior: the sides of polygons can"

Triangle:

"Amongst all the polygons only the triangle is structurally stable. We are being informed that in a multiplicity of omnidirectional actions in the close proximity of the viewable depth of the surfaces structurally stable triangles are everywhere resultant to the similarly random events. That triangles are everywhere is implicit in the fact that wherever we move or view the concentric circles they occur, and that there is always a triangle at the center of the circle. We could add the word approximately everywhere to make the everywhere-ness coincide with the modular frequency characteristic of any set of random multiplicity. Because the triangles are structurally stable * each one imposes its structural rigidity upon its neighboring and otherwise unstable random events. With energy operative in the system the dominant strength of the triangles will inherently average to equilateral-ness."

'•No surface is conceivable without its inherent sphere as a flat Universe is contradictory to experience. The construction of a triangle involves a surface and a curved surface is experimentally satisfactory. Now the minute a triangle is constructed on the surface of a sphere — because a triangle is a boundary line closed upon itself--the boundary lines of the triangle automatically divide the surface of the sphere into two separate surface areas, each of which are bounded by three lines of arc and by three vertexes— which is the description of a triangle. Therefore both areas are true triangles. . . It is impossible to construct one triangle alone. In fact, four triangles are inherent to the (oversimplified concept) constructing of 'one' triangle. In addition to the complementary surface triangle already noted there must of necessity be two complementary concave triangles appropriate to them and occupying the reverse or inside of the spherical surface. Inasmuch as convex and concave are opposite they cannot be the same. Therefore a minimum of four triangles are always constructed and which one of them is the 'fixation' of the constructor is irrelevant. He might be on the inside, constructing his triangle on

Triangling:

'All scientists as yet,,say, 'X squared,' when they encounter the expression 'X⁴,' and 'X cubed' when they encounter 'X⁻⁵'. * Now we may say 'one to the second power equals one,' and identify that arithmetic with the triangle as the unit of area. Two to the second power equals four: four triangles. Three to the second power equals nine. Four to the second power equals sixteen. Now, we may say •triangling* instead of 'squaring.' Every square consists of two triangles. Nature needs only triangles to identify arithmetical 'powering' for self-multiplication of numbers. Therefore, 'triangling' is twice as efficient as 'squaring.' This method is what nature uses because the triangle is the only structure. We must learn to say 'triangling' and not 'squaring.''

-pHA SfttXrt, $y > 7$ s', Jun '66

4 crowwnws— SEC 0/1

("Triangling")

" We may say 'triangling' instead of 'squaring'.¹ When we say 'triangling*' we are referring to stable structures. When we say 'squaring' we are referring to unstable shapes. Because squares are utterly unstable they may not be called structures. Squares, when partially stabilized, always consist of two triangles which can move in respect to one another as the two halves of a hinge. When we deal with triangling we are being more economical with space than when we employ squares with edges equal to the triangles'. Nature

always insists on being most economical.

Nature 'triangles.' Nature accounts all of her structuring entirely rationally when measuring with triangles.

. . . . Ergo: triangular observation of physical phenomena from any angle always produces reliable and rational accounting not available in quadrangular accounting. " tT; , • -TP*

1965 -Cite Kepes, Caption Fig. Ba p 85

Triangling: (1)

' ` Now here is the way we are used to appraising area. We have a square and we divide the edges into two and we say that the increments are two, so $2 \times 2 \ll 4$; and we count the squares and we say that $3 \times 3 = 9$, etc. I am now going to do this with the triangle. I divide the edge into two and I say $2 \times 2 \ll 4$, $3 \times 3 = 9$, etc: and you can say 'triangling' instead of squaring.

"Maybe you never thought about doing that. None of the scientists do--- they always say --- they always say squaring. It seems that it never occurred to them that they could say triangling instead of squaring. When you find you can triangle, and you recall Mach's definition of physics--- 'nature always does things in the most economical ways'--- and if you are triangling you only need half the area to account it in triangles. The triangles use up less of your area. ~

"Furthermore, there is a very trusting characteristic. Let me look at any quadrangle and I look at it prospectively--- let's say any quadrangle in which the four edges are not the same.

I bisect those edges and interconnect and I get four dissimilar'*

- Cite Oregon Lecture #6, p.212, 10 Jul'62

IrlanRUng: (2)

"quadrangles. Let we take any triangle and I bisect its edges and the length of its edges are different, but I always get four similar triangles. There is no way you can subdivide an asymmetrical triangle and not come out with identical triangles. There is no way you can subdivide asymmetrical quadrangles and come out with the same.

"If I am using triangling as my fundamental mensuration, and I have a frequency of modular subdivision of the edge (that is what we said we were doing, and what we mean by linear subdivision and that simply means that we must divide the edges up evenlyj, and when I do so I always get an Identical triangle. Therefore, if I am playing the game iritriangulation, I don't have to look at it absolutely symmetrically to be sure that they look nice and even. They can look like anything I like and I am still getting the same information. When I am dealing with quadrangular forms I am not getting the same information; I can be completely misled.

"I suddenly found that triangling is not only more economical but it is always reliable." - Cite Oregon Lecture #6, p.212, 10 Jul'62

Trigonometric Limit;

"45 is the limit. You don't have to know more than 45°, which is the maximum asymmetry. If you have to go higher than that you treat it in terms of the complementary. This is the strategy of trigonometry, where the tables go no higher than 45°.

The complementarity of the vector equilibrium with the octahedron permits us to get down to the local and not be afraid of missing the rest of Universe, because we know the fundamental complementation of macro tetra and micro tetra. We were always looking at the XYZ quadrant--- focusing on the crossing at the center of the octahedron, rather than on the functioning of the covariations.

"This is why we factor the first 15 primes--- that is up to the limit of the 45° angle, to all the variations of all the trigonometries

from 1 to 43 — accommodate of Universe."

Trigonometry: Spherical Trigonometry:

"Many of you have been exposed to the trigonometry and it seemed really to be the first kind of difficult phase to kids in school because they came to words that didn't seem familiar. A line and a face sound familiar, but you got into some Greek words and you got into sine, cosine, tangent, cotangent and so forth, and you said I don't know what these are and then you said, Show it to me. They couldn't show it to you because it is a ratio. That was annoying to you to have a ratio. . . I can give you a very good case of a ratio that you are familiar with that doesn't give you trouble. . . A knot is a ratio of miles and hours. . . . But the trouble was that all those functions of the angles, they were Greek words and a very upsetting thing. The trigonometry showed us

ways of dealing in edges and angles. One of the things that made you kind of upset was that you were ratioing an angle to an edge, and that was something like ratioing cows to moons and you are not really sure that they fit together."

- Cite Oregon Lecture #7, pp. 271-271. 11 Jul'62

Trigonometry: Spherical Trigonometry:

"This is one of the troubles of having started our education with parts--- of starting with lines and planes as being simple, and solids as being very difficult and sphericals even more difficult. I have given you a Universe where we start with the whole and then we begin to take out all our parts and inspect the parts, and you will always find a finite relationship of those parts--- so we come to a sphere long before we come to a plane. A planar trigonometry would be a very difficult one compared to spherical. Once I am in the spherical I have a very fundamental condition which is, in making these circles, what we call the arcs, is a central angle. It is an angle. Therefore, when I am doing spherical trigonometry, when I am dealing in central angle or surface angle, you needn't say angles and edges. . . I say this is a central angle because if you look on the circle that arc is proportional to the central

angle. It is a central angle and a surface angle. You are dealing entirely in angles. If you started again from the outside you would never have the uncomfortable feeling about solving ratios between angles."

- Cite Oregon Lecture #7, p. 272. 11 Jul'62

Trigonometry; Spherical Trigonometry:

"Now we have learned about precession. We find that there are fundamental conditions of waves and the effect of systems of precessing from the 90-degreeness so you go from the central angle to the surface angle and you find over and over again, each one of the progres-

sion . . . shown in the series of 25 great circles. 8 We find the three, going to the four, the four going to the five. What had been the central angles before became the surface angles; what were the surface angles became the external angles. We find the systems inherently turning themselves inside-out in respect to these angles. The angles are independent of size.

They are fundamental. They are nondestructible. And so we get the processing of edges from insideness and outsideness and are beginning to understand and have a feeling about the propagation of electromagnetic waves. And I have been showing you where things literally were turning themselves out and the space became the sphere and the other way. They were doing that on the 25 great circle patterns. We have a great pulling together of a concept of fundamental waves and understanding inside and outside angles. . . .

Inter-tripie-bonded

Tripod:

"Goldy now sees that gravity makes the three legs of the tripod spread apart, but gravity also pulls the tripod toward the Earth and also coheres the Earth on which the tripod stands and gratuitously provides three more base lines formed as a closed tension triangle which keeps the three disintegrating tripod legs from coming apart and thus guarantees the structural integrity of the tetrahedron so formed.

"Since each of the tripod*s three legs are trying to part from the others, they are trying to subtract themselves from one another so they are minus quantities. Therefore, in this particular synergetic formulation*s formula, one vector leg minus a second vector leg minus a third vector leg equals (results in) the six positive vector legs which is the minimum number of structural members of a structural system."

Truth:

"We may say that thinking about the truth alters truth, but only to the extent of defining it. We may always clarify and redefine the truth by making it more comprehensively considerate and more incisively exquisite. Truth alters truth only by refining the definition. The substance of the sensing and instrumental control of the physical means of communication are always refinable and trend toward the ephemerization of doing ever more with ever less, but you can never get to the exact, most economical statement of the truth for the very communication will have ephemerized to pure metaphysics. Truths are like generalized principles: interaccommodative and nonintercontradictory. Truths are special case realizations of the generalized principles; by these very aspects are they discovered to be truths."

RUF DEFINITIONS

Tunability:

"A wave is a principle. Discovering that we have waves which are tunable waves, which we will call the spectrum of light, and that we have waves of the air which we call sound, and other kinds of waves, there are tunable limits to what hear and then we get into infra and ultra sonic. We recognize then that we have a very small spectrum of tunability in respect to each one of our apprehending capabilities, Recognizing then that we have discovered this wave that operated in the phenomena water, milk or whatever it was, and yet was not a tunable wave, it was not in the spectrum of tunability, but yet we got information from it by what we call step-up or step-down transformations. Time and again as scientists we go through step-up and step-down frequencies and bring things into the audible range by relayings and stepping-up until finally we get the messages coming over the air, coming out of electromagnetic waves, and we put these together as familiar sounds."

- Cite OitEGUN Lecture //5 - p. 164» 9 Jul'62

Tunability:

"When television or radio waves pass through the walls of a house, when light waves pass through a window or a lens, OfB there are always some comprehensively relayed local jostlings, some sets of submicroscopic eddies of force that accommodate the push through. The complementary effect— what in conversational language is the 'resistance' of the wall,

window or lens— and what in synergetics is called the precessionally shunted pattern relay.."

Turtle Dome;

"Look at this turtle. This is the way I am going to do another dome... where the outer ring is continually opening from the inside out, so it gets to be bigger. You build on the inside and it keeps on unrolling. You get to a great conch

shell and every time the creature pushes more goo out--- the creature keeps pumping in and out---it gets built on the outer rim as he keeps pushing it out. The big turtle does not have more rings than the small one, he Just has bigger ones. All the plates grow locally.

"How do you make a whole building grow? I saw that this was a way to make a whole geodesic dome grow; where the hexagons simply grow you can have an expandable dome with no trouble at all. Local finite closures: expanding each hexagon from the inside. That solves the problem when people say you can add to a rectangular building but you can't add to a dome. But you can in this way. Notice how long the turtles live. They last out pretty well; they can accommodate their growth with a hard shell

Turtle Hex-pent:

"The back of a turtle is a combined pattern of pentagons and hexagons: a hex-pent matrix. As the turtle grows, each individual hex-pent pattern adds a new ridge in the outer edge. This is apparent when you closely examine the turtle's back.

"The process is analagous to how I have provided for the organic growth of geodesic hex-pent domes, which could be done just by inserting successive caulking or layerings around each hex-pent module."

"I want to share with you a little exercise I frequently give myself in order to decondition my subconscious reflexing whenever that reflexing produces spontaneous behavior in ways that we know through experience to be ignorant, inept, irrelevant, and evolution-frustrating. This is my cosmological exercise. I think about the following: The planet Earth is about 8000 miles in diameter. The highest mountain is five miles above sea level. The deepest ocean is five miles below sea level. There is a tensile differential between the innermost and outermost aberrations in the spheric surface of our Earth. Ten miles in relation to 8000 miles is 1/800.

"If you take a twelve-inch world globe of polished steel, it probably has greater radial dimension aberration than 1/800 of its diameter. Astronauts cannot see any signs of humans aboard our planet as they ancroach the ~arth from the Koon. They do not even see mountains. They see only a polished, color- marbleized ocean and continents' pattern through the dominant cloud cover. The average height of humans of all ages is about five feet. There are approximately 5000 feet in a mile. If 1000 humans made a column by standing on one another's heads, we could make a columHM ten miles high. Ten miles is the" - Cite THLSKltlG OUT LOUD: ;,Z ARE KOTHIKG 2UT A SPACE PROGRAM,1 %

Twelve-Inch Steel World Globe: (2)

'difference between the deepest ocean and the highest mountain, so you and 1, then, are 1/10,000 of invisible on our twelveinch globe. Now 75 percent of our planet Earth is covered with water and another 20 percent is uninhabited for one 'frozen mountain' reason or another,

our 7.5 billion Earthian humans are invisibly secreted in fractional percentages on those little continents, with six percent in Central and South America, eight percent in North America, ten percent in Africa, 20 percent in Europe, and 50 percent in Asia.

"The diameter of the star betelgeuse is exactly 100 times that of our 8000-mile diameter Earth. With an engineer's scale you can see 1/50 of an inch, but you can't see 1/100 of an inch--- it is a blur, if you make a little circle of wire one-inch in diameter and hold it at arm's length from your eye, you will find that it matches the size of the perimeter of the whiteghost disk of the betelgeuse on a day when the betelgeuse can be looked at through thin clouds. And so, against that one inch, the 1/100 of an inch that is our earth's diameter would not be visible."

"The star Betelgeuse in the constellation Orion, has a diameter" - Cite THINKING OUT LOUD: WE ARE NOTHING BUT A SPACE PROGRAM,

World Mag., 1? Jul'73

"larger than that of the orbit of the Earth around the sun. Betelgeuse is one of the big stars. Our Sun is one of the small stars. There are 100 billion stars in our galaxy. There are a billion other such galaxies within the 22-billion-diameter sphere of observation of Mount Palomar's 200-inch 'reflector.' Ninety-nine percent of the 100 quadrillion 'known' stars are beyond the range of the naked eye, but altogether they form, in effect, a thickly galactic, spherical cloud array surrounding us, at whose billion-mile-radius center is located our little Milky Way galaxy and, deep within it, our minuscule solar system, deep within which rotates and orbits our minuscule earth. That will give you an idea of what a fantastically negligible cosmic speck is this Earth of ours. We are 92 million miles away from the sun, and we receive all our life-supporting energy from it.

"If our local 'gas station,' the sun, ran out of life-supporting energy, the next closest refueling star is 25 trillion miles away. It takes 4-2/3 years to get to us--- coming at 100 million miles an hour, but when someone says, 'Never mind that space stuff-- let's get down to Earth; Let's be practical!' pay no attention. We are nothing but a space program. We are so"

- Cite THLHHHG UUT LOUD: WE ARE NOTHING BUT A SPACE PROGRAM World Mag., 17 Jul'73

"physically negligible as to be approximately space itself.

"I don't think that stars are paying much attention when one of those little specks on board this almost invisible Earth says, 'We can't afford it.' I don't think the Sun is saying, 'We can't afford to keep those people living on planet Earth because they haven't paid their bill.' The Universe is not concerned with how Earthians raise millions of something they call dollars."

Twelve-Inch Steel World Globe: (A)

"...And Professor Goddard then said: Here's our planet Earth going around the Sun at 60,000 miles an hour. And you and I are on board with it going at 60,000 miles an hour around the Sun, if we take any of the objects on board in this co-orbiting of the Sun, and accelerate one of them, as it leaves this Earth every time it doubles its distance away, the attraction--- the tendency to fall back in--- is only one-quarter of what it had been before. It wouldn't have to go very far out before there would be no tendency to fall back in at all. That is you would then be affected by other bodies in the Universe. Out of

this came our rocketry but very few people would have really pictured this in any kind of a model form. To get a little idea--- when we were first told that the vehicles being rocketed into the sky had gone into orbit the altitude that they did so was about 100 miles out from the planet Earth. You and I, with the highest mountain at five miles, and the highest flying jet plane flying at about ten miles out, 100 miles is way out. And it is so far out that people don't start to try to picture it.

"But I'd like you to take a twelve-inch globe representing an 8,000-mile diameter Earth: and 100 miles in relation to 8,000 miles is 1/80th. And you'll find then that if you take a twelve-inch globe, the thickness of a paper match, the thinness" - Cite HBF Address, transcript p.5, Tel Aviv, 1b Jun'72

Twelve-inch steel world Globe: (B)

"of a paper match, gives you 100 miles. So if you glue just a little paper match on to a twelve-inch globe, that's the altitude at which it goes into orbit. In other words it's just presumably almost still in the print of that globe, in other words, then, almost no distance at all when the other bodies take over. And at this point we say it goes into orbit, instead of trying to fall in, it now goes off in orbit at 90 degrees. Now this is very strange because 180 degrees is what we had with the falling-in, it now goes off in orbit at 90 degrees. Now this is very strange because 180 degrees is what we had with the falling-in and now suddenly it's going at 90 degrees--- going around. The effect of bodies in motion on other bodies in motion is what we call precession. And precession is to affect them at angles other than--- they do not tend to at 180 degrees of falling-in--- but to operate at angles tangent, sometimes 90-degrees, sometimes maybe at other angles, but primarily in the 90-degree range. Okay?

"if you think about the dimension that I've just given you in relation to our tiny little Earth, and to think about the distance to our own sun, 93 million miles, or the next nearest"

"The eternality of the generalized principles brings about differential lags, the aberrations in the rates of recall. Differential lags are inherent in the mathematics of the twelve universal degrees of freedom of the vector equilibrium which characterize an event in pure principle. The six vectors of an event can be articulated linearly or in a hexagonal circle. It is inherent in the mathematics of the degrees of freedom which demand the invention of time due to the varying rates of recall of observation of the behavior of the vectors."

- Cite KBF to EJA, J200 Idaho, ..ash DC, 29 lay'72

"With respect to every nonpolar point in omnitriangulated systems there are three lines, or edges, networking the surface There are also always three lines (which can be regarded either as tetragonal edges or vectors) connecting the points by omnitriangulation either to the next inwardly or outwardly concentric omnitriangulated point layer.

"It follows from this that every nonpolar point in the energy Universe monopolizes an inherent inventory of six energy lines. Of even more significance is the fact that each of these six energy lines, impinging on every nonpolarized point (focal event) in the Universe has a unique and symmetrical continuation beyond that point. The continuation of the lines can be regarded as negative vectors. The six positive and and six negative vectors are symmetricaly arrayed around the point. Consequently, if we exclude two points in Universe, all other points in Universe are inherently the center of a local and unique(veBbeF-equilibium-doMarin} isotropic vector matrix contairtt 12 vertexes as the corresponding centers of the 12 closest packed spsheres aroudd a nuclear sphere.**

"A basic event consists of three vectorial lines: the action, the reaction, and the resultant. This is the fundamental tripartite component of Universe. One positive and one • negative event together make one tetrahedron or one quantum unit. The number of vectors (or force lines) cohering each and every subsystem of Universe is always a number subdivisible by six; i.e., consisting of one positive and one negative event, each of three vectors which adds up to six. This holds true topologically in all abstract patterning in Universe as well as in fundamental physics. The six vectors represent the fundamental six. and only six, degrees of freedom in Universe. Each of these six,

however, has a positive and a negative direction and we can speak therefore of a total of twelve degrees of freedom. These twelve degrees of freedom can be conceptually visualized as the radial lines connecting the centers of gravity of that central sphere. The twelve degrees of freedom are also then identified as the push-pull directions of the tetrahedron's six edges."

"Here are some drawings I made to show the different degrees of freedom for a mast. If I wanted to have a mast on the face of the Earth it would take me a minimum of three legs, and a tension member to hold these legs down: so it takes four members. I can have one compression member and three tension members or three compression members and one tension. It always comes out four. I can put the hole in the ground and we will find that there is still the four. We will find that we might have to have the mast bending over like that, and it would take two tension members going up to hold it: that is called a gin pole; and then it takes a fourth member of gravity to pull this end down so there are four members operating. You could do that with two compression legs, sometimes called a Jack in the Navy, and one tension member and gravity: four members every time. So there are the four degrees of freedom and the local twist you will remember which gave us twelve.¹¹ I began to see then that we would always have these kinds of fournesses gM always operative."

"In regard to your degrees of freedom, these are at minimum twelve for the wire wheel which requires twelve spokes which are the six edges of the combined positive and negative tetrahedra whose vertices are inherently turbinal and there can be the explosive wheel

and the contractive wheel by which all the tensions and compressions are reversed. Then it is to be noted that we need twelve double rim increments between the external terminals of the spokes. This makes 24. My vector equilibrium model shows 24 circumferential vectors and 24 radials. This is the omnidirectional closest packing model of twelve spheres around one. This means a total of 48 vectors representing the two main classes of accelerations of physics: angular (circumferential) and linear (radial), i.e. now have 48 vectors which may be reversed, explosively or contractively, into tension or compression. And tension and compression are not equal opposites as tension tends to arcs of greater radius and compression to arcs of lesser radius, ergo the spiralling arcs of greater radius of tension must finally come back on themselves and are therefore inherently self-closing and finite and account for the comprehensive cohesive integrity of local systems and their intertwined comprehensive adhesiveness"

Twelve Universal Degrees of Freedom : General Systems: (HI)

"We don't see the atomic motion. We don't even see the stars in motion though they move at speeds of over a million miles per day. We don't even see the hands of the clock in motion. We remember where the hands of the clock were when we last looked and thus we accredit that motion has occurred. In fact, experiment shows that we see and comprehend very little of the totality of motions.

"Therefore, society tends to think statically and is always being surprised, often uncomfortably, sometimes fatally. Lacking dynamic apprehension, it is difficult for humanity to get out of its static fixations and specifically to see great trends evolving. Just now man is coming into discovery of general systems theory in his own right. The experimental probing of the poter' ials of the computers awakened man to realization of the vast complexes of variables that can be mastered by general systems theory. So far, man has dealt but meagerly and noncomprehensively with its powerful planning capability. So far, he has employed only limited systems theory in special open-edged systems--- 'tic-tac-toe' rectilinear grid systems."

"... .."hen we stack planar groups of triangular aggregates of spheres on top of one another in such a manner that they will be structurally stable without binding agents ... we nest six balls in a closest-packed triangular planar array on top of the first triangularly arranged ten-ball aggregate. And on top of these six balls we nest three more. We now have a total of 19 balls. ./e may now nest one more topmost ball in the one ` nest* of the three-ball triangle.

".<e now have a symmetrical tetrahedreaal aggregate consisting of 20 balls without any nuclear ball occurring in the center of the tetrahedronal pyramid of ba 11 s.

•Vertical stacking withWa)

begun our symmetrical base triad. 20 is a multiple of ten and now we have a tetrahedron composed of 20 balls. Just as fingers alone might not have been the only reason for the choice of base ten, fingers and toes together may not have been the only reason the - ancient priests chose congruence in modulo 20, or that 20 was considered a magical number. It might have been the result of an intuitive understanding of closest packing of spheres, which is something more fundamental. For unlike our fingers which lie in a row, the packing of 20 spheres which can be grouped symmetrically together without a nucleus

SYNERGETICS Sec. 1055: Twentyfoldness of Ename System Indestructibility," 2 Oct*72

"Many humans alive today are old enough to realize what has happened and can recall many things that have happened contradicted by popular thought.

"In the game of twenty questions as played in my childhood, the first question to be asked was, Is it animate or inanimate?

The words animate and inanimate had been invented by man long before chemistry and biology started. Early humans apparently assumed there was obviously a fundamental difference between warm soft flesh and cold hard stone: ergo the quickest way to narrow the field of potential answers was first to ask, Is it animate or inanimate?

"As humans learned more and more about self and environment, they identified various species by names. At this late 20th century--- with Darwin's work only 100 years old--- humanity has acquired a great deal of knowledge about biological phenomena. A contemporary of Darwin, Dalton, was the leading physicist of the time. Dalton wrongly assumed that the hydrogen atom was the 'building block' of all the 60-other then-known chemical elements. Looking for the building block, or the 'key'¹, to any subject seemed popularly logical."

- Cite THINKING OUT LOUD: PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES. World Mag. 11 Sep*73

"Darwin's theory of evolution was based on the concept of the single-cell amoeba as the building block. In their early days physics, chemistry, and biology were three different worlds.

"Suddenly, scientific instrumentation increased the macro-micro range of eye-piece-visible exploration. It was only as recently as World War 11 that the interrelatedness of physics, chemistry, and biology dawned. In 1940 appeared the hyphens--- bio-chemiswts bio-physicists, et. al., The instrumentation produced overlapping of these previously separate worlds. Post World War I biology developed knowledge of the genes controlling the design of biological species. Further biological exploration focused on the even more fundamental virus. For example, teams consisting of physicists, chemists, geneticists, biologists-- really across-the-board teams of different specializations--- zero in on virology.

"The virology exploration brought discovery of the protein shell of the virus and, within it, the DNA and RNA tetrahedral design codifications of all biological phenomena. All this time there was thought to be a fundamental □ cosmic threshold lying between"

- Cite THINKING OUT LOUD (3): PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES, World Mag., 11 Sep'73

"animate and inanimate phenomena. The individuals co-working in virology have been too busy and too specialized to philosophize on the significance of the incidentally-discovered fact that no threshold exists separating animate from inanimate. The inanimate crystalline behavior of inanimate atoms crosses right over the threshold. We know that humans, too, physically consist entirely of atoms and that atoms are completely inanimate.

'Inanimate

"What is «aMHHXabout all biological organisms has become clearer and clearer, and what is physically animate has become not only less clear but is apparently zero or physically nonexistent. There is no experimentally demonstrable physical animism. Cinema cartoons can be 'animated' to simulate superficially the presence of animism in exclusively atom-structured organic mechanisms. Apparently the original hypothesis erred in assuming that both animate and inanimate were physical. There have been quite a number of weighings of people as they died. Many cancer-doomed paupers have been willing to have their beds placed on scales. The only difference manifest between weight before and after death is that caused by air exhaled from the lungs or urine that has been passed. What-"

- Cite THINKING OUT LOUD (3): PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES, World Mag.. 11 Sep*73

"ever life is, it doesn't weigh anything. I am not credulous when I hear 'pure science* research chemists talking about finding the key chemical constituents of life in Earth-intercepted stardust, or the means by which to synthesize the key enzymes of life and thereby to institute and control the design of life. This chemistry is not life; it is physical. That is, it comprises 100 percent of the physical inventory. Life is metaphysical, weightless, limitless. Each life is an eternally individual, unique pattern of integrity.^{1*}

- Cite THINKING OUT LOUD (3): PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES, World Mag., 11 Sep*73

"Once you state what your realistic optimum recognition of totality consists of, then you will find how many bits or subdivision stages it will take to Isolate any items within that totality. It is like the childhood game of Twenty Questions ; You start by saying, 'Is it physical or metaphysical?' Next: 'Is it animate or inanimate?' (One bit.) 'Is it

big or little?' (Two bits.) 'Is it hot or cold?' (Three bits.) It takes only a few bits to find out what you want. When yam we use bit subdivision to ferret out the components of our problems, we do exactly what the computer is designed to do."

Reduction ad Absurdum

"The senith constancy of the transformational projection's topological trigonometry discretely locates the common senith points of any counonly centered concentric surfaced systems.

"if camera-equipped telescopes were mounted aboard Eartg-dispatched- and-controlled satellites, which satellites were 'locked*' in fixed formation flight positions around our planet Earth with one such fixed satellite hovering steadily over each vertex of

a one-mile-edged triangulation grid, and each telescope was trained in such a manner that die eyepiece of its eyepiece-to-optlcs' axis is pointed exactly toward the center of the plerjtt Earth, and its outer optics' end is pointed exactly toward whatever star, if any, may be in exact zenith over the point on the surface of Earth above which the satellite was vertically positioned, a human on Earth at any one of those points looking vertically outwardly into the heavens with a radarscope would discover that satellite as a blip in the middle of his scope-viewing-tube*s grid.

"Now let us have an around-the-world simultaneous clicking of the shutters of the cameras attached to each of the telescopes

$\frac{1}{2} \left(\frac{1}{\sin \theta} + \frac{1}{\cos \theta} \right)$ of each of
 those around-the-sartk-fixedly-hovering photo-satellites with”

 RBF DEFINITIONb

"their telescope* pointed to whatever star* may be vertically out-
 ward from the Earth at their respective omni-Earth-triangula-
 ted, one-mile-apart, grid vertexes. Let us assume the photographing
 telescopes to be very long-barreled to shield those not pointing at
 the Sun from its intense luminosity. A composite mosaic of all those
 pictures could now be print-mounted spherically on the inside of
 a translucent 200-foot globe of Earth's conventional geographic
 data of continents, islands, etc., together with the conventional
 latitude-longitude grid. Because they were photographed outside
 the Earth's cloud cover they would present a composite and accurate
 spherical picture of what the navigators and astronauts call the ce-
 lestial sphere with the relative brilliance of the stars in evidence with
 astronomically calculatable corrections being made in the printing
 for the Sun luminosity effects.

"rfhile this picture was onentationally unique to its one moment in
 eternity in respect to the harth-to-celestial-sphere orientation, the
 Earth data per se ana the celestial sphere data per se remain constant
 at their magnitude of scrutability within the lifespan of any human.

- Cite iXiMtatuETICb draft at bees. 1110.0J-04, 2\$ Jan'73
 KBF UhFIftliluWb

"Because of the accuracy with which this spherical picture was made
 it would also be possible to take a transparent plastic 20-foot globe
 of the Earth with the latituae-longitude grid and the continents ana
 islands outlined, together with the marker points identifying the re-
 spective positions of the satellitemounted telescope cameras at the

time of the photographing, and to position the 20-foot Earth globe within the 200-foot celestial sphere globe within the miniature Earth's spherical center congruent with the spherical center of the 200-foot celestial sphere.

"it is then possible to orient the miniature 20-foot diameter Earth globe so that its polar axis is pointed toward the North Star, making a small correction to correspond with the astronomical correction for the strall aberration well-known to exist in this respect, which is negligible in this description of the properties of our triangular geodesics transformational projection. We may then rotate the miniature Earth 20-foot globe around its axis until a sighting from its exact center will register each of the stars of the 200-foot celestial sphere which the satellites photographed in exact verticality outward from Earth."

- Cite SYNEKUETiuo draft at bees 1110.05-06, 25 Jan'73

"The Earth's highest mountain top is five miles above sea level and the ocean's deepest bottom is five miles below sea level. We could now modify the surface of our transparent plastic 20- foot model of the Earth to show those aberrations which would show that some parts of the Earth's surface have a different radial distance from the Earth's center; but it would be in evidence that the stars would be in zenith over the same latitude-longitude grid points as would also be all of the satellite photographic stations.

"Finding that surface aberrations include only radial distance variations and changes in the spherical surface line-of-sight projections from the /fonter, we will now introauce a clear plastic shell model of a whale, and another of a crocodile ^{ag5gBS}---of such sizes that the crocodile is large enough to omnisurround or swallow the 20-foot miniature Earth globe, and the whale is large enough to swallow

the crocodile yet small enough to be inside the 200-foot diameter clear plastic celestial sphere; With omnidirectional spokewires we will now tensionally position the whale within the 200-foot celestial sphere and we will tensionally wire-position"

- Cite SYNEKGELICb draft at Secs. 1110.07-08, 25 Jan'73

"the crocodile within the whale, and the 20-foot miniature Earth within the crocodile with the miniature Earth oriented as before, its volumetric center exactly in congruence with the center of volume of the celestial sphere, with all the stars at the time of the photographing in register with the same satellites which photographed those particular stars.

"Now the whale's and the crocodile's surfaces will be at a great variety of different radii distances from the concentric volumetric centers of the 200-foot and 20-foot spheres. We are going now to coat the surfaces of the transparent whale and transparent crocodile with a photosensitive emulsion after which we have a high intensity light source flash at the common volumetric centers of the 20-foot and 200-foot spheres. This process will reproduce on the plastic skin of both the whale and the crocodile--- as well as on the celestial 200-foot sphere--- the triangular satellite positioning grid together with the latitude-longitude grid and all the Earth's continental and insular outlines. Then, traveling with a pencil beam strobic light on the outside of the 200-foot celestial sphere we will point vertically inward against each of the stars, thus project-

- Cite SYNEKGETIUb draft at Secs. 1110.08-09, 25 Jan'73

**ing their positions radially, i.e., vertically, inwardly to register on the skins of both the whale and the crocodile and on the 20-foot Earth globe. Now, with the human eye at the common concentric centers of volume of the 20-foot and 200-foot spheres, as well as both the

whale and the crocodile, we may sight outwardly--- which is inherently radially--- in all directions, and will observe that all the grids and all the geographical and celestial star data appear as one grid, being in exact radial register. We have all the same grids and data on all four of the concentric surfaces: 200-foot celestial sphere, whale, crocodile, and 20-foot Earth globe. That registering of all data is obviously independent of radial distance from the common center; ergo, the only variable in the system is the radius to any given point within the concentric systems.

"As we have demonstrated with geodesic domes and spheres, what is meant by compound curvature is 'omni-intertriangulated structuring (i.e., balanced connectors) of concave-convex surface points'. Given a unit radius sphere and the known central angle between any two radii of known length, then the length of the chord running between their outer ends may be calculated by trigonometry by running a line from the sphere center per-*

- Cite SFUERGETICS draft at bees 1110.09-10, 25 Jan<73
KBF UEFIINITIUMS

"pendicular to the midchord and solving for the right triangle thus formed, whose halved-chord outer edge is the side opposite its central angle which is half the central angle originally given, and we know that the sine of an angle is the side opposite. When radius is assumed to be one then the well-known sine of 1/2 the original angle given is the length of that half chord. With the chord length calculatable for a given central angle it is easy to calculate the length of any line running between the outer end of one of the radii to a position on the other radius at a known distance outward from the spherical center. With this knowledge we can design struts of suitable structural material, say aluminum tubes, and we may triangularly interconnect all the vertex

points of the triangular grid of the 200-foot sphere, then we can triangularly interstrut all the grid points on the inside of the whale, then we can interstrut all the grid vertexes of the crocodile, and finally intertriangularly strut the 20-foot Earth globe.

"Now again, viewing outwardly in all directions from the common volumetric centers of those concentric forms, we will see nothing changed because all the struts will be in register with all the"

"lines of the four separate grids. We may now dissolve the plastic SKins from all four shells: the 200-foot celestial sphere, the whale, the crocodile, and the 20-foot globe, and we will find that all four hold their shapes exactly as before and, being intertrussed I intertrussea ana intertriangulatea are the same woras: Truss: Trace: ana Triangle.) between vertexes of the grid, and the grid now being omnitriangularly interstructured, we may again sight outwardly from the volumetric center and, if photograjiing what we see, we will see only the same lines in exact register that we saw at the time of the original first spherical printing.

"Since the speed of light permitted astronauts to understand and adopt the light year in their observational data, we have learned the great variation of radial distances outwardly to the different stars, in the Big Dipper one star is hardly 200 light years further from earth than the next one on the handle that is a distance of 200 quadrillion miles further away from you and me than is the other, if we ran rods radially from the volumetric center of our model outward perpendicularly through each of the stars shown on the 200-foot celestial sphere to a distance perpendicular outwardly from the 200-footer equal to their"

- Cite bYNERGETiCo draft at bees. 1110.11-12, 25 Jan'73

"distance away in light years from the Earth, with the 200-foot sphere's 100-foot radius equalling that of the nearest star other than the sun, and assume that the cameras had photographed only those stars visible to the naked eye, then a few of the rods would reach outwardly ten miles, but most of them would be much nearer in, with one of the Big Dipper's one mile out and another a half-mile out. It would make a vastly varied porcupine if we mtertriangularly interconnected the outer terminals of the lines of interconnection which would as yet be in exact register with the original grid as seen from system center.

"Now let us separate the four structures by opening up an approximate equator in the outer ones and rejoining the equatorial points. The celestial porcupine rolled into our deepest ocean and then resting on the bottom, its top would reach outwardly above the ocean surface to the height of Mt. Everest with its densest, most high-frequency trussed spherical core being only 200 feet in diameter and occurring at ocean surface. The triangularly trussed 1'75-foot whale would hold its shape and size as would also the bO-foot crocodile and the little 20-foot miniature Earth, Obviously they could not appear more differently

- Cite sTNEttGETiuS Secs. 1110.12-13, 15 Jan'73

"Our triangular geodesics transformation projection would show all of these four dissimilar systems in the flat plane in exactly the same manner and in exact register with that of the Earth alone as shown later in the icosahedral flat-out of the world nap, but with a number (or numbers of different styles) shown at each grid vertex, which number indicates the radius distance of that vertex outwardly from the center point of the system 'Earth.* Four different colors: blue for the

celestial, black for the whale, green for the crocodile, and brown for the 20-foot Earth globe, would identify the relative radius distances outwardly from the congruent systems* center which occurs at each vertex of these four utterly differently shaped and sized systems---all on the same map. This would provide all of the data necessary to reconstruct each of the four systems in exactly the same relative sizes. Every point in the four systems remains in exact perpendicular (zenith) whether in the spherical or planar flat-out phase or any interim transitional phase. This makes possible the design of an airplane or an ocean liner all on one map. And the flat-out map may have its triangular mosaic pieces rearranged in many ways, for instance, to center the oceans or to center the lands. And the building of that airplane or ocean liner, as with the geodesic dome, will generate"

- Cite blhEkCETlCo draft at Secs. 1110.14, 25 Jan*73

"compound curvature, omnifimte, tensegnty trussing far stronger and lighter than the presently designed and built XYZ-parallel coordinate grids and their parallel plane sectional designing.

"With omnidirectional complex computerized world satellite sensing, comprehensive resources inventorying and inter-routing, the triangular geodesics transformational projection can alone bring visual comprehending and schematic network elucidation.

"Just as triangular geodesics transformational projection can alone reduce the astronomical to the cosmic middle ground of eye-comprehensible coordination with the mind explorations and formulations in metaphysics in general and mathematics in particular, especially in relation to computer programing, so too, may the triangular geodesics transfer national projection enlarge the complex invisible microcosmic patterns to eye- and sense-comprehendibility."

"There are two kinds of twoness:

(a) the numerical or morphationally unbalanced twoness;

and

(b) the balanced twoness.

The vector equilibrium is the central synnetry through which both baiced and unbalanced asymmetries pulsatingly and complexedly intercompensate and synchronize. The vector equilibrium's frequency modulatability accomodates the numerically differentiated twonesses.

"There are four kinds of positive and negative: (1) the eternal equilibrium-disturbing plurality of differentially unique, only-positively-and-negatively-balanced aberratings; (2) the north and south Doles; (3) the concave and convex; and (4) the inside (micro-cosm) and outside (macrocosm) always cosmically complementing the local system's inside-concave and outside-convex limits."

"There is a fourfold twoness: one of the exterior, cosmic finite ("nothingness") tetrahedron, i.e., the macrocosm outwardly"

- Cite SYNERGETICS, 2nd. Ed. at Secs. 223.05-.07, 10 Nov'74

Two Kinds of Twoness: (B)

"complementing all ("something") systems and the interior micro-cosmic tetrahedron of nothingness complementing all conceptually thinkable and cosmically isolable 'something' systems.

"A rock dropped into water precessionally produces waves moving both outwardly from the circle's center; i.e., circumferentially of the Earth sphere, and reprecationally outwardly-and-inwardly from the center of the Earth, i.e., radially in respect to the Earth sphere; which altogether interregeneratively demonstrate (1) the twoness of local precessional system effects at 90 degrees and (2) the Universe-cohering gravitational effects at 180 degrees.

"These are the two kinds of interacting forces constituting the regenerative structural integrity of both subsystem local twonesses and nonunitarily conceptual Scenario Universe.

"The four cosmically complementary twonesses and the four local system twonessjaltogether eternally regenerate the scientific generalization known as complementarity. Complementarity is sumtotally eightfoldly operative: four definitive local systems

- Cite SYNEKGETICS, 2nd. Ed., at bees. 223.07-.08, 10 Nov'74

(C)

"complementation and four cosmically synergetic finitive accountabilities.

"Topologically the additive twoness identifies the opposite poles of spinnability of ajl systems; the multiplicative twoness identifies the concave Insideness and convex-outsideness of all systems: these four are the four unique twonesses of the eternally regenerative, nonunitarily conceptual Scenario Universe whose conceptual think-aboutedness is differentially confined to local "something" systems whose inslideness-and-outsideness- differentiating foci consist at minimum of four event "stars." "To the Greeks a two-way rectilinearly intersecting grid of parallel lines seemed simpler than would a three-way grid of parallel lines. And the two-way grid was highly compatible with their practical coordinate needs for dealing with an assuredly flat plane Universe. Thus the Greeks came to employ 90-degreeness and unique perpendicularity to the system as a basic additional dimensional requirement for the exclusive, and consequently unchallenged, three- dimensional geometrical data coordination.

"Their arithmetical operations were coordinated with geometry on the assumption that first-power numbers represented linear module tallies, that second-power N^2 - square increments, and that third-power N^3 • cubical increments of space.

First dimension was length expressed with one line. Two dimensions introduced width expressed with a cross of two lines in a plane. Three dimensions introduced height expressed by a third line crossing perpendicularly to the first two at their previous crossing, making a three-way. three-dimensional cross, which they referred to as the XTZ coordinate system."

Unit:

'Unit means system integrity. Organic means regenerative system integrity. As minimum or prime systems consist of four event foci and their always and only coexisting fourness of triangularly defined planar facets, and sixness of wavelinearly defined minimum set of unique componentation relatedness, unity is inherently plural. Unity is plural. A system is a local phenomenon in the Universe. Each of the conceivable or imaginable awareness or thinkability entities or phenomena inducing or producing onenesses of twonesses are subvisible

and potentially further subdivisible, or as-yet unresolved, ergo unrecognized systems. Functions always and only co-occur as subsystem relativistics, characteristics, inherencies, and proclivities. Functions occur only as parts of systems. The Universe is constituted of a complex plurality of nonsimultaneous and only partially overlappingly occurring systems, not one system."

"It is more and more in evidence that the United States is not a nation, and we talk very improperly of it as a nation.

It is the beginning of a very important phase of crossbreeding world man. Here is cross-breeding world man on this continent, his young life having been very negative of regarding an older world, but not knowing just what ought to take its place; but now really finding out what can be done. . . . There's no question about it: this young world is going to move forward, and going to move forward very powerfully everywhere, with good working information, to work for what is truly constructive. So that's what you're witnessing."

United States: One of the Most Difficult Sovereignities to (1) Break Up:

"I actually feel very sorry for the politicians and pay very little attention to them. I am impressed that when I talk to the Russians, they said to me When President Johnson was in, Johnson is really nearer to our kind of man but there's no use in our meeting with him because any agreement we made with Johnson, the Russians would never ratify. We can only deal with Republicans if we're going to have anything that will stick. I think this is very much the viewpoint of China and Russia; they think there's no use in dealing with people who are in anyway liberal. . . . And I'm convinced that all the sovereignties will have to go! That's clear. We will perish. They were absolutely valid in terms of my roots here, projecting our ignorance. But in terms of our discovering that the metals are not part of the roots; they are very unevenly distributed around the Earth. In order to be able to play this new game it has to be World Game. All the boundaries have to go. Therefore, I simply say, one of the most difficult of the great sovereignties to break up is the United States. Particularly due to the fact that it is operating under a misconception. It calls itself a nation. A nation is a group"

- Cite RBF at DSI Conference, NYC, pp.11-12, 28 Jun'72

United States: One of the Most Difficult Sovereignities to (2) Break Up:

"Of human beings who have been isolated from other human beings for thousands of years and who have developed great inbreeding local characteristics. We are the most crossbreeding phase of world man. We are world man. To call ourselves a nation, nothing could be more nonsense. At any rate, the most difficult of the situations to get corrected is the American political situation because America is moving and becoming world man. Nobody is staying around to watch the politicians. The politicians are getting more and more decentralized, where nobody locally knows what they're doing. . . In order to be able to break up American sovereignty. I think Mr. Nixon is much more capable than Mr. McGovern would be. . . Nixon's re-election might serve history. I feel sorry for Richard Nixon. I feel sorry for all those people. Because I feel he's one of those little. . . rather a small man. Rather preoccupied with Mr. Nixon and he just wants to win anything, just as long as he wins. I feel that his lack of real vision means that the United States will come apart more rapidly. That's all. It has to go. Sovereignty has to go."

Radiational Constant Synergetic Hierarchy VE &. Icosa

See Powering: Fifth Dimeneion, 29 Nov*72

Universal Integrity: Second-power Congruence of Gravitational & J
Radiational Constants:

"Second-power Congruence of Gravitational and Radiational Constants: The relative mass-energy content magnitude of a polyhedral system is arrived at by multiplying the primitive, frequency-zero, a-priori-state volume (relative to the tetrahedron-equals-one) of the geometric, concentric, structural system's hierarchy, by the second power of the (both minimum and maximum) limit linear velocity of all classes of radiation when unfettered in a vacuum; i.e., multiplying initial volume by the terminal rate at which a spherical wave's outermost, unique-event-distinguishability progressively and omniexpansively occurs, as expressed in terms of the second power of relative frequency of modular subdivisions of its initially-occurring, polyhedral system's radius; ergo as manifest in Einstein's equation $E = Me^2$.

"Energy equals a given mass with its relative mass-energy compactedness tighteningly modified by the velocity of energy-as-radiation intertransformability potential (not just linearly, but omnidirectionally); ergo as a potentially ever-expansively enlarging spherical wave's outermost-event, one-radial-wavelength-deep surface; ergo the end power of system frequency (because wave surfaces grow omni-outwardly as of the second power of the radial, linear frequency) rate of gain."

- Cite RBF rewrite of SYNERGETICS gallery at Sec. 1052.10, 9 Jan'74

Universal Integrity: Second Power Congruence of Gravitational, j » ---
and Radiational Constants:

"Finding that a systert is growing around a nucleus in terms of a second power is what Einstein wrote when he wrote his equation, $E = Me^2$. Energy, he said, equals a given mass, its relative tightness as modified by the velocity of energy as radiation, not just linearly but

omnidirectionally--- by a wave which would be second power. His waves are growing outwardly of second power. These little points and dots will be identified as an energy phenomena of the quantum wave, really as photons. You have units of photons and you have the numbers for any given wave, and you begin to get any given relative concentration of given masses. With unit energy, you have much more of it packed up in tighter packages in small frequency against the large frequency.

"Now we have another kind of second-power relationship which has always been very impressive when you think about it. The word second power now gives you something to do with radials and surfaces. Newton discovered, regarding gravity, a certain relationship of masses and unfortunately his relationship is stated in a negative way. He talks about an inverse ratio. The word inverse ratio makes it very difficult conceptually. You talk about it and it is

Universal Integrity: Second-power Congruence of Gravitational (2) and Radiational Constants

"not what it is but something else, the opposite of what you say it is. It could have been stated that the gravitational relationships are in the terms of the second power of the relative distance between the given masses, as stated in the terms of the radius of one of the masses. That is the way you could say it today. We find that the gravitational law is in the terms of the second power of radius and terms are just converting Einstein's mass phenomena into terms of radius also--- which is the way he did it. We would be able then to know where relative mass was-- how much energy, how many quantum were in it; and you would then suddenly see the gravitational state in terms of the second power, and this relative concentration of the masses.

"The gravitational one, then, is the contractive, quantitative one of second power of relative masses stated in quanta or photons, and the other one is the Einsteinean one, which is the radiation of the other condition.

"You have two main conditions of energy: energy divergent and energy convergent, and we find both of them in the second power. We suddenly find this very neat relationship. It seemed very"

Universal Integrity: Vector Equilibrium and Icosahedron: (1)

'•The vector equilibrium and the icosahedron are the same twenty-ness. But the icosahedron is either a positive or a negative phase of the pulsatingly alternating first-degree structural self-stabilization in the asymmetric form of the vector equilibrium whose alternating pulsations are propagated by the eternally opposed radiant-attractive inter- self-transformable potential of ideally conceptual unity of Universe.

"The icosahedral phase of self-structuring is identifiable uniquely with the electron whose mass relationship to the proton is as 1/1836, whereas the icosahedron's volume is to the vector equilibrium's volume as 20/18.51. This difference is to be identified with the ratioing of the electromagnetic constant to the gravitational constant.

"The number of icosahedral electrons always are equal in number to the protons which are in the vector equilibrium's idealized form of the same surface layer phenomenon."

- Cite RBF Assam holograph, rewritten at Kennedy Airport. 1 Apr '72
Incorporated in f LUKriGuTIdS at Secs. 1055.11-15, 11 Oct'72

Universal Integrity: Vector Equilibrium and Icosahedron: (2)

"The icosahedron manifests only the external layer of omniintertriangulated closest packing of spherically conformed energy quanta and the vector equilibrium is closest nucleated, omni-intertriangulated, radial packing--- i.e., in mass-attractive concentrations.

"While the icosahedron's electrons display the same surface number of spherically conformed quanta, the icosahedron's surface array is omnitriangulated while the vector equilibrium's surface is arrayed two-fifths in triangulation and three-fifths in open, unstable square tangency. As spherical agglomerates decrease in radius, as for instance does the vector equilibrium contract to the icosahedral phase, their sphere centers approach one another and Newton's mass-attraction law, which shows a second-power gain as the proximities are halved in distance, imposes an intercoherence condition whereby as their overall system radius decreases, their circumferential Inter-mass-attraction increases proportionately."

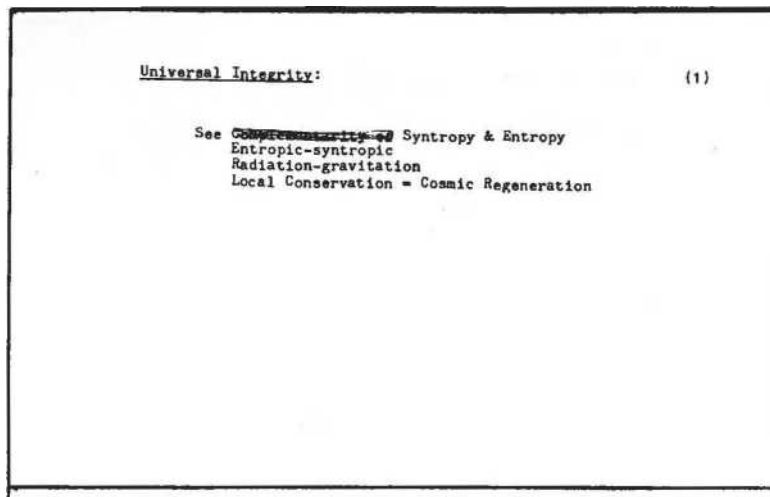

- RBF holograph written over the Himalayan Mts. entering Assam, 7 Nov *71, as rewritten by RBF at Kennedy Airport, NY, 1 Apr 72 Incorporated in SYNERGETICS at Secs. 1055.11-15, 11 Oct»72

Universal Integrity: Vector Equilibrium k Icosahedron:

"The vector equilibrium (vequilib) and icosahedron are the same 20-ness. But the icosahedron is the structurally asymmetric form of radiant-attractive unity--- • *. the number of electrons, i.e., the icosahedron form are always equal to the in number to the protons which are in the vequilib idealised form of the same surface layer phenomenon. The icosahedron is circumferential closest packing (i.e., surface packing--- equal gravitation-all-sj ere closest-packed area is less mass-attraction increased) ana vequilib is closest of nucleated packing or radial packing--- i.e., in mass-attraction concentration; while the icosahedron and the electrons are the most deployed of same surface number.

"As objects get smaller their circumferential mass attraction increases,"

"Tetrahedron has the extraordinary capability of renaming symmetrically coordinate and entertaining 15 pairs or completely disparate rates of change of three different classes of energy behaviors in respect to the rest of Universe and not changing its site. As such* it becomes a universal joint to couple disparate actions m Universe. So we should not be surprised at all to find nature using such a facility

and moving around Universe to accommodate all kinds of local transactions, such as coordination in the organic chemistry or in the metals. The symmetry, the fifteeness, the sixness, the fourness. and the threeness are all constants. This induced 'motion,' or position displacement, may explain all apparent motion of Universe. The fifteeness is unique to the icosahedron and probably values the 15 great circles of the icosahedron."

Universal Requirements of a Dwelling Advantage:

(1)

"The star radiations impinging upon us regenerate all life. Even as children, we feel intuitively the mysterious import of the stars: but have no knowledge whatsoever of the technological complexities by which this regeneration is accomplished. Most people live out their lives thinking of the stars only as an aesthetic and not realistically-relevant, decorative feature. 'Stargazers are nuts.' Each human as a metaphysical complex of events, recalls deduced principles and speculative assumption. Events impinge upon individuals from both outside and inside themselves. Those of internal microcosmic origin usually impinge subconsciously. Most of those of external macrocosmic origin also impinge subconsciously.

"The environmental events come in all kinds of frequencies and magnitudes— 99 percent are sensorially unapprehendable by humans. Comprehensive anticipatory design scientists, dealing on behalf of their fellow humans, must cope effectively with all these frequencies visible and invisible.

"Nature has a very basic pattern governing frequencies and energy event magnitudes. The biggest energy events occur least"

- Cite RBF to Michael Ben-Eli, A J, Dec*72

Universal Requirements of a Dwelling Advantage; (2)

"frequently and the smallest energy events most frequently. There are frequently enormous amounts of mosquitoes to be dealt with and very infrequent hurricanes. This frequency-magnitude relationship provides the scientific basis for establishing anticipatory design requirements. It is also fundamental that the design scientist must accomplish his task without diminishing individual human freedoms and contrariwise must reduce prevalent restraints upon humans, while providing each individual's gains without doing so at the expense of any other individual. In 1930, I published my 'Universal Requirements of Human Dwellings' which is predicated upon general systems theory. Covering all the above parameters and more, it has been revised mildly and has been republished periodically since 1930. Most recently it is included in my book, 'No More Secondhand God.'

OMSSE add# the following to definition as found in Nehru Speech

"nonidentical. but always complementary. omni-transforming . . . weighable~and unweighable. . . event sequences.

"Each experience begins and ends--- ergo, is finite. Because our apprehending is packaged, both physically and metaphysically, into time increments of alternate awakeness and asleepnaas as well as into separate finite conceptions such as the discrete energy quanta and the atomic nucleus components of the fundamental physical discontinuity, all experiences are finite. Physical experiments have found no solids, no continuous surfaces or lines--- only discontinuous constellations of individual events. An aggregate of finites is finite. Therefore, universe as exoerientally defined, including both physical and metaphysical, is finite.

- OMSSE, Pp. 62,63. 1969

Universe:

"Can we think of, and state adequately and incisively, what we mean by universe? For universe is, inferentially, the biggest system. If we could start with universe, we would automatically avoid leaving out any strategically critical variables. We find no record as yet of man having successfully defined the universe--- scientifically and comprehensively--- to include the nonsimultaneous and only partially overlapping, micro~macro, always and everywhere transforming, physical and metaphysical, omni-complementary but HOnidentical events.

"Man has failed thus far, as a specialist, to define the microcosmic limits of divisibility of the nucleus of the atom, but, epochally, as accomplished by Einstein, has been able to define successfully the physical universe but not the metaphysical universe. The scientist was able to define physical universe by virtue of the experimentally-verified discovery that energy can neither be created nor lost and, therefore, that energy is conserved and is therefore finite. That means it is equatable.

- Operating Manual for SSE, Pp. 60,61 1969

5Ge-ricx—.Sf:c 2__?)

Universe:

"Each experience begin and ends: ergo is finite. Because our apprehending is packaged, both physically and metaphysically, into time increments of alternate awakeness and asleepness as well as 'into separate finite conceptions such as the discrete energy quanta and the atomic nucleus's components of the fundamental physical discontinuity, all experiences are finite. Physical experiments, Zfve found no solids, no continuous surfaces or lines--- only discontinuous constellations of individual events. An aggregate of finites is finite. Therefore, universe, as experientially defined, including both physical and metaphysical, is finite."

RBF DEFINITIONS

Universe;

"I have found, my whole life, that I've had a problem dealing with society, because I'm dealing with that which is not obvious to the rest of society.

I have found that the universe is actually operating in an entirely different way from the way society thinks it is. Society's living in a sort of 'fault.' The kind of 'fault' I'm thinking of is like an earth fault, like a great cliff, a great discontinuity in the earth's surface. There are great discontinuities in the public's image of what the universe is. '*

- Cite MERGERS & ACQUISITIONS Vol. So. 1, p. 4, 1965

Universe:

"Since by my own definition Universe is the historically synchronous aggregate of all men's consciously apprehended and communicated (to self or others) experiences, and since the experiences are each finite but nonsimultaneous, Universe is a nonsimultaneous yet dynamically synchronous structure, which is unitarily nonconceptual as of any one moment, yet as an aggregate of finites is sura-totally finite. Thus we realize that finite structures are mostly nonconceptual in any momentary sense, though certain local structures in Universe are momentarily conceptual, such for instance as the continually transforming historical aggregate of men's experiences packaged together in the words 'Planet Earth.'"

- Citation and context at Structure Sequence (3), 1965 Incorporated in SYNERGETICS "at Secs. 303 + 324.

Universe:

"Conceptuality of Fundamental Structures" (Cite KEPES4 adds the following to the definition of universe as found in Nehru Speech, page 7:

. universe is the historically synchronous aggregate of all men's consciously apprehended and communicated (to self or others) experiences and since the experiences are each finite but nonsimultaneous, universe is a nonsimultaneous yet dynamically synchronous structure, which is unitarily non-conceptual as of any one moment, yet as anw aggregate of finites is sum totally finite. Thus we realize that finite structures are mostly non-conceptual in any moment*

sense though certain local structures in universe are momentarily conceptual such for instance as the continually transforming historical aggregate of men's experiences packed together in the words "planet earth."

- 1965

Universe:

". . . . Because of the fundamental nonsimultaneity of universal structuring, a single, simultaneous, static model of universe is inherently both "nonexistent, conceptually impossible," as well as "unnecessary." Ergo, universe does not have a shape. Do not waste your time, as man has been doing for ages, trying to think of a unit shape "outside of which there must be something," or "within which, at center, there must be a smaller something." All the words in the dictionary do not make one sentence; all the words cannot be simultaneously considered, yet each of the words is valid as a tool of communication; and some words combine in a structure of meaning."

Universe:

"The physicists began to demonstrate very effectively that the perpetual motion machine wouldn't work because they were always losing energy and so the local system was always running down. What the physicists, however, did when they posited energy universe, the Law of Conservation of Energy: no energy can be created and no energy can be lost, they developed universe as the first and only successful perpetual motion machine.

"In other words universe is the minimum perpetual motion machine. There is a minimum set of patterns that is a consequence of this set of patterns reacting with that set of patterns. In order to have a monkey wrench you also have got to have a store, and in order to have a store you have to have other things. You have to have all the great complex of events and we get then to a minimum set of complementary events where the system then regenerates itself and we come to what we might call universe, it is interesting then to discover that this tends to be a clearly defined inventory, of relative abundance of the various chemical element patterns in the universe so that you need then a great deal of the pattern hydrogen and you don't need so much of the _____ pattern uranium." cite Oregon Lector #5, PP. 11-12

Uqlyerg; (1)

"That most comprehensive question was, 'What do you mean by the word 'Universe¹?' *If you cannot answer, you had best abandon use of the word 'Universe' for it will have no meaning.' My intuitively adopted rules for self questioning and answering were that the answer must be made exclusively from man's experience patterns. I learned many years later that the Nobel physicist Percival Bridgman had identified this same rule adopted by Einstein as 'operational procedure' subsequently a much abused phrase. My answer (or discard of the word 'Universe' as a communication tool) was operationally inherent: 'Universe is the aggregate of all consciously apprehended and communicated (to self or relayed to others) experience of man.' If my finite answer holds against all specific experience challenges as being comprehensively anticipatory and adequate, the Universe is finite, and all its components definable. Each life as we know it is definitive, i.e., consists of a plurality of terminable, ergo definite, experiences, beginning with each awakening and terminating with each surrender to sleep (no man can prove upon awakening that he is the man who he thinks went earlier to sleep, or that"

"Only the physical is alterable; the metaphysical is unalterable. All the physical is continually intertransforming in orderly ways discoverable only by the weightless metaphysical mind. The local physical systems are everywhere energy exportive, which is humanly misinterpreted to be entropic and dissynchro- nously expansive only because the exported energies are electro- magnetically (i.e. nonsubstantially) dispatched only as information--- which is purely metaphysical--- to be always eventually imported as information by electromagnetic reception in elsewhere-newly-born regenerative assemblages of cosmic systems. The local exportings appear to be dissynchronous only when viewed from too short a time span to permit the tuned-in occurrence of the next synchronous moment of the aeons-apart frequencies often involved in celestial electromagnetics."

University: New York City as a Vast University:

"... What is going on with the cities, all the physical has gone out«, the metaphysical coming in--- it is not just exchanging of goods, as for instance, the mammoth stores beginning to deploy also, to get to where there could be some good parking by going out of town to the new

shopping centers leaving a downtown hole. Into that center must-come the educational centers. This is what is happening in New York City, for instance. New York City is becoming a vast university, where Columbia owns all of Radio City-- it owns much of that part of the real estate of New York. Then New York University owns all Washington Square and going south of that. We simply find New York tending to become a big dormitory University, though it has different names, this is it. And much of this University is not the enrolled student, but just the adult or even the young coming in to find out what it is all about, to have some experiences. There is no question about the major part of our education being something that occurs outside of the organized educational facilities."

"It takes just ten triple-bonded tetrahedra to make a helix cycle, which is a molecular compounding characteristic of the Watson-Crick model of the DNA. When we address two or more positive {or two or more negative) tetrahelices together, the positives nestle their angling forms into one another (as do the negatives nestle into one another's forms). When so nestled, the tetrahedra are grouped in local clusters of five tetrahedra around a transverse axis in the tetrahelix nestling columns. Because the dihedral angles of five tetrahedra are 7° 20* short of 360°, this 7° 20' is sprung-closed by the helix structures' spring contraction. This backed-up spring tries constantly to unzip one nestling tetrahedron from the other, or ethers, of which it is a true replica. These are direct (theoretical) explanations of otherwise as yet unexplained behavior of the of the DNA."

- Cite MEXICO '63, p. 61, 10 Cct 'o3

"We see three such columns /tetrahelices/ and we see they tend to nest into one another. If you make three of them they do nest very neatly, but when they nest together they bring about a condition where around one vertex--- if they are really nested down well---

we get five tetrahedra around one common axis. We know that if we take a tetrahedron that its edge angle is 70 degrees and 32 minutes and five times that is about six degrees less than 360 degrees. In other words, five tetrahedra round a common edge axis do not close up and make 360 degrees, but when we bring them together in a helix like this--- due to the fact that the helix is a spring, the total helix as a spring will contract enough to allow these five to connect, because part of the five are in one column and part of the five in another column. The sets of springs will collapse enough; and no matter how long they are we find that these springs will collapse and let them come together. You are doing it against the spring and they are on the spring so therefore they would like to tear it apart."

W

•'There are no specific directions or localities in Universe which may be opposingly designated as UP or DOWN. In their place we must use the words OUT or IN."

- Citation k context at In k Out. 1J Nov'69

~ tfaCH⁻, - p. ITT"13 Nov¹69

"If he persists in the up-and-down language man may never communicate accurately with other men for they do not employ the same meanings, either from moment to moment, or in respect to their individual 'ups*' and 'downs.' . . . Only when man learns to say 'in' and 'out' relative to designated common centers {for example, of Earth} is the meaning constantly reliable. The sky is outward to all men, at all places, at all times, on any planet. While enjoying an infinity of individual 'ins,' we, anywhere in the Universe, also enjoy one common nonsimultaneous, omnidirectional aggregate called 'out.'"

- Citation and context at Dynamic Frame of Reference (4), May*49

"As taught in the late twentieth century geometry commences with plane geometry. This is because geometry was conceived and methodically formulated in history during the early times when humanity envisioned the world as a mountained and valleyed island floating upon an infinitely deep watery plane which extended laterally in all horizontal directions to infinity. Above everywhere was the sky. But the experience of remotely converging lines of perspective suggested reflexively to man that an optical aberration existed whereby though you could not see that far, all the upward bound parallel lines perpendicular to Earth must ultimately converge, as do all parallels, receding from where one stands.

"The parallel up lines were assumed to converge in Heaven--- a haven--- a sky harbor. Until the twentieth century humanity, all those separate individuals within their respective lifetimes, each saw less than a millionth of the total surface of our spherical space vehicle Earth. All the foregoing conceptioning is so logical that, despite theoretical knowledge to the contrary and their quick denial of such misconceptions, approximately all humans as yet 'see' the world in that image."

- Cite NcHRU SPEECH,p. 16, 1J Nov'69

"Witness that they all use the words 'up' and 'down. They speak about 'Getting down to Earth,' 'the wide, wide world,' and always spell the Earth with a small 'e' because it is simply the stuff under our feet, 'down here,' which stretches away laterally to infinity.

"It is not surprising that we continue now to start our children's geometry--- meaning world measuring--- with plane geometry. This, however, is intellectually devastating, and constitutes the parting of the ways with one road leading into the scholar's 'pure' mathematics, and the other continuing as the reality, which disagrees with all that is found by physics, mathematics, and chemistry to be the natural orderliness of Universe. The 'practical' man who was disgruntled by the awkward misconceptions of mathematics is one who is so dull as not to be bothered by the measurable discrepancies and keeps on 'brilliantly and courageously' doing all the short-sighted, expedient 'things' which, applauded by the most powerfully advantaged seifists, are so swiftly consigning man to extinction as 'unfit' for survival in the vast reality of the Universe of weightless, invisible, omni-interaccommodative generalized principles, which are"

- Cite NEHRU SPEECH, pp.16-17, U Nov*69

"forever faithfully governing electromagnetic wave frequency radiating propagations and mass attraction's concentricity, much of whose integrity has become understandable by humanity's metaphysically comprehending mind.

"Foremost of the debilitating effects of predicating all the students conceptually calculatable logic upon a plane geometry foundation is the spontaneous

persuasion of the reasonableness of forthright bias which it engenders. Thus, for instance, loyalty, which is powerfully one-sided, has come to be rated as a noble attribute.

Loyalty can take outright lies in its stride. It thinks nothing of defending a fallacy. How does that all come about? Prove your contention. All right!

"All the entities and conceptual formulations of plane geometry commence as follows: 'A triangle is an area bound by a closed line consisting of three edges and three angles. A circle is an area bound by a closed line everywhere equidistant from a point.' Areas bound by closed lines are the essence of plane geometry. Only that which is bound by a"

- Cite NEHRU SPEECH, pp.17-18, 13 Nov'69

'closed line is definable, valid, calculatable, and useful.

Why is this so? Because the plane outside the bound area leads in all lateral directions away to infinity and, therefore, is undefinable. On the inside of the boundary line was definability, finity. On the outside was only undefinability, infinity. The 'Ins' were reliable. The 'Outs' were dangerously unpredictable.

'Only the phenomenon on one side of the line was valid. So there is your taught-in bias of all the /qylrd around's schooled society. The outlaws and the in-laws. I am okay. You?

Ky family in; yours out. Our Town . . 'The damned foreigners,' etc. Now we at least know theoretically that both sides of the line are valid.``

- Cite NEHRU SPEECH, p.18, 13 Nov'69 "I have questioned many scientists and have never heard one deny that he realistically sees the Sun set, which is to say that he sees the Sun 'going down.' All scientists as yet use the words up and down. These words are now meaningless for they were invented by man to accommodate

his sense of the world stretching away to infinity as a plane around him, to which he is perpendicular. Because he has thought of the world that way for two million years, he goes on celebrating spontaneously that of course all the perpendiculars to the world plane are parallel to one another and all the parallel perpendicular lines point in two opposite directions: 'upward' or 'downward.' But all scientists agree that there are no regions of the Universe which are uniquely 'up' or 'down' and also that none of the perpendiculars to a sphere are parallel to one another.

"But, ask the scientists annoyedly, 'What else can I say?'

'The answer was found by world-around flying aviators who 'come in for a landing' and go out to fly their courses at greater altitudes in the world surrounding skyocean. In, out, and around are the words that indicate conceptually all "our"

"sensing of directional behaviors of physical Universe. When these directions are modified by relative angle and frequency changes, they accurately satisfy our needs in respect to all conceptual systems of consciousness--- subjective or objective--- and all systematic considerations of experience, from instrumental probings of the atomic nucleus to celestial nebulae.

"As do the others of Spaceship Earth's involuntary and unwitting astronauts, the scientists go on speaking reflexively about 'The four corners of the Earth' and the 'Wide, wide world.'

"Frequently the flight control scientists on the spherical deck of Spaceship Earth are heard to say--- on the manned and rocketed capsule television programs--- "Well, boys, how are things up there this morning!/' as the astronauts orbiting the 1,000 miles-per-minute speeding Spaceship Earth approximately every hour, pass

through a spiraling series of positions, each of which eight-Earth-diameter-miles apart checkpoints are halfway around the Spaceship Earth from where the scientist is speaking, through one of those points which are in the direction of the 'upwardly' inquiring scientist's feet."

van't Hoff:

"Late in the nenteenth century the organic chemists led by van't Hoff discovered that all organic chemistry is tetrahedrally configured. In all the structuring we know of in organic chemistry--- plastics or gaso- lines or what-have-you--- the atoms form molecules by little tetrahe- dral arrangements: tetrahedra point-to-point (univalent), tetrahedra edge-to-edge (bivalent), tetrahedra face-to-face ((trivalent), or con- gruent tetrahedra (quadrivalent). These are the primary bondings. The range goes from C (carbon), which is relatively light, to C (car- bonaceous diamond), which is quadrivalent: four points of the tetra- hedra are congruent with one another.'*

- Cite Conceptuality of Fundamental Structures (Kepes), p.72, 1965

van't Hoff: Jacobus Henricus van't Hoff: (1852-1911)

"van't Hoff said he thought this oneness, twoness, threeness and fourness has something to do with tetrahedra. ... He went to work very hard and he lived to make optical proof with the microscope of the tetrahedral configuration of carbon. He was the first man ever to receive the Nobel Prize. One reason the chemists hadn't accredited him was that most chemists were metallurgists. Organic chemistry was a very new phase of chemistry and they hadn't found any bonding in the metallurgy, so the chemists were simply bored with this phase of chemistry and when this man comes along with some kind of crystallographic configuration of conceptuality it annoyed them very much. They had been getting along very nicely with just numbers. They had the kind of relationships where they did not have to have the tetrahedron shape. Then there is a great hiatus after van't Hoff and it goes up to 1932, and that is a half-century hiatus."

"In the general theory of variables, it has been recognized that the set of all the variables may be dividied into two classes: {1) the class of all the inclusive variables within a given system, the interior relefrants. and (2) the class of all those operative exclusive of tKe systera, the exterior relevants. It has been further recognized that the "variables outside the system may affect the system from outside. In varying degrees, specific levels of subclasses of these 'background' or outside variables are identified as parameters. But the 'background' concept is fallaciously inadequate; dealing with insideness and outaideness for 'background' is limited to the two-dimensional or flat projection concept, which inherently lacks insideness---ergo, cannot also have outaideness, which always and only coexists with insideness. Ergo, all two-dimensional copings with systems are inherently inadequate and prophetically vitiated."

Vectors:

"Now we have what we call vectors. Vectors represent energy experiences, a vector is-a line going in a specific direction in relation to two ffnnts giving you an axis, say your head and your feet. That gives you an axis of reference and then you have a vector, an energy action moving at some angle in relation to that axis of yours. And the length of the line is arrived at by multiplying the mass times the velocity. Those then are energy vectors. And energy vectors are extremely useful because they do represent actual experience in relation to yourself as observer. It acts as a reference."

"We, however--- inspired by Avogadro's identical energy conditions under which different elements disclosed the same number of molecules per given volume--- are exploring the possible establishment of an operationally strict vectorial geometry Held, which is an isotropic (everywhere the same) vector matrix. We abandon the Greek perpendicularity of construction and find ourselves operationally in an omnidirectional, spherically observed, multidimensional, omni-Inter- transforming Universe. Our first move in spherical reality scribing is to strike a quasi-sphere as the vectorial radius of construction. Our dividers are welded at a fixed angle. The second move is to establish the center. Third move: a surface circle. The radius is uniform and the lesser circle is uniform."

"Each vector is composed of two halves, each half belonging respectively to the unique radius of one of the tangent spheres that is perpendicular to the point of tangency. The half-vector radii of the isotropic vector matrix are always perpendicular to the points of tangency; therefore they operate as one continuous vector."

- Citation at Isotropic Vector Matrix. 28 Oct'73

RBF DEFINITIONS Vector:

Half Vectors:

"In the isotropic vector matrix derived from the closest packing of spheres, every vector leads from one nuclear center to another, and therefore represents the operational effect of a merging of two force centers upon each other, Each vector is composed of two halves, each half belonging respectively to any two adjacent nuclear centers. Each half of the line represents those unique radii of each of the tangent spheres which alone are perpendicular to the identical points of tangency and therefore they operate as one continuous vector.

"Unity as represented by the internuclear vector modulus is of necessity always of the value of two, that is, unity is inherently two for it represents union of a minimum of two energy centers."

"When there is an interference of two energy events of similar magnitude, there is a coequal pattern of interference resultants, as when two knitting needles slide tangentially by one another. But when one converging body of an Interfering pair is much larger than the other, the little one `seems* to do all the resultant moving as viewed by an observer small enough to see the small converger's motion---as, for instance, human beings see a tennis ball hit the big ball Earth and

see only the tennis ball bounce away, the Earth ball being too big to be seen as a ball by the viewer and the relative bounce-off deflection of Earth's orbit from the tennis ball point of impact being too small for detection. As the magnitudes of energy vectors are products of the mass multiplied by the velocity, the velocity may be high and the mass small, or vice versa, and the vectors remain the same length or magnitude. A little body moving at sufficient velocity could have the same effect upon another body with which it interferes as could a big body moving at a slower rate. With these vectorial variables in mind, we see that there are three fundamental preconditions of the interference vectors: where one is larger than the other; one is the same; or one is smaller in energy magnitude than the other."

Vector Equilibrium, 23 Oct'72

Vector: Threeness of the Vector:

(1)

"There is a constant relative abundance for every vertex in the Universe. There will always be two faces and there will always be three edges. Which is to say then, that for every event in the Universe the number of lines (which are the vectors, the energy actions) will always be three--- or multiples of three.

'Now this is consistent with what we used to have in engineering where we learned that 'every action has a reaction.* But since the discovery of the speed of light ... we realize that every action has a reaction and a resultant. The resultant and the reaction are not the same. This, then, gives you something very interesting. Every energy action, every energy event is three-part: action and reaction and resultant. They are the vectors. Now we find that the reaction and the resultant are never a 180° continuance of the vectors. There is always something that transpires that makes it precess. So an energy action is some kind of a 'Z*--- an open 'Z* if you think of a *2' as three connecting lines. Now the ends of the same three could come around and make it look like a triangle. So it might be a 'Z' or a triangle. There are always three parts, but never at 180° so it's not a straight line

- Cite RBF to Verner Smythe, NYC, Reel 2, p.6, 11 Mar*69

Vector; 1'hreeness of the Vector: (2)

'It has been found that the proton and the neutron consist of three basic energy components. The proton has its electron and its antineutrino. That takes three vectors. The neutron has its positron and its neutrino. Each one is threefold. Now I take these two and I put them together. Each one of those is called in physics--- either could be called 'One-half quantum,' 'one-half Plank's constant,* or one-half spin.*

"I find when 1 join the two of them together they give me something that is very stable: it makes one tetrahedron. There are the six edges of the tetrahedron. ... A tetrahedron is one unit of quantum. This threeness of the vectors is always in here so this gets to be the basic model. The only difference here is that the prime numbers 1, 2, 3, and 5--- they take care of the hierarchy of all the polyhedral geometries, of all the structures of all the atoms."

"Systems are domains of volumes. One difference between a domain and a volume is that a domain cannot have an interior point, because if it did, it would be subject to more economical subdivision. For instance, the vector equilibrium is a system and has a volume, but it consists of 20 domains. A vector equilibrium is not a prime domain or

a prime volume, because it has a nucleus and consists of a plurality of definitive volumetric domains. The vector equilibrium is inherently subdivisible as defined by most economical triangulation of all its 12 vertexes into eight tetrahedra and 12 quarter-octahedra constituting 20 identically volumed, minimum prime domains."

Vector Equilibrium:

(I)

"The vector equilibrium is of the greatest importance to all of us because all the nuclear tendencies to implosion and explosion are reversible and always in exact balance. But the important thing is that the radials which, if they are outwardly pushing, would tend to explode, are always frustrated by the tensile finiteness of the circumferential vectors which close together in an orderly manner to cohere the disorderly sundering.

"When the radial vector are tensilely contractive and separately implosive, they are always prevented from doing so by the finitely closing pushers or compressors of the circumferential set of vectors. The integrity of Universe is implicit in the external finiteness of the circumferential set which always encloses the otherwise divisive internal radial set of omnidirectional vectors.

"All the internal or nuclear affairs of the atom occur internally to the vector equilibrium and all the external or chemical associations occur externally to the vector equilibrium."

Vector Equilibrium:

di)

"The vector equilibrium itself is never found exactly symmetrical in nature's crystallography. Nature, which is ever pulsive and impulsive, refuses to get caught unrecoverably at the zerophase of energy. Therefore, there will always be positive and negative sets which are ever Interchangeably intertransformative with uniquely differentiable characteristics. The vector equilibrium is the true zero reference of thewmi energetic mathematics."

"In the vector equilibrium form we have an enormous number of random lines running omnidirectionally which begin to triangulate omnidirectionally. On of the important aspects of this is that it consists of four planes. At its equator it has a hexagon and four hexagonal planes

crossing each other at the center of the system. Those four hexagonal planes correspond to the four faces of the tetrahedron, and they are parallel to them. . . It has eight tetrahedra; there is one on the top, or four altogether in the northern hemisphere and four in the southern hemisphere. And there are six one-half octahedra. There are six square faces and eight triangular faces and the square faces are part of the half octahedra. Therefore it consists of six one-half octahedra each with a volume of $n > 2$, $6 \times 2 = 12$, and eight tetrahedra each with a volume of one, so $8 + 12 = 20$.

Vector Equilibrium: Great Circles Of:

(1)

"The great circle planes of the vector equilibrium projected as true circles on a sphere represent the equators of spin... The vector equilibrium has 14 faces which represent the 14 main aspects of a regular tetrahedron. Six of these faces are square and they are symmetrical to one another. We can pair the square faces so that there are three

pairs of square faces and we can interconnect their opposite centers of gravity, which provides three axes corresponding to the XYZ coordinates, 'we can spin the vector equilibrium on any one of these three axes of symmetry to produce three equators of spin. These we speak of as the 'vector Equilibrium's three great circles.

'There are also the eight triangular facets of the vector equilibrium. If we take the opposite midpoints of these eight triangles, we can pair them into four sets giving us four axes and spin the vector equilibrium on these axes to produce four equators of spin of the vector Equilibrium's four great circles.

'The vector equilibrium also has 12 vertexes which provide six axes of spin. These produce the vector equilibrium's six great circles. The vector equilibrium has one other set of symmetrical'

- Cite Oregon Lecture //6, p. 22\$, 10 Jul'62 j RBF rewrite, Aug'71 secs HSV-OI

axes: if we take the 24 mid-edge points and interconnect their diametric opposites, we get 12 axes of spin; when rotated these generate the vector equilibrium's '12 great circles,* which run from the corners to the opposite mid-edges of the (□□MB vector equilibrium's six squares.

"So we now have three axes (from midpoints of the squares); plus four axes (from midpoints of the triangular facets); plus 6 axes (from vertexes); plus 12 axes (from the mid-edges of the squares). $3+4+6+12=25$, for a total of 25 great circles for the vector equilibrium.

"It is a characteristic of all those great circles that every one of them go through two or more of the 12 vertexes and these 12 vertexes correspond to MB all the points of tangency of closest packed spheres: four go through six;

three go through four;

six go through two; and

12 go through two."

- Cite Oregon Lecture //6, p.226, 10 Jul*62 J^{RB}F rewrite, Aug*71 q
S'd.di

"It is a characteristic of all these great circles of the vector equilibrium that every one of them go through at least two of the 12 vertexes.

"When spheres are closely packed, what do we mean by that? Let us take four billiard balls on a billiard table. We get them as close together as we can, and they could make a square; but they are unstable as a square. Let them rotate a little as ball bearings and they become a diamond; and then they are stable because they consist of two triangles and triangles are stable. I can get three together stably or I can get six-around-one stably, or four as a diamond. They pack in omnitriangulation and that is called closest packing.

"I can get 12 spheres around one omnidirectionally--- six around it in a plane and 12 omnidirectionally. The 12 balls then are in the position of the 12 vertexes of the vector equilibrium where we say all the radii are identical in length. This would be the radii of the spheres. We would have a sphere the same size as the center of the system and its radius would use up half of the radius of the vector equilibrium's radials. They"

'sfSreH- s~ics. 4 S/* 4 S'T)

` ` would be tangent to one another, giving us 12 balls tangent around one. In the closest packing of spheres, which the physicist finds is employed by nature in the basic gridding of all agglomerations of atoms--- and we find time and again nature using this closest packing for basic coordination--- and you always get 12 around one. The 12-around-one would then be at these various points.

"Therefore in finding all the sets of great circles which can be generated by all the axes of symmetry of a vector equilibrium, and finding that they all go through the 12 vertexes is very interesting, because if this sphere were tangent to other spheres these would be its points of tangency in closest packing. The point of tangency of spheres in closest packing would be a very important point because any energy traveling over the surface of one sphere to get to another sphere would have to go through a point of tangency to the next sphere.

"The great circles represent the shortest distances between points on a sphere; they are the most economical lines on a sphere. These 25 great circles represent all the railroad tracks of energy following the shortest distance between points— all the impossible railroad tracks that go through all the points of

— Cite Oregon Lecture 6, p.227, 10 Jul'62

'tangency of other spheres. Therefore, energy could travel from sphere to sphere in closest packing following the surface of the spheres, but in order to do so it would have to follow the most economical distance between those points and it would have to go on one of these railroad tracks. These are the railroad tracks of energy following the surfaces of spheres of closest packing. These are the most economical distances. Therefore they get to be quite important kinds of lines.*'

VgJXflE. Equilibrium: Polarisation: (1)

"...There are two ways you can play thia game, because time and again you find that in nesting work., we are, for instance, taking six which would be in thia position and you enly neat three on it: so we use this neat: this nest: and thia nest. We leave untouched, thos nests. They are in closest packing, we find, always alternate spaces that are not being used, so that triangular groups can be rotated into one position--- or 60 degrees to an alternate □MSBSHt nestable place.

We get vector equilibrium in this condition: but in the other condition I have it rotating 60 degrees, ana instead of being a vector equilibrium, we simply have in effect a polarized system. These are equilibriums going on in all directions' and" this goes into a polarized condition. Apparently all the organic chemistry is predicated on this polarized condition.

"We find that you can take two halves of the vector equilibrium made out of balls and take one hqlf off it as vector equilibrium, rotate it 60 degrees and bring them together again and Instead of having the condition you have in the vector equilibrium of alternate faces being squares and triangles in array around it,"

7 Cite Oregon Lecture #7, pp.234-235, 11 Jul'62 54, oT]

Vector Equilibrium: Polarization: (2)

"you will get a top triangle and a bottom triangle in the system by rotating it 60 degrees--- and then you will get a square and a square touching each other, and a triangle and a triangle, a square and a square.

"It is polarized. In other words you take the vector equilibrium, rotate it 60 degrees to the next nestable position and suddenly it is polarized. It is this polarized condition, then, that a section through--- it makes the famous chemical hex that the chemists have used. The chemists recognize that form but 10 or 15 years ago they didn't have an experience like that, but they did in the polarized system. Apparently then, all the chemical compounding in the organic chemistry relates to polarized systems."

Vector Equilibrium; Spheres & Spaces: (1)

"Spheres enclose the packing of the spaces between them. And the spaces turn into only two kinds: there is a concave vector equilibrium and a concave octahedron. Those are the two spaces.

"So I call the sphere a convex vector equilibrium and space a concave vector equilibrium: and an alternate one, which is the octahedron. So it is a precessional side shift. There are three alternates: so suddenly a space, a sphere, becomes a space and the space becomes a sphere. And I have a model where you can see it actually do that. You just press one energy action and the whole thing takes place and propagates an omnidirectional wave. You can literally see it--- drop a stone in the water and you can see an omnidirectional wave occurring... So the curves are generated and are not instantaneous. I have really the only instantaneous way of carrying on, where I don't have a curve generated by a hexagon: I simply have the hexagon, and its chords are equal to its radii.

"Physics has had only two kinds of acceleration: angular and linear. But it hasn't been able to coordinate the angular, so she uses only the line* and tries to experiment. So she hasn't been able to use the angular, so she uses only the linear and"

"tries to experiment. So she hasn't been able to use the angular because it did involve this pi . so she throws in this constant to make up for it.

"And they have been going with analysis by yO-degree position- ings of the actions; and nature doesn't make those yO degrees... So my chords and my radii are the same and they are the angular and the linear accelerations. They are the vector zones.**

- Cite RBF tape to BO'R, Carbondale Dome, pp.2-4, 1 May'71 "A sphere is an asymmetrical phenomenon. It is an inward-outward pulsative from the vector equilibrium. The sphere's spaces are interchangeable. The spaces between the spheres are complementary. Our model really shows each sphere becoming a space and every space becoming a sphere. Each one can be either a concave or convex symmetry of the vector equilibrium. Vector equilibrium then having the maximum radius, then the radius contracts in order to be a sphere. That is how it can be accommodated within the total frame of reference. The edge of the vector equilibrium gets bent into becoming the arc of the sphere. So that the sphere of the vector equilibrium is contracted as a chord turns into an arc the radius contracts."

"There is something I would like to speak about in regard to vector equilibrium and tetrahedron. I spoke yesterday about a rather extraordinary realization that in looking at a tetrahedron we say. I see there are three around any one vertex: there are three faces and three edges in beautiful synchronization and we say that all looks simple

and logical. Then we find it rather surprising because we find that the inventory of three faces came out of an inventory of four total that are available in the tetrahedron. And the inventory of three edges came out of an inventory of six that are available. So that the sixness and fourness were very different inventories. Somehow around any one vertex nature had arranged to put them in neat balance of different inventories.

"Consider the case I spoke of one time of the cheese tetrahedron as pushing one of the faces towards the opposite vertex. I am not going to talk about it as a cheesenow, but for a moment we will think of it just as a plane. As the top plane of this tetrahedron--- I am going to move it (the plane) towards MB this opposite vertex. Finally I move it until it is congruent with"

— *secs. H 41.6G .OT+.»«*

'the opposite vertex. There is now no volume, but we have agreed that the conditions of syrrmetry in the tetrahedron, the sixness and founness, are all still there, but they are empty.

"Now with this plane congruent with the opposite vertex we have a very interesting condition. We have all four planes of the tetrahedron going through the same point at the same time--- or, theoretically, as close as you can ever get. You have six edges going through the same point at the same time. We have agreed that this is a condition that can never happen in reality, but in the vector equilibrium--- where it has no size--- we have the only possible time when this would seem to occur.

"So we now have all six edges and a total inventory of four faces and six edges all going through the same theoretical point at the same [Q]moment. We have said that this is a vector equilibrium and in a zero condition and is nonreality. Nature would not permit it. But a

minute after that, those six edges turbine around the point one way or another--- and you see plenty of models of the lines turbinig around--- but we will have to say that there had to be a moment theoretically when this plane"

syj H - se-cs VVI.el. . *1 t.oB'l

"went from being a positive tetrahedron to a negative tetrahedron, which it could be, and had theoretically to pass through that point. Very clearly vector equilibrium is a zero tetrahedron: and we already had tetrahedron as an indestructible conceivable phenomenon independent of eize. And then we have it getting into its own true zero vector equilibrium. It is very interesting to realize what that condition is. It is a condition that nature apparaently does not permit in our life, but what we call reality is always a positive and negative set of the whole."

"Now let's look at the present situation in agriculture where the basic food production is. Of the total vegetable crop harvesting about 10 percent is actually, finally available for human consumption in America. There are various reasons for this, but it is if you were sort of standing and picking apples, and for every nine apples that you pick, you only get« one in your basket. It's a very frustrating, inefficient process."

Vertex:

"Eiller showed that there were lines-- any kind of lines, crooked or not
so crooked. He then showed that the

pattern of two or more lines crossing one another was completely dis-
tinguishable from any single line by itself. We call this crossing, or
convergence of lines a Vertex.

"When three or more lines each cross two others, we have enclosures or areas. So Euler had areas, vertexes, and lines which he said were fundamentally unmistakable for one another. Euler showed also that all conceptual experiences which we can pattern, or form, are composed exclusively of three patterning elements: lines, vertexes and areas. They are all that are necessary to analyze and inventory all parts of, as well as all whole, patterns."

dBf DEFINITIONS

"In topology we have then a unique aspect that we call a line, not a straight line but an event tracery. When two trceries cross one another we get a fix, which is not to be confused in any way with a non-crossing. Fixes give geographical locations in respect to the system upon which the topological aspects appear.

"When we have a tracery or a plurality of trceries crossing back upon one another to close a circuit, we surround a novent area. Trceries coming back upon themselves produce areas or noventa. The areas, the traces, and the fixes of crossings are never to be confused with one another: all visual experiences are resolved into these three conceptual aspects."

Vessel:

"Inspired by nature's nut, mollusk, egg, and vegetable shells, men learned, hundreds of millions ago, how to hollow out or build up and bind together hydraulic containers or vessels. Learning gradually how to expand the vessel-making art, men finally hollowed out large logs and then later shaped and tied together tree planks, later bent around stout frames. They w pitch-sealed the seams between planks to exclude, rather than include, the hydraulic element, as had their earlier water-holding vessel, the vase— ves. short for vessel.

"Vessels represent man's discovery not only of the generalized principles governing stabilized separations of liquids and gases anywhere locally in Universe, but also of the generalized solution of local environment pattern-controlling by man within the otherwise frequently hostile, if not lethal, environment event patterning of total energetic Universe. Vessels embrace the fundamental principle of finite local system mathematics. Vessels. as systems, divide the Universe into two main parts— the withinness and the withoutness." - Cite I&I, DOI-1ES, Pp. 157-158. Undated

"Talking about the synergy of synergies we find over and over again that precession is not predicted by mass attraction; the chemical compounds are not prophesied by the atoms; the biological protoplasm is not predicted by the chemical compounds and the design of the elephant or the pine tree is not predicted by the protoplasm. We know there is DNA and rRNA, of which any one set of those form a special case: they don't carry the general capability. They don't tell us why the protoplasm could be elephant or pine tree. Viral steerability is angle-frequency design. There's no question about it, it's a specific set of cases and it has its four fundamental constituents---its two pairs. . . Third pairs, which are upside down, are GCTA, , .

..e know the code, but we don't know how it comes out elephant. . .
The complementarity of the holistickness of it would balance out. And
so an elephant does walk and its not something left over with some
gaps in it. That's how it is with DMA and HNA."

SYUEKCETICS WIC/CMCWY- SFCZ IoSoTot*1

Viral Steerability:

Angle-Frequency Design Control:

"Ue know that there is DNA and RNA, any one genetic code of which
dictates both a species and within it an individual or special-case
formulation. DNA-RNA codes do not explain why the protoplasm
could produce either an elephant, pine tree, or daisy, 'hat we call
viral steerability as produced by the DNA-RNA codes is simply our
familiar and generalized angle-frequency design control."

"Now one of the main important characteristics of DNA is that we have in the DNA helix a patterning instruction.- There is a coding of four principal chemical compounds:-- GCTA. They find that all the instructions for the designing of all the patterns known to biology! life is contained in GCTA. which will sometimes read GCGCGCATATTA. These are the four letters that are used and they govern all the coding of all the life structures. They know that one of these codings, then, makes a parent /apparent? . . .J and then there is some kind of zipping that occurs where there is a dichotomy and the new life breaks off from the old pattern with a perfect imprint and repeats the other./ It is quite interesting that in these helices you have the ability for them to literally nest by virtue of the spring, so that even though one is being imprinted by the other, it is not because one is a negative column and the other a positive column. They are all the same columns and yet they nest. Therefore, the other column, when it comes off, is a replica of the original column. They also found there is a tendency in the dichotomy to unzip:for the new life printed by the old life to unzip itself from the previous life--- so we have found in this model so far a tendency to unzip, to primp, and there is a coincidence of

Virus;

• Frequency to the second power times ten plus two: is the number of balls in any given layer. This simple formula governing the rate at which balls are agglomerated around other balls or shells in closest packing is an elegant manifest of the reliably incisive transactions, formings and transformings of universe. I made that discovery and published it in 1944. This is the mathematics which the molecular biologists have confirmed and developed by virtue of which we can predict the number of nodes in the external protein shells of all the viruses, within which shells are housed the DNA-RNA programmed design controls of all the biological species and individuals within those species. Although the polio virus is quite different from the common cold virus, and both are different from other viruses, all of them employ frequency to the second power times ten plus two in producing those most powerful structural enclosures of all the biological regeneration of life. It is the power of these geodesic sphere shells that makes so lethal those viruses unfriendly to man. They are almost indestructible."

"There are six uniquely differentiable components of all systems and of all thoughts: (1) insideness; (2) outsideness; and (3) (4) (5} (6) the four star events that do the defining of the insideness and the outsideness, which inadvertently display

- six interrelationships, which, in turn, inadvertently define
- four triangles; which, again inadvertently define
- the four areas (openings) of most economical omniinterrelationships between the triangles'

edge-defining lines that deflningly exclude the macro-outsideness and definingly Include the micro-insideriess.

"Therefore there are six parts of Universe and four of them are always human-
lQconceptualizable and always define the successively cons'laerable domains of human
thought, while the other tw of the six cosmic parts are always invisible; i.e., the
ultra-macro tunable otherness and the infra-micro tunable otherness

- Cite SYNERGETICS, 2nd. Ed. at Secs. 400.71-.72, 16 Kay'75

Visibility,. & Invisibility of Systems:

(2)

"The visibility of conceptuality is always so preoccupying of human senses and minds
as to render spontaneously forgettable our only-progressively-acquired knowledge of
the vast ranges of the know-to-exist but nonsimultaneously tunable, ergo invisible,
otherness of scenario Universe."

- Cite SYNERGETICS, 2nd. Ed, at Sec, 400,73, 16 May'75

"The three aspects of systems are (a) insideness, (b) out- aideness, and (c) the four
star events «tat® which do the defining of the insideness and the outsideness, which
inadvertently, have

- six interrelationships; and
- for triangles, which exclude the macro-outsideness and include the micro-
insideness.

"Therefore there are six parts of Universe and two of them are always invisible.
There is an inherent twoness in the invisible macro and micro. The four visible parts
define the system."

Visual Symphony;)

"What World Game does have is confrontations... in terms of sounds, words, and languages. When we had the radio, it was only words. People are going to say that in the television there is only an embellishment: the fact that you can see, and nothing more. We can only shout a half mile. Words are in all languages, special languages. But sight is a universal language. A person goes to a horse race in Japan and on TV it's the same thing. This is not like radio at all. I can see 700 million miles an hour and I can hear only 700 miles an hour. The step-up to sight was a millionfolding.

•'The information that TV really gives to people; when there's a program there the kids are feeling the dancing, and feeling the gravity. And this is informing them in ways that they have no idea of how they are really being informed. And World Game has to work this way,

"You can listen to a symphony. but you can only hear one set of chords at a time. It takes you an hour to wait and hear the whole symphony. In sum total they have only so many notes in "

- Cite Tape *iff*, pp.7-8; RBF to W. Wolf, Phila., PA, 15 Jun'74

Visual Symphony: (2)

"the symphony, maybe five or ten thousand, whatever it is. You look at the sky and you're looking at a symphony that took over a million years. You're looking simultaneously at events that took place a million years ago. We forget that sight is incredible. World Game is a visualization of so much that is not otherwise visible.

"You have to realize that every thing I do is synergetic and has to be talked about only in terms of the big complex. The point is that man cannot see the very limited spectrum of motion and change. He can't see the stars moving from the distances where they are, an incredible

distance, the motion rate at which they are moving; he can't see the tree grow. And if he doesn't see something in motion, coming at him, he doesn't get out of the way. But it is possible to step-up and step-down, so that he can suddenly see all these things coming together to WHAM!... and that's exactly what World Game is: it's always visual....

You have this slow playback. The point is that World Game can make visible what was not visible in the statistics or in curves."

Vltalistics;

"At the outset, certain new words must be introduced, among which are vltalistics to replace the dead word statistics. and mobilata to supersede data. These substitutions are necessary in order to incorporate a time element and to make allowance for the constant ,-adjustment of figures into the meanings of the words. Ststics are static, time-less, the blinding dust of death. Vltalistics and mobilata, on the other hand are appropriately used in connection with a cosmic inventory because scientific events and corrections may cause a one hundred percent amplification or refinement in our cosmic inventory even before the manuscript reciting the itei.is can be printed."

"What Michael Berz is discovering here and what I had discovered and incorporated in the Kepler-like drawing of concentric symmetrical geometries of the 12 spheres surrounding the nuclear sphere (Fig. 982.61) and all the other well-known symmetrical systems which I showed in the chart, which occurs below my drawing showing MKSHKGQESSHl that the central sphere has a volume of and the central sphere is in fact the spherical icosahedron ' giving complete rational value to the sphere in the terms or the vector equilibrium's 20-ness, the octahedron's fourness, the rhombic dodecahedron's sixness, the cube's threeness and the tetrahedron's oneness. This particular drawing and the hierarchy of volumes I consider to be the most important single contribution of the whole book, 'Synergetics.'

"This is why I felt devastated by the lack of color as well as the separation of the drawing from the hierarchical chart which itself had been done in color. This is the very essence of what Kepler's great drawing hoped to discover but failed to do so because of his assumption of the cube for volumetric unity.

- Cite RBF Itr. to EJA, U Nov'75

"rthat Michael, with his thorough reading ofi 'Synergetics,* missed the significance of my drawing and its elsewhere included hierarchical chart and felt that he was making a discovery that the difference between the rhombic dodecahedron (the spheric) and what he callsthe small vector equilibrium five, is exactly the volume of one tetrahedron."

"If we try to express it in terms of cube as unity, which has the number three, then these others would come out unevenly because due to the irrationality that the three would bring about in relation to the others. When we start with the tetrahedron as unity, then the cube comes out even. These are all whole rational numbers. It is an extraordinary sublime relationship.**

,jall8 vs, Ajrapagg TfchnQlflgy? (,)

"Allied with ancient Crete and allied with its sea power, Mycenae was a very successful city-state, so successful as to have developed the additional capability of building ships and going to sea. Its peoples were able to control the line of supply to besiege the walls of Troy. Homer's epic probably represents the first change in the grand strategy of the world from the power of the almost invincible walls of the great city-states to the power of the line of supply at sea.

"The higher and bigger the walls, the more secure had the human insiders felt themselves to be. Economic mastery of the world affairs by the mobile, more-with-lessing, frail wooden ships of the sea gradually overwhelmed the static state's security. Their symbol was the six triangle hexagon, for only triangles are stable. Those ancient water people of the world had the stem ends of their ships keels curved upwardly to best cope with the waves. The swift changes occurring within my own short life span are undoubtedly related to the swift advancement in the technology of the sea and the sky.

"With the world's comprehensive disarmament occurring possibly within the next decade, the airspace technologies bid fair"

KBF UhFIUITIUNS

"There are official wars and unofficial wars. There has never been anything approaching peace. The unofficial wars occur as billions of lives deteriorate prematurely and finally die for lack of vital necessities. They are deprived by economic warfare which is shrewdly and cruelly waged during the preposterously called 'peacetimes' as well as in anticipatory competition for access to the inadequate supplies or in hoarding against feared for scarcity.

"There are no medals given during unofficial warfare. The brotherly excitations occurring amongst each of the opponents' respective peoples during official warfare are almost entirely lacking in unofficial warfare. Though much discomfort exists, the lowest death rate anywhere on Earth is now manifest in the direct combat deaths amongst official warfaring opposed fighting forces in Viet Nam. On the other hand, within the economic struggles and reflexive indulgences of the unofficial warfaring people on the North American continent. . . more lives have been lost in the automobile toing and froing within the last century than in the official warfaring of 100 percent of humanity in all history,"

HBF DEFINITIONS

(⁵⁸ Wave vs. Particle:

58 Citation at Pattern, 22 Apr*71

'•One of the things we have to make clear for society is the dilemma of the Max-Planck-descended scientists, the way they do their problems, you can have either a wave or a particle, but not both simultaneously.

Heisenberg has the same fault. They make the error of having a wave as a continuity, as a picture--- not as a pulsating frequency. A planar reflex causes them to think of continuous waves,"

"Wave as a constant topological aspect is exclusively defined by angle, conceptually independent of frequency; ergo, frequency is the additional special case fifth characteristic: the generalization realized in time,

"Particle is frequency-definable special case and wave is angularly-defined generalization. The numerically unique condition of special case 5 to 4 of generalizations, identifies the dilemma of physics in reconciling the minimum fourfoldedness of wave definability by angles and the minimum fivefoldedness definability of particle particularization by unique frequencies.

Wave Pattern of a Stone Dropped in Liquid:

"Electromagnetic wave generation is omnidirectional like a stone dropped in water... If you stop moving the magnet, everything stops... A_a a complex of hinged vector equilibria can be vertex-connected to fill allspace, and you can touch any one of them anywhere and the spheres become spaces and the spaces become spheres in an omnidirectional pulsing.

"The model of a stone dropped in water requires tunability and memory---the succession of images disturbing the set of images we can tune---colors, or whatever it may be."

- Cite RDF to World Game Workshop'77; Phila., PA; 22 Jun'77

Wgye Pattern of a Stone Dropped in Liquid: (a,j)

"When we drop a stone into water, we see a wave emanate outwardly in a plane. We agree that it is not water but that we are seeing a wave in pure principle. It is not simultaneous: therefore to conceptualize we are using our memory and afterimage. We can never have static waves; they have nothing to do with statics. We see a wave operative in time and in pure principle. If we initiate wave-propagating energy action at one point, a complete omnidirectional wave develops."

"When a stone is dropped into a tank of water, the stone does not penetrate the water molecules. The molecules are jostled; they 'accommodate'¹ the stone and in the process jostle their neighboring molecules, which, in turn, jostle their own outwardly surrounding water molecule neighbors. Thus waves of relayed jostling are propagated. Each relayed wave, although a composite of locally forwarded actions, provides a synergetic continuity scenario of those actions. The consequence is a pattern of events that has an integrity of its own, independent of the local displacement accommodations (which are innocent with respect to the overall synergetic pattern)."

"...It is like dropping a pebble into the water: the crest is the expanded phase of Universe and the trough is the contracted phase of Universe. Looking at the ripples we see that they are the locally initiated expandingcontracting of whole Universe as a consequence of local energy event inputs."

- Cite SYNERGETICS draft At Sec. 1005.U, 16 Feb'73 »Humana about to die in hospitals have been carefully weighed as life departed. No weight was lost. Whatever life is, it is imponderable. I am convinced that 'we', the utterly abstract integrities regenerate our own waves and ripples in the physical apparatus and environment which we employ just as stones create waves and ripples in the different liquids into which they are thrown, I am convinced that those waves and ripples are not the liquid milk, kerosene, or water into which the stone happened to be thrown. If we dump milk upon water and quickly drop a stone into the milky area, the waves rippling in the milk roll on from milk into water. The wave is neither milk nor water. The wave is an abstract pattern integrity, just as is the abstract concept of an angle. Waves are weightless patterns. The room we sit in is permeated by thousand of weightless

waves, each of unique character. You can tune in hundred of wide frequency range radios within your room and each can bring in a different program from a different part of the world because the individual weightless waves were flowing through trees and housed walls. That extraordinary world of weightless, invisible waves is governed by mathematical laws and not by the opinions of men. The magnificent orderliness”

"We drop a etone into the water and everybody is used to something happening. A set of rings appears; we call them waves. There are a set of circular waves that appear. It is a very reliable pattern and it is wonderful that this thing should happen this way... You see the

waves, and say, What are the waves? Are they water? The fact is that I am going to drop some popcorn on the water first. I'm going to have a few pieces of red popcorn and the rest are yellow. Now I'm going to drop this stone. You will see the waves go and they are nice yellow waves, but you discover that the red popcorn doesn't go from here to there. It simply went outwardly, inwardly, and outwardly, but stayed in place. All the popcorn stays in place. We begin to discover that the wave is not the popcorn going from here to there; then you discover that the water molecules don't go from to there. They simply accommodate the wave. They go inward and outward from the center of Earth accommodating a pattern that took place, but it really isn't water. The wave isn't water. The wave went on and the water didn't move.

"I can do this now in kerosene and I find it works just as well.

- Cite Oregon Lecture #3, pp.100-101, 5 Jul'62

"And I can do it in milk; and it isn't kerosene, milk, or water In fact, I could dump some milk fast on top of the water and drop the thing and it goes from the milk into the water. We can then say: it isn't water; it isn't milk; and it isn't •»' issarily liquid--- and it isn't Just something you are looking av, because if it is night you don't see it. You may hear a plop on the dock when the wave hits and you get a kind of aural information, but you don't think of that in quite the same way.

"It is a very still day, and I have begun to discover looking at the water, and I have dropped this stone, and I see the mast of the boat floating out there--- maybe the mast was doln g this and the dock was doing that. In other words, there was a temporary set of distortions. What is happening is that light emanating from the Sun. coming through the atmosphere and getting refracted in different wavelengths so there is some blue sky and the radiation is hitting the mast, and so forth,

being reflected in different frequencies. I see the yellow frequencies as masked in front of the blue, which is not distorting. I am getting a set of interferences from different kinds of frequencies. I am getting some frequency information,"

- Cite Oregon Lecture #3, p.101, 5 Jul'62

"wave information. We are saying the wave isn't water; it isn't air. We are beginning to discover that it has some kind of integrity of its own. We see waves from the sea coming into this concrete wall, and we see a new pattern of wave as it hits here and bounces out there, and we find the outgoing wave over the incoming wave. They accommodate each other very nicely. We find they do angle just like the reflecting of light. Every once in a while a peak comes together with a peak and they will send a spurt outwardly. Sometimes two valleys come together exactly and we get an inward swirl. We have gone then from a long set of waves, part of very big circles where they get into, almost into linears. We begin to discover, for instance that a waterspout is just such a kind of wave...

"I am beginning to talk about wave in principle. Pure principles are usable. They are reducible from theory to practice."

- Cite Oregon Lecture #3, p.102, 5 Jul'62

"I had yesterday the stone drop in the water and nobody really explains why it did what it did until you know about precession. The molecules are all little molecular actions, kinetics, little locals, and all kinds of shuntings. So there is a great deal of motion going on---atomically enormous. When this stone impinges on the atoms, with everything in motion, immediately at 90 degrees there is a resultant that goes like that. The stone is going like that and goes at 90 degrees

precession. The resultant is the wave. The 90 degreeeness begets another 90 degreeeness; and this 90 degreeeness begets another 90 degreeeness, and so on until you have a series of 90 degreeenesses. The stone falling like this, goes boom, boom, boom. Precession is regenerative and that is why you have the wave. It is very simple then to see why there is a wave. Pure precession."

- Cite Oregon Lecture #4, p.152, 6 Jul*62

'Action and interaction of events are accompanied by relative displacements and Accommodations of other events. For example, when a stone is dropped into a tank of water, the stone does not penetrate the water molecules. The molecules are Jostled; they 'accommodate' the stone; and in the process jostle their neighboring molecules, which, in turn, jostle their own border companions. Thus waves of relayed jostling are propagated. Each relayed wave, although a composite of local actions, provides a synergetic continuity of those actions. The consequence is a pattern of events which has an integrity of its own, independent of the local accommodations (which are innocent with respect to the overall synergetic pattern). The same stone, dropped successively in pools of water, milk, and gasoline, will generate the same wave patterns. Yet the waves are essences neither of milk nor water nor gasoline; the waves are distinct and measurable pattern integrities in their own right. The invariant relationships which govern pattern integrities in nature'* are "'pure principle.* The stone thrown into the tank inaugurates a complex of accommodative events operative in pure principle.

Wealth:

"Energy la the essence of wealth, wealth being the organised capability to support life."

- Citation *6c*. Context at Human Unsettlem_t, (2); 20 Sep⁷⁶

Wealth:

"With the computers' integrative examination of the physical and metaphysical resources available to human beings it will be discovered that we are incredibly wealthy.

"Wealth . . . being predicated on the degree of organised competence to nurture, protect, and accommodate today's and tomorrow's human lives. It will be clearly manifest that we have aboard Spaceship Earth four billion billionaires--- heirs-apparent who have never been notified of their magnificent inheritance, which have been overlong hidden within the world's probate courts of obsolete laws, customs and fee- hungry fiduciary administrators, whose ignorant divorce-ment of money from wealth has altogether hidden from the fiduciary administrators themselves as well as the rest of the world, the late-20th-century-realized existence of omni-humanitysustaining, inexhaustible wealth."

- Citation t context at Cosmic Accounting. 20 Sep^{*76}

Wealth:

"I want to stress very much the things that Gerard _/?ie!7 talked about: wealth.... Wealth is--- as far as I am concerned--- the extent to which human beings have discovered principles that are operating in our Universe and the extent they use the experiences that come before us and the principles that we have learned (of leverage--- or whatever it may be), the extent to which we have organized our life, our environment, to take care of how many lives for how many days--- the capability to protect it, accommodate it, to feed it-- that is wealth.

"We are now in a great deal of confusion in our Western world by what has been done by the digits with which we recorded the wealth and tried to give the people producing it a chance to save it. The gains of that wealth have been plagued with interest charges---lending that wealth out to others when people didn't know whom it was being lent to.... Then there's the money game, where the money is really very remote from the wealth. When we consider that this is so we can begin to look at our cities in a little different kind of a way.

We have all kinds of very important resources available when we begin to resurvey the accounting system we are using on our planet_J8 Dec*75 - Cite RBF to National Geographic Land Use Symposium: transcript

Wealth:

"Wealth is the measurable degree of established operative advantage locally organized by intellect over the locally occurring differentiable behaviors of universal energy, W_e alth is an irreversible advantage: it cannot be expended in preferred reorganization of past events; it can only be expended on organizing forward events in preferential patterns.

- Citation & context at Intellect: EquationOf. (B), 17 Jun*75

Wealth:

"Wealth includes the accommodation of man's proclivities, degrees of freedom, and needs for information."

- Cite RDF at Penn Bell videotaping, Philadelphia, 28 Jan'75

Wealths

"Wealth, I would say quite clearly, is our capability to take care of lives. To what extent do we, then, know how to cope with principles to take care of how many lives for how many days? That's what real wealth is. Nothing else really counts. And they can only be articulated forwardly; they can't be articulated backwardly."

- Cite RBF to Harvard Law School Forum, 10 Dec'74

Wealth:

"The big problems that come out are really not being put on the books, because society was not really thinking in big enough ways--- not realising. Pretty much one-waying. There's a fairy godmother operating here and it's not really being put on the books. Society is going to be kidding itself a whole lot.

"I've had a number of big audiences in university lecture series; and I've said, 'I'm sure everybody in this room has a little different idea of what wealth is. And I'm going to ask if anybody in this room will contradict me in this audience if I say that no matter how much you have of it, no matter what you think it is, but how much you have of what you think as wealth, will you all agree with me that you can't alter one iota of yesterday?' It wouldn't do you any good. They agreed. So then I said, what ever it is, it is irreversible. It's something to be articulated now--- or forwardly

"When we ant to do our thinking about what is wealth, I've eliminated a lot of things I don't have to think about any more.

"Now I'm going to have a man we'll call a millionaire, a billionaire. And he has all his check books and all his stock"

- Cite RBF to Arthur Anderson & Co., (pp.6-7), New York, 13 Mar'74

'certificates and his deeds and contracts; the works--- and so he can articulate at any moment. And he's going from here to another country and he's going on a ship and the ship is sinking from fire and all the small boats are burnt. And he holds on to his gold and he sinks a little faster than the other people. So he doesn't have anyfuture either. So whatever that kind of wealth is--- he has AM all the controls of what we call wealth. We have one man on board who brought along a pneumatic life preserver; and he's floating out there and he says, 'Hey, Mister, I'll give you a billion dollars cash.' And he says, No thank you.

"In other words, I think that what man really means by wealth, then, is its capability to support forward life, I really want to get now to hard accounting when we get to cosmic accounting. As far as human beings go: do you have any more life? And wealth would be: for how many lives, for how many days--- owpvy thing you need to keep life going--- have you already organised? ... The environment is always changing around, transforming. And the resources are there, but how much 'know-how' do you have?

"In the terms of yesterday, up to this century when thermodynamics - Cite RBF to Arthur Anderson & Co., (p.7), New York, 13 Mar'74

"was discovered by the scientists and they discovered that local systems always lose energy. And they discovered that because man didn't know that light had a speed--- and he thought of Instant Universe... Everything Einsin introduced as not thinking Instant Universe

because Mr. Newton did think Instant Universe. And if that was so, then Universe itself was a system and it too was losing energy, running down. Therefore we had a basic negative accounting, when I came to Harvard University before World War I, the intellectuals assumed that the Universe was something being run down. What we used to call a fundamental conservatism was based on the bias that energies were always being exhausted anywhere. And anyone who makes any changes, that just means that it's running down a little faster.

"This was very convenient actually for the early great fortunes who went from the sea onto the land to produce steel £3l steamships and the equipment for them. Suddenly they found they could make money with both-- and up on the land, too! Once they had a factory, they didn't want to change the factory. Up to World War II, anybody who wanted to propose change--- he got fired. And after World War II, suddenly it was an entirely new story: if you didn't propose change, you"

- Cite RBF to Arthur Anderson & Co., (p.7), New York, 13 Mar'74 "didn't get advanced. What a big Jump that was... from a basic accounting viewpoint. These are the things I find are not properly discussed by anybody, looking at things sumtotally, and I was thinking that it's your business to understand what really is there and be able to tell management what they have. That is why I think this meeting is possibly one of the most important meetings I've ever had in my life.

"Q.--- 'When you say that you can't change wealth, are you saying that wealth can't be destroyed?' "I'm first trying to run down what wealth is. And I'm only saying that--- whatever it is--- it won't work backwardly; it only works forwardly, today or tomorrow.

K&9SBS&Z3EBQB And you Just add all the things that seem to make a man wealthy, and I find it didn't give him any forward tomorrow. So maybe that's not what we're looking for. I'm trying to find out what it really is. So I find out that whatever it is, it has to be one of two things. One is our Universe. Universe is physical, and, as Einstein said, is all energy. Energy associative as matter; energy disassociative as radiation. And we find it pulsing, going back and forth between'

- Cite RBF to Arthur Anderson & Co., (p.7) New York, 13 Mar'74
Wealth: (E)

"the two. And, as of this century, we come to discover that the energies are not lost. This is a great jump--- where we've had such specializations, with the economists and the philosophers not really being able to listen to what the physicists have been saying.

"80 the physical side of wealth, which we will use then to make tools, or whatever it may be, is now inexhaustible.... What we've had on the books up until this century--- these things were always being written off. Very logically. Nature seemed to have a negative accounting of the capital account,

"But I'm saying that the capital account is not going down. So the other variable is metaphysical. What we did get from those more messages on the same copper. That was our 'know-how.' Learning principles. There is a principle of leverage. There is a principle of refraction. There is a principle of really exponentials that really do become operative. So I said, the difference here is metaphysical.

"Next thing I found out about this metaphysical was that every time we make an experiment, we always learn more: we don't learn less. There are numbers of words in the dictionary to"

- Cite to Arthur Anderson & Co., (p.8), New York, 13 Mar'74

'accommodate all the things we've found out about Universe--- they don't get less, they get more. I find then, that the metaphysical side of wealth is always increasing and this is what has brought the words 'know-How* (metaphysical sounds fancier). But know-how always increases. The physical does not decrease. Wealth is very extraordinary and this is what happens with World War I. The great change is that wealth always increases. Now it can increase faster or lesser--- as you use the principles properly. And I've discovered that the negative accounting that we've really been operating in, is no longer valid. The minute we began to pay attention to what Einstein and Max Planck and everybody really found out, that accounting has to change. This is a very, very severe change."

- Citation and context at Fellowships: Life Fellowships in Research and Development. Y959

Wealth: (1)

"To account our success in terms of gold and various traditional banking practices is irrelevant. Real wealth is organised capability. One of its Important characteristics is that it is irreversible--- no matter how much wealth you have, you cannot change one iota of yesterday.

Wealth can only be used now and in the future. What we really mean by wealth is how many days forward we have energy available and organized for work to keep the machines running, to keep the foods growing, the refrigeration, transportation, and so on. The basis for our new accounting system will be 'How many forward days of organized capability do we have available to serve how many men?' We will be able to make the working assumption that it is normal not only for man to be successful but also normal for him to be able to move as freely as he wishes without interfering with any other man. Our overall accounting assumption will be based on whatever amount of organized energy capability is required so as to make it possible for any man to travel around and enjoy the whole Earth, and be completely supported in doing so. There will be no such thing as deficit accounting. You cannot live on deficit accounting. You cannot eat"

- Citation & context at Economic Accounting System.(1)(2), Feb'67

Wealth:

"deficitly or drink water deficitly. What is to eat is there as the water is there.

"All such negative accounting procedures went along with the need for exploiting others in the 'you or me' phase of man's past struggle for basic survival."

"Let us ask ourselves some fundamental questions regarding the meaning of wealth. The biggest question we can formulate proposes that 'no matter what it may be or how we define it, will you agree that wealth cannot alter one iota of yesterday*? The answer is always that we agree to the proposition.

"We discover that whatever wealth is, it has an irreversible direction of articulation. We next note that if a reportedly very wealthy man is in a shipwreck in midocean and has all his checkbooks with him for all the monies he has on deposit in the bank plus all his stocks and bonds and physical property deeds--- and there are no physical means of saving himself from drowning-- that his wealth becomes meaningless to him. If he had all of his assumed-to-be-wealth with him in gold coins, he would only sink faster. If, however, he 4KK3B0 knew how and did convert physical components present in the disaster environment into energy-mastering tools that could keep him from drowning and from perishing from cold and sharks while also propelling safely to land, * might we not logically designate wealth as the means of sustaining forward life and the magnitude of the wealth in terms of how many fcrwrfd days of healthy metabolic regeneration have been provided for in *

"tools and energy mastery?

"We will also have to recognize that Robinson Crusoe's wealth was limited due to his enforced imprisonment on an island seemingly devoid of either humans and with whom he might procreate further life. If we recognize the built-in drives and selective functioning of humans, we will concede that the more freedom and the greater tooled energy at his command, the further and the more swiftly could the individual travel and the greater the opportunity thereby derived to increase or regenerate both his 'know-how' for dealing with forward evolutionary events and for meeting the individual of opposite sex most favorably and logically suited to marriage and their mutual regeneration and forwarding of human life.

"Thus we begin to discern that wealth may be at least partially defined as our energy-mastering, tool-organized capability to cope effectively and healthfully with our forward life regenerating and protecting and physically advantaging needs and development with ever increasing degrees of freedom and without gaining advantage through the disadvantage of another human."

- Cite NASA Speech, pp.27-28, Jun'66

"Because the 20th century physicists have shown that energy is finite and can be neither destroyed nor created, the energy component of wealth cannot be depleted. The other fundamental component of wealth is intellect. Intellect's 'know-how' can only increase. Every time intellect makes an experiment with energy it learns more. Therefore wealth, consisting of indestructible energy plus ever-increasing 'know-how' can only increase. The more we employ the wealth, the more rapidly it increases.*

Wgapong TMhnQlQKy Scqugncg: (A)

"The integration of the new 20th century science and technology during World War I resulted in entirely unprecedented magnitudes of technical advantage gains accomplished in all the fundamental capabilities of the world's industrial networks. As a consequence of this major mobilization of industry, brought about through realizations of the long-suppressed scientific backlog, the industrial advantage subsequently accruing in the domestic economy as by-products of the munitions industry, had so increased that by 19'9 six percent of humanity were enjoying the prevalently 'high' standard and ever-advancing physical advantages of the industrial network. By 1940 the percentage of the ever-increasing world population that had now come to enjoy high standard industrial advantage increased to 20 percent. As a consequence of the again extraordinary advantages of technology during World War II, and in the post-World-War II cold wars, we have now increased the numbers of those humans who are participating in the Industrial network to 44 percent of the world's total population. The continually accelerating rates of increase in the number being served with even-higher standards of industrialization has occurred despite the ever-more rapid increase in world population,"

- Cite RBF to William Marlin, Architectural Forum, Feb'72

"concurrent with a continual decrease in the world metals per capita. The surprising rise in the number of people enjoying higher standards may only be accounted for by the fact that the increased ability of man and the Increase in the number being served is an indirect consequence of our constantly doing more with less per given unit of resources. per given function.

"Doing constantly more with less came from the world of seaborne or airborne weapons. To persist as a 'winner* in the game of world armaments a constantly accelerating evolution must be regeneratively initiated in specific improvements in performances per pound of physical resources and per hours of scientific and technical expertise invested in a given task in order to be supreme in carrying the greatest hitting power the greatest distance in the shortest time, with ever-increasing accuracy of aim and at ever- higher degrees of energy efficiency."

- Cite RBF to William Marlin, Architectural Forum, Feb'72

"The high performance technology developed for the production of weapons comes progressively to levels of obsolescence--- for instance, the premier type of submarine or airplane finally becomes eclipsed by competition and therefore becomes obsolete. Second grade weapons are worthless. The contractor who has been producing the now obsolete item often finds himself failing to get the next contract for the newer kind of weapon or tool. However, the ex-contractors are tooled up with the powerful high performance technology. They can produce a geeat deal with very little, i.e., with high performance per pound. For these obvious reasons the ex-government contractors look around in the domestic market to find ways in which to exploit their super technical ability. The ex-government supplier thus brought the dynamo, originally developed exclusively for the battleship, into the city to light man's streets and

the electric lights developed for the battleship came thereafter to replace the candles in our domestic candelabras, but the candelabras were not changed. The domestic economy was never made the comprehensive focus of generalized system theory and the prime beneficiary of scientific knowledge."

- Cite MEXICO '63, p.8, 10 Oct '63

"The high performance technology items were only progressively substituted for low performance items within the overall low performance, or indifferent performance, of the total structural and mechanical scheme of the

forever fortuitous land-borne edifices. Parts became improved without improvement in the total concept of land borne technology. All of our television, or radios, our electronic developments in general, came out of the original weaponry development. We see millions of glistening metallic TV antennae sprouting above the roofs of filth-festered, bathroomless, fire-trap living shacks the world around. Thus we find ourselves continually advancing in domestic technology, but only as the second-hand gadgetry, by-producted by the cast-off segments of the weaponry industry,

"Livingry vs. weaponry" characterizes "the causal pattern and curve of comprehensive improvement and amplification of world technology."

Weather:

*1'11 give you in my own words very much the pattern of what we speak about as the weather. In the weather, we have the Sun shining on the atmosphere of our little planet; on the sunny side, heating it up, and making it expand; and on the shadow side--- cold, and it's contracted. Then there's a difference of rate of absorption of the Sun's radiation by the rock and the water and the atmosphere, so that in the shadowed side the waters are still warm. So there are all kinds of turbulences set up. As a consequence, there are low pressure areas and high pressure areas--- that's where we get our weather being reported. And the lows exhaust the highs; they pull on them, tense on them; finally they become the high and there's a new vacuum over here beginning to pull. So there's a pulsing pulsation going on in our Universe of collectings here and disbursements there."

- Cite RBF in Edward Newman TV Interview, transcript p.21, Feb*73

“We discovered that the motion of wind along the surface of the Earth is a turbulent affair, rising here and hitting the Earth’s surface there and rising again. We discover that the wind, instead of being considered blown horizontally along the Earth from a god’s mouth or by a mysteriously hidden blower, should be recognized as enormous convection columns in the thin atmospheric layer surrounding the Earth and caused by a warm Earth in the presence of a cold outer space, so that Earth continuously heats the atmosphere at its lowest point, thus expanding it, which causes it to be of lesser specific gravity and therefore to be less attractive to gravity, which pulls the top layer of chilled and concentrated air downward and causes the heated air to rise in columns somewhat as water boils upward in expanded bubbles and draws downward in concentrated pinpointed bubbles. There are predominant heat points on Earth caused by less insulation or color variations of surface. There was a strong column here and more of a tendency to have that column go here than there.

"As a net result of these convection column tests it was discovered that the rising winds tend to greater velocity than that of the lowering air moving in from the outer reaches to"

Lasso, 1946

"I am very much concerned with the uses of power.

"When Alfred North Whithead first came to this country from England, in the early part of this century, he remarked upon the fact that the graduate schools were all turning out specialists. Not that specialists weren't needed. But all the bright ones were becoming specialists. They were the only ones being educated for the graduate schools. As a result, the best brains are highly specialized. Not only that, but along with high Intellectual capabilities they developed a high intellectual integrity- no specialist of integrity would think of going into some other expert's field/and making quick assumptions as to the significance or lack of significance of the work of a specialist in another field. So communication ceased between them. We have teams of all-stars supposedly designing the system--- and they can't even talk to each other!"

- Cite MERGERS &. ACQUISITIONS

Winter 1966, Vol. 1., No. 2., p.

"Then Whitehead said we now come to a surprise because we then will discover that the specialists will not have the capability to integrate the potentials that are accruing to the special information they are finding because they are not able to communicate in this way. Certainly they wouldn't feel they could look into the significance of this as it might impinge on general technology--- they are pure scientists. Therefore, he said, having suddenly discovered that these people would not have the ability to integrate their capabilities, then society's hopes would be frustrated.

Somebody would have to put their potential together. He said that inasmuch as they couldn't do it themselves and someone else was going to have to do it--- who would do it? Now we discover that we may have possibly made a mistake, because, having deliberately sifted out the bright ones, we had left over a pile of tailings of the not-so-brights and inasmuch as the bright ones cannot put their work together, we will have to leave it to the not-so-bright's to put these things together. I gave this the name of Whitehead's Dilemma."

"1 aaid synergy was behavior of whole systems unpredicted by the parts. A minimum system would be two. We can deal with the whole of the solar system if we want, but minimum system is two. And the behavior *□ which can only be observed when theirs the plurality; it's not any of the parts by itself. This makes it also very clear, once you get to the beginnings of things, that out of what we have as an a priori complete mystery... to many of us what Newton had really hypothesized--- that a body ought to keep in a straight line, that it really is deviating and being pulled by another--- is a very strange matter. Nothing could be stranger. The whole integrity of our Universe is here. The very essence of why there is any consciousness, any Universe. And yet it starts with absolute a priori mystery, within which a priori mystery there suddenly is a lucidly apprehendible mathematical behavior."

- Cite KBF Address, Tel Aviv, transcript p.4, 16 Jun*72

Whole System:

"Instead of starting with parts: points, straight lines, and planes, and then attempting to develop these inadequately definable parts into omnidirectional experience identities, we start with the whole system in which the initial 'point' turned out to self, which inherently embraced all of its parameters wrapped tightly in that initial underdeveloped self focused aspect of self and went on to self develop through successively discovered relative awarenesses whereby the proof of totality and omni-integrity is not only always inherent but all the rules of operational procedure are always totally observed."

"A generalized Principle--- Corollary to synergy---

Whose mathematical characteristics are statable as: The known behavior Of whole systems And the known behavior Of some of its parts Make possible the discovery Of other--- if not all--- Of the originally unknown Component parts Of the system."

- Cite INTUITION, p.45, May»72

(Corollary of Synergy)

"There is a corollary of synergy which says that the known behavior of the whole and the known behavior of a minimum of known parts often makes possible the discovery of the values of the remaining parts as does the known sum of the angles of a triangle plus the behavior of three of its six parts make possible evaluating the others. Topology provides the synergetic means of ascertaining the values of any system of experiences."

- Cite OPERATING MANUAL FOR SPACESHIP EARTH, p.73, 1969

"A corollary of synergy discloses that the known behaviors of the whole plus the known behavior of some of the parts may make possible discovery of the presence of other parts and the latter's kinetic behaviors, structural form and relative dimensional characteristics."

- Cite Nehru Speech, p.35, 13 Nov'69

"It is a corollary of synergy that the recognized behaviors of whole systems may disclose discretely <□□□□□ required behaviors of their components. Known behaviors of wholes and some of their parts may provide clues to behaviors of

unknown parts. The concept of the triangle as a synergetic unity and the assumption of 100 per centum totality of angles

independent of asymmetrical variations of the whole triangles constituted the earliest synergetic strategy of scientific exploration, Newton's gravitation was synergetic as it involved behavior of a plurality of bodies. Its MSCQaaSBDKS* assumption required more planets that were then Known in the

solar system. Its 'known' total behavior required the coexistence

of unknown planets of specific dimensions which were later discovered with more powerful telescopes than those of Newton's day, Euler's topology was a successful synergetical stratagem. Gibbs' phase rule was a successful synergetical stratagem. Ohm's law was synergetic.

"Einstein, Planck, and other physicists adopted the working synergetic theory known as the law of conservation of energy, wherein it was posited that energy could neither be created nor lost. By adopting the concept of physical Universe as"

- Cite RBF Ltr. to Colliers (full text), p.4, July'59

"the sum of universal energy, they obtained a theoretically finite physical Universe whose component behaviors could be definitely differentiated and progressively accounted $E = Me^2$. The 'Einsteinian' synergetic strategy is responsible for the exploratory success of subsequent nuclear physics. The 100 per centum requirement of their synergetic energjt-Universe accounting disclosed progressive increments of nonaccounted behaviors, whose exploratory pursuit progressively unraveled the atomic nucleus.

"Common to all the synergetic and therefore powerful strategies of scientific endeavor has been the fact that their success was local because it was won by excluding other considerations of universal behavior. The results were that awkward complications always arose when the special local advantages were completely interassociated.'"

- Cite RBF Ltr. to Colliers (full text) pp4~4A, July'59

(Corollary of Synergy)

"There is an important corollary of synergy which postulates that the known behavior of the whole system and the known behavior of at least three of the parts of the system makes possible the discovery of other parts of the system and their respective behaviors."

- Cite Senate Hearings, p.12, 4 Mar*69

(Corollary of Synergy)

"The synergetics principle of the whole system holds that given a whole system, its components* behavior may be differentially discovered and predictably described as required by the already evidenced behavior implicit in the a priori-definitive experience and conceptioning of any given experience-verified system."

- Cite RBF Glossary of Terms bound with "The Live Book Squad * May'67 '

"Corollary to synergy is the whole system. Systems are definite as they rethrust upon themselves in a plurality of directions, ergo have concave inwardness and convex outwardness, ergo Adherently subdivide universe into mutually exclusive definitive macro and micro entities. The law of the whole system, states that, given the sum of whole system pattern conception its component behaviors may be differentially discovered and predictably described as required by the already evidenced behavior functions implicit in the a priori-definitive experience and conception of any given experience- verified system. Thus by the law of whole system as corollary of synergy, the component behaviors of systems may be predictably differentiated as primary and secondary componential sub-divisions of whole system and then progressively isolated and locally reconsidered for further dichotomy."

"Whatever nature permits is natural. If nature does not permit it, it cannot occur. Human scientists have learned to a mathematically elegant degree how mass interattraction behaves but the mathematical-principle-discovering scientists have no idea what mass attraction is. An eternal principle is found to exist as a relation between special-case experiences. Out of the a priori cosmic mystery we learn a new principle "How it behaves" only to discover the concomitantly unanswerable "Why does it so behave?" "What is it? No answer. Only the eternally unlimited could comprehend and elucidate the eternally unlimited. MB Humans are temporal, finite, limited, inherently unable to comprehend the incomprehensible. Out of the a priori void of absolute mystery, i.e., out of the unanswerable Why?¹ a little how is extracted."

Windmills!

Windmills turn out electrical power which operates on a direct current. The problem has been to adapt that direct current to electric utility systems which operate on alternating current In Wisconsin and 21 other states, utility companies using these converters, are allowing individuals to feed wind power into their electrical lines. The utility companies give these people wholesale credit for the power they feed into the system and charge them retail for what they take out. The public benefits by harvesting windmill power. The young people got busy and used their heads. Instead of having the public utilities fight them, they cut the utilities in on the action."

"I have a project coinc on windmills. Hen began to give up windmills when they began to burn their fossil fuels. Burning up fossil fuels, because those are the energies impounded by the vegetation and buried deeply in the soil. We are part of the Universe, this planet is, where energies are being collected, some day to become a star. And we are only really entitled to use a very little of our savings account energy--- to get things going but not to continually exhaust the savings account. Anybody knows better than that: we've got to live on our energy income. At any rate, once man got rural electrification and began burning up the fossil fuels, the farmers wanted to give up their windmills. Windmills, of course, did not produce very much power. So what can we do about it?

"Of course, wind power is Sun power; it's the effect of the Sun on the atmosphere of the Earth. And of all the energies that are available anywhere in large magnitudes, there is nothing to compare with wind power. But the only thijp'is, it is intermittent. So we're developing a beautiful new windmill using all the knowledge of <rodynamics. Aero-nautics started Just after the windmill had been given up, so the interim knowledge which has been acquired is phenomenal.' "

- Cite RBF at DSIPress Conference, NYC, pp. 13-14, 28 Jun*72

"We have some beautiful new windmills. And we're using the energy harness to generate electricity... and also to make hydrogen. With hydrogen and oxygen we have a circuit and then we make a fuel cell which is going to be 85 percent efficient. Finally we are going to get one windmill which is going to be able to take care of all the energy needs of one family. This is a very different story from when it just produced enough energy to put running water into your house, which the farmer used to do."

Windows of Nothingness: ⁽¹⁾

"What Euler and all professional topologists called 'areas' are only windows in polynedrally conceptual systems. You look out the window at the nothingness of undimensional night---or of fog. The windows packaged the undimensionable nothingness into arbitrary somethingness which thus misassigns the dimensions of the windows and their closed-circuit edges to constitute dimensional attributes of the undimensional nothingness so framed. It is just like going to the blackboard and drawing a 'square' and saying to the students, 'A square is an area bound by a closed line of four equal-length edges and four equiangled corners,' without paying any attention to the inherently existent complementations of Universe. To start off with, the phenomenon 'square' is dependent on the phenomenon 'blackboard,' whose structural matrix alone maintained the symmetrical shape of the non-structurally-stabilized pattern of the

square. The closed-line pattern of the square inadvertently subdivides the whole surface of the polyhedral blackboard into two areas, both bound by the closed line of four equal edges and four equal angles. The four equal edges of the large complementary square are the same length as those of the small square; the big square's corners are 270° each while the small square's corners are 90° each. Moreover, the drawing of the square also inadvertently subdivided the insideness and outsideness of" - Cite SYNERGETICS, 2nd. Ed. at Sec. 261.02; 13 Nov'75

"No matter how dubious one may be of such wgs®realisations of our potentials, the fact remains that our net receipt and impoundment of cosmic energy amounts to 168 quintillion horsepower-per-minute, which is also statable as 125 quintillion kilowatts per minute which, with 525,600 minutes per year amounts to 66 septillion kilowatts per year (66×10^{21} KW), which is eleven-billionfold the world's present 5×10^9 KW production of electric energy power.

"If all humanity enjoyed 1973's 'highest' living standards, each human on Earth would consume 200,000 (2×10^5) calories per day. Assuming 5 billion (5×10^9) humans by 2000 A.D, each consuming 2×10^5 calories daily, we will need 1×10^{11} calories per day. Our actual daily terrestrial income of cosmic energy is 72×10^{10} calories. Our planet's usable daily energy income is therefore 72×10^{10} - seven-millionfold, our daily requirements of 2000 A.D."

- Cite RBF Ltr to Mrs. Peggy Rockefeller, 25 May*73

"About wind power, I am glad we pioneered in such experiments on Little Spruce Head Island 'early on,' I have been pursuing the subject in varying degrees of intensity since 1927 when I included windmills, air compressors, liquid oxygen, liquefaction equipment, and air turbines in the design of the first Dymaxion house.

"At Little Spruce Head Island in Maine in the summer, and on a Wisconsin farm throughout the remainder of the year, n our program is well under way to develop windmill-generated electricity to electrolytically convert pure Sun-stilled water into hydrogen and oxygen, thereafter to use the hydrogen directly for power purposes, or to re-associate the hydrogen and oxygen through the now wall-developed and much reduced-incost fuel cell to produce electric current at an overall 85 percent efficiency....

"Concurrent with rural electrification a third of a century ago, I saw that windmills went out just as modern aerodynamic research began. In order to take advantage of this potential scientific harvest, four years ago, I took on Hans Meyer, a brilliant aerodynamics scientist. We have had great success"

- Cite RBF Ltr. to Mrs. Peggy Rockefeller, 15 May'73
flXnd. Pwcr SMMncr (2)

"in propeller blade development* We have not only developed much better blades, but with an accompanying 90 percent reduction in aerospace industry's cost of advanced propeller manufacture. In addition to Hans' new blades and aerodynamic cowlings, we have developed low-cost methods of mechanical linkage from the mills to the generator and have also developed new octahedral windmill mast structures employing some of my geodesic principles--- which are transportable, powerful, economical, and swiftly erectable.

'•In addition to our own windmills, we are installing on Little Spruce Head some of the Greek-island-type windmills with selffurling sails. They are very efficient.

"I have some interesting and comprehensively considerate figures in relation to wind power. Whereas three-quarters of the Earth is covered with water, the 25 percent that is not covered with water is covered in major percentage by ice, snow, deserts, rocky mountains, et. al. The percentage of our planet's surface whereon vegetation is impounding Sun (star) radiation by photosynthesis amounts to approximately 10 percent."

- Cite RBF Ltr. to Kirs. Peggy Rockefeller, 15 May'73

"Half of that 10 percent is always in the shadow or night side, which reduces to 5 percent the working area of the Earth's surface where vegetation is impounding Sun energy from which humans can produce commercial alcohol or leave to nature's further-ages-requiring fossil fuels production and storage in Earth's crust. Though solar energy impoundment inventions are fascinating to the imagination, as we shall discover, the amount of energy that can be captured by any local Sun-reflecting or lensing devices is relatively insignificant. Even though one-half of Arizona were turned into a direct sunlight energyconverting mechanism, that source would be negligible in productivity as compared to other sources. The local solar powercapturing devices will not work at night or when there are clouds. In fact, they work only during a few hours daily when The Sun is at a favorable angle.

"The area of the surface of a sphere is exactly four times the area of the sphere's great-circle disc (as produced by a plane cutting through the center of the sphere). The surface of a hemisphere is, then, twice the area of the sphere's great-circle plane. When we look at the 'full' Moon, we are looking at a surface twice the area of the seemingly flat circular disc in the sky."

- Cite RBF Ltr. to Mrs. Peggy Rockefeller, 15 May'73

` ` All of the energy of our Earth comes from the stars, but primarily from the Sun (star) as radiation or as inter-astro gravitational pull.

' 'Twenty-four hours a day the Sun is drenching the outside of the hemisphere of the cloud-islanded atmosphere's 100 million square-mile surface area which is twice that of the disc of the Earth's profile.

""His gives us one billion cubic miles on the sunny side and one billion cubic miles on the shadow side. The atmospheric mass is kinetically accelerated in the constantly Sun-energy-saturated hemisphere, while simultaneously the atmospheric kinetics in the night hemisphere are decelerated.

' 'All around Earth, yesterday's Sun-impoundings perturbate the atmosphere by thermal columns rising from the oceans and lands. The shadow side consists of one billion cubic miles of contracting atmosphere, while the one billion cubic miles of atmosphere on the sunny side is sum-totally expanding. This brings about a myriad of high-low atmospheric differentials and world-around*

Wind Power Sequence; (6)

"As the U.S. Navy reckons it, one minute of one hurricane releases more energy than that of the combined atomic, bomb arsenals of the United States and Russia. Deaign-scAce-wise it is simply a matter of coping with the calm .zephyr, gale, or hurricane variabilities of wind power.

"Great corporations have not as yet ventured into this field because wind energy has not seemed to be monofipolizable over a pipe or wire. However, enterprise can be rewarded, in greater magnitude than ever before, by producing and renting world-around wind-harnessing apparatus--- as they already do in the computer, telephone, car rental, and hoteling service industries.

"Hydrogen, harvested in the manner I described/.can be used immediately to operate all the world's piston or turbine- driven engines now driven by gasified petroleum products. The National Science Foundation spokesman has recently and publicly confirmed my statement that wind power can take care of all of our Earth's energy needs, and this can be accomplished in short order. The National Science Foundation's development strategy, however, is aimed exclusively at producing large,"

- Cite RBF Ltr. to Mrs. Peggy Rockefeller, 15 May '73 offshore, ship-mounted windmill batteries to supply large cities. In contradistinction, my windmill development work is aimed at supplying individual consumer families....

"Wind power permits humanity to participate in cosmic economics and evolutionary accommodation without in any way depleting or offsetting the great ecological regeneration of life on Earth."

effect of Earth's rotation on wind

Q:

A.:

"What is the power?"

"Rotation is the heating-cooling pressure differential input. Rotation does not cause the wind. In fact, the wind goes faster from west to east than the Earth turns in the same direction. The rotation of the Earth changes sunlight and shadow, causing changes in temperature, causing changes in the weather causing the wind."

"Then we discover additional mutual advantage to our house inherent in combination of the geometry of circle and the curving of sheet, not by virtue of the respective unique properties but by their interactive virtue when associated for purposes of housing. This new advantage is discovered as we consider the second major stress applied to house by nature. Second to gravity is wind stress.

"The average wind speed over the United States is computed by widely reported recordings is approximately 12 miles an hour. Houses may be considered aerodynamically as little shins whose standard cruising speed is 12 miles an hour, but which suddenly are accelerated to 30 miles an hour, then suddenly again have to go 50 miles an hour, and sometimes suddenly they have to go to 70 miles

an hour and then the flat planking begins to fly off as flat boards develop lift in parallel with the wind, which lift is opposed only by the friction of the nails amounting to but a few pounds in tension as nail pulling e merle nee confirms.

"Designed to look secure by guess and by nraye to the gods of inertia, conventional houses are not engineered from measured"

- Cite DESIGNING * NEL.' INDUSTRY, (RBF Reader, p.220), 1946
Wind Stress fr. Houses: {2}

"data to cope with the greater wind speeds which they sometimes encounter.

"Looking for chances to take advantage of high tensile ability of the new sheet, I became interested in the effects of wind stresses on houses and discovered in wind tunnel tests that a cube and hemisphere of equal volume indicate a drag advantage of 10 to one in favor of the hemisphere, that is the drag is 10 times greater on the cube. That indicates that we might either cut down the size and weight of our original structural members in the hemisphere to maintain equivalent wind strength to that of the cube or we might take part of the increment and turn it to greater strength advantage. Thus we might build a hemisphere structure that could take enormous wind stresses many fold those which a cube of an equal weight of structural members could withstand.

"Another interesting discovery in the wind tunnel was that the heat losses were in direct proportion to the drag. It was indicated that you might be able to reduce your amount of heat necessary to heat the building, to a very high degree, by employing efficient aerodynamic shape. Shape factors are used very little"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.201), 1946

"today in heating and ventilating, they have been toyed with to date only by higher mathematics, which concludes that there are great potential deficiencies to be had by measured evolution of shape control. In our own tests we had discovered the relative degree of that shape importance to heat savings in the coincidence of drag and heat loss curves.

"Having been in the building business in the 20s. I was particularly interested in heat losses because my material... was a very good insulating material.... We discovered that heat losses in buildings of comparable tolerance of Joint fittings was directly proportional to the drag. Houses represented very large obstacles, and the low-pressure tails on buildings are very long. They stream out to 200 to 300-yards in relatively mild winds. Houses are usually surrounded by trees and other houses and those tails get mixed up with each other, but if you discover a house out in the open you can observe this 300-yard pattern in the snow shaping as seen from an airplane.

"Air being highly compressible as it goes around large objects like houses you get a fairly high degree of compression at the widest beam of the obstacle to the wind. The result is a very"

Wind Stress Houses: (4)

"long low pressure tail because the pressured air shoulders dissipate their pressure outwardly as well as into the wake. You have a long lag in the rate of re-establishment of pressure equilibrium in the wake, and much energy is required from somewhere in the form of high pressure to satisfy the long low- pressure streamer. This wind wake is mildly dissimilar in MB behavior to the water wake of ships in that water is approximately noncompressible and such low pressure as enters a ship's wake must take place in the form of air bubble® expansions which whiten the ship's wake for great distances.

"The heating energy inside buildings is converted in the air of rooms into the work of expanding air, and expanding it within enclosed chambers necessarily develops an Increase in pressure. So you have a high pressure in this side of your house wall and an enormous low-pressure tail on the outside to be satisfied, and your high pressure inside the house simply is extracted by successive energy conversions right through a masonry wall to satisfy the low pressure as does gravity pull the water down Niagara Falls. The high pressure is drafted directly through chinks or cracks, ergo the fine showing of weather stripping.

Q Cite DESIGNING A INDUSTRY, (RBF Reader, p.202), IQ46

"...People still/say that cold comes into their houses... they would say 'the cold is coming in and chilling the UOHi radiators upstairs on the northwest side so rapidly that we can't keep any heat in.' I'd go up and the radiators were cold. I went around the front of the building and even with a fairly good wind on that northwest side, it was almost still air; it was just the ideal place to light your cigarette. I had learned in the Navy that when we wanted to light a cigarette on board ship, you would go un in front of the nearest housing to discover almost still air. If you followed the radiator pipes down through the wall¹ and floors you found that they were cold all the way down to the cellar. In fact no heat was going up on the northwest side, and the pipes going to the southeast side were very hot, even when you shut off the valves. The heat seemed to be working toward the lee side and creating high pressure there to satisfy the low pressure. The balancing between high pressure and low pressure was using up all your fuel, we charged the pipes around from the furnace down in the cellar so that the pipes that started northwest were turned around and led southeast, but the heat still went out into the lee side so it was very clear that the chain of"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, n.93), 1016 "energy exchange events worked to provide a high pressure in closest proximity to the low-pressure side of the house and employed further energy to effect the energy release through the wall by various energy conversion principles to stabilise energy balance in the wake of the house...,"

“One way you ought to talk about the phenomena house and cold is that cold and vacuum are in physics almost identical--- that is you have energy in the presence of cold and in the presence of vacuum and when your energy--- either as heat of kinetically accelerated gas molecules or as radiation--- is eliminated, cold or vacuum alone remain. That is the best way for you to look at it. You see, when they say 'cold is coming in,' it is because energy as heat is dissipating so fast as to leave cold gases in your presence. Air that is cold because low in energy content moves to you so that you seem to feel cold draft but there is no physical entity 'cold'. Temperature should be thought of as relative Wheat concentrations or dissinations...•

"The large low-pressure area in the lee of the house, of course, tends to float upward thus adding to the upward angle."

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p. 204), 146

"Trees are also aerodynamic design structures to permit a large frontal area necessary to the functioning of the trees.

"Trees tend to avoid destruction by the wind by rounding their lower frontal branches to the approaching air and by coning their upper branches to point in the direction of the leeward and upward draft, thus reducing drag to a vital degree,

"In the same way it became evident that a large ventilator could be designed to rotate upon the top of the house in such a manner as to focus the low pressure--- caused by the air passage about the building--- at a point about 45 degrees leeward and upward from the center of the

house. The ventilator was developed... until a successful design was arrived at which reduces drag to a minimum and prevents oscillation of the ventilator, while at the same time putting the focused low pressure to work in pulling the draft out of the building through a duct system that induces the draft to create an air conditioning circuit, as well as to remove dust from sweeping trans in the floor and odors from the kitchen and bathroom.

"Certainly air conditioning is a requirement of housing which"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.205), 1946 "attempts to raise the standard of living and to serve men over wide geographical ranges. It makes possible comfortable conditions for man in the atmospheric extremes of arctic and tropical zones from which he has been previously excluded by the inability of housing to provide atmospheric— thermal and humidity— balances with man's precise requirements to complement, for instance, his unique temperature of 98.6 F., whether white, black, or yellow, whether at pole or equator.

"Another effect served by the large, rotating, 18-foot diameter ventilator... is that of proofing the house against the explosion effect... of tornadoes, hurricanes, typhoon, and major explosions.... It is mounted not only rotatively but on a splined shaft which allows it to rise three feet above the house thus to release the pressure and then fall back into place as does the safety valve on a steam boiler,...

"This conversion of advantage is entirely an engineering responsibility to society..., So it becomes profitable to explore the advantage of the circle in terms of the efficient placement of energy units for the service it is desirable to provide."

"Placement of the energy units at the center of the circular"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.206), 1946

"area at once affords the shortest possible service distances in all directions and the greatest possible isolation... for conservation of energy potential. The energy loss is very great... so that a circle advantage is very important. It... indicates a maximum of service for least weight.

' 'With the central vantage point for generating air, light, sound, and work services, we discover that those services when in operation describe fountain-like flows upward, outward, downward in all directions with concentric flow for recycling below.... This fountain flow can be reversed, but in either case, maximum coverage with least distance is effected.

"The fountain flow is important for maintaining relatively warm atmospheric flow in winter, and reverse fountain... is most efficient in summer.

"As a fountain of water is seen to operate freely in space as a system, or a light outdoors in the night creates a hemispherical system of illuminated space by atmospheric refraction of light, so also do these other dynamic functions of heat, light, air, sound, and smell constitute natural systems of"

' 'physical phenomena.... as does a lamp chimney protect the flame or an electronic tube protect the free functioning of its central element. The principle demonstrated by the boomerang is only a tracer device to demonstrate the boomerang refractions in all directions...

' 'Complementary handling of dynamic flows teaches that... in effect the principles of push and pull and their unique characteristics of distinctly limited compression behavior and almost unlimited tension behavior hold true also in, hydraulics, pneumatics, sonics, and electronics. You can pull or draft air over vast distances but you can push

it only a few feet by blowing... In the same way visible light is a pushed phase of radiation and is limited to relatively short distances through atmosphere and required enormous power to push it, while what we call electricity is tensioned or pulled radiation and the distances over which radiation can be drawn by wire is very great compared to searchlight beaming....

"Even as a tension-controlled lasso can be gyrated and thrown and wave impulses can be sent out controllably over it, as a snake whip may receive a wave by the wrist to hit an object and"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.207), 191,6

"return the wave as a tension circuit again to the sender, so does radio and radar tensively induce circuits to null radiation phenomena over almost unlimited distances,

"By simple attention to this phenomena of push-pull, enormous advantages can be gained by man over his environment through ... our dwelling machine,... Now with our ventilator employing outside air motion to accelerate interior dynamic fountain motion it becomes an inexpensive feat to provide excellent air conditioning. The aluminum duct subfloor makes a very good energy exchanger and recirculates enough warm air through it to keep your energy poised at the ankle level by the counter convection fountain motion, thus to retain the heat units in the house and to run the air through them using very little heat."

Wind Sucking Saucer: (

The Earth "is then, very clearly to us, a place in the Universe where energies are being collected and impounded and put away. Apparently, then, as we would have in our weather, there are low pressures and high pressures. We have discovered of course that the high pressures don't blow the wind from here to there. It's the low pressures that suck the air from here to there.

"You know, I've found that you can't push air any distance at all. The minute you push it it turns right around--- and stuff like this. But you can pull it over enormous distances. You can't push the air through the house, but you can pull the air through the house. Open the front door and open all the windows and all the doors inside and have a fan exhausting. . . Anybody got a piece of fabric? Just hand me quick a piece of fabric. Because you can just take a handkerchief and put your fingers like that and find out how you can pull it. It pulls around corners. You can pull it around the windows and the doors. You can't push it around those corners at all, but tension will pull it. So tension can pull the air over enormous distances."

- Cite RBF to World Game, Jun-Jul'69

SgcKinfi (2)

"So when they tell you the wind is blowing, it's always sucking. If there's a low pressure to the southeast, it's sucking it that way though it seems to be blowing off west. So you tend to like to face into the wind, but the fact is that what's bringing it about is the suction to the southeast.

"Having learned that there are atmospheric highs and lows, you can really begin to think about the way in which the Universe itself ought to be able to have Suns that are giving off energy in enormous ways; there must be some place where energy is being concentrated to become a new Sun."

Windpower Windmill: (

"The windmill from Kedco of Inglewood. California, was equipped with a synchronous inverter from Windworks of Mukwonago. Wisconsin, which embodies the latter's new, much advanced in efficiency, electronic circuitry for converting the direct current inherently produced by the windmill into the 110-volt alternating current required by most electrical equipment.

"Windwork's new high sensitivity electrical meters permit them to feed their alternating current directly into the public utility's power lines. When windpower-generated electricity is fed into batteries and that electric charge is later taken from the batteries for final light or power use, a loss of approximately 50 percent of the energy occurs. Feeding the unscheduled wind energy harvest directly into the power grid avoids this 50-percent, in-and-out storage loss. This innovation of windworks has now been accepted by the public utilities in 20 of the 50 United States. The utilities pay the local windmill owner at wholesale rates for the energy he puts into the system and charge him at retail rates for the energy he takes out. This increases the economic advantage of both the private windmill owner and the public utilities."

- Cite ACCOMMODATING HUMAN UNSETTLEMENT, pp.12-13; 20 Sep'76

"It is a fundamental energy-income gain by humanity over and above dollar consideration.

"It is found that somewhere within a 100-mile radius the wind is always blowing: i.e.» within a 200-mile-diameter circle of 31.000 square miles. With proliferation of such local windmills, the public utilities can progressively retire significant amounts of their standby generators while also reducing their fossil fuel burning."

- Cite RBF to Yale students at Berkely College breakfast, New Haven, 10 Dec'73

Womb of Permitted Ignorance:

"Playboy: And you say that man is on the pointful discovering his role?

"RBF: I think he's just discovering himself in his full significance. The child in the womb is absolutely innocent and completely looked out for. 'Then he comes out and has to do his own breathing. Then he gets to his feet and has to do a little more. He takes on a little more responsibility and gains in self-discovery. Well, man is just now coming out of the womb of what I call permitted ignorance. . . .

I find that we are in a moment of fantastic self-discovery and are approaching an entirely new relationship with our Universe."

- CITE RBF in Barry Farrell Playboy Interview, 1972 - Draft, p. 15.
MSB Womb of Permitted Ignorance;

"Humanity as a whole is Indeed being emitted from a two- million year gestation within the womb of permitted ignorance, for which infantile period cosmic mechanics have been making ample provision not only to offset ignorance and waste abut also to permit humanity's gradual trial-and-error experimental discovery of the relatively negligible effectiveness of its muscle--- which it had at first employed not only exclusively but savagely--- and the concomitant discovery of the infinite appreheddeing and comprehending effectiveness of the human

mind, which alone can discover and employ the universal verities--- and thereby realize comprehensively the potential, progressive, non-wasteful, competent, considerate mastery of the physical environment by the metaphysical intellect."

Womb Population:)

"At all times nowadays there are approximately 66 million human beings around Earth who are living comfortably inside their mothers' wombs. The country called Nigeria embraces one-fourth of the human beings of the great continent of Africa. There are 66 million Nigerians. We can say that the number of people living in Wombland is about the same as one-fourth of the population of Africa. This 66 million Womblanders tops the total population of either West Germany's 58 million, the United Kingdom's 55 million, Italy's 52 million, France's 50 million, or Mexico's 47 million. Only nine of the world's so-called countries (China, India, Soviet Union, United States, Indonesia, Pakistan, Japan, and Brasil) have individual populations greater than our luxuriously-living, under-nine-months-old Womblanders.

"Seemingly switching our subject, but only for a moment, we note that for the last two decades scientists probing with electrodes have learned a great deal about the human brain. The brain gives off measurable energy and discrete wave patterns disclosed by the oscillograph. Specific, repetitive" dreams have been identified by these wave patterns."

- Cite RBF Intro, to "Expanded Cinema," p.16, Oct'70

"The neurological and physiological explorers do not find it extravagant to speculate that we may learn that what humanity has thus far spoken of mystifiedly as telepathy, science will have discovered, within decades, to be ultra-ultra high- frequency electromagnetic wave propagations.

"All good science fiction develops realistically that which scientific data suggest to be imminent. It is good science fiction to suppose that a superb telepathetic communications system is interlinking all those young citizens of worldaround Worobland. We intercept one of the conversations: 'How are things over there with you?' Answer: 'My mother is planning to call me either Joe or Mary. She doesn't know that my call frequency is already 7567-00-3621.* Other: *My mother had better apply to those characters Watson, Crick, and Wilkerson for my call numbers!' And another of their 66 million Womblanders comes in with, 'I'm getting very apprehensive about having to 'go outside.'" We have been hearing from some of the kids who just got out--- they say we're going to be cut off from the main supply. We are going to have to shovel fuel and pour liquids into our systems. We are going to have to make our own blood. We are going to have to start pumping"

- Cite RBF Intro, to "Expanded Cinema," p.16, Oct*70

"some kind of gas into our lungs to purify our own blood. We are going to have to make ourselves into giants 15 times our present size. Worst of all, we are going to have to learn to lie about everything. It's going to be a lot of work, very dangerous, and very discouraging.¹ Answer: 'Why don't we strike?? We are in an excellent posture for a "sit-down.'" Other: *Wow! What an idea. We will have the whole population of worldaround worobland refuse to go out at

graduation day. Our cosmic population will enter more and more human women's wombs, each refusing to graduate at nine months. More and more Earthian wome will get more and more burdened. Worldaround consternation-- agony. We will notify the outsiders that, until they stop lying to themselves and to each other and give up their stupid sovereignties and exclusive holier-than-thou ideologies, pollutions, and mayhem, we are going to refuse to come out. Only surgery fatal to both the mothers and ourselves could evacuate us.*

"Another: 'Great! We had might as well do it. If we do come out we will be faced with the proliferation of Cold War's guerrillerized killing of babies for psycho-shock demoralization of world around innocent conr.unitles inadvertently"

- Cite RBF Intro, to "Expanded Cinema," p.16, Oct*70

"involved in the abstruse ideological OMB warfare waged by diametrically opposed, equally stubborn would-be do-gooder, bureaucratic leaders and their partisans who control all of the world's means of production and killing, whose numbers (Including all the politically preoccupied individuals around Earth) represent less than one percent of humanity, to whose human minds and hearts the politicos and their guns give neither satisfaction nor hope. Like the women in Lysistrata who refused Intercourse with their men until they stopped fighting, we Womblanders would win.*' "

Wood:

"We should do things to wood that the wood likes. There are certain things it likes to be used for. When I use wood I make sure it likes what I'm doing to it."

- Cite RBF quoted by Cam Smith in RBF TO CHILDREN OF EARTH, DEC'72

Wood: "Building houses of wood will within a few decades sound as oeculiar as building houses with slabs of human flesh,"

« Cite RBF holograph on program of N.I. State Institute of Housing meeting, Hotel Pennsylvania, NT, 3 Jun'4S

"...Housing, as you have known it up to now, used the wood or stone or clay which was at hand. These component materials were not understood scientifically to any Important degree. Wood might be considered pretty as oak, or pretty as maple. One was a little harder or softer to work and suited a man better than another. But it was little understood what a tree was. Despite academic study, man's understanding of trees was popularly vague. Then trees began to be used industrially by the chemical industry. It began to develop wood pulps and other by-products of wood. To some extent this began to

affect the 'scarcity* or 'quantity' of wood relative to its availability for house building. These new Industries, particularly newsprint pulp, exhausted a lot of it. Builders had to take greener and greener lumber as stockpiling dwindled.

"During World War II one of the most extraordinary things that happened, in its broad effects on technology and on economics, is what the Germans were forced to accomplish in wood chemistry in order to plan on how to survive during this extraordinary industrial warfare, which they introduced and in which energy played such an important role. The Germans had to plan in"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, pp.214-215), 146

Wood Technology: (2)

"advance on being bombed out of their oil fields. It was obvious that they could plan to use oil to a certain extent but that eventually their most vulnerable position was their oil supply. This was an 'oil warfare* in a big way. Therefore the Germans set about finding other important sources of energy. They went to wood technology. The chemistry of wood developed in many directions in Germany. They suddenly discovered that here was nature's most important trick in impounding Sun energy—and in a most useful way, for therefrom you could release energy in many useful directions.

"They immediately brought it to the one great "Grand Central Station *• of energy, in its most stable storage form, which was alcohol. From alcohol of various kinds you could make foods— first for cattle, then for people. You could make high octane gas or synthetic rubber or plastics. The chemistry of wood began playing such an important part that the scientists in Washington were talking about it constantly and there was a book published called 'The Nigger in the Woodpile* which was what Germany had."

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.215),

1946

Wood Technology: "Wood technology has advanced the basic economic case for wood to such an important position in the advancing technical world that we can no longer afford to use wood in the careless way we have in the past— to put it in houses for termites to eat up, or a possible fire to consume. Even if we could, worldwide technology forces our technical hand as it never has before, the rest of the world is now industrialising and is starting the most advanced World! War II levels of technology and not at our 1861 or 1890 or 1917 level. Industrial technology is bom of latent knowledge and is not an inventory of obsolete machinery, so wood is in a very new historical position. How does that affect the historical wooden house picture?

(3)

"As children of the pioneers also came along to build a house— or their grandchildren wanted to— there was no longer much wood on the farm. They had to go increasing distances for it.

—- • • Finally

they went out of the state for it. Today they habe to send 1,000 to 5,000 miles for M most of their building wood." "They were using it simply by habit because it was originally handy and suddenly they had exhausted that suoply, Long ago"

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, 215-216), 1946

"wood boxes disappeared from our cellars. In the war's great motion, packing cases went all over the world. That broke the wood supply equilibrium altogether. World increased caper needs and the new chemistry of wood-energy conversion makes it unthinkable that wood will ever again be available in anv large way for building it into houses, even into prefabs which average 70 oercent wood. Wood is suddenly going from 'for free' as it sat stacked on the farm because it had to be cleared away, to a rapidly inflating price structure— owing not so much to its scarcity, as to its newly recognized inherent wealth.

"On the ether hand there are now many by-products of the soil and by-products of the wood, which chemistry is develoning, whether it is cellulose as plastics, or the metals developed from the clay, etc., which were just kicking around unrecognized on the early farm. These by-products, however, were very expensive to extract in

the beginning and called for a large energy expenditure and fancy and complicated mammoth plants with giant stills and ovens such as required millions of dollars to install and develop. Few industries could afford to buy the original speciality by-products of high performance characteristic.'

Words;

"Time and again I find oyr vocabulary the most extraordinary phenomenon, , . that human beings before us have contrived these words and the thought that required these words. I see our vocabulary which would include all the words of all the languages as all the

attempts of all men to communicate all their experiences and I am amazed at how many experiences must have gone before us and how many there must have been of them to generalize them to the point where you have a generalized word for experience. When I recollect I reconsider the significance of the collection and reconsider is a beautiful word because "consider" is putting together of stars. "Sider" is from the Latin "sedes" for star and "consider" is stars that stand together, as when we look at constellations. If we reconsider I review stars that seem to stand out in my experience. You are amazed at the poetic lucidity and eloquence of the thinking that went on before us that could invent the word "reconsider." At times I am appalled with the velocity at which we use these tools without understanding the beauty and significance of their buildup."

Words for Coping:

"...Whatever humans have learned had to be learned as a consequence only of trial-and-error experiences. Humans have learned only through mistakes. The billions of humans in history have had to make quadrillions of mistakes to have arrived at the state where we now have 150,000 common words to differentially identify that many unique and only-metaphysically-comprehensible nuances of experience. The number of words in the dictionary will always multiply as the progressive complex of cosmic episodes of Scenario Universe are subjectively experienced and thoughtfully considered by each of us.

"The whole complex of omniinteraccommodative generalized principles... altogether manifest an infallible wisdom's inter- considerate, unified design, and an a priori, intellectual integrity conceivability as well as a human-intellect discoverability. By wisdom of the great design humans have the capability to formulate and communicate from

generation to generation through words and thus to progressively accumulate knowledge through sharing the exclusively self-discovers significant nuances of experience. The quadrillions of mistakes were the price paid by humanity for its presently accrued competence to cope with both survival and growth problems."

- Cite RBF Ltr. to Bro. Jos. Chuala, p.2; 7 Nov*75

"The first industrial tool is really a very interesting one.

We have the description: In the Beginning was the Word. So in the beginning of industrialization was the word. Because one man could not invent a word... he'd have no reason to invent it. And it would take a great deal of identification of experience and the sounds for it for him to begin to realize that you'd have something called a 'word.' "This was, then, the beginning of the intercommunication of experiences, compounding the experience of the individual. And with the written word you had it from generation to generation. This cumulative experience is a very extraordinary matter

"The craft tool was inherently local in time* and geography.

But the industrial tool was for the total experience of all of humanity that had ever been communicated with one to the other, covering the total sweepout of humans."

Preface, "Decease of Meaning" 1971, p. 23

Cite Dreyfuss

28 April

` ` In marked contrast to the accelerating increase in organized mis-understanding, combatively led by political representatives of world peoples employing over two hundred different language tools to identify single meanings, and no individual capable of cross-translating in more than ten percent of those languages, there is an accelerated emergence of a world language within the supra-national network-integrated world industrialization. World industrialization stripped of its thin garment of political expediency thrown upon it by its would-be masters for purposes of exploitation, discloses a naked organism integrated entirely of precise functions derived only from the findings of

the full gamut of the exact sciences. The increasing precision of function is accompanied by increasing precision of behaviors and an increasing commonality of word-taggings for those efforts and accomplishments transcendental to national or ethnic boundaries. Led by the world-around radio-hamming*s international electronic and communication language, and followed closely by the identities of the totalities of the evolving apparatus of the world Airocean, technicians from any part of the world can communicate with other technicians regarding Airocean technology apparatus."

- Cite W typescript, Synergetics Notes, circa 1955

"World nut-bolt-and-screw standards now trend towards world interchangeability through events such as swiftly shifting world orientations implemented by lend-lease apparatus, successful operation of which is dependent upon comprehensive interchangeability. These trends towards interchangeability, gaining swiftly in the last decades, are counter to the many exclusive international policies of commercial exploitation adopted in the first century of industrial revolution which sought anarchistically for unique standards representative of the industrialization originating in the respective economies to be superimposed upon the respective competitive colonization with hope of insurance of perpetuated dependence of the colonies through lack of interchangeability of their maintenance requirements with out-nation sources. The net of the world integrating events is that wherever generalized physical principles exist these generalized principles trend to persistent re-emergence while false clues dwindle and fade, and as all the while the scientific and technical leadership identifying generalized principles, seeks clarifying communicatable identity of the underlying phenomena."

Humane City, (1) Human Unsettlement, (5)(6) "World corporations' ownership shares are so worldwide in distribution pattern that soon all big corporations will no longer be known by prefixes, such as American, German or English. They will be known simply as world corporations. While this hatching of a World breed of chickens out of nationally laid eggs is an economic trend as yet popularly undiscernible, it is unquestionably one of the most important of present world history's developments. Corporations need no passport. They

do not need to give up one brand of citizenship to take up another. Many had thought that the development of 'world man' would be a uniquely political phenomenon. I do not think so. I think that the phasing out of all sovereignties and emergence of a one world society and its governing system will come about uniquely through the economic development of world industrialization economic systems---i.e., world corporations. The latter inanimate legal entities will ultimately require world passports for their personnel. 'World' citizenry will finally be recognized politically after a majority of humanity become involved in the world-around industrial activity as consumers and share-owners, physical workers having been progressively displaced by automation.*!

- Cite RBF Ltr. to D.W. Robertson, 24 Feb '65, Pp. 3-4.

"In regard to a territorially exclusive license, geography is an absolute category as 'territory,' and exclusivity is far more quickly reached and maintained by uniquely advanced service within areas of unique functioning. This is the new world coming up when local town, county, state and national identifications are absurd other than as APO foci for communications between a world-around circulating and integrating humanity.

"This is a powerful trend. Private enterprise is taking the initiative entirely away from politics. Politics lingers in the twilight of geographical islands. Enterprise operates transcendently to such limits. Major enterprise is inherently bound by Universe alone. The limits are the physio-chemical-mathematical economies of nature's multi-freedomed equi-economies. You can't be in the enterprise frontiers unless you are ready to operate transcendently to yesterday's politically-fortified, Maginot-circumscribed, earthworm islands...

Gang: (1)

"I'm going to try to give the best definition I can today of world game. We've discovered that while you can't be exact, you can progressively reduce error, and that's exactly what mechanics and technology are doing • . .

(See Tolerance Sequence. Jun-Jul'69)

"At any event I'd like then to try to be as exact as we can in talking about world game. We will make the best definition we can, to start off with, and then we'll keep refining it, making the first sorties at what we're talking about.

"World game is an attempt to ascertain the most effective way of complementing man's functioning in the Universe in evolution. We're seeking to discover what the options are, if any, and then we're seeking to measure what the effects of our employment of various options are. Our resource is synergetic capability. Our strategy starts

with the whole And works toward the particular. We've already ourselves learned that there is a phenomenon synergy and the very simplest case was that one single massive sphere hung up in no way indicates that there would be mass attraction if"

World Game: (2)

"there were another sphere » . .

(See Synergy Sequence; Two Massive Spheres, Jun-Jul'69)

"This is simply saying that taking our statistics and starting with parts is never going to give us the kind of results we get when we start with wholes and and find out what behaviors as a whole are, To begin with, that gives us clues as to ways of exploring the behaviors of the parts, We find that we deal in a Universe in which unity is plural and at minimum two. We find that this is what we really mean by fundamental complementarity— what the physicists are trying to get society to realize. . .

(See Keyhole Sequence. Jun-Jul'69) "So we find that complementarity is even more complex, that there had to be not only the keyhole, but the keyhole had to be in something, and the keyhole that was in something had to be related to the rest of the Universe. . .

(See Rubber Glove Sequence, Jun-Jul'69)

- Cite RBF to World Game, Jun-Jul'69

World Game: (3)

"We have discovered that man has a function in Universe.

If we know that he has a function, which man had not tended to think of before. .
. I think that generally society looks on experience the way Shakespeare did: that man may be a theatergoer to be pleased or displeased.

"And I have not read anyone else finding or asking the question: Does man have a function in Universe? We have found one, which is a good tentative one, which is found in the same synergetic manner, looking at things in the biggest possible way.

Observing that there is a fundamental complementarity, and that the complementations are rarely mirror images of one another, we find that the physical Universe is always locally entropic— that is, it is always giving off energy in one way or another. Because each local system has its own orbiting, and its own frequencies, and so forth, the ways in which they give them off are not synchronized with the others. Therefore, as they're given off, they're relatively disorderly.

(See Relative Asymmetry Sequence. Jun-Jul'69)

World Game: (4)

"There seem to be phases when you and I automatically check in and say, 'That's a man.' 'I can see that's a living organism.' And another might say, 'I can see that's a crystal.' But we've learned now there's no threshold between these two. They used to be called animate and inanimate, and then we found that that is not true. . .

(See Animate and Inanimate Sequence. Jun-Jul'69)

"Man is so specialized that he didn't notify society that he had found no threshold between animate and inanimate. This is simply to say, then, that whatever we really are, whatever life is, there is no identity of any threshold between or within the physical. And I'm saying to you very powerfully that I'm confident that our communication, everything you and I do, is absolutely weightless. The only thing that counts between you and me is thinking. The difference between human and other physical organisms is always the metaphysical, the thought."

(See Tactile Sequence,. Jun-Jul'69)

World Game: (5)

"This is by way of really identifying that we are not the physical. We have an integral physicalness and we have an externalized physicalness, and I call you on the telephone and there you are, and you're not the telephone and I'm not the telephone. But what we really are has nothing to do with the physical, yet it is so intimately associated,

so emphatically, due to the fact that we see and feel in those touching things. Only in the past hundred years did we learn about the speed of light. Therefore we thought that things were instant: it was instant when, of course, you were the touchable.

"But if--- with no instant, then this is no longer true, and you and I are seen, we even see each other, here--- I don't see out there anyway. I'm checking up on a communications system by touching here, but I'm seeing here in my television set.

"These are a lot of reviews and I want to review with you our looking for man's function in Universe. We have our observation that every local physical system in the Universe"

- Cite RBF to World Game, Jun-Jul'69

World Game; (6)

"is entropic and becoming increasingly disorderly, taking up much more room. Because we've found out a fundamental complementarity--- that when the wave goes positive it also goes negative later on-- then we say there must be some phase of Universe where Universe is contracting and becoming increasingly orderly.

(See Radiation Sequence, Jun-Jul'69)

"And so this enormous energy is being collected here. Radiation is atomising the ocean, and it gets dropped back again, pulled back by gravity as rain. We find vegetation operating on the dry land and the algae in the sea impounding the energy of the Sun by photosynthesis.

(See Fossil Fuel Sequence, Jun-Jul'69)

(See Wind Sucking Sequence, Jun-Jul'69)

"Having learned that there are atmospheric highs and Iowa, you can really think about the way in which the Universe itself ought to be able to have Suns that are giving off energy"

- Cite RBF to World Game, Jun-Jul'69

World Game: (7)

"in enormous ways and there must be some place where energy is being concentrated to become a new Sun.

"All the biologicals are antientropic. A baby couldn't grow to be entropic; the child would nil shrink, get smaller and smaller. But a child gets bigger, sot it's antientropic. And it's absolutely orderly--- the most beautiful pair of two eyes doing whatever. Everything about it is antientropic. And everything about a human being that makes you sit where you're sitting in a quiet way is because we're seeking to understand and put in order. Understanding is finding order.

(See Generalization Sequence. Jun-Jul'69)

"There's no dri/j/we have quite so great as the sense of order and the urge to employ the sense of order. The best I can see of man's function is the one of the mind. The mind has the ability to generalize. We don't have any experimental suggestion that the physical would be able to generalize. The physical is always special case."

(8)

World Game;

` ` The great scientists and artist-scientists finding these life principles find them all never contradictory one of the other. They are intercomplementary; they are interaccommodating. There can't be a principle that has a 'beginning' and an 'ending.' We cannot suggest that an abstraction could have a beginning and an end. The words 'beginning' and 'end' have to do with the physical. . .

`` All of this has to do with summarizing the why of the world game and what we're trying to do in the world game. I've come to my own working conclusion that the human does have a function; and that he is to be the most effective metaphysical orderer, comprehender, employer of information to be employed in different ways to make the world even more orderly--- and to do so without undue wasting of energy. Energy is supposed to be collected here. Therefore man can learn how to employ the energy patterns of Universe to do work. His job as metaphysical orderer has antientropic force or capability. His job is to rearrange the scenery continually--- to rearrange the somewhat random receipts of the stardust, and so forth, and to keep rearranging them in more effective ways and certainly for the regeneration of life itself."

- Cite RBF to World Game, Jun-Jul'69

World Game:

"Part of this great orderliness is to try to understand that there is this function of understanding in the Universe. Man seems to be the prime, the only, manifestation we have of it; other than the a priori Greater Understanding, and I would think that our functioning is in every way to make that functioning successful aboard this spaceship Earth.**

World Game:

"What we're proposing here is that the computerised world game become, really, world acceptable, because it is not in terms of bias. It's going to come out with answers all the time that don't correspond to any of the political theories of aiCy of the countries. But what is important is assimilation by our society, and particularly by the young world that is finding the older world locally preoccupied.

A young world that's suddenly informed by television and thinks about total spaceship Earth for the first time. But the older generation doesn't. The younger generation has the same compassion old generations and young generations have always had, but now it's for all of humanity, and the young generation is extraordinarily well apprised of all kind of new technical capabilities. They feel they're just going in the wrong negative directions. So they feel very intuitively that the older people are asleep at the switch and that something needs to be done. This is the first public witnessing of this group playing the world game. You are going to be confronted with finding out what are the potentials and actually mastering them."

- Cite RBF to World Game at NY Studio School, 12 Jun-31 Jul'69, Saturn Film transcript, Sound 1, Reel 1, pp. 109-111.

World Game:

"...Most important of all we can't see the abstract weightless thoughts in the minds of other men. When we survey the total inventory of the motions and informations which we can sense, we find it to be very limited. The significance of all the foregoing is appreciated when we realize that it is only by such phenomena as can be seen to be moving or changing by the public that are politically recognized and heeded. That is why public opinion and vote sampling has come into ever more reliable use.

"Our computerized world game is designed to accelerate the too slow and decelerate the too fast of all the known vital trendings and thereby to bring them dramatically within popular consideration and our world game's solution. The game will show clearly how the trends will affect everybody's lives everywhere around Earth and how they could be taken advantage of in ways favorable to all humanity."

- Citation and context at Optical Motion Spectrum (3), 4 Mar*09
World, Gamj:

"The World Game I proposed for an exhibit in my dome in Montreal for the U.S. but the U.S. did not accept it as an exhibit but they did take my dome. I propose the World Game which would be played in the same comprehensive way that the navy has played war games--- through the ages, dealing totally with all resources.

"But with the computer comes a new capability. I have proposed that the United States have an enormous setup with miniature lights and have my map spread out flat so you see it as a football field. And there is an enormous bank of data in the inventory of world resources. You would then with the computer play the game which is the opposite of Von Neumann's game theory, where it is assumed that one side has to lose. It is assumed that there's nowhere near enough to go around, so one side has to die. He just plays off the dead and that's all you have. Sum zero.

"There is another game which is not really played in any general way, except it's sort of a lovely way, which is: 'How can both of us win?' Is it possible for both to be successful? Is it possible for all sides to be successful?"

- RBF with Verner Smythe, New York, Tape 1, pp.1-2, 25 Feb'69
World Game: (II)

"That, of course, looms as possible in terms of science.

But the trouble is all the international setups; you see the bureaucracy of politics everywhere. We are not educatable fast enough to realize that scientists could bring us enough to go around. But you can't do it if you have the protective barriers because the resources must be able to flow very evenly around. You would have to make all these alloys, and so forth. Have to be equal. You don't judge people in terms of where they live. They are simply world men. You must produce the world man. Science says you could make the world successful if you do that.

"So in my World Game I have proposed that we play the computer game and with this very dramatic setup, electronic capability, to see we might say: 'Where is all the copper?' and here's where it is. Which is low grade? How much is in buildings? How do we re-use our copper in such a way that we can improve the performance per pound, which lots of people haven't realized you could do. The game would be played by anybody. We would like the Russians to play this game. And everybody."

- Cite RBF to Verner Smythe, New York, tape 1, pp.2-3, 25 Feb'69

World Game: (III)

"And quite clearly the game would come out in a way to be very contradictory not only to United States policy but to Russian policy and every policy. And it would be so dramatic--- what is going on-- that it would have to be published by all the magazines and television. It is so photogenic because everybody is so concerned. So we keep on playing the game and finally we find we could make it work, but it would take a thousand years to work out. So you play it safe. How do

you reduce those years to get it down to 10 years? On top of this publicity, hand in hand with all the bad the world knows, we would get the world pushing on with: 'Why don't we follow the computer instead of following the old politicians and our reflexes. . . '

- Cite RBF to Verner Smythe, New York, tape 1, pp.2-3, 25 Feb'69

World Game:

"How may we organise our self-disciplining to deal comprehensively and capably with the maximum and minimum of limiting factors of the combined and complementary physical and metaphysical prime subdivision of universe?"

- Citation at General Systems Theory, Jun*66

"I've been making a fantastic error in saying that World Game was not played against anybody and had no opposition. You play it against a fantastic number of things. For instance, inertia--- unfamiliarity, fear. We worked out a football team. We have 11 very important players, life fear, and so forth. Who was the quarterback? Ignorance! He plays center. One of the guards is Inertia..."

"So we do have great opposition,"

- Cite RBF to Barry Farrell: Bear Island: Tape Side A Transcript p.3; 23 Aug'70

Bob Brooks: "What is the grand strategy of World Game?"

RBF: "I start with the Universe and everything in the Universe counts. So there's a theory of first things first. So you do have critical paths, overlappings, and the scenarios, of course.

BB: "What are the criteria for evaluating the effectiveness of your strategy?"

RBF: "The support of life on our planet."

BB: "So what in Particular?"

RBF; "Actually you get down to two things: metaphysical and physical. So there's the physical regeneration and the metaphysical know-how of how to employ all the resources, all the patterns, that are operating in Universe.... These are the criteria of what you need to keep a human being going."

- Cite Tape transcript, pp.16-17; RBF to Bob Brooks, 2 Jun'74

"Well, I might just also say that at the same time we were playing the world game was the first time that a man landed on the Moon. And I don't think it's coincidental. I mean I think that the consciousness of the world manifests itself in several different ways, and I think it was just absolutely vital that we were playing world game at the same time, and we could get the idea that there was a man, one of us, standing on the Moon looking back and seeing the whole Earth for the first time. It's really quite astonishing that we've never been able to see the whole Earth before, and we've never been able to play, not as politicians, but as world men.

"So I think the basic assumption that there are going to be political problems that will exist for a long time, but now for the first time we can really see the whole Earth, we can begin to work with the whole Earth in mind. . . There's been an enormous amount of attention paid to politics, and not much attention paid to understanding the whole of the world at one time:

"This now feasible intercontinental network would integrate America, Asia, and Europe and integrate the night and day, spherically cycling, shadow-and-light zones of Planet Earth and would occasion the 24-hour use of the now only 50 percent of the time used world-around standby generator capacity whose 50 percent unused capacities heretofore were mandatorily required only for peak load servicing of local interconnected energy users. Such continental network integration would overnight double the already-installed and in-use electric power generating capacity of our Planet."

- Cite RBF quoted from his writings by ` .Im. Marlin, Architectural Forum, p. 76, Feb*72

"The problem is always the electrical power. It's always the necessity of processing the food and getting the food to the people. It's fine to grow it in this area, but if you can't store it, you can't feed the people who are living in the other area.

"So, using all the information we've gotten about power and generating stations, and realizing that really the most efficient thing would be to overlap day and night and seasonal changes, we developed a way of ... in a sense, cycling all the information toward one central scenario . . . which was to set up a major power grid over the face of the Earth. . .

"The first thing we find out is that if we do this, if we incorporate all the total potential, we gain about 15 trillion kilowatt hours, which is about a fifteenth of the total required. We begin to see that all over the globe we're able by 1980 to bring everybody to the bare minimum, which is about 2000 kilowattCBB hours per capita. . . Based on this information we draw one continuous network which is essentially a closed system with existing transmission technology."

- Cite RBF to World Game at NY Studio School, 12 Jun-31 Jul'69, Saturn Film transcript, Sound 2, Part 3, pp. 53-56.

"Due to the fluctuations in local systems where peak demands occur at different times, you can use the same amount of generating capacity more efficiently, with no increase in terms of more plants.

"Another efficiency factor comes when we begin to cross the continent and we see that we begin to change seasons, so there are different amounts being used--- seasonal changes like day and night.

"This network allows you to bring in the income energy sources. One of the problems with wind power or solar power is that they are not dependable. For instance, if this city depended on solar power--- for the last two weeks it's been cloudy--- and we would have been in a lot of trouble. If you can tie into a network though, then it can feed in at times when the Sun is shining, but you don't worry about it, because you have other sources that you can get through your network.

"All these lines represent an enormous quantity of metal tied up in shipping, which could be scrapped and cycled into the power network. . . The synergetic effects of new technologies"

- Cite RBF to World Game 12 Jun-31 Jul'69

"would probably reduce or eliminate the need for the actual metals to be invested in the system. But we are not investing anything new. What we're trying to do, and what world game is really always trying to do, is just to show what can be done with present efficiencies."

- Cite RBF to World Game at NT Studio School, 12 Jun-31 Jul'69, Saturn Film transcript, Sound 2, Part 3, pp.57-65.

Wow:

"Some of them take over hundreds of millions of years for each wow. And if you haven't been around long enough to come to the next wow, you don't realize that it is orderly, that in due course it is matching, but on a very slow frequency basis. So because all of us have relatively very short lives, there seems to be a great deal of disorder to us, which m would not seem disorderly to us if we had longer spans of observation . . . We have very significant information coming to us from those who are doing the largest measuring and the most minute measuring. We do have entropy and the physical is expanding and temporarily, locally, very disorderly. It seems very clearly demonstrated in all our experience that the physical assumes a complementary oscillating phenomenon often when we have not been able to discover it. He suspects the positron to be possibly demonstrable sometimes when he's only found the electron. And he has this theoretical existence which

may in due course make experimental demonstrations of the actual occurrence of that which he had held to be operational±ji theoretically. In this kind of assuming it would seem to be absolutely logical that we have a physically expanding UjUVeXjejwhichs getting more and more crowded, and therefore

"the expansion is in acceleration. That there must be some phase of the Universe where the physical energies are contracting and increasingly orderly. In order to sustain a regenerative Universe, it could not just be all expansive. There have to be collections to balance it, very much as we think of our experiences with the weather, we have low pressures and high pressures in the atmosphere, and the low pressures are exhausting it by vacuumizing, pulling the energies out of the highs until that low pressure itself forms a high pressure. There is a great pulsative exchange of highs and lows. An 1 felt that what our physical Universe sumtotally might have is just such a pulsating. I'd be very interested if we could discover some phase of the Universe where the energies are contracting and becoming increasingly orderly."

Wow: The Last Wow:

(1)

"The energies that fit into our local system here on Earth are energies given off by other systems. Every chemical element has its unique frequencies, and those frequencies can be thought of as the teeth of a gear. . . In synchronization you have two engines of an airplane or boat and they don't turn over at exactly the same rate, so you hear rhoOWW, rrhooOWW. rrhooOWW. They come into phase and go out oT phase. Universe is doing just that with these constantly associating and disassociating energies. Some take millions and millions of years before they rrhooOWW. But in any case we can observe that these energies appear disorderly merely because they are temporarily not meshing with something else.

"When the gears and the teeth don't mesh, they talup more room. You get an omnidirectional crowding, thingsmoved faster and faster around the periphery to accommodate the continual expansion of crowding and disorderliness. But the limit of that velocity is what Einstein called the speed of light, the speed of radiation of all kinds, 186,- 000 miles-a-second. This is top speed because when you get to where everything is in phase, all the crowding stops."

- Cite RBF to Barry Farrell Playboy Interview, 1972 - Draft, p. 11

Wow: The Last Wow: (2)

"In other words, energy in disassociation expands outwardly until it reaches the last cycle in the total regenerative system. We know about total regeneration because physics has demonstrated that energy is never created nor lost. So we know that as men alive in the Universe, we're dealing in a finite system of overlapping scenarios in which finally the whole scenario tape gets melted down and reprinted and we get a new show."

Playboy Interview, 1972. Draft, p. 12.

- Cite RBF to Barry Farrell,

'The speeds of all the known different phases of measured radiation are apparently identical despite vast differences in wavelength and frequency. Einstein's adoption of electromagnetic radiation expansion--- omnidirectionally in vacuo--- as normal speed suggests a top speed of omnidirectional entropic disorder increase accommodation at which radiant speed reaches highest velocity. This highest velocity is reached when the last of the eternally regenerative Universe cyclic frequencies of multi-billions of years have been accommodated, all of which complex of nonsimultaneous transforming multivariateied frequency synchronizations is complementarily balanced to equate as zero by the sura totality of locally converging orderly and synchronously concentrating energy phases of scenario Universe's eternally pulsative, and only sum totally synchronous, disintegrative, divergent, omnidirectionally exporting and only sum totally synchronous, Integrative, convergent and discretely directional individual importings."

Wow: The last .tow: (A) <

"Finding a Universe in which energy is not being lost, Einstein assumed a finitely regenerative physical Universe. Some of the regenerative transformations occur rapidly; others very slowly. As energies which were in smooth coordination within a system are given off entropically they do not immediately synchronise with energies given off by other systems, due to the fact that every chemical element has its unique frequencies. Toothed gears correspond with

wave frequency cycles. Waves are cyclic. Whatever the number of teeth might be, we can call the wave frequency. Two gears that do not mesh can only be brought into tangent proximity and take up more room than do

meshing gears. Frequencies given off entropically that don't mesh with energies given off by other systems take up more room in Universe. Therefore we have a physically entropic Universe that is everywhere locally taking more room, ergo expanding, and increasingly disorderly, from the short time-span local viewpoint. However, from time to time you will have frequencies synchronized. You may be familiar with the sound of an airplane's engines when they are not synchronized. You hear them go, periodically . . . wow

wow . . . wow . . . wow . . . because every so often they do

to: The teat Wow? (B)

"synchronise. Amongst all the various energies being given off locally and entropically in scenario Universe--- some of them wowwowwow-wowwowwow, very fast--- and some of the periodic wows may not occur for multi-year spans; and some of the periodic wows don't repeat in less than 100 million years and greater spans. The significance of Einstein's assumption of a maximum 186,000 miles per second velocity of radiation of the energies being given off in a disorderly omnidirectional way, is that there is a top speed. And while 700 million miles an hour, or 186,000 miles per second is very fast, it is very slow in comparison to no time at all. And this 700 million miles an hour top speed of Einstein has utter significance because it means that when we come to the last periodic wow--- necessary to accommodate all frequencies--- Universe doesn't have to expand any more and relative disorder ceases.

"The significance of Einstein's radlational top speed is that there is a point of complete regeneration by which our Universe is the only and minimum perpetually self-regenerative system, a self-regenerative Universe of fantastic complexities and design of great integrity, of which then the sum-total of"

"It is possible for us now to take the design initiative, not waiting for patrons to tell us to go to work and thereby freeing ourselves for the scientific designing of a successful livingry system for man in Universe. . . There are no patrons with free capital initiative who are con-

cerned exclusively with world problems. However, there was nothing fundamental to stop the Wright Brothers from considering the use of all the sky surrounding the Earth and all the technical knowledge accrued to mankind and all the developed resources of the Earth in their invention and development of the airplane. Their province was inherently transcendental to sovereign nations and political theories. Their fLOHm victory affected all men everywhere. Within ten short years the two Wright brothers did more for mankind--- by bringing men to their collective senses, and by bringing men together around the world to witness one another's ways of life, and one another's individual integrity, thereby to understand each other-- than all the politicians have been able to do in all the milleniums of history."

RdF DtFINKluM'

"In" Synergetics' "isotropic, vectorially triangulated, the omnidirectional matrix initiations fn angular and linear accelerations are rational and uniformly modulated, whereas in the XYZ coordinate analysis of the calculus only the linear is analyzable and the angular resultants are usual;y irrationally expressed."

- OMNIDIRECTIONAL HALO, p. 156, i960

Lacking awareness of the comprehensively rational coordinating facility available in nature (which upon its discovery we have named Energetic-Synergetic Geometry—En/Syn Geom, for short), men have developed and adopted their special-case local coordinations of modular mensuration as necessary observational frames for accounting

the special local aspects of nature with which they have been respectively preoccupied. From time to time it has become desirable to integrate the data harvested in various specialized fields. On such occasions it has frequently happened that the special-case coordination systems are mistakenly assumed to have general capabilities which they do not possess. For instance, there is the mistaken assumption made by analytical geometgers that the special three-dimensional case XYZ coordinate system constituted 'The* generalized case of all coordinate accounting. The

XYZ coordination of analytic geometry this became limited to linear expressions of the radials of exclusively 90-degree central angle relationships— wherefore, despite that physics had discovered the equally valid linear and angular acceleration functions of an omni-interaccelerating Universe, all of its behaviors had to be translated into linear coordination.'*

"Even in 1960 most, scientists as well as laymen will say •squaring' when referring to 'second powering' of numbers, and 'cubing' when referring to*third powering.' En/Syn Geom. says 'triahgling' and 'tetrahedroning,' respectively. And because triangling and tetrahedroning are two and three times, respectively, more economical of available local space (and nature insists on being most economical) En/Syn Geometry is the most economical accounting system of nature.

"The assumption that XYZ linear expression was essential to the translation of observed phenomena into computational analysis, as well as the translation of computational analysis into realized technology, imposed the invention of the calculus.

This and other errors of prime assumption resulted in an interaccounting of the data won by remote disciplines which in turn seemingly disclosed that these remote areas of inquiry were inherently interlinked only by irrationally ratioed values. The well-known irrational constants. Pi, e, etc. stand as present-day monuments to the awkwardly ratioed communication links.

Precession of Two Sets of 10 Closest-packed Spheres,

"We know the fundamental intercomplementations of the external convex macro-tetra and the internal concave micro-tetra with all conceptual systems. Looking at the four successive plus, minus, plus, minus, XYZ coordination quadrants we find that a single 90-degree quadrant of one hemisphere of the spherical octahedron contains all the trigonometric functioning covariations of the whole system. When the central angle is 90° then the two snail corner angles of the isosceles triangle are each 45°. After 45° the sines become cosines and vice versa. At 45° they balance.

Thereafter all the prime numbers that can ever enter into prime trigonometric computation (in contradistinction to complementary function computation), occur below the number 45. What occasions irrationality is the inability of dividends to be omni-equi-divisible due to the presence of a prime number of which the dividend is not a whole product.

”This is why we factor completely or intermultiply all of the first 14 prime numbers existing between 1 and 45 degrees, inclusive of which 14 we multiply the first eight primes to many repowerings which produces the Schehehazade Humber which, when used as the number of units in a circle, becomes a dividend permitting omnirational computation accommodation of all the variations of all the trigonometries of Universe.”

Yin-yang: (1)

"Goldy tries putting a light inside a translucent tetrahedron. Next
she encloses the translucent tetrahedron Inside a translucent plastic
sphere. The light at the system center casts the shadow lines of the
tetrahedron's six edges outwardly and symmetrically onto the plastic
sphere to produce the outlines of a spherical tetrahedron. Goldy

draws circles around each of the spherical tetrahedron's four comers of such a unit radius that each of the four circles is tangent to each of the three others. Using a sharp-edged cutting tool, she severingly follows around the perimeter of one circle to its point of tangency with the next adjacent circle, and there she inflects her« cutting tool to follow around that next tangent circle to its next point of tangency, where she once more inflects her cutting tool's severancetrace to follow around the next circle to reach the next tangent point; which procedure she repeats until finally returning to the point of origin.

"She completes the severance and cuts the spherical tetrahedron's surface apart in two similar equi-area sections, each of which corresponds to the two similar, dumbbell-profiled, skin sections of a baseball. With these two similar, half-a-sphere-surface"

"sections precessingly aimed toward one another in such a manner that the bulge of one section registers symmetrically with the half-circle valley on the other, Goldy finds that she can sew the edges of the sections together around a core to produce a baseball.

"Goldy shows the bears that when you look at the baseball with the inflection point of its 'S'-pattern stitching located at the circle's center and aimed directly toward you, you will see that the baseball's surface pattern is the same inflection pattern as that of the most profound oriental symbol: yin-yang.

"This observation makes Goldy say to the bears that it would seem that long ago human minds of the orient had discovered precession, tetrahedra, and synergy. Goldy says that those ancient people'who had discovered those principles must have kept them secret to surprise people and thereby gain powerful, popular, mystical accredita-

tion; and that during the millen-iums since, humanity had lost track of the yin-vang significance. Daddy bear answers, 'We have been watching the humans since they landed on your planet a few millions of years ago and can say that is just what happened.'"

Young World:

"So I'm saying to you that it's now perfectly clear that not only is there no race, there is no class. Here we are. One of the most extraordinary moments of our life to realize that we are really one. This is very important for us to realize because our young world in its compassion for the underdog, for the ill-treated, its feeling then for the poor is such that it wants to cast its lot with the poor. And there has been a tendency of the young them to take on standards that are really lower and less imaginative than other standards in order to get into this working class world, which they have a great compassion for. I'm simply saying to you now that it's a matter of our elevating all . . . all of humanity. We have then, instead of pulling the top down, vindictively, it's a matter of pulling the bottom outwardly. And here we are the new integrating world. Here are our challenges: a complete reversal of all the seemingly obvious of yesterday. Here are the fundamental conditions that we are brothers, and that we are meeting here . . . with this drive of ma youth to find about how we can really use our minds. And not just use our minds to give ourselves special advantages, or some sensation, but so we can really be of great fundamental use to our fellow man."

Young World?

'•More and more of the young world is going into the university and into more and more research and we are going to get to the point, I think, where a very large number of the individuals of humanity---it happens first to the scientist---will begin to recognize and integrity of Universe and an integrity of the total experience of life that will be of the order apparently experienced by some of the first very great men---such as Christ, or the theoretical unit man who is thus reported. This takes the place of religions. No one is asked to believe anything. Everybody makes firsthand discoveries. If you want to read it, I have written a book... being published by Southern Illinois University which comes out this fall and is called 'No More Secondhand God' and it has to do with just what I am saying here.'

- Cite Oregon Lecture ,75, p.163; 9 Jul'62

"It's all a question of hanging on through this period of peril, because once man reaches the point of the 'haves' being in the majority, the mood of the politicians will change very dramatically. So it's a question of encouraging man to really be aware of his great potential and not throw away his chance for success. I can understand why there's such impatience with those who fear change and really do find themselves rooted in the old ways. But for the young people to expect older people to get their conditioned reflexes out of their system in a hurry is unreasonable, ./e are coming to success by virtue of all the people who fall in the fantastic continuity of sacrifice that has been made by all humanity all down the line. The number of human beings

who have perished and sacrificed and given themselves is just unbelievable, and I don't like to hear any young people belittle what society has been through to bring it to where it is now. Boy! It's been a hard-won battle, and we are now very close to where it can be won. And it could also be lost because of kids becoming intemperate and not being tolerant of the people around them."

AS

Zero:

"The center ball of a vector equilibrium is zero.

The frequency is zero, just as in the first layer the frequency was one. Sc zero times 10 is zero, to the second power is zero, plus two is two. So the center ball has a value of two. The significance is that it has its convave and its convex. It has both insideness and outsideness. it is as far as you can go.. You turn yourself inside out and it goes

in the other direction again. This is a terminal condition. I give you then a tetrahedron which has an external and and internal: a terminal condition. This is exactly why, in physics, Einstein is correct with the conservation of the universe because there is a limit M.nt at which you turn yourself inside out. You get to the outside and you turn yourself inside out and come the other way. This is why radiation then does not go off into a higher velocity. Radiation gets to a maximum and then turns itself inwardly again--- it becomes gravity. Then gravity comes to its maximum concentration and turns itself and goes outwardly, becomes radiation."

- Cite REF tape to EJA and Bu'li, Blackstone, Chicago, J1 Kay '71. Pp. 17-1 a.
Zero:

"Size alone can come to zero--- not conceptuality. In the jitterbug we need a sizeless nucleus for the pumping model The point is the micro-cosmic turning around between going inwardly and going outwardly."

Blackstone Hotel, Chicago, 31 May 1971.

Zero Condition;

"The old Greek sphere's surface was anywhere and everywhere tangent to an infinity of planes, which planes were for an infinitesimal moment thought to be 'self-evidently' congruent with the holeless spherical surface, ergo around each of the sphere's infinity of surface points the sum of the surface angles was always 360 degrees. It is this zero condition of the calculus which is proven by physical experiment to be untrue, for no solid surfaces have been found and there may exist only a spherical galaxy of minutely discrete energy events whose most economical and comprehensive interrelationships consist always of local intertriangulations the sum of whose surface angles is always one tetrahedron less than the number of vertexes multiplied by 360 degrees."

Zero-nineness:

"When the four planea of each of the eight tetrahedra move toward their four oppoaite vertexes OM the momentum carries them through aero-volume nothingness of the vector equilibrium phase. All their volumes decrease at a third-power rate of their linear rate of approach. As the four tetrahedral planes coincide, the four great circle planes of the vector equilibrium all go through the same nothingness local at the same time. Thus we find the vector equilibrium to be the inherent zero-nineness of fundamental number behavior."

Zerophase: (1)

"At eternal 'outset' the vector equilibrium's frequency is none--- non, which is inactive, which is different in meaning from nonexistent. Zero is the inside-out phase of conceptual integrity; it is the eternal complementation of system. Quite the contrary to 'nonexistent,' it means only 'eternally existent' in contrast to 'temporarily existent.' Experience is all temporary. Between experiences is the forever eternal metaphysical, which cannot be converted into existent. Zerophase, i.e., the absolute integrity, is a metaphysical potential in pure principle but is inherently inactive. The inactivity of zerophase can be

converted into activity only by pure principle of energetic geometrical propagation of successive positive-negative-positive-negative aberrational pulsations which intertransform locally initiated Universe through vector-equilibrium complex frequency accommodations in pure principle. The propagative pulsations are unopposed by the inherent but eternal, limitless, unoccupied outwardness of absolute metaphysical integrity. The unlimited metaphysical conceptual equilibrium integrity permits the limited specialcase realizations. The limited cannot accommodate the unlimited.

Zerophase:

"Nature does not really become disorderly. She goes through a zerophase as we saw in the vector equilibrium, at which equilibrium state nature refuses to pause or to be caught in structural stability. She goes into progressive asymmetries, and all the crystals are built up asymmetrically in positive or negative triangulation stabilities--- which is the maximum asymmetry stage. And then nature turns and repeats her transformation through equilibrium to the opposite triangular stability of positive and negative. The maximum asymmetry will probably be in the range of plus four and minus four, or the fourth degree--- or fourth power--- of symmetry. The octave, again."

"The zero volume phenomenon altogether avoids the operationally prohibited concept of a plurality of lines going through the same point at the same time. In the zero volume tetrahedron each of the four great circles are folded into a 'bow tie' pair of double-bonded tetrahedra, each of which is doublebonded to the three others. The eight vertexes of the eight tetrahedra at each of their four open corners only seemingly pass through each other, whereas each converges in the other and turns around divergently outward at 60 degrees, thus producing a nucleus with an energy potential of eight but presenting the topologically visual aspect and enumeration of one."
