Order Underlying Randomness

This drawing is a spontaneous exercise in synergetic geometry illustrating the fundamental relationships between geometrical order and numerical order. Whenever Fuller sketched out an original concept—or repetitive amplifications thereof—he liked to document the occasion by citing the time and place of execution. He did this for his own gratification, to celebrate his pleasure in the conceptual breakthrough, to record the event meticulously for his chronofile archives—all perhaps not without some thought for posterity. The drawing is signed in his handwriting:

R. Buckminster Fuller
Sept-11-1963
15268 Earlham
Pacific Palisades, Cal.

“Order Underlying Randomness” is the kind of exposition in which Fuller delighted. He loved to share this kind of graphic demonstration with lecture audiences and hundreds of blackboards have been temporarily filled to their furthest corners with these patterns of his geometrical accounting. Sometimes he would omit some of the events or vary their sequence, but this drawing is one of the most exhaustive expositions of a major theme: that there is a geometry of thinking, that understanding results from the accounting of the sum of all numerical and geometrical relationships, and that the aggregate of understood relationships is always tetrahedral.

E.J.A.

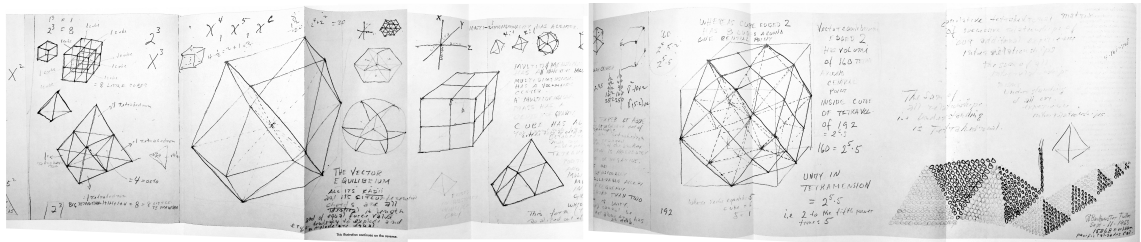

Figure 1: Order Underlying Randomness

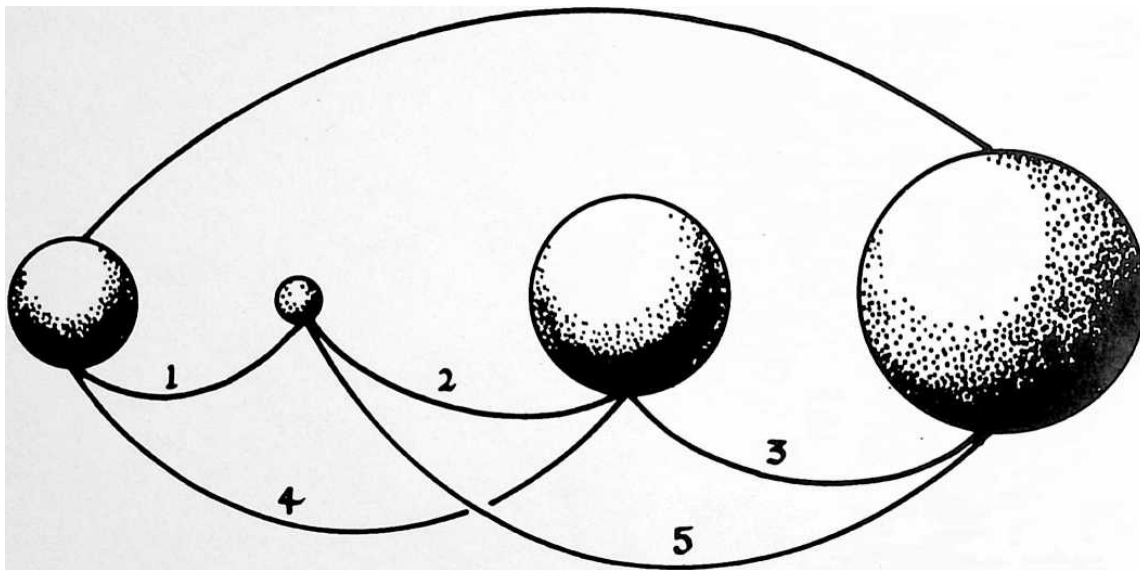

Figure 2: A Linear Tetrahedron has six relationships

The genesis of numerical and geometrical accounting occurs with four initial events of experience. The device above—two concurrent aspects of the same phenomenon—illustrates the origin of conceptuality in the recognition of the interval between the third and fourth periodic events of experience. Here in graphic form is the initial act of the geometry of thinking. It is used here as a colophon to the dictionary because it epitomizes the sensorial genesis of mathematical experience in physical reality with the transition from instability to stability and the creation of insideness and outsideness.

The closest Fuller ever came to giving a name to this figure is the term *Linear Tetrahedron* he employed in the caption to fig. 2 of *Omnidirectional Halo* (1963). It illustrates the dynamic pattern of events defining periodicity, frequency and shape in the minimum

geometrical consideration from which all other geometry and structure is derived. Hugh Kenner has called it “stability incarnate...a nest of principle.” Here is a symbol devoid of cultural nuance or mythological freight; it is pristinely abstract. Conceptually and geometrically, this linear tetrahedron is Fuller's minimum limit case.

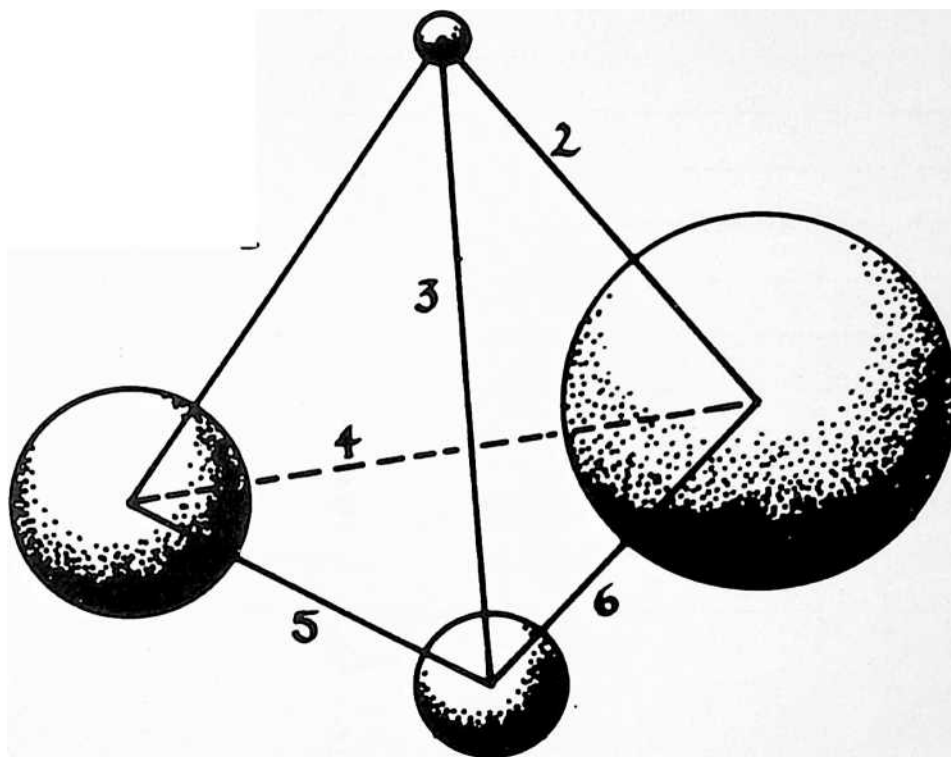

Figure 3: Four frequencies (sizes) of Entities or Particles comprise the Tetrahedron

An exhaustive philosophical and psychological exposition of the linear tetrahedron phenomenon may be found—in the context of “The Geometry of Self and Otherness”—in *Synergetics 2* [FA79] at secs. 265.08—13.

So long as man is alive and has more days, he is going to be acquiring more information regarding those factors which are a priori to existing. So the dictionary is going to continually increase in size. That is absolutely inexorable.

R. B. Fuller to Alan Watts Los Angeles, 19 Oct 1970

All words in the dictionary do not make one sentence; all the words cannot be simultaneously considered, yet each of the words is valid as a tool of communication; and some of the words combine in a structure of meaning. All the words are memoranda of all of humanity's attempts to communicate to self or to others their understanding of the unique evolvement of their separately viewed experiences. The dictionary is the inventory of unique aspects of the totally composited experiences known as Universe.

List of Main File Indicators

This list contains the principal file indicators in each volume. The file indicators were compiled by the editor to provide a recapitulation—perhaps even a redundancy—of cross-references. Some are purely technical, like running lists of rules, equations, and corollaries. Others reflect Fuller's propensity for lists, inventories, and trends. Some few suggest critical concepts peculiar to synergetics, such as ethical physics and psychological geometry. The most significant of the file indicators are *Paired Concepts and Sequences: Metaphors*.

Preamble with a Few Explanations

Since the death of R. Buckminster Fuller in 1983 at the age of eighty-seven, the record of his prodigal career as a writer, artist, designer, and philosopher continues to be widely recognized—and even celebrated—out of all proportion to the notable paucity of serious critical evaluation of his work.

It is not my purpose in this introduction to correct that imbalance. I have not acquired the academic credentials for such a task, and besides, as his longtime collaborator, I could not muster the necessary detachment.

So many of the discoveries of synergetics remain undiscovered by those very mathematical and scientific disciplines to which they would appear most relevant. But are they relevant? Will there ever be a synergetic accommodation with the psychologists and the particle physicists and the topologists? Can Fuller's claimed discoveries be reconciled with the latest accepted picture of reality as described by the various branches of physics? Maybe only the beginnings of answers will be found in this dictionary, but at least it exhaustively documents Fuller's proposal of a whole new field of study: a geometry of thinking and a geometry of physical reality.

This dictionary represents the first comprehensive documentation in one publication of all the major avenues of Fuller's thinking since they were first anticipated in his *Nine Chains to the Moon* of 1938 [Ful38]. Here is the full array of the themes and concepts of his half-century of writing and lecturing—including many propositions that remain to be tested—always expressed in his own words but organized in a way to help the inquisitive reader pursue his own explorations. Hundreds of the entries herein are unpublished table talk and ephemera now in print for the first time, while roughly a third of the entries trace their way back to the primary source material of Fuller's dozen or so books published since 1938.

Though the systematic arrangement of the dictionary is inescapably analytic, it aims to be expository rather than critical. I organized it as an instrument to help the two of us write the *Synergetics* books. My hope is that it can serve as a tool for students and critics to make their own assessment of his work and thus reinforce the recognition of his achievements with the weight of discriminating examination.

At this point Fuller might tell us in his sometimes simpler words, “Every time man makes a new experiment he always learns more. He cannot learn less.”¹

This *Synergetics Dictionary* was developed primarily around Fuller's system of synergetic geometry as later incorporated in *Synergetics* and *Synergetics 2* (published by Macmillan in 1975 and 1979). But as a dictionary it goes well beyond the geometry to cover the full range of his original strategies of economic accounting, tensegrity engineering, energy harvesting tactics, individual and group psychology, Dymaxion airocean world map, and world game patterns of industrialization, and their ultimate synthesis in one grand scheme that he termed *design science* (q.v.).

For Fuller it was all one gestalt book that never quite got published—one endless lecture with slides—a mosaic of his engineering blueprints, his allegorical lithographs, his lecture transcripts, his economic polemics, and his geometry. It was a frustration for him that his two *Synergetics* books were not fully comprehensive—particularly in the omission of his almost desperate lifelong commitment to the *geosocial revolution* (q.v.), his hallmark strategy of making the world work. The current Garland edition enables me to make public amends for the first time by placing his synergetic geometry in the context of the complete body of his work and his program. For Fuller mathematics is intensely relevant to the evolution of humanity.

The obituary of R. Buckminster Fuller that ran on page one and continued for six columns in the *New York Times* of 3 July 1983 made no mention of his magnum opus *Synergetics* although these two volumes are his chief literary accomplishment, his most original work, and constitute what I believe is his major legacy to posterity. *Synergetics* has gone through many printings and is available in both hardcover and

1 See entry in dictionary captioned *Learning: You Can't Learn Less*, dated Dec 1972.

paperback. It has a devoted following of readers young and old. But the *Times* failed to mention the work—with apparent impunity—because it has received a dearth of recognition from academic specialists in the fields it presumes to explore, and because of the peculiarity and difficulty of its language.

In fact it has been easy for many otherwise responsible people to absolve themselves from paying attention to Fuller's work solely on the grounds of the inaccessibility of its style. Perhaps I should not have expected others to share my intrigue with that mode of expression: I would prefer to collaborate with a difficult writer who might need more help than an easy writer, and Fuller could always be counted on to come up with drafts that were complex to the point of obscurity and devoid of the least risk of banality.

Although Fuller declared that he was striving for a style expressing the most accurate and comprehensive observation of experience², he ended up with a wholly new and unfamiliar and often polysyllabic vocabulary of his own invention. At their best his descriptions achieve a kind of poetic combination of feeling and abstraction—physical sensations merging into metaphysical patterns. Because it verges on a prose poem I describe *Synergetics* as a literary rather than a scientific work. In fact when we started to collaborate on the project in 1969 he had an impulse to write the whole book in blank verse—or at least with unjustified right margins. The manuscript as I discovered it after years of gestation had the first two chapters in verse form. Fuller agreed to my suggestion that these chapters had an integrity of their own, and with the invaluable guidance of Bill Whitehead at Doubleday 1 helped him prepare them for separate publication as *Intuition* in 1972.

Synergetics is a book without genre. It proposes no less than a geometry of thinking and a *geometry of* physics. It deals with questions of geometry and philosophy through an exposition which does not conform to the conventions of mathematicians and philosophers. Fuller's descriptions reintroduce those very subjective properties and

2 *Synergetics*, sec. 203.06.

sensory impulses that have been eliminated by classic science from formal descriptions in physics. He rejects the established disciplines of the universities by ignoring them; in their place he imposes his own self-discipline and his own way of thinking in a deliberate attempt—as artists do—to change his generation's perception of the world.

0.1 FULLER AND GERTRUDE STEIN

In his preface to *Synergetics*, Professor Arthur Loeb of Harvard compares Fuller's literary style to that of Gertrude Stein. They were both innovators in the metaphorical use of language. She made the English language “an artist's medium, a sort of prose imitation of the Cubist practice of portraying an object on all sides at once.”³ He made poetry a strategy for arriving at truth. For Fuller a poet is “a very general term for a person who puts things together in an era of great specialization...where most people are taking things apart.”⁴ By such a definition, “Einstein became and will probably remain history's greatest poet—for who could say so much so simply as did Einstein when he described physical universe as $E = MC^2$.”⁵ Fuller does not describe himself as a poet because the term is not really professable; it is a term which only society can bestow and then only retrospectively.⁶ For Fuller, the essence of engineering is poetry:

Take out for yourself some engineering and science textbooks and break the words up into phrases . . . and prove it for yourself. Then fry some non-engineering prose and it probably won't work. I would not be surprised if some day it were proven a law that the better the science the better the poetry.⁷

3 James Atlas, review of *Everybody Who Was Anybody*, by Janet Hobhouse, *New York Times Book Review*, 11 April 1976.

4 See dictionary entry captioned *Poet*, 22 Apr 1961.

5 See dictionary entry captioned *Poetry*, 13 Nov 1969.

6 E. J. Applewhite, *Cosmic Fishing* (New York: Macmillan, 1977), p. 57.

7 See dictionary entry captioned *Poetry*, 1962.

Fuller's language fuses the sensorial and the technological, as in “...the echoed voice of a poling raftsman to the forwardly informative radar manipulations of the stratojetpiloting airman.” His speech abounds in physical allusions:

holding patterns of energy
corkscrew spiral traceries
impact extrusion
jet-stilting
pumping fraction factors
reach-miles
swivel-moored
girth-tensed bonds
fibrous crystalline units
invisible trampoline
vacuum-fulcrumed oars

Not so rich perhaps as Homer's rosy-fingered dawn and wine-dark sea, but what could convey more energy than Fuller's vacuum-fulcrumed oars?

0.2 FULLER AND EDGAR ALLAN POE

Perhaps the nearest thing to *Synergetics* in its cosmological range is the work of another American poet-philosopher, the *Eureka* of Edgar Allan Poe published in 1848 [Poe48]. As Paul Valery says of *Eureka*, “Cosmogony is one of the oldest of all literary forms. ...As for the idea of a beginning—I mean an absolute beginning—it is necessarily a myth.”⁸ I am not suggesting that Poe had any influence on Fuller; he was only a casual reader of Poe and had never read *Eureka*. But both were amateurs and autodidacts venturing into heady speculations into the nature of physical reality.

8 *Variety* (New York: Harcourt, Brace, 1944), pp. 137, 141.

Since Fuller was not an accredited mathematician it was an act of presumption for him to dedicate *Synergetics* to a leading geometer of the day, Professor H. S. M. Coxeter of the University of Toronto. With comparable audacity Poe inscribed his work to Alexander von Humboldt. Poetic license indeed.

In an even greater extension of hubris, Poe goes on to invoke the example of Johannes Kepler: “I care not whether my work be read now or by posterity. I can afford to wait a century for readers when God himself has waited six thousand years for an observer. I triumph. I have stolen the golden secret of the Egyptians. I will indulge my sacred fury.”⁹

And *Synergetics* is an even more ambitious elaboration of the cosmological themes, both in the originality—the gritty intent—of its epistemological starting point and in the exquisiteness of its geometrical expositions. For Fuller the lodestar is what he calls *omnirationality*—the reciprocity of geometry and number.

What he shares with Poe is a fierce conviction in the inevitability of his description of the cosmos.

On the opening page of *Synergetics* Fuller exhorts the reader, “Dare to be naive.” Similarly in speaking he tended to address professors as if they were nine-year-olds and nine-year-olds as if they were professors. This is a strategy that was anticipated by William Blake who “liked to think that his works were perfectly comprehensible to the innocent, to minds not blunted by education and fashion, especially children.”¹⁰

0.3 MATHEMATICS DERIVED FROM EXPERIENCE

Fuller's alternate term to describe “synergetics” is “experimentally founded mathematics—EFM.” This explains why mathematicians can ignore Fuller's conjectures with impunity: partly because the Cartesian *XYZ* coordinates and the centimeter-gram-second system of coordination work so well that there is no particular incentive to adopt the synergetic model, and partly because any mathematician will tell you

9 *Eureka* (New York: Mclellan Book Co., 1908), p. 190.

10 Mark Shorer, *William Blake: The Politics of Vision* (New York: Henry Holt and Company, 1946), pp. 13–14 [Sch46].

that, whatever it is he does, it has nothing to do with physical experience. In fact, one of the glories of pure mathematics, to its practitioners, is its essential irrelevance to all but psychic or esthetic considerations. It is a discipline devoid of empirical content. Indeed, the branch of mathematics that is most remote from practical applications (except perhaps in codes and ciphers) is number theory, whose purity has gained it the description “the queen of mathematics” (That is, the basis of the mathematician's work is in pure logic, and the application of his work to the physical world is left to others.)

Fuller had no intention of reforming conventional mathematics; he merely wanted to introduce the world of science and physics to popular understanding. He had no quarrel with the deductive reasonableness of mathematics, only with its axiomatic assumptions of hypothetical points, lines, and planes based on grounds of strict logic. Fuller proposes a new philosophical foundation for a mathematics based on observation and experience, deriving from the physical reality of the energetic behavior of atoms, molecules, and gravity. His strategy is designed to cope with the information available directly from our senses as well as “the information progressively harvested through microscopes, telescopes, and electronic probings of the non-sensorially-tunable ranges of the electromagnetic spectrum.”¹¹

Fuller says that “even the development of sets derives from experience because mathematics is generalization—and generalization itself is sequitur to experience. The mathematicians talk of 'purely imaginary numbers' on the false assumption that mathematics could be a priori to experience.”¹²

The world of mathematics is not about to give up its axioms to accommodate the world of physical experience—much less the picture of reality presented by today's physicists. The mathematicians have no imperative to confront or judge Fuller—they are doing quite different things—as long as they do not object to his application of mathematical strategies to his experiential picture of the world.

11 See dictionary entry captioned *Mathematics*, 13 Mar 1971.

12 See dictionary entry captioned *Mathematics*, 22 Apr 1971.

0.4 GETTING NATURE INTO A CORNER

In its simplest terms synergetic geometry aims to substitute triangular and tetrahedral mensuration for the rectangular and cubical XYZ coordinates of Cartesian accounting and calculus.

It describes energetic phenomena in terms of angle and frequency and rejects what Fuller considered the vulgar quest for the ultimate “building blocks” of matter that has become the theme of so much journalistic description of science. Synergetics generates its modularities from the operation of a few limit-case geometrical phenomena: the closest packing of unit-radius spheres, the foldability and triangulation of great circles, and the fractionation of the regular tetrahedron.

A tetrahedron may be thought of as a pyramid with a triangular base: a four-sided polyhedron with three angular corners at each vertex. Tetrahedra are the basic modules of Fuller's philosophic system. In his most elegant formulation he says, “Substituting the word *tetrahedron* for the number two completes my long attempt to convert all the previously unidentifiable integers of topology into geometrical conceptuality.”¹³ Understanding that sentence is the key to understanding synergetic geometry, where tetrahedron is unity and unity is two. Here is his integral pattern for the coordination of thinking with physical action, incorporating the energy quantum of physics into a rational metaphysical system: this is what he means by “getting nature into a corner.”¹⁴

13 From “Omnidirectional Halo” in *No More Secondhand God* (Carbondale: Southern Illinois University Press, 1963), p. 156. Also found at *Geometrical Conceptuality*, 11 Nov 1973 in this dictionary.

14 See *Synergetics 2*, sec. 261.01—which is excerpted among the five citations to *Nature in a Corner* in this dictionary.

0.5 DICTIONARY AS AN ANALOGUE OF UNIVERSE

Knowledge organizes itself geometrically. There is a pattern in the very process of dismissing irrelevancies. (“The dismissing of irrelevancies” [q.v.] is Fuller's description of the process of thinking.) This dictionary should be thought of as systematic rather than linear. Though the dictionary contains the heart of *Synergetics*, it is organized for shorter spans of attention.

For Fuller the dictionary is an analogue of the universe itself. He defines universe as an aggregate of humanity's communicated nonsimultaneous and only partially overlapping experiences. Dictionary is likewise a collective concept, integral but ipso facto nonsimultaneously recollectable. Thinking, remembering, and looking something up all require time. Though the set of all the words in the dictionary cannot be simultaneously considered, their overlapping sequence is progressively revealing. In the same way the universe encompasses too many simultaneous events for any man to have a comprehensive understanding of them at any one time.

So much for a glimpse through the magic casements—a foray into salvation by mathematics. Now let's get to the files.

0.6 RATIONALE FOR THE DICTIONARY

On 9 February 1970 Buckminster Fuller addressed a memorandum to one of his office assistants at Southern Illinois University saying, “Please arrange to have an exhaustively cross-referenced, alphabetically coded, first-word indexing of my topical concept files ...to package up all the concepts ...and save me from repetitive discourse and writing.”¹⁵ As a result of that initiative, Fuller's office in Carbondale sent me (at my home and office in Washington, D.C.) over a period of many months copies of all books and articles by Fuller and relating to his geometry, including lecture transcripts, untranscribed tape recordings, manuscripts, letters, and unpublished papers, and two trunkfuls of the original files of his synergetics notes dating from the

15 RBF memorandum to Dale Klaus, 9 Feb 1970.

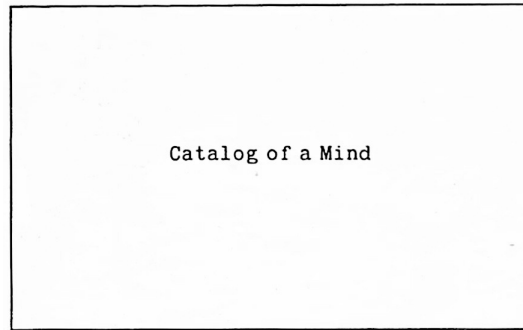

Figure 4: Catalog of a Mind

1940s, together with notebooks, drawings, blueprints, and collateral clippings. Here was plenty of grist for the mill to keep me busy excerpting and indexing when Fuller was not visiting with me in Washington over the ten-year period of collaboration in which the two *Synergetics* volumes were completed.

Neither Bucky nor I realized it at the time, but as all those files were compiled, they seemed to manifest a sort of self-organizing character, and we ended up creating something approaching a new art form.

In preparation for collaborating with Fuller on the work that was to become *Synergetics*, I had, beginning in 1969, accumulated on 5 x 8-inch cards in alphabetical sequence by topic the best net statements I could get my hands on from everything he had said or written about almost everything. I typed all these entries myself on an old Underwood standard typewriter. (The few corrections to these entries made especially for this Garland edition of the dictionary may be identified by their new IBM typeface.) Eventually, there came to be twelve file boxes arrayed around my desk like the manual of an organ so that I could reach any of the 22,000 excerpts from where I sat while typing the successive drafts of *Synergetics*. (See photograph.) The current edition is designed to provide the reader with comparable easy access. (In 1976 Princeton Datafilm Inc. published the dictionary in a format of 250 microfiche.)

The first title entry of the dictionary reads

The second title entry of the dictionary is replete with antique initial capitals:

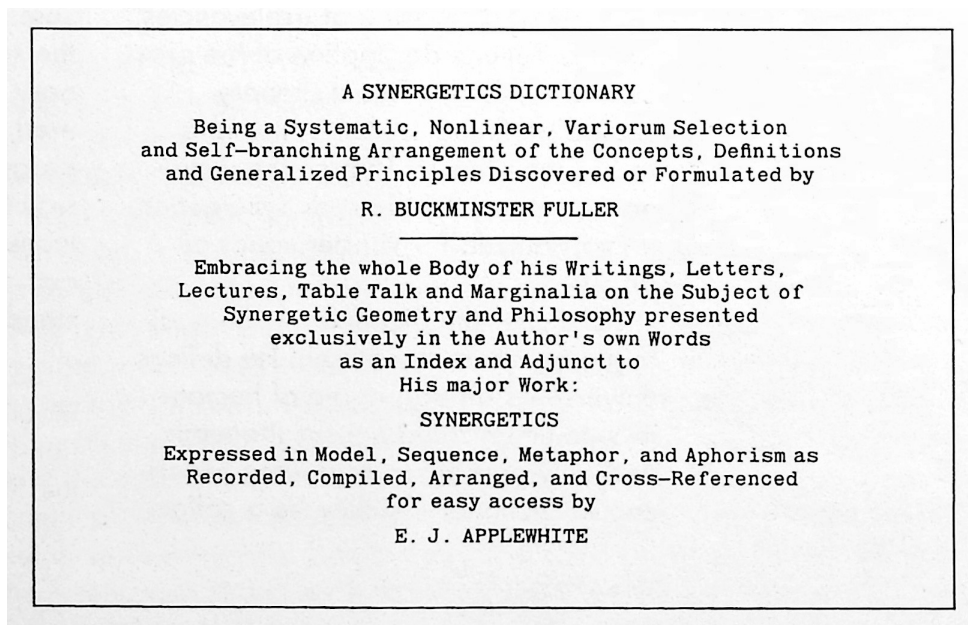

Figure 5: A SYNERGETICS DICTIONARY

A SYNERGETICS DICTIONARY

Being a Systematic, Nonlinear, Variorum Selection
and Self-branching Arrangement of the Concepts, Definitions
and Generalized Principles Discovered or Formulated by

R. BUCKMINSTER FULLER

as an Index and Adjunct to
His major Work:
SYNERGETICS

Expressed in Model, Sequence, Metaphor, and Aphorism as
Recorded, Compiled, Arranged, and Cross-Referenced

for easy access by
E. J. APPLEWHITE

Fuller had a penchant for putting things together, I for taking things apart. We both wanted to write a book as accessible as possible to the common reader, and wherever his peculiar and invented terms were unavoidable we wanted to be sure that they were exhaustively defined. Like many great teachers, Fuller's communications mode of choice was oral discourse. The transcripts of his many—always extemporaneous—lectures recorded the sound without the sight with unavoidable loss of the gestures and body language that always helped him juggle several themes at once in a tapestry of interwoven exposition. Sometimes a Fullerian metaphor will run on for minutes and pages at a time, strung together by gesture and intonation despite illuminating asides and digressions, but making for a certain complexity of syntax and some strain on the auditor's span of attention. As the architectural critic Reyner Banham once put it in describing Fuller's creative thinking, “Problems are simultaneously bulldozed frontally, undermined termitically, and outflanked by relative clauses lasting up to six weeks.”¹⁶

Even on the occasions when Fuller is terse and aphoristic, his statements can benefit from being read in context. Thus the problem of the dictionary as I saw it was to index it in such a way that it could afford the reader (including Fuller himself) both the short focus of the net statement as well as the full context from which the phrase was abstracted. At the price of redundancy, the dictionary provides both. For example, take his arresting statement “Time is an invention.” In these files that observation is indexed for comparison with Fuller's other notions of inventions and cross-referenced to passages where the phrase appears in its full philosophic context.

The method is tomographic, like a succession of medical X-rays in which details on one plane of a tissue appear clear and sharp while adjoining planes are blurred: by varying the focal length we can concentrate on different objects of consideration.

For instance, take a short paragraph from Fuller's essay “Total Thinking”:

16 *Arts Magazine*, London, October 1963.

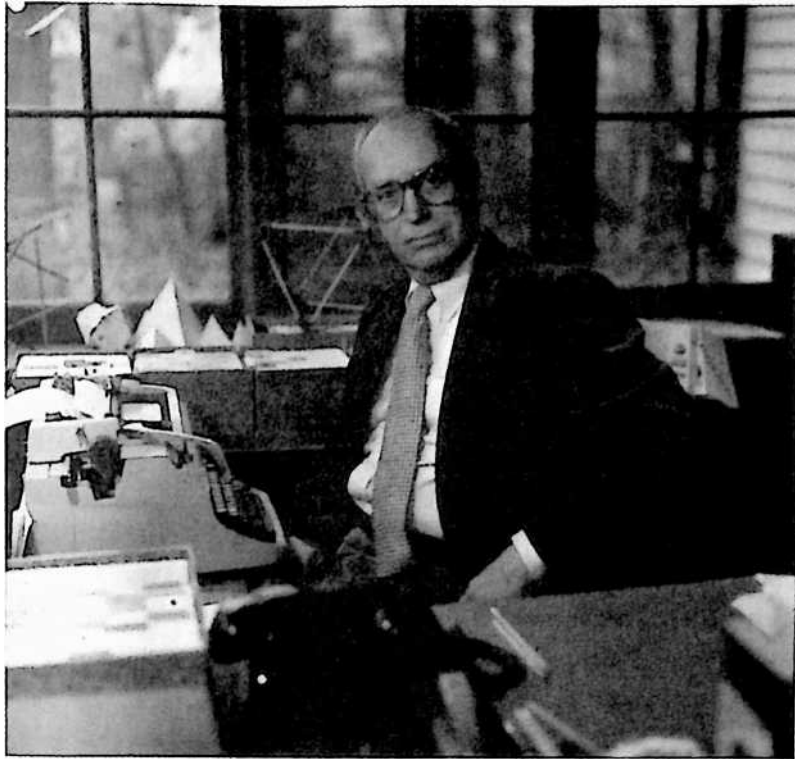

Figure 6: E. J. Applewhite and the *Dictionary* (Photo by Steve Flores, New York)

*Mathematical concepts of group phenomena may be acquired in principle by the willingness (subjectively initiated) of the individual to be governed by the integrity of progressive conceptioning principle—the objective synchronizations are implicit and unavoidable competence and comprehensive, realizable design will result. Let us pursue further the conceptioning in specifics of group principle.*¹⁷

That unusually difficult passage initiates an uninterrupted narrative of exposition requiring thirteen successive file card entries subsumed under the caption *Periodic Experience* (1)—(13). That particular paragraph is abstracted under *Subjective & Objective* and cross-referenced to *Individual & Group Principle*.

0.7 DEFINITIONS AND SEQUENCES

Fuller's vocabulary may be unconventional but it is rigorously consistent—there would be no point in a dictionary if it weren't—both in its employment of invented words and in its use of familiar words in a special way.

The dictionary is organized to serve as a bridge between the peculiar concepts and terminology of Buckminster Fuller and the more common terms of our everyday discourse. Thus for convenience some common terms that he simply never uses, such as “psychology” and “mortality,” are listed in the dictionary to provide cross-references to the invented phrases that he uses in their place. (For some examples see “Enter With Your Word: Exit With Fuller's” on page xxxviii

9: add link

.)

When appropriate, both the most concise and the most all-embracing definitions are presented—always in the author's own words. In cases where there has been a significant evolution in the development of a concept, successive citations are presented in chronological order. Sometimes the chronological sequences are not only of interest in themselves as an illustration of Fuller's *modus operandi*, but also of possible clinical interest as an exercise in cognitive science.

¹⁷ Chapter 12 of *Ideas and Integritys* (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1963), p. 237.

There are two main classes of entries (intermingled by alphabetical order). They are *Definitions and Sequences*.- *Metaphors*; the former tend to be topical in form while the latter tend to be narrative.

Definitions: Explicit statements of what the author means by each word he uses. Some words are limited to the most graphic and definitive examples; for example, there could easily have been a hundred different entries for the term *Regenerative* (a word Fuller works into almost every paragraph) while in fact there are seven. In a few cases the dictionary attempts to be exhaustive, as with philosophical concepts like *Limit*, *Set*, and *Metaphysical & Physical*. In other cases, like *Environment* and *Universe*, there appears an exhaustive record of the chronological evolution of the author's progressively poetic refinements of phrase.

Metaphors: Sequences: These narrative sequences that recur time and again in Fuller's lectures and writings have been assigned descriptive phrases or clauses to permit their systematic recapitulation. An alphabetical list of these major metaphors—in fact 668 of them—may be found under the file indicator *Sequences*. Sometimes as many as a half-dozen different versions are presented when there are significant variations, particularly over a period of time. For examples, see:

Bubbles in the Wake of a Ship

10: Add link

Sequence

11: Add link

Divide & Conquer Sequence Lever: Fallen Tree As a Lever Rich Man Drowning in Shipwreck

12: Add link

Wave Pattern of a Stone Dropped in Liquid

13: Add link

Miscellaneous entries: Some of the “table talk” items in the dictionary are not filed strictly as definitions but under the name of the person or object considered. Fuller always said that conversation was the most generous of the arts. Even when not lecturing, he was a prodigal talker—not at all as an indulgence but as what he considered an act of responsibility. Although he loved people and funny stories, he had no small talk. One could not inquire about his health or the journey or the weather without risking a response of disconcerting gravity.

I gathered these informal and impromptu observations from his casual discourse at such unpromising occasions as breakfasts with sophomores or long waits at airports—not to mention his marginalia on the back of envelopes, tickets and menus. As an example of his free-form conversation see the entry for *Aiken: Conrad*, 14 Feb 1972

14: Add Link

; it may not tell you much about Aiken but it's quite a glimpse into the mind of RBF and his views on the social function of literature.

For detailed instructions on all the nuances of tracing and searching available from the various types of cross-references, see “How to Use the *Synergetics Dictionary*,” beginning on page xxxiii.

15: Add Link

An incidental result—Fuller might have said a synergetic result—of the process of compiling the dictionary was its use as a device and stimulus for furthering the creative process itself. For Bucky there was never a final draft and seldom a time when he could be confronted with a file card of one of his earlier statements on some topic without wanting to amplify it (almost never to delete or erase). Some holographic examples of this procedure are included among the initial cards in “Sample Entries Edited by Fuller.”

16: Add link

0.8 A PERSONAL NOTE

People often ask me why I don't give a course or write a book that will really explain synergetics. One of the reasons I don't is that I see a basic incompatibility between the passive role of an editor and the active role of a teacher. A collaborator should not be an explicator. I have tried to write synergetics in the voice of one person—Fuller's. I never want the reader to have to worry about whether this is something RBF is saying or is it EJA who is talking; in these two books and in this dictionary the reader need have no doubt: the voice is always that of Fuller.

As for teaching synergetics I can come up with no better curricula than those I have already devised. They are the ninety-page index at the end of *Synergetics 2* and the comprehensive introduction to Fuller's work that this dictionary constitutes. I have nothing more to add.

An Annotated Bibliography of Books by R. Buckminster Fuller

Nine Chains to the Moon. Philadelphia: Lippincott, 1938. The original printing was 5000. Republished in paperback by Southern Illinois University Press in 1963. Republished in paperback by Doubleday Anchor in 1971 [[Ful38](#)].

The title derives from a statistical cartoon: “If ...all of the people of the world were to stand upon one another's shoulders, they would make nine complete chains between the earth and the moon. If it is not so far to the moon, then it is not so far to the limits—whatever, whenever or wherever they may be.” This is Fuller's first book and one of the few he wrote *as a book* and not as a composite of articles, transcripts, or letters. Many of his original and lifelong metaphors and strategies were introduced in this volume. A projected final chapter, “From Bibble to Bible to Babble,” was rejected by the publishers because its concrete poetry format was deemed too radical for inclusion in a trade book. The end papers anticipate the Dymaxion airocean world map. There are five appendices documenting Fuller's virtuosity in large patterns: (1) on the chronology of scientific events from the ancient world to 1936; (2) coincidence of U.S. population centers with isotherm of 32° F; (3) U.S. to become world's greatest exporter; (4) world copper production and consumption; and (5) growth of U.S. industry correlated with inventions.

Untitled Epic Poem on the History of Industrialization, with an introduction by Russell Davenport. Published in two separate paperback original editions from the same plates. Both now out-of-print. [[FW62](#)]

(1) Highlands, North Carolina: Jonathan Williams, publisher, the Nantahala Foundation (Jargon Series 44), 1962 (\$3.50).

(2) New York: Simon and Schuster, 1962 (\$1.95).

Jonathan Williams and Fuller became friends at Black Mountain College in North Carolina in the 1930s. Williams was delighted when in 1962 Fuller offered him a grant to help bring out this long poem in the Jargon Press series. Williams knew nothing about the concurrent Simon and Schuster edition until some years later when he came across a copy in a bookstore. Given Fuller's casual approach to the publishing process this kind of funny coincidence was not unusual.

Russell Davenport was an editor at Fortune magazine during the period from 1938 to 1940 when Fuller was a consultant. (Davenport was later national campaign manager for Wendell Willkie in the Republican campaign of 1940.) Almost buried on *the back* of the folded inside flap copy of the Jargon edition is Fuller's statement that he and Davenport closely collaborated on the *Industrialization* piece: "About 10 percent of the wording was Davenport's" and "...neither of us ever hoped it would find a publisher." In the introduction Davenport describes Fuller as "not a poet in words" but "a poet in science," and he had once described Fuller in Fortune as "the first poet of industrialization."

Hugh Kenner has characterized this anthem to American industry as "our only readable didactic poem."

Education Automation, Freeing the Scholar to Return to His Studies. Carbondale: Southern Illinois University Press, 1962. Hardcover (\$2.00). Republished in paperback by Doubleday Anchor (A0-30), 1971. Republished in London in hardcover by Jonathan Cape, 1973. [\[Ful62\]](#)

A transcript of Fuller's discourse to a university planning committee.

No More Secondhand God, and Other Writings [\[Ful63b\]](#). Carbondale: Southern Illinois University Press, 1963. Hardcover (\$4.00). Republished by S.I.U. press in the Arcturus paperback series in 1967 (\$2.45). Republished by Doubleday Anchor (AO-33) in 1971 (\$2.95). Vernon Sternberg of the S.I.U. Press was responsible for bringing out the first edition of this collection of occasional pieces. In addition to

the title piece, written in 1940, it includes other blank verses: “Machine Tools,” 1940; “The Historical Attempt by Man to Convert His Evolution from a Subjective to an Objective Process,” 1948; “Universal Requirements of a Dwelling Advantage,” 1917–62; “The Fuller Research Foundation,” 1946–51; “A Comprehensive Anticipatory Design Science,” 1956; and two prose essays with geometrical diagrams and tables, “Introduction to Omnidirectional Halo,” 1959, and “Omnidirectional Halo,” 1960.

I once asked Fuller whether *No More Secondhand God* meant secondhand as in clothes or second hand as in watch? He seemed bemused by the question and answered with a casualness I found suspect—“Now that you mention it,” he said, “I suppose both.”

Ideas and Integrities: A Spontaneous Biographical Disclosure. Englewood Cliffs, N.J.: Prentice-Hall, 1963. Republished in paperback by Collier Books, 1969. [\[Ful63a\]](#)

A major compendium of occasional writings with photographs and an index. I was able to establish dates for most of the chapters as follows: (1) “Influences on My Work,” January 1955; (2) “Later Development of My Work,” June 1958; (3) “Margaret Fuller's Prophecy,” November 1932; (4) “The Comprehensive Man,” January 1959; (5) “I Figure,” December 1942; (6) “Fluid Geography,” April 1944; (7) “The Cumulative Nature of Wealth,” from *Earth, Inc.*, 1947; (8) “Domes—Their Long History and Recent Developments,” first published 1963; (9) “Comprehensive Designing,” 1 June 1949; (10) “Design for Survival—Plus,” January 1949; (11) “Preview of Building,” 1 April 1949; (12) “Total Thinking,” May 1949; (13) “Prime Design,” May 1960; (14) “The Architect as World Planner,” July 1961; (15) “World Planning,” September 1963; (16) “The Long Distance Trending in Pre-Assembly,” no date established; (17) “The Future,” no date established; (18) “Continuous Man,” 1963; (19) “The Designers and the Politicians,” 1962.

The essay “Total Thinking” in this volume is a dense rhapsody ranking with “Omnidirectional Halo” (in *No More Secondhand God*) as one of the two most concentrated expositions of the major psychological and philosophical themes in Fuller's work, including man's conscious participation in his own evolution and the concentric organization of individual and group observations of experience.

“Total Thinking” and “Omnidirectional Halo” depart from the common pattern of transcripts of extemporaneous oral discourse; they show the kind of writing that Fuller is capable of when he is alone with his thoughts and putting it all down in longhand with no one else's assistance whatever.

Ideas and Integrity was organized and edited by Robert W. Marks who also contributed an introduction and participated in the initial royalties.

Operating Manual for Spaceship Earth. Carbondale: Southern Illinois University Press, 1969. Hardcover (\$4.25). Republished by Simon and Schuster as a Clarion paperback, 1970 (\$1.95). Republished as a Pocket Books paperback, November 1970 (\$1.25). Republished as an E. P. Dutton paperback, 1978 (\$2.95). [[Ful69a](#)]

Of all of Fuller's books this is the simplest introduction to his thinking and the most accessible for the general reader. It is a transcript of a lecture that Fuller gave to a meeting of the American Institute of Planners in Washington, D.C., in October 1967. A member of the institute, William R. Ewald, Jr., and his wife edited the tape from a faulty transcript and prepared it for initial publication in *Environment and Change*, issued by the Indiana University Press.

Utopia or Oblivion: The Prospects for Humanity. New York: Bantam Books. Paperback original, December 1969. Republished in hardcover in London by Allen Lane, The Penguin Press, 1970. [[Ful69b](#)]

A substantial compendium of transcripts of lectures during the period from 1964 through 1967. The individual transcripts were edited and this anthology was organized by Robert W. Marks who was science editor of Bantam Books at the time. Marks also contributed a signed introduction.

The Buckminster Fuller Reader, edited and introduced by James Meller. London: Jonathan Cape, 1970. [[FM70](#)]

This anthology—available only in England—recapitulates all of the essays in *Ideas and Integritys* except for the three chapters 9, 14 and 17. It also contains “Universal Requirements of a Dwelling Advantage” from *No More Secondhand God*, and two pieces not elsewhere published in book form: “Buckminster Fuller Chronofile” and “Designing a New Industry.”

Intuition. Garden City: Doubleday, 1972. Hardcover (\$5.95). Revised edition in Anchor paperback (AO-58) (\$2.95). [Ful72]

In 1970 and 1971 Fuller was concurrently composing a poem suggested by his new Morgan sloop “Intuition” and rewriting, with my collaboration, the projected first chapter of *Synergetics* called “Brain and Mind.” Fuller agreed with my suggestion that this first chapter had an integrity of its own separate from the rest of the *Synergetics* manuscript, and he felt that both of these works had an urgency that argued for their publication at the earliest possible date. With the help of Bill Whitehead, our editor at Doubleday, they were combined in *Intuition*, the first of his two books of blank verse.

Earth, Inc. Garden City: Anchor Press/Doubleday, 1973. Paperback original (AO-62). [Ful73]

A collection of occasional polemical pieces on the continuing theme of making the world work.

Synergetics: Explorations in the Geometry of Thinking, in collaboration with E. J. Applewhite. Preface and contribution by Arthur L. Loeb. New York: Macmillan, 1975. Third printing, 1978. Macmillan paperback edition, 1982. [FA75]

And It Came to Pass—Not to Stay. New York: Macmillan, 1976. Hardcover (\$6.95). [Ful76]

Seven compositions in blank verse form. The best known of these poems is not the title work but the often-cited “How Little I Know” and “What I Am Trying to Do.”

Tetrascroll: Goldilocks and the Three Bears. Published jointly by Universal Limited Art Editions (ULAE) and St. Martin's Press, New York, 1977. [Ful82]

A series of twenty-one original triangular lithographs (with narrative captions) which may be displayed in a helical scroll of linked tetrahedra. They were executed during the years 1975 and 1976 under the guiding light of Tatyana Grosman (to whom Fuller had been introduced by Edwin Schlossberg) at her ULAE print workshop in West Islip, Long Island. In something of a publishing innovation this trade book was brought out concurrently with a limited edition of the signed original lithographs. Michael Denny was the editorial impresario at St. Martin's and Ronald Feldman Fine Arts handled the exhibition of the lithographs.

Fuller composed the *Tetrascroll* between the publication of *Synergetics* in 1975 and *Synergetics 2* in 1979. He had been frustrated by the rigid structure of the synergetics books which, despite certain advantages, he felt robbed the work of spontaneity and narrative force. To compensate for this Fuller worked feverishly on the *Tetrascroll* as a free-form obbligator to the synergetics books. He explained to me at the time, "The empirical, the scientific way to present the argument of synergetics is the way I am doing it in *Goldilocks*."

Synergetics 2: Further Explorations in the Geometry of Thinking, in collaboration with E. J. Applewhite. New York: Macmillan, 1979. Macmillan paperback edition, 1983. [FA79]

Synergetics 2 contains a ninety-page index to both volumes. They comprise a single work with the sequence of paragraphs numbered to dovetail in a single integrated narrative. They should eventually be published as a single work eliminating the artificial division into two volumes resulting from the chronology of their composition.

Critical Path, with Kiyoshi Kuromiya, adjutant. New York: St. Martin's Press, 1981. In both paperback and hardcover (boxed). [Ful81]

A mature summation in one volume of all of Fuller's lifelong design artifacts and planning strategies. It has an introduction on the "Twilight of the World's Power Structures" and presents a systematic critical-path analysis of the crisis of humanity in this century—his most urgently polemical prescription for the geosocial revolution. As the book went to press he told me fervently that *Critical Path* was by far his "best and most important book because it has everything you wouldn't let me put in *Synergetics*."

Grunch of Giants. New York: St. Martin's Press, 1983. Hardcover (\$8.95). [Ful83a]

Grunch stands for “Gross Universal Cash Heist,” a graphic turn of phrase intended to excite and admonish. This is a hortatory sequel to *Critical Path* and its program for individual dedication to strategies for making the world work. Kiyoshi Kuromiya's role in helping Fuller prepare this book for publication was equal to if not greater than his contribution as adjuvant—Fuller's term—in *Critical Path*.

Inventions: The Patented Works of R. Buckminster Fuller. New York: St. Martin's Press, 1983. [Ful83b]

An oversize volume presenting photographs and facsimile drawings of twenty-eight of Fuller's patented inventions from 1927 to 1983. It contains an autobiographical introduction, “Guinea Pig B”—“B” is for “Bucky,” who always said “I'm the only guinea pig I have.” An appendix recapitulates Fuller's honorary doctorate citations with notes by St. Martin's editor Michael Denny whose close collaboration with Fuller included review of the final galleys, which was not completed until after Fuller's death. 356 pages with 75 photographs and more than 400 drawings.

The Artifacts of R. Buckminster Fuller; A Comprehensive Collection of His Designs and Drawings in Four Volumes. Edited with descriptions by James Ward. [FW84]

Volume One. *The Dymaxion Experiment, 1926–1943*

Volume Two. *Dymaxion Development, 1927–1946*

Volume Three. *The Geodesic Revolution, Part 1, 1947–1959*

Volume Four. *The Geodesic Revolution, Part 2, 1960–1983*

New York: Garland Publishing, Inc. 1985.

Engineering and architectural drawings from the Fuller archives. In addition to the editor's introduction, Volume One contains a chronology of Fuller's career and a bibliography. A profile of Fuller written by Calvin Tomkins, “In the Outlaw Area,” which originally appeared in the *New Yorker* (8 January 1966), is reprinted here in full at the suggestion of Mr. Fuller's daughter Allegro Snyder and through the courtesy of Mr. Tomkins.

A Special Note:

The Dymaxion World of Buckminster Fuller, by Robert W. Marks. New York: Reinhold Publishing Corp., 1960. Republished by Southern Illinois University Press, 1969. Republished by Anchor Press/Doubleday in paperback (A0-35), 1973. [MF60]

This book by Robert W. Marks is a special case as strictly speaking it doesn't belong in a bibliography of books by R. Buckminster Fuller since it is a book about him. But it is almost a book by Fuller, for Marks says in a prefatory note that there are many quotations and paraphrases based on personal conversations with Fuller, and besides, when the book was in galleys, Fuller intervened and rewrote and amplified many of the captions.

The Dymaxion World of Buckminster Fuller is copiously illustrated. It was for many years the only available introduction to all aspects of Fuller's work and it remains the most comprehensive and sympathetic one.

It should be noted for the record that the S.I.U. Press edition of 1969 is not a "second printing" as indicated in the front matter, but actually a second publication after the Reinhold edition had gone out-of-print. To make the S.I.U. Press republication possible, Marks was reluctantly persuaded to relinquish his rights in the book to Fuller. To confound matters further, the revised Anchor Press paperback edition of 1973 was brought out without consultation with Marks and (though throughout the text it consistently refers to Fuller in the third person) it lists Fuller first on cover and title page as co-author.

Over the years, a number of other books have appeared that give Fuller's name as co-author. I have omitted them from this listing as his connection with such works was invariably too casual or too remote to implicate him in the result.

When Fuller died he left behind for us a virtually completed manuscript for his posthumous work *Cosmography*, and when that eventually appears in print it will become the nineteenth and final book in the Fuller canon.

How to Use the *Synergetics Dictionary*

The description of the dictionary and instructions for its use are divided into the following sections: Rationale; Captions; Citations; Cross-References; Scope; File Indicators; Tomographic Effect;

Enter with Your Word: Exit with Fuller's.

0.10 RATIONALE

The design of the dictionary derives from the assumption that Fuller's idiosyncratic style, difficult syntax, and predilection for oral discourse make his message not easily accessible to the average reader. He has a penchant for juggling several themes at once in an interwoven tapestry of exposition. Even his most terse and pithy statements benefit from being read in context. Sometimes an extended metaphor may take him pages to complete while he strings together a provocative pattern of digressions and observations.

For example: "Time is an invention." Certainly this thought is an arresting one. It merits being abstracted for comparison with other Fullerian inventions. But to get the author's full philosophic intent it must be read in context where the dictionary file card indicates it may be found, at both *Twelve Universal Degrees of Freedom*, 29 May 1972, and *Timeless*, 1 April 1972.

Thus the rationale of the file is to provide the reader with both the short focus on the isolated aphoristic net statement—or definition—as well as the full context from which the word or phrase was abstracted. At the price of redundancy, the dictionary affords both.

Letter to Dale Klaus: On the ninth of February, 1970, Fuller wrote a letter to his administrative assistant at Southern Illinois University in Carbondale, which read in part:

Dale:

Please arrange with Constance Abernethy [a free-lance editor in New York] to have an exhaustively cross-referenced, alphabetically coded, first-word indexing of my topical concept files upon which she has been working for several years. I feel it imperative for the World Game computerization of the scenario strategies that this work be completed while I am as yet alive and able to supervise its insinuation into the total playing and to be able to do so at the outset before lines of alternative and less alternative strategems have been hardened—which may preclude the ready insinuation into the grand strategy of the insights and concepts which I have been employing successfully over the years. ...I want you also to study the means...to package up all the concepts for quick retrieval printouts to save me from a fantastic magnitude of repetitive discourse and writing.

Commencing exploration: The best way to judge an atlas is by looking up your hometown or some place you are familiar with. What are some phrases that come to mind when you think of Buckminster Fuller? Such phrases or keywords should lead you to main entries or a choice of cross-references.

If nothing in particular comes to mind, try starting in at any of the following:

Starting with Universe

identity

Technocracy

Social Sciences: Analogue to Physical

Sciences

Games

Sex

Dreams

Prognostications about Future of Man

Artist

Walking

0.11 CAPTIONS

At the top left-hand corner of every dictionary entry, and above the underlined caption, is the phrase “RBF DEFINITIONS.”¹⁸ The caption itself, whether a word or a phrase or a clause, is always underlined. And the caption is invariably in Fuller's own language wherever it is followed by an excerpted text. Captions which are not representative of Fuller's vocabulary are employed only for purposes of cross-reference.

0.12 CITATIONS

Citations are listed as the bottom line or last two lines of the file-card entry. They are from both published and unpublished sources. Published sources list the title of the volume in capital letters, the page number or numbers, and the year of publication. Only a very few unpublished sources are undated; most unpublished citations provide month, day, and year as well as a geographical location. One of the purposes of the precise dating of citations is not only to list them in proper order for cross-reference but to provide a documentation of the evolutions and refinements of Fuller's phraseology of his concepts over a period of many years.

The major published sources for citations in this dictionary are the two volumes *Synergetics* and *Synergetics 2* published by Macmillan in 1975 and 1979; in these cases, citations are to section number rather than page number. In many cases the cited text will have preceded or anticipated the text of the books as finally published; in these cases section numbers have been provided retrospectively.

Synergetics 2 is sometimes referred to as “Synergetics, 2nd. ed.” Section numbers cited in italics (e.g., Sec. 100.020) or preceded by “s” (e.g., Sec. *si00.020*) also refer to *Synergetics 2*. The abbreviation “I & I” stands for *Ideas and Integrity*; “U or O” stands for *Utopia or Oblivion*. Citations such as these appearing in IBM typeface were prepared specially for the Garland edition of the dictionary.

18 Where the phrase “RBF DEFINITIONS” is three to five spaces to the left of the margin, this indicates all extracts included in the Princeton Datafilm microfiche edition of July 1976. In extracts cited since that date the phrase “RBF DEFINITIONS” is directly flush with the left margin.

0.13 CROSS-REFERENCES

There are three types of cross-references indicated by a number in parentheses in the upper right-hand corner of the file entry: primary reference (1); secondary reference (2); and third-level reference (3). An effort has been made to provide cross-references that are extensive if not exhaustive. However, some entries will have no cross-references, some will have only primary references, many will have both primary and secondary references, and only major subjects will be recapitulated with third-level references. Examples are as follows:

Primary references

(1)

Membrane:

See Diaphragming

Invisible Trampoline

Occulting Membranes

Omnidirectional Shutterable Sieve Monometric Bubble Skins

Electromagnetic Membrane

All entries under each cross-reference refer to the caption *Membrane*.

Sweepout: (1)

See Ecology

Deployment: Man's Increasing Deployment Pattern

Human Sense Ranging & Information Gathering

Locomotion: Radius of Man's Locomotion

Man's Universe Penetrations

Man's Degrees of Freedom of Action

Outreach

Radial Reach

Reachability Range

Science-Technology-Industry-Economics-Politics Sequence

Travel in a Human Lifetime

All entries under each cross-reference refer to the caption *Sweepout*.

Secondary references

Membrane: (2)

See Bubbles, (2)

Domains of Actions, 21 Dec 1971

Privacy, 22 Apr '61

Only the specific entry cited in the cross-reference refers to the caption *Membrane*.

When an asterisk (*) appears following a citation in the listing of secondary references, it means that you need not bother to look it up in its primary location, as that particular

reference has already been abstracted and retyped for inclusion (in proper chronological sequence) among the subject captions in the upper left-hand corner.

Third-level references

Cosmic: Cosmos: Cosmology:

See Cosm

Cosmetry

Cosmic Accounting

Cosmically Bankrupt

Cosmic Bridge

Cosmic Coherence

Cosmic Communication Circuits

Cosmic Complementary...

(3)

The third-level cross-reference card recapitulates all the subordinate captions under the major topic.

0.14 SCOPE

The editor has attempted to be highly selective and discriminating in compiling this dictionary. Fuller's vocabulary is unconventional but consistent, in both its employment of invented words and its use of familiar words in a special way. Wherever possible both the most concise and the most all-embracing definitions are presented, always in the author's own words.

There are two main classes of entries (intermingled by alphabetical accident):

Definitions: The definitions are explicit statements of what RBF means by each word he uses. Some words in the Fuller litany are limited to the most graphic examples. In only a few categories does the file attempt to be exhaustive, mostly with abstract or philosophical concepts. In some cases there appears a fairly exhaustive record of the chronological evolution of the author's phraseology.

Metaphors: Sequences: "Metaphors" and "sequences" are the terms used to describe the many frequently recurring narrative passages employed primarily in RBF's oral discourse. These are captioned and indexed under a selected salient phrase, all of which are recapitulated under the file indicator Sequences. Sometimes as many as a half-dozen different versions of the same theme are included in the files where there appear to be significant variations.

0.15 FILE INDICATORS

The file indicators comprise a virtual fourth level of cross-references in an effort to make every aspect of Fuller's language available to the reader for easy access. See page xiii of this volume for a list of the principal file indicators with page numbers.

0.16 TOMOGRAPHIC EFFECT

To illustrate how the *Dictionary* allows for exploration of the full context of an entry, one of the file entries for *Periodic Experience* is reproduced below. The words for which there are cross-references have been italicized in this example and references suggesting further planes of meaning have been added vertically.

Periodic Experience: (1)

“Mathematical concepts of group phenomena may be acquired in principle by the willingness (*subjectively* initiated) of the *individual* to be governed by the integrity of progressive conceptioning principle—the *objective synchronizations* are implicit and unavoidable competence and comprehensive, realizable design will result. Let us pursue further the conceptioning in specifics of *group principle*.

“It is not difficult to understand that the trends to synchronization by *harmonic interval* of one collection of events can seemingly and sumtotally create an aspect of such superficial incongruity in respect to the sumtotal collected harmonic events of other phases of functional disposition, of the differentiable Universe, as to predispose us to assume that there might never be synchronization of one major collection with another. We obviously incline to this predisposition by virtue of the persistence of the familiar in our own *environmental close-up*—thought, which causes the *dynamic* interpenetrations to appear as a *static*, rather than as a *periodic-continuity* environment reality.

Abstraction;

"Complete abstraction is a formidable force."

- Citation A context at Design Science A World Gama (B), 28 Apr'74

Abstraction:

"What the mathematicians have been calling abstraction is reality. When they are inadequate in their abstraction then they are irrelevant to reality. The mathematicians feel they can do anything they want with their abstraction because they don't relate it to reality. And, of course, they can really do anything they want with their abstractions but, like masturbation, it is irrelevant to the propagation of life.

"The only reality is the abstraction of the principles, the eternal generalized principles. . . Most people talk of reality as Just the after-image effects--- the realization lags, which register superficially and are asymmetric and off center. (The principles themselves have different lag rates and different interferences.) When we get to reality it's absolutely eternal."

"The inherent inaccuracy is what people call the reality. Man's way of apprehending is always slow: ergo the superficial and erroneous impressions of solids and things, which can actually be explained only in principle."

Syntropy A Entropy

^A GC Ale ration: Angular k Linear 8

"Release from angular acceleration appears to be linear acceleration but the linearity is only theoretical. Linear acceleration is the release from the restraint of the nearest accelerator over to the angularly accelerative or decelerative restraint of the integrated vectorial resultant of all the neighborly dominant forever-otherness restraints in Universe. Linear acceleration never occurs because there is never innocence of otherness,"

$C^1 J?H_{on} 2t^{htr^{naaa}} \gg \ll t Einpt.ir.i$

Orbits, (1) , 20 May *75

Acceleration: Angular &. Linear:

"Physics does not speak of motion; it speaks of acceleration* And physics has identified only two kinds of acceleration--- linear acceleration and angular acceleration. We are informed experientially that this is a misinterpretation of the data.

"There are indeed two kinds of acceleration but they are both angular. All accelerations are angular and cyclically complete There are no open endings in Universe. Physics has discovered only waves and no straight lines.

"The angular accelerations, however, manifest a vast variety of radii. The differentiation of physics into linear and angular occurred when the humans involved failed to realize the the diameter of the little circle is always a small arc of a vastly greater circle passing through it. The greater the radius the slower the total cyclic realization. There are no straight lines or 'linear infinities.' Realization of this is what Einstein spoke of as 'curved space. •"

A&E&L&M&B: Angular and Linear Acceleration:

In Synergetics there is a total "correspondence of radial wave modular growth with circumferential modular frequency growth of the totally involved vectorial geometry." This means that "angular and linear accelerations are identical."

- Cite Ltr. to Prof. Von Hochstetter

18 Oct 1964, p. 4 and footnote.

Acceleration: Angular & Linear: (1)

"There is something else that I will draw for you now that is not in the pictures that I have shown to you and it has to do with the phenomenon I was talking to you about: the insideouting of the tetrahedron. I spoke about the physicists having two ways of classifying the movements of the Universe, what they call acceleration.

"They have angular and linear acceleration. The angular accelerations go around like this while they are restrained from a common center; and the linear, when you let go of it, let go Just like that. When we let go of a rocket we just see a point for a very few minutes. The it

is outside and we put radar on it and we can tell where it is. We can only really do it in terms of the angular direction--- where it is going--- ana watuning clockx suy: •! know what it's velocity is; I know how far it is.'

"What we are doing is using a clock, which is an angular acceleration; and we say it went one minute, and two minutes, and so forth--- these are linear increments. What we call size are some kind of linear increments which you could treat in"

- Cite Oregon Lecture #6, p.21O, 10 Jul'62

AcfiaXsjatlsn: Angular A Linear: (2)

"terms of first and second power. You would not have a linear increment until the cycle was complete. We use some kind of cycle. It may be a cycle of atomic oscillation. Or it could be of a clock. But it is some kind of cycle, and until the cycle is complete you don't have an increment.

"Therefore we discover that in angular acceleration--- I started at six o'clock to play the game and I have only gone this far and I haven't made a cycle, and yet this is measurable.

"V/e find that an angle is subcyclic. We said there was no size until the cycle had been completed. V/e find an angle is a priori of no size: it has nothing to do with the phenomena size. The length of the edges are the linears and have nothing to do with what this angle is. Angle has nothing to do with size.

"It was one of these qualities of the tpahedron with the 60-degreeness, synmetry, and so forth, which was completely independent of size. I found this a very important discovery. We see the tetrahedron turning inside-out, so now you know what that one was about."

- Cite Oregon Lecture 6, p. 211, 10 Jul*62

"In the inherently subjective language of physical transformation of an omni-interaltering and accelerating Universe there are only two fundamental kinds of observable transformational changes, i.e. angular, or subunity alterations, and linear, or plural unity (frequency modulated) accelerations. These subjectively viewed transformations of Universe are also objectively and locally controllable by man through designed angle and frequency modulations.

"In the Energetic/Synergetic Geometry's isotropic, vectorially triangulated, omnidirectional matrix initiations the angular and linear accelerations are rationally and

uniformly modulated, whereas, in the XYZ coordinate analysis of the otulus only the linear is analyzable and the angular resultants are usually irrationally expressed."

Acceleration of Change? I¹)

"There is no longer valid dissent to the concept of accelerated change in the affairs of man on Earth. The average USA family now moves out of town every four years. My present official address for passport taxation combination is in Carbondale, southern Illinois, the sixth state in which I have had successive voting privileges. Whether I am in residence or not, my land, my house, and I whirl constantly around the Earth's axis together at about 800 miles per hour. All the while our little Spaceship Earth zooms around the Sun at 10,000 miles per hour, while at the same time our solar system rotates in its nebular merry-go-round at hundreds of thousands of miles per hour.

"In all reality I have not left home, as it is usually said of me. My backyard has just grown progressively bigger. Since now, the world is my backyard. Where do you live and what are you are progressively less sensible questions. As of now I am a passenger on Spaceship Earth. I don't know what I am. I know I am not a category hybrid specialization. I am not a thing, a noun. You and I seem to be verbs in evolutionary process. Are we not integral functions of the Universe?

"In 1917 in the U.S. Navy I had intuited that our intermultiplicated acceleration of technical events was beginning and that" - ItiJF to B. Farrell; Bear Island; Tape 6A, p.15, 16 Aug'70

Acceleration of Change: (2)

"would bring about a fundamental reorientation of human life on the Universe. This concept of accelerating acceleration had been discovered by Galileo circa 1600 with respect to the first laws of motion. They were not conceived of, however, as accelerating ecological evolution up to the date of my intuiting and acting upon its arrival. Discussion of economic* and evolutionary acceleration does not begin in the intellectual publications until more than a decade later. Nor did

my 1922-27 discoveries that ever higher tool performance per units of pounds, time, and energy fallout from the weapons industry into the domestic consumer economy, when erstwhile weaponry-support contractors sought to exploit their advanced technological position after their war goods contracts were terminated by progressive obsolescence. It was resulting in doing ever more with less, ever more with ever less in the domestic economy. This domestic economy thought only in terms of more security only to be accomplished with more weight.

"This reversal of affairs seemed to me to suggest that the Malthus dictum that only a few could survive, might be wrong. It seemed that it could come to pass that all humanity might"

- HBF to B. Farrell; Bear Island, Tape 6A, p.16, 16 Aug'70
Acceleration $Q? \text{ } ^c b^a n r > s: ^{13}$)

"become both physically and economically successful in the foreseeable future. I identified this progression of doing more with less as ephemerization. Fortune magazine published my 1922 concept of ephemerization in 1940 in a prominent manner. Despite ephemerization having subsequently wrought epochal advancements in the standard of living for two billion previously deprived humans, ephemerization is a fact that, in 1966, is largely unknown to or overlooked by the world's professional economists. Nonetheless the concept of accelerating acceleration and ephemerization have now brought 40 percent of humanity into the paradoxical state of world success, ergo apprehensive physical and economic success.

"I decided in 1917 to contribute to the scientific documentation of the emergent realization of the era of accelerating acceleration of progressive ephemerization. I determined to do so by methodical and chronological inventorying of all the human communications

in which I was personally involved, all mention concerning me transacted by others. I have kept this lifelong file, which I call the dymaxion chronofile...which consists bo of 250 volumes containing 80,000 letters, 300-400 pages per volume. The first important regenerative effect upon me of keeping this active chronological record was, I learned, to see myself as other see me."

" RBF to B.Farrel, Tape 6A, p.17, 16 Aug'70

it BE dtHKITIUKS

Accommodation:

'Action and interaction of events are accompanied by relative displacements and accommodations of other events. For example, when a stone is dropped into a tank of water, the stone does not penetrate the water molecules. The molecules are jostled; they 'accommodate* the stone, and in the process jostle their neighboring molecules, which, in turn, jostle their own border companions. Thus waves of relayed jostling are propagated, such relayed wave, although a composite of local actions, provides a synergetic continuity of those actions. The consequence is a pattern of events which has an integrity of its own, independent of the local accommodations (which are innocent with respect to the overall synergetic pattern). .

. .

"The stone thrown into the tank inaugurates a complex of accommodative events operative in pure principle. . .

"When radio or television waves pass through the walls of a house, when light waves pass through a window or a lens, there are always some comprehensively relayed local jostlings, some sets of submicroscopic eddies of force, that accommodate the push through ..."

12 Jun'74

"Engineers have been proud of pointing out that the difference between engineers and lay society is that engineers know that every action has its reaction and that lay society thinks only of the actions. Before the speed of light was measured, light seemed, to all humanity, to be instantaneous. Since we now know experientially that neither light nor any other phenomenon is instantaneous, we may conclude that an

action and the vectors it creates are neither simultaneously occurring nor instantaneous. Because vectors have discrete length, whose dimension represents the energy mass multiplied by its velocity, every action vector has two terminals--- a "beginning¹ and an * ending!* at the end of its noninstantaneous action. The beginnings and the endings are nonsimultaneously occurring. Therefore the 'ending' terminal of an action's vector occurs later than its 'beginning.' Therefore, every action must have a reaction vector at its 'beginning' terminal and a resultant vector at its 'ending' terminal. The reaction vectors and the resultant vectors are never angled at 180 degrees to the action vectors. They are always angled precessionally at angles other than 180 degrees."

Additive Twoneia:

"Thia number plus two is a very interesting kind of a number. The fact that it is second power and it is times tens Does this fact bother you? Not particularly, because we will find out later what the times ten is. Ten is a number made up of two primes, the prime numbers five and two. We will discover what its significance is. It has something to do with the fact that the vector equilibrium has twelve degrees of freedom, and we find that two of those degrees of freedom are always subject to being polarised...If you remember looking at the center core of the vector equilibrium system, you found six sets of lines leading in, , making 12 radii going through the ceneter. We found twelve fundamental degrees of freedom, so one of the degrees of freedom could be used for spin, and if you do, then you automatically have to assign two of the balls out of the 12 for the problem of spin. We find that there are always in any layer two left over in that layer to act as bearings for the spin. They could be isolated from anything else this does energetically. You have to have something that takes care of the axis; and they take care of the neutral axis,"

Aesthetics of Uniformity: (1)

"I must caution you that you will be confronted constantly by the statement that mass production of houses eliminates the aspect of individuality which is so cherished by humans and without which they are afraid they will lose the identity of their personality, therefore, mass production houses will never gain popular acceptance.

"My answer to that is that reproduction or regeneration of form is a fundamental of nature and that it is neither good nor bad in itself. However, reproduction of originally Inadequate or awkward forms, or poor mechanics or wasteful structures, either by the hand of man

or by the regeneration of the biological species, tends to amplify the original characteristic. If the original is annoying, reproductions become increasingly annoying; if the original is highly adequate to its designed purpose, reproductions become increasingly pleasing in the consignment of adequacy. In the latter light, we continuously admire a fine species or cultivated rose or nature's wildflowers--- the more frequently repeated, the more beautiful. Conversely, the more frequently we see a maimed soldier, the more disheartening becomes the repetition. There would be even less virtue of the so-called individuality in the discovery*

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.218), 1946

"of soldiers¹ sons born with a half a face blown away* or with three legs.

"Individuality goes far deeper than these surface manifestations with which people have sought to deceive one another as to the relative importance of their status and in the bitter struggle to validate one's right to live. Those who were powerful but ugly and lousy paid for fine clothes and fine surface architecture, and a superstition has persisted that people who could afford to pay must be superior individuals. The powerful have whipped the weak for centuries on end to instill that superstition. As long as might excelled over right that superstition had to continue. Now that we propose housing to be produced by an industry in which right makes might at less than a pound per horsepower the superstition is obsolete.

"There is no individuality in conventional houses. They are all four-square boxes with varying lengths of rotting wood Greek column, nailed on to the front, every house so similar and the streets so similar that without signboards the stranger cannot tell the difference between one American town and another,

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.21g), 194.6

"let alone detect individuality in the separate and pathetic homes*

"On the other hand, it has been discovered that the more uniform and simple the surfaces with which the individual is graced, the more does the individuality, which is the abstract life, come through. Trained nurses in uniform working in a hospital are notoriously more attractive as individuals than the same girls in their street clothes when off duty."

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, p.219)» 1946
AgattittlGfl gf VnlfCTltT

"There is that sameness that makes twins, or even brothers and sisters of different ages, oft times indistinguishable to strangers; that makes whole races indistinguishable to the members of another race, yet which, with familiarity, becomes suddenly inconceivable of existence. That kind of sameness embodying character and harmony through repetition is not unhappy. There is the even greater sameness of a flotilla of destroyers, far more accurate in duplication than the human, with inspiring rhythm of appeal when seen in formation under way or moored. Without visible distinguishing mark to the stranger, the destroyers have almost living individualism to their crews."

"I've been fighting--- many of us have--- to stop sulphur going into the sky. The Edison electric generating stations all around the country are bad culprits about this. As you fly over the different cities you see smog and you look where it comes from and a dozen chimneys provide the whole damn thing, primarily Edison chimneys. I was the speaker three weeks ago in Hartford at the National Edison Institute of America, all the executives...The host was one of the large engineering manufacturers of boiler equipment. And while talking with engineers and research men I found that the equipment exists and is highly perfected to take all the sulphur out. The cost it would add to the production of electricity would be only thirty percent and you'd have no fumes in the sky."

' "Thirty percent?"

"Yes, practically nothing.

"Isn't that kind of high?" I ask.

Fuller has been looking out toward the bay. But at this he snaps around, claps his hands together sharply, and glares at me."

- Cite Rasa Gustaitis in WHOLLY ROUND (HR&V,NY) p.154, Feb'73

' "High? High for what?" he shouts. There's fury in his face.

"High for what, dah'lin', high for what?*" he repeats, straining to speak more calmly.

"The company would think it high," I stumble.

"High for death or high for life?"

"I understand you, Dr. Fuller, but..."

"To take the fumes out of the sky would cost thirty percent more," he interrupts. "The Edison men think it's so high that the industrial companies which could generate their own electricity but buy it from them would start generating their own. So they don't want to put the price up.

"I was thinking they would think it high." All I meant was that under current conditions a thirty percent rise was unrealistic."

But later, when I reflect upon that incident, I decide he was the realist, not I. I reflect that Cliff Humphrey, head of

- Cite Rasa Gustaitis, WHOLLY ROUND (HR&W,NY), pJ55, Feb'73

Ecology Action had said he was engaged in 'changing what was politically feasible,' That's what Fuller was doing too. And the obstacle for both of them was the sort of timidity of expectation I had just manifested.

Fuller spoke radically, that is, from the root of the thing.

He assumed that people had the right to expect industry to stop poisoning them. And the right would be recognized only when enough consumers and citizens stopped believing industry's propaganda about what was politically and economically feasible."

Afyep Ljfy:

"...Finally there was so much know-how, and so much tooling, and so much resource development that they said, "You know we ought to be able to take care of the pharaohs and the nobles but the middle class. That's where you really watch history opening up. With Greek and Roman history we have a rich middle class --- also with its mausoleums getting ready for the after life. Finally there's so much accumulation of know-how in the present life that we finally have a Buddha, and A Christ, and a 1-lohairmed saying, "We have enough now to take care of the after life of everybody.' That really is a significant moment when everybody is in on the after life. That begins the whole era of all the

great cathedrals, looking out in every way to help those people get ready for the after life. Everybody's in. This exerts a very powerfully operative effect. You see the figure in a black shawl in those great cathedrals and there's fantastic pathos, and her eyes light up with ecstasy to think of joining her lost ones..."

Air:

I'm just going to throw in some figures I find very startling. Have any of you any idea about the weight of air? Do you have any feelings about the weight of air? I have a 100-foot sphere full of air, 10 stories high. Somebody tell me quickly the weight of air in a 100-foot-diameter sphere. Everybody avepges about three pounds of food a day; some way overdo that. We take on also about eight pounds of water and every one of you breathes and combines with that food and water 84 pounds of air a day. This is your really big food. I think it's simply astonishing. The sphere full of air--- there's seven tons of air in it. Air weighs plenty."

Air Delivered City;

"The building industry is the last holdover of the archaic craft system. We are going to have to revise our building technology. The Lockheed Corporation already has drawings for an aircraft holding ten thousand passengers. There is no reason why you couldn't build a New York skyscraper along similar lines. It could be built horizontally under mass production conditions and flown in horizontally to minimize drag, then upended. In this fashion we would be able to deliver a whole city in one day by air."

- Cite RBF quoted in New York Magatine, p.26, 30 Mar'70

Air P-ollyYW-A SMbaarlM n)

"You asked me how much should go into air transportation or to building new harbors.... Well, as for carrying passengers, ships have gone out--- 100 percent--- no longer a way to get from here to there; not even as local ferries. The main tonnage on the sea is going to become the ore carriers; I think they will probably do extremely well. They don't have loads that are going to pollute our Earth.

"I have often pointed out the factor that if you double the length of a ship you get four times the surface and eight times the volume and twice as much payload-per-skin surface, which is the critical factor. So it might seem that it would also pay for airplanes to get bigger and bigger, but they found that they would have to get the runways longer and longer-- which approaches the point of no return. Obviously, the next phase is vertol, but the United states is not doing much about

that as there are too many people making money in the airplane runway business. So we got hooked, into a pattern. The English are the only ones who have carried vertol into being--- I know the Russians did too; but the English are the ones who have shown that vertol is completely practical. One could have very large airships and"

Air Delivery &. Submarine Cities: (2)

"and we could have vertol tugs to get you into altitude and then start you horizontal. I want you to understand that that is a very practical art and it will come.

"So then we are going to have all those container ships going by air--- particularly as we cut down on the weights of materials. I first began to talk about freight by air in the mid-1930's when we didn't have any transoceanic yet--- flying boats, yes, but there was no land for landings. You first got freight by air with the Ford tri-motors moving mining gear into places you could never go before except by air. Well, I'm simply saying that we're moving into the miniaturization of everything; we are going to get into the great containers and they are going to contain less weight goods and this is all going by air.

"With design science we can work out what we can do by water with the sea as a resource. The sea bottom could not be more important. You could not dock ships at sea, one with the other, due to the rolling of the sea. The great tonnage is in there, but the mass attraction would chew them to pieces. You have to always go to harbors; and there are not many harbors around the world so you have to go enormous distances to transfer your"

"cargoes. And that gets us into a solution with the great big submarines going 70 knots, three times the speed of any surface freighters. They are very fast as they are down below the turbulence. Thus it is a very practical matter to transfer cargo below the turbulence. This brought me into the development of submarine cities where you can have an enormous caisson going down through the turbulence. You can make helicopter landings on it from above and the submarines are going to just nestle right up to it from below and that's where we'll have the cargo transferring. The sea surface phase will go with the interface between water and air and man fighting all that turbulence: nothing could be more illogical. I hope I've given you a clean simple insight to the questions you asked. And as for how this influences the politicians, I'm just never going to try to influence the politicians. They are just going to get themselves more and more into trouble and you have the solution waiting for them. That's called emergence by emergency."

"I don't try to influence. I have standbys ready when they get into trouble. That's exactly why the geodesic dome came in. That's why they were used for the DEW Line, for instance."

Airplane Flight aa Lift

¹¹ It appeared and as yet appears to follow, in conventional, state-licensed structural engineering, that if tension is secondary and local in all men's structural projections, that tension must also be secondary in man's philosophic reasoning. As a consequence, the popular conception of airplane flight was, at first and for a long time, erroneously explained as a compressional push-up force operating under the plane's wing. It 'apparently' progressively compressed the air below it, as a ski compresses the snow into a grooved track of icy slidability. The scientific fact remains, as wind-tunnel experiments proved, that three-quarters of the airplane's weight support is furnished by the negative lift of the partial vacuum created atop the airfoil. This, is simply because, as Bernoulli showed, it is longer for the air to go around the top of the foil than under the foil, and so the same amount of air in the same amount of time had to be stretched thinner, ergo vacuously, over the top. This stretching thinner of the air and its concomitant greater effectiveness of interpositioning of bodies (that is, the Airplane in respect to Earth), is our same friend, the astro- and nucleic-tensional integrity of dynamic inter patterning causality."

Airport;

"Having been commissioned to design a prototype international domestic airport (sic) enduringly suitable to the next two decades of human evolution on our planet in the face of accelerating-acceleration of technological evolution, it is a commission which cannot be realized simply by adequate money, good will, cooperation, etc.. If it can be realized at all. it can only be realized by the most daring employment of fundamental wisdom thus far accorded to humanity. For the transportation communication at the astronautic level not only millenniums ahead of the strictly landed and urban arts, are accelerating at many fold the rate at which the landed arts are accelerating. The airport is where these two- millenniums-apart, astronautical and ground arts are to be wedded."

Air Space: .

"While earliest hunting men were linear, agricultural/ and trade-center colonizing men began to deal in planes. The crisscross, right-angle grid of the 'plane' is apparent in civil and agrarian law. A realistic geometric progression is disclosed in the transformings of legal evolution.

Building vertically as he became crowded, three-dimensionality entered man's law governing, for instance, multiple occupancy buildings, and the like. Now legal prospecting attempts to deal statically (and futilely) with dynamical fourth-dimensionality air space, outer space, and so forth.

' 'Here the laws of man will have to conform eventually with Einstein's relativity, which will bring about an omnidynamical symmetry marriage of social and natural law. The airs flow continually around the Earth, so the air above any one

point does not stay there. Because of the Earth's revolutions and orbiting, as well as the other astronomical motions, geometrical relationships continually change above any point on Earth. Ergo, neither the air nor the starry frame of reference remains the same. So we ask what the properties are of their 'air space' which men, cities, and nations, assert to have been violated. How violate nonexistence?"

- Cite RBF in AAU'.V Journal, p. 177, Nay *5

Airspace Technology:

"World War II took humanity's technology into the sky and deep into the ocean and eventually into outer space. These latter arts required an enormous step-up in doing more with less in order to make all logistics flyable, rocketable, or electromagnetically transmittable."

- Citation & context at Human Unsettlement. (3), 20 Sep*76

"Nonscientific architecture became obsolete in the 1920s and was central to the crash of 1929- By guaranteeing mortgages in 1933, the United States Government underwrote this obsolete, nonscientific building activity often erroneously spoken of as the 'building industry.' It is the antithesis of industry. It is a 'one-off' craft.

"The United States is now gone into debt to the extent of three-quarters of a trillion dollars. About half---a---trillion of that is in government underwritten mortgages. No longer can the government pay even the interest on this debt and the end of the world-around subsidising of the obsolete building craft is near at hand. If humanity survives it will do so by cessation of its \$200-billion-a-year investment in the preparation for war and the production of armaments. If humanity survives, the metals of those armaments will be melted up to be turned to high advantage as the airspace weapons technology in general converts to production of environmental-controlling facilities and services of humanity. When that time comes, science, technology, qnd industry whole, air-deliverable, scientific, environment-controlling apparatus. Whole cities will be air-delivered in a day and removed in a day, in the"

- Cite RBF Ltr. to Ms. Anne Sayre, 2 Sep'75

"same manner that great fleets of ships can come into harbor in one day and vanish the next. Yona Friedman's return to the science of architecture is not only intuitively sound but very practically sound. He writes in a way that should be very understandable in general and should help prepare for this severe reorientation in human affairs,

"The architects of the Boeing-747 have produced a 400-occupant. sky-dwelling device able to move through the air at 10 times

the velocity of hurricanes. The atmospheric resistance increases as the second power of the speed, which meand. in this case, 10^2 - 100, ergo the ferocity of the interaction of the Boeing 747 and the air is a hundredfold the energetic ferocity of a hurricane.

"When the captain of a Boeing 747 tells the passengers over the intercom to fasten their seat belts because it is going to be a little bumpy, the plane travelling at 10 times the velocity of a hurricane may be about to pass through vertical thermals, one outbound from the Earth at 100 miles per hour, the other inbound toward the Earth also at 100 miles per hour. The stresses the 747 endures going through opposing thermal shears"

- Cite RBF Ltr. to Ms. Anne Sayre, 2 Sep'75

"at these speeds is equivalent to taking the S.S. Queen Mary over Niagara Falls so successfully as only to provoke passengers saying, 'It is a little bumpy today.'

"The captains of Boeing 747s land their craft weight 150 tons at 150 mph. often in a foggy night, and do so with such competence that, with the music going, people think no more of it than steering an automobile to the curb. That is scientific architecture which has been evolved from millions upon millions of scientific measurements and on billions of flying hours' experience. The silver ship going through the sky is a thing of great beauty, but in no way was its structural design arrived at by arbitrary shape preferences. The shaping came out of the wind tunnels. The shaping of the wings came out of the Bernoulli principle of atmospheric pressure differentials. The aesthetic of scientific architecture derives entirely

from both comprehensive and incisive integrity and from faithful adherence to science and technology's discovery of physical laws."

All-Acceleration Universe; ,

(1)

"We have come to the realization that we are in an all-dynamic Universe, that the old concept of 'at rest' is not normal. When we lie down to go to sleep we do not shut off the valves and freeze into rigid statues. Our billions of atoms take on a myriad of constellation activities in lieu of a few galaxy motions of the day's routine regimentation of the body's subassemblies.

"All our curves of measurement of man's earthly doings show and acceleration 'upward,' that is, with 'at rest' regarded as normal, the curves of man's doings have taken the shape of a ski (reading from heel to toe). The curves have ascended now into almost vertical abnormality. Is this race schizophrenia? No! It is just that our standards of reference are cockeyed.

"Obviously we must now abandon the unrealistic 'at rest' and refer all our affairs to the realistic yardstick of energy and its velocity aspect, as recently and universally adopted by science from Albert Einstein's work. To do so we need only revolve our charts /` ` through 90-degrees of angle, so that we may see the curves descending precipitously from the old heights"

Allspace Filling:

"Because the cube is the basic three, if we assess space in terms of the cube as volumetric unity, we will take three times as much space as would be occupied by the tetrahedron as volumetric unity. The arithmetical-geometrical coordination in terms of cubes is threefold inefficient for we are always- dealing with physical experience and the structural systems whose edges consist of events whose actions, reactions and resultants consist of one basic energy vectors; therefore the cube requires threefold the energy to structure it as compared with the tetrahedron. We thus understand why nature uses the tetrahedron as the unit of energy, as its energy quantum, because it is three times

as efficient. All the physicists' experiments show that nature always employs the most energy-economical tactics."

Ulpftso HIUni;

"If I put a little one-eighth octahedron to the corner of each of the eight triangular faces of the vector equilibrium it becomes a cube. Therefore, when I bring vector equilibria together in masses, it leaves a little space on each of these corners, but you remember that eight cubes always come together around one point. Therefore, there will

be eight of these one-eighth octahedra on each of the corners which come together at this point. Therefore the eight of them together would make one octahedron. We find then that the vector equilibrium plus the octahedron on the outside of each of the triangular faces would fill all space.

When we bring the vector equilibria up to each other we find that two of their square faces match together. Within a square face we had a half octahedron, so that brings two of the square faces together and I get an internal octahedron between the two of them. The external octahedra are intervened between the vector equilibria on their triangular faces and there is an internal set of octahedra between the square faces.*

Allepace Filling:

"The tetrahedron will not fill all space. If we take an equilateral triangle and bisect its edges and put three little tetrahedra on the three corners of the triangle and put a fourth tetrahedron in the center, we find that there is not enough room for other $\frac{1}{8}$ tetrahedra to cone down in the crevices between the peaks of the tetrahedra. So you cannot fill all space with tetrahedra. What you do is fill all space with tetrahedra and octahedra. They complement one another. But if you were looking for a monological explanation this wouldn't be nice for you. If you are willing to go along with the physicists, recognising complementarity, then you would say that this method of accounting, which is coming out nice and rational, is a * perfectly

good way of accounting. "Tcould talk tetrahedra even though i am using different forms. Now we have tetmrahedra being agglomerated with octahedra and we have a very interesting kind of condition."

"The complementarity of the vector equilibrium with the octahedron permits us to get down to the local and not be afraid of missing the rest of Universe, because we know the fundamental complementation of macro tetra and micro tetra."

- Citation in context at Trigonometric Limit. 22 Jun'72

Filling*: Octahedron and Vector Equilibrium "Concave octahedra and concave vector equilibria pack together to define the voids of an array of closest packed spheres which, in conjunction with the convex spherical vector equilibria fill all space. This array suggests how energy trajectories may be distributed through great-circle geodesic arcs from one sphere to another always passing through the vertexes of the array, which are the vertexes of the vector equilibria and the points where the spheres touch each other."

cjn.J/ C***4 X, ,
r/Kr«sec, ioJZ.3'/

"We find that in closest packed spheres there are only two shapes spaces: what we call the concave octahedron and the concave vector equilibrium. . . . One is an open condition of the vector equilibrium and the other is a contracted one of the octahedron. So we begin to discover something fascinating, which is, if I take vector equilibria and contract them, as I showed you with internal-external octahedra, each one of those vector equilibrium packages, ...we find that the triangular faces are occupying a position in closest packing of a space

and the square faces are occupying the position of a sphere. Between them we had the internal and external octahedra; that is, the spaces between are either concave vector equilibria or concave octahedra. We could take the original vector equilibrium and bend the edges inwardly to make it concave or we could bend them outwardly and make spheres. In the first degree of contraction from vector equilibrium, it becomes a sphere or a space. If it bends inwardly it becomes spaces and if it bends outwardly they become spheres. We can then begin to call a space a concave vector equilibrium and we call a sphere a convex vector equilibrium, or we can call a space a concave octahedron which is one of the other kinds of transformations."

- Cite Oregon //7, pp. 257-258, 11 Oct '62

"Half octahedra can be pulled out of the square faces of the vector equilibria. This goes on in atoms joining one another and they are able to lend something to one another sometimes, they are able to lend electrons. We can lend out of the square faces without in any way jeopardising the structural system which was dependent upon the triangulation of the tetrahedral parts. We can lend up to four without bothering it."

Allapace Filling - Scenario:

See Field, 2 Nov*72

Filling folf-PftCkXM:

"There are to my knowledge now six unique, all space filling geometries. Any one of them can be ∞ amplified upon in unlimited degree by high frequency permitted aberrations. For instance, the cube can reoccur in high frequency multiples with fundamental p rectilinear aspects--- with a node on the positive face and a corresponding dimple on the negative face--- which will fill all space simply because it is a complex of cubes.

"The six fundamental all space fillers are:

- (1) The cube (six faces), discoverer unknown.
- (2) The rhombic dodecahedron, discovered unknown (twelve faces). This all space filler is the one to occur most frequently in nature. Rhombic dodecahedron crystals are frequently found on the floor of mineral rich deserts.
- (3) Lord Kelvin's tetrachideca (14 faces).
- (4) Keith Critchlow's snub-cornered tetrahedron (16 faces).
- (5) My own— Fuller's asymmetric tetrahedron (4 faces).
- (6) My own— Fuller's asymmetric hexahedron (six faces).

America:

"Because of the evolutionary requirement for the integration of all men around our planet, I would like to point out what I feel is the reason why America seems, for the moment, to be an active field of creative capability. In the five and a half million known years of man's presence on Earth, with man born naked, helpless, without any information, with beautiful equipment, but ignorant, but. gradually gaining in experience and gradually finding his way. Well there has been a pyramiding of such experiences and America happens to be in the midst of these waves that have gone around the world, it's a cross-breeding world man here. And the developing world man here is beginning to export and become part of the world. There is a tendency of the crowd to be excited by the nan who makes a score on the football playing field, by the man who makes the touchdown. But I feel that America has been thrown a forward pass by all of humanity. Therefore, it's spectacular--- making the touchdown, but it's part of the great team of all humanity. Ana I want to be sure not to try to develop in any way--- or to curry an unnatural ego.' "

RBF DEFINITIONS

Angular Sinus Take-Out

"Absolutely straight lines or an absolutely flat plane would, theoretically, continue outwardly to infinity. Intellectual comprehension occurs when patterns of experience return upon themselves in all directions. The difference between infinity and finity is governed by* the taking of angular sinuses, like pieces of pie, out of surface areas around a point in an absolute plane. This is the way laAnshades and skirts are made.

Joining the sinus ends together makes a cone; if two cones are made and their open, ergo infinitely-trending, edges are brought together, a finite system results.

It has two polar points and an equator. These are inherent and primary characteristics of all finite systems."

Annular Topology: Principle of:

"I made the original topological discovery that all local or closed systems in universe (which includes all geometrical forms, asymmetric or symmetric, simple or complex) are always accomplished by nature through the elimination of 720 degrees of angle. That is to say: the sum of the angles around all vertexes of all systems will always add up to 720 degrees (or two times unity of 360 degrees) less than the number of vertexes of the system times 360 degrees. This is the way in which nature takes two complete 360° angular tucks in infinity to render systems locally finite."

- Cite RBF Letter to Dr. W.D. Robertson, 3 Oct '63

Annular Topology: Synergetic Principle Of: (1)

"Absolutely straight lines or an absolutely flat plane would, theoretically, continue outward to infinity...The difference between infinity and finity is governed by the taking of angular sinuses, like pieces of pie, out of surface areas around a point in an absolute plane. This is the way lampshades and skirts are made. Joining the sinused fan-ends together makes a cone; if two cones are made and their open, ergo infinitely trending, edges are brought together, a finite system results, it has two polar points and an equator. These are inherent and primary characteristics of all systems.

't.an has employed the convention of subdividing the unity of encirclement around a point into 360 degrees, formed by the sum of the radial segmentations around a point in an absolute plane. If we call 360 degrees 'unity,* I may state my discovery of the synergetic principle of angular topology as follows:

"If we subtract the sum of the convergent angles around all the vertexes of any system from the number of vertexes times 360 degrees, the difference will always be 720 degrees, which"

RbF DEFINITIONS

Animate and Inanimate:

"Very, very slow changes humans identify as inanimate.

Slow change of pattern they call animate and natural."

- Citation & context at Change. Oct*70

"Today's hypersocialization in socio-economic functioning has come to preclude important popular philosophic considerations of the synergetic significance of for instance, such historically important events as the discovery within the general region of experimental inquiry known as virology, that the as-yet popularly assumed validity of the concept animate and inanimate phenomena have been experimentally invalidated.

"Atoms and crystal complexes of atoms were held to be obviously inanimate. The protoplasmic cells of biological phenomena were held to be obviously animate. It was deemed to be common sense that warm-blooded, moist, soft-skinned humans were clearly not to be confused with hard granite or steel objects. A threshold between animate and inanimate was therefore assumed to exist as a fundamental dichotomy of all physical phenomena. This seemingly placed life exclusively within the bounds of the physical.

"The supposed location of the threshold between the animate and inanimate was methodically narrowed down by experimental science until it was confined specifically within the domain of virology.

- Cite NEHIT SPEECH, pp.37-38, 13 Nov'69

Animate and Inanimate Sequence:

"Virologists have been too busy, for instance, with their DNA-RNA genetic code isolations, to find time or to see the synergetic significance to society of the fact that they have found that no threshold does in fact exist between animate and inanimate.

"The possibility of its existence vanished because the supposedly unique physical qualities of both inanimate and animate have persisted right across yesterday's supposed threshold in both directions to permeate one another's, previously-conceived-to-be, exclusive domains. Subsequently, what was animate has become foggier

and foggier, and what is inanimate clearer and clearer. The inanimate alone is not only omnipresent, but is alone experimentally demonstrable. Belated news of this threshold elimination must be interpreted to mean that whatever life may be, it has not been isolated and thereby identified as residual in the biological cell, as had been supposed by the false assumption that there was a separate physical phenomenon called animate within which life existed."

- Cite NEHRU SPEECH, pp.37-38, 13 Nov'69

Animate and Inanimate Sequence: (

'There seem to be phases where you and I automatically check in and say, 'That's a man.' 'I can see that's a living organism.' And another might say, *I can see that's a crystal.' But we've learned now that there's no threshold between these two. They used to be called animate and inanimate, and then we found that that is not true. Xs we got into virology the distinction was no longer there.

We found that all the descriptive attributes of the crystals permeate--- go right across the threshold--- so you'd have to call everything that is physical, just physical. Man used to think that he could identify life all within the physical. At one end of the physical was the thing we'll call animate organisms; at the other end of the physical was something called inanimate. So, he called it that, and was kind of satisfied that these two qualities were all within physical.

"It's not just the chemists dealing in molecules, but the biologists and the physicists. All the lines have broken down, the instruments and everything. The investigator would take everybody right across all those borders, genetics, and so forth, DNA running through it. and getting down to virology where we discover DNA and RNA and all the design**

- Cite RBF to Wortld Game, Jun-Jul'69

RBF Db-FI NITI OKS

Animate and Trvtnimar.p Sequence: (2)

` ` controls, and found that right there that whatever was originally called physical as the atom--- the atoms go right on combining. So it's physical all the way; there's absolutely no threshold.

"I-.an is so specialized that he didn't notify society that he had found no threshold between animate and inanimate. This is simply to say, then, that whatever we really are, whatever life is, there is no identity of any threshold between or within the physical. And I'm saying to you very powerfully that I'm confident that our communication, everything you and I do, is absolutely weightless. The only thing that counts between you and me is thinking. The difference between human and other physical organisms is always the metaphysical, the thought."

- Cite RBF to World Game at NY Studio School, 12 Jun-31 Jul'69, Saturn Film transcript #327, pp.4-6.

Animate and Inanimate;

"Mortal physical human bodies have the function of providing a regenerative succession of fresh physical vehicles for the mortal--- because entropic--- articulation of metaphysical immortality. The long-held popular conception of the existence of two kinds of physical substances--- one called animate and the other called inanimate--- the first rather mysticdly maintained and the other subject to stark chemical analysis, was altogether invalidated as science closed in on the assumed threshold between the animate and inanimate at the virus level only to find that there is no threshold and that all the phenomena followed strictly inanimate physical laws. So we find the real separation of the life and the inanimate when humans die and no weight is lost. Life is metaphysical and anitentropic. The inanimate is physical and entropic.**

- Cite KBF at benate Hearings, p.33, 4 Mar*69

Animate and Inanimate:

. . It is logical to hypothesize that all of nature's structuring both 'animate' and 'inanimate' may be tejpahedronally coordinate. I put animate and inanimate in quotes as their previously assumed identification with life and non-life respectively has been experimentally discovered to be invalid as the two overlap throughout the virus structures. The viruses may be described as entirely animate or as entirely inanimate."

- Cite NASA Speech, pp 57,Jun'66

Animate and Inanimate;

"It is the area /~DNA_7 where the chemistry could be called crystallography, it could be called metals or it could be called animate. You could call it animate or inanimate: it is the complete threshold of the two. Because it is the threshold people who like to be prosaic and like to make man feel so small can say everything is just going to turn out to be inanimate chemistry, and you are all the consequence of ? robabilities, and you might as well go jump in the river.

his area, then, of the threshold is where the DNA is found and the controls of the patterning of life are down to four compounds of chemistry which somehow or other develop a code, and out of this code of these four letters are all the designs that occur."

AnUcnWQPYS (A}

"What is the complementary or opposite of the expanding physical Universe that grows progressively more diffuse, complex, chaotic, and disorderly? Is there a phase of Universe equal in magnitude to that of the physical, but which is contracting and becoming ever more orderly? This question moved the astronomers to look for black celestial bodies in the heavens to balance the radiant stars. While the astronomers have as yet found none, our own Spaceship Earth constitutes one such important black body.

"The cooling Earth is a contracting phase of Universe, Our Spaceship Earth is continually receiving radiant energy from the Sun and other stars. One finding during the recent International Geophysical Year indicated that Earth probably receives 100.000 tons of stardust daily. These physical receipts impinge randomly upon our spherical spaceship. On Earth the biological organisms go to work on these random receipts and continually rearrange them in giant but orderly molecular chains. Biological life impounds the Sun's radiation in many orderly ways, e.g., through photosynthesis."

Antientropy:

"The precessionally regenerative concentricity of structure is antientropic.

and evolutes towards optimally economic local compressibility and symmetry."

- Cite INTRO, to UMiDIRECTIONAL HALO, p. 126, 1959

Antientropy: (1)

"We know scientifically that all local physical systems are continually giving off energies. We call this entropy.

Due to each of the local systems' unique periodicities, etc. the given-off energies are diffusely and randomly released in respect to other systems. Thus the physical Universe is continually expanding and increasingly disorderly. Fundamental complementarity requires that there must be some phase of Universe where the Universe is contracting and increasingly orderly.

"We look at all the stars and find that we 'see' them only because they are giving off energies in increasing disorder. We call this radiation. We find only one place in the Universe where we know energies are converging, collecting, and being stored, and that is our own spaceship Earth.. our planet. In the International Geophysical year, world-around measurements indicated that approximately 100,000 tons of stardust are accumulated daily at our Earth from other stars. Thus energy is being collected here as matter. We also are collecting an enormous amount of radiation from the other stars,"

- Cite WORLD GAME (3), Oct'69

"primarily from the Sun, but also as cosmic radiation from myriads of other stars. The energy either as stafoust

or radiation increments, arrives in a very random frequency pattern. We may state it to be experimentally proven that our special space vehicle Earth is at least one mobile energy collecting center in contradiction to the stars which are energy distributors. The Sun's radiation is not being reflected off Earth as from a mirrored ball. It is refracted, or angularly deflected, by the atmosphere. Thus the Sun energy as heat is impounded in the atmosphere to produce weather changes. Thus also are the waters refractionally heated by the

Sun's radiation. Thus by a series of relay stages is energy impounded aboard our spaceship Earth to regenerate life by the photosynthesis of the vegetation, which is a beautiful process whereby the random energy receipts are transformed chemically into beautiful orderly molecules which are beautiful structures. Here you see the turnaround from disorder to order--- from entropy to antientropy. All the biologicals are converting chaos to beautiful order. All biology is antientropic."

"Wherever you have actions you have reactions, and where there is priority there is antipriorlty□ So in wartime you pick

your primest young people to send to the front, helping to keep the front away from home and you are taking scarce resources and scarce braini that know how to work them and scarce tools with which they can be worked on high priority to make the weapons to Implement your boys you send to the front. The idea of someone taking some of the high capability, high priority resources to make themselves a finer home during the war would be a most immoral kind of thought. . . Any kinds of sheds that will keep the rain off will do. . . We find that during wartime the housing, the environment controlling arts become the entipriority arts.. . . You find that you go from pretty nice looking

spigots on the sink down to lead spigots. You find the housing arts in
gei eral are what we call the antipriority arts and this holds true in the
peace time . . . because in peace time the high priority is with produc-
ing foods . . . tending the metabolic processes so you could survive.
. . When winter was coming on and the harvest was in you have a
little more time and you get some more wood and you run it over to
the chimney so you get yourself covered in for the, winter and that is
more or less the fortuitous way in which housing gradually occurred."

Apprehension + Comprehension - Awareness:

"Apprehension is the physical brain's coordinate storing of all the special case, physically sensed information of otherness (integral---the thumb sucked by the mouth; or separate---the mother's udder, ditto..). Comprehension is the metaphysical mind's discovery of meaningful interrelationships existing between the special case informations that are neither implicit or inferred by any of the special case informations when taken separately---the meaning discovered by mind being the generalized principle manifest exclusively by the interrelationship variable and constants.

"Awareness means apprehending while also intuitively comprehending that the incoming information is significant because pregnant with meaningful principles."

- A Priori *W-dip?n?ippal Rlly: (1)

"Fourth Power In Physical Universe: While nature oscillates and palpates asymmetrically in respect to the omnirational vector equilibrium field, the plus and minus magnitudes of asymmetry are rational fractions of the omnirationality of the equilibrinous state, ergo, omnirationally conn.ensurable to the fourth power, volumetrically, which order of powering embraces all experimentally disclosed physical volumetric behavior.

"The minimum set of events providing macro-micro differentiation of Universe is a set of four local event foci. These four 'stars' have an inherent sixness of relationship. This four-foci, six-relationship set is definable as the tetrahedron and coincides with quantum mechanics' requirements of four unique quanta per each considerable 'particle.'"

- Cite SYNERGETICS text at Secs. 966.10 & 966.11 as revised on galley by RBF, 20 Dec'73

"In synergetics, all experience is identified as, a priori, unalterably four-dimensional. We do not have to explain how Universe began converting chaos to a 'building block' and therefrom simplex to complex. In synergetics Universe is eternal. Universe is a complex of omniinteraccommodative principles. Universe is a priori orderly and complexedly integral. We do not need imaginary, nonexistent, inconceivable points, lines, and planes, out of which non-sensible nothingness to inventively build reality.

"Reality is a priori Universe. What we speak of geometrically as having been vaguely identified in early experience as 'specks' or dots or points has no reality. A point in synergetics is a tetrahedron in its vector-equilibrium, zero-volume state, but too small for visible recognition of its conformation. A line is a tetrahedron of macro altitude and micro base. A plane is a tetrahedron of macro base and micro altitude. Points are real, conceptual, experienceable visually and mentally, as are lines and planes."

Integrity

A Priori Intellect (i)

"If one realizes that Universe is aum-totally an evolutionary design integrity, then one may be prone to acknowledge that an a priori Intellect of infinitely vast considerateness and competence is everywhere and everywhen overwhelmingly manifest,

"In view of a number of discoveries such as the ecological regeneration manifest in the mammalian-vegetation interchange of gases, we can comprehend why responsibly thinking humans have time and again throughout the ages come to acknowledge a supra-human Omniscience and omnipotence.

"The self-regenerative scenario uni- so is an a priori, design integrity. The Universe is everywhere, and continually, manifesting an intellectual integrity which inherently comprehends all macro-micro event patterning and how to employ that information objectively with omniconsideration of all intereffects and reactions. The Universe manifests an extraordinary aggregate of generalized principles, none of which contradict one another and all of which are interaccommodative, with some of the interaccommodations"

"The profession of architecture as practiced today, ie a slave function, exercising good taste in purchasing and assembling industrially available components, a superficial veil to cover the steel or concrete frames which are completely conventionalised and organised by the engineers*

"This slave profession only goes to work when it is hired and told what to do. The client says. 'I am going to build a building on such a corner; this is its purpose; this is what it is to cost; this is what it should look like; this is what the building codes and labor unions tell you you are going to do; I want my relative's equipment used.' The architect plays his game with those dominoes. Under such conditions all you can do is arrange a few beautifully laid brick panels between the columns. That world of archi

tecture is completely superficial and is going out. There are going to be individuals who do not assume a client knows what he wants or a society knows what it wants to do, but examine potential environmental controls, human needs, world resources, and iddustry's capabilities."

- Cite RBF in "Architectural Forum," pp.66-67; Nov'66

Architecture:

"I often hear it said in our technical schools, and by the public, that architects build buildings out of materials. I point out to architectural students that they do not do that at all. That kind of definition dates back to the era of men's thinking of matter as solid. I tell architecture students that what they do is to organize the assemblage of visible modular structures out of subvisible modular structures. Nature itself, at the chemical level does the prime structuring. If the patterning attempted by the architect is not inherently associative within the local regenerative dynamics of chemical structure, his buildings will collapse. The kinds of spans man builds, the sizes of his columns, and the ways in which, in the end, man must enclose space, are governed by the fundamental principles of structuring preconceived in a priori structuring laws of nature. The principles governing structure not only prescribe what man can put together, but they are operative at the molecular level, at the atomic level and at the nuclear level. They are also operative in each of man's life cells and throughout principles of structure in the starry heavens."

Architecture:

"An inconsequential profession of interior and exterior house and building decorators."

- Citation & context at florid BfloUn SfiXfincO PQCado, 13 Aug'6

Architecture:

"...Pan has ignorantly classified the whole gamut of non-sensorial module structuring by nature under the illusion evoked designation of 'solid'¹ matter. Consistent with this illusion man traffics in various solid substances known as 'materials.' Kent do not, however, in real-

ity build structures out of materials. Ken build visible module structures out of subvisible module structures. There are generalized laws governing structure. The generalized laws of structure are oblivious to the special threshold existing between the man-tuned sensorial spectrum and the vast ranges of Universe structuring infra-and ultra-sensorial to man's narrowly tuned conscious reception faculties."

- Cite, Isol, DOMES, Pp. U6-147. 1963

Architecture:

"In 1927 ...it was very clear to me that the building world was the antipriority world and that it was run by ignorance. This was in contrast to the extraordinary new ability that was going into the building of navies . . . and into airplanes, into a new kind of navy of the air. The very highest capabilities of man were being invested in these and nothing was being invested in the direction of the house. I didn't find any scientist working on the plumbing. The architects were getting some purple tile or some pink tile, and so forth, but no one was concerned with what goes on behind the wall. There have been no changes back of the wall for at least 3.000 years! Our hole's are serviced today by the same sewerage system invented before the time of Christ. I felt that this kind of inattention to our home was responsible for the fact that our first child died. . . ^B and I felt the conditions could have been controlled if the same kind of capability had been going in the direction of our life to make life a success, it might have been a success."

Artifact;

"An artifact is any participation using the principles of nature to reassociate them for a specific purpose. Nature does this: she takes her own rocks apart."

- Cite RBF at Bell studios videotaping, Phlla. PA, 26 Jan'75

Artifacts:

"I am committed to boItIng all problems by development of artifacts rather than by political reforms. Do not talk about inventions until you have reduced them to practice and have found that they demonstrate higher technical advantage for humanity." ⁶

- Cite RBF Ltr. to Bruce Carrick, Ilacalllan; p.3, 17 bep'74

Artifacts:

"Design science undertakes a functional solution of problems. The methodology is First; What is the problem to be solved? and Second: How can that be solved by artifacts rather than by political contriving, or persuasion, or reorganisation of the present situation. So I always go to the artifact. And I've never had trouble demonstrating that, the simplest one being that there's a roaring gorge and you put a bridge across it. People are going to try to use the bridge and not swim across. Artifacts induce their spontaneous use. By virtue of their spontaneous use the pattern of society changes, the problem is solved, and the previous situation becomes obsolete.

"Now that's grand strategy. Therefore, if I'm going to get artifacts I'm going to see what are the structural things that I can solve structurally or mechanically: is it a machine, is it a structure, or an engine? What are the various inputs of all the chemical elements involved? What is their inventory? I think the methodology is quite clear. You first go to the artifacts and in doing so you are going to unquestionably cut out a lot of the wasteful uses of materials. We are going to release materials that are doing the job in an obsolete way."

ArUfacta;

"The design scientist's function Is to solve problems

Only through introducing new artifacts

Into the environment, the availability of which will induce

Their spontaneous employment by humans

Thus coincidentally discontinuing and rendering obsolete The previous problem-producing human behaviors and devices."

- Cite Universal Requirements for a Dwelling Advantage, 31 May'74

"I feel that your letter is correct in its statement of the problem, but it suggests more governmental or private patronage focused on social, political, and economic reforms such as can only be effected by complex agreements at the sovereign nations* level.

` ` If you look into my work...you will find that I committed myself in 1932 to solving problems by artifacts: what I call reforming the environment rather than trying to reform human behaviors. Nature is ceaselessly transforming. Every event has six equieconomxcal alternatives. Eternal transformation is inexorable. Discovery and employment of the principles employed in nature may bring about the desirable environmental conditions spontaneously inducing omnifavorable human behavior.

"When humans have vital need of reaching the other side of a roaring river's rapids, if I design and produce a bridge to the other side, I am sure they will use it spontaneously instead of risking their lives in trying to swim across.

"Inasmuch as nature's omni-inexorable transformings consist of a plurality of equieconomxcal, alternatively employable,"

ArUfa<?:

"rfhat I find as the big pattern is that human beings continue to make babies where they're not going to be successful. Look what happened when waterworks came in. Long before the flat census in 1810--- go back to 1600 and look in the family bibles and you will find the average of Early American and Colonial families are between 10 and 13 children per family with many of them dying at the time of childbirth. It was very sad. But as in came waterworks, or any kind of an artifact, that changed the probabilities and down went the number of babies per family and up went the life expectancy." These two are in absolute balance. In country after country, as the kilowatts- per-capita consumption goes up, down goes the birthrate. The two are absolutely irreversible."

MMB Arxlfagls:

(A)

"More than a third of a century ago I became intuitively excited by the idea that, whereas I had been brought up in a world in which humanity spoke about the tools it used and the machinery of the new industrialisation as artificial, these artefacts and tools, if seen from far enough away in time, might be realised to be an actual an integral part of the pattern Man. So I began to feel that the word 'artificial,' which I had heard so much of, was a word that was obsolete and could be discarded. I saw that everything I was experiencing couldn't be experienced unless nature permitted it, and it was all part of the extraordinary pattern of the Universe, and therefore every bit of it was, I might say, not artificial but natural."

Artifacts: (B)

"As soon as I began to look at man in that way, I began to realize that men were really very large and I made some research as to how much our various tools were being employed relative to the total population. In America in 1936 I found that every American weighed nine tons of steel and 22 tons of concrete and HO pounds of copper and so forth. This is the relative amount of externalized tooling per capita. Man is really larger than the dinosaur, larger than the mammoth, but the dinosaur and the mammoth became obsolete simply because they tried to run all their tools around integrally: the dinosaur was pulling a great big one-ton tail along, with the idea that it could knock down a banana with it. So that man was uniquely successful by virtue of this grand strategy of differentiating out his functions, and developing interchangeable functions."

Artist:

"I don't think of art as modern art or classic art. I just think of the artist as someone who speaks to me. Not as a painter or as a sculptor. For the artist it is just not an expression of his ego. I see in the artist the deeper or mysterious urge of another individual feeling deeply of the great mysterious wonderment--- with a feeling of awe, even ominous. And I wonder how this artist could be so extraordinarily sensitive and articulate. Art is always inspired. It is very different from ambition. Inspiration comes from outside: we don't know where, or exactly where. Ambition has nothing to do with art: we do know where ambition comes from. . . . Amongst the present painters I feel that Dali is an artist, truly inspired--- like Frank Lloyd bright, loving and thoughtful with his own wife and family, not being ambitious, bright had all the Dali-like histrionics, and he had great confidence in his own insights, but he had great humility too. Their public appearance seems to be very remote from their beautiful private worlds. And Poe was an artist; of course he drank, and F. Hopkinson Smith's 'Rennet Square' tells how he passed out, but when he came to he recited the Lord's Prayer and said it beautifully

Artist: (1)

"Sensitivity is enormously excited by paradox. And paradox can be so paradoxical as to be out-and-out comical. E.G., Edward Lear; Lewis Carroll's 'Alice in Wonderland,' are equivalent to Dali and Frank Lloyd Wright and Poe. Poe's histrionics were in his drink: the paradox was such pain to him but it did not betray the artist. . . . When you really hit an audience with the truth--- the absurdity of UP and Down, and IN and OUT--- they are full of giggles and laughs. F.L. Wright and Dali could not resist getting the giggles out of people. They say: Isn't it wonderful that people are shockable. Dali can reverse it. He can give them an untruth that will shock them. Wright and Dali regenerate themselves by shocking: that's what this histrionics was all about.

•./right was not as deep as Dali--- who is overwhelmed by the great mystery, like Poe. Wright let Gurdjieff take over. He therefore had a religion rather than make his own attempt to explain his experiences to himself. Poe and Dali really tried to explain things to themselves. Dali showed KBF his greatest painting in his studio in Spain. A picture of the Fishermen in the parable of the loaves and the fishes.

Artist-Scientists:

"The greatest and most enduring discoveries and inventions of humans on our planet are those of the scientist-artists, the name joined, or artist, or scientist. The name of artist or scientist, though often professedly proclaimed, can only be given to an individual by others who in retrospect discover the enduring qualities of the symmetries with which the individual converted his conception to the advantage of human understandings, reinspirations, and realizations of increasing Interadvantage in respect to survival--- the gradual discovery of the function in Universe for which humanity has been designed to fulfill,"

RBF DEFINITIONS

Artist-Scientist:

"Only the free-wheeling artist-explorer, nonacademic, scientist-philosopher, mechanic, economist-poet who has never waited for patron-starting and accrediting of his coordinate capabilities holds the prime initiative today. If man is to continue as a successful pattern-complex function in universal evolution, it will be because the next decades will have witnessed the artist-scientist¹'s spontaneous seizure of the prime design responsibility and his successful conversion of the total capability of tool-augmented man from killing to advanced living--- adequate for all humanity."

, The progress we have made is not the result of blindly proceeding from one precedent to another. Only by escaping from the popular frames of reference and critically examining the conventional methods and techniques have we set up a new hypothesis and arrived at our present solution with its prospect of a new and transcendental industry. To do this it was necessary to make broad and daring assumptions. This talk is full of them, and I have not taken time to substantiate or develop them in detail. Assumptions grow out of experience and new postulates stem from observation which reveals the inadequacies of our previous concepts. However short of the mark our an-

swers may be, I know that our method is right, for all the great scientific advances in history have been made by the Newtons and Galileos who were not afraid to form their own hypothesis. I am saying this to you because engineers have too often let others make their assumptions for them. In the months ahead the engineering staff has a great responsibility in getting our house into production. By attempting merely to improve and modify the familiar ways of designing and building you will succeed only in perpetuating original errors and limitations. So do not be afraid of radical methods or of setting up your own hypotheses."

' 'Though I have found an omnidirectional vector equilibrium matrix and the complex of momentarily positively and negatively asymmetrical intertransformabilities pulsating through the equilibrium state, I knew that nature would never allow temporal humans to omniarrest cosmic kinetics at the timeless, i.e., eternal equilibrium zero. But experimenting in cryogenics, taxing energy-as-heat out of the insulatingly isolated liquefied gaseous element system approaching absolute zero, we learn that as the temperature gets lower and lower, an increasingly orderly and an increasingly symmetrical, micro-geometrical patterning occurs— the Platonic solids appear to become more symmetrically uniform. Contrariwise, when energy-as-heat is progressively reintroduced, the kinetics increase and the complex of conceptual behavior becomes progressively disordered. At lowest cryogenic temperatures the omnidirectional interpatterning approaches isotropic vector matrix equilibrium.

' 'The progressive energy-starving experimental strategy reveals that nature always transforms through, and relative centrally to, the omni-isotropic-vector-matrix equilibrium, while Kinetically"

- Cite by i.f.R.Gt.TiCb draft at bees. 427.01-02, iay'73

"emphasizing the mildly off-center asymmetric aspects. Nature grows her crystals positively or negatively askew— she twists and spirals around the local, three-way great-circle grid systems in the alternate positive-negative geodesic complementations. Such kinetic considerations of closest packing are significant.

"The isotropic vector matrix equilibrium multiplies omnidirectionally with increasing frequency of concentric vector-equilibrium-conformed, closest-packed uniaxial sphere shells, conceptually disclosing the cosmically prime unique sequence of developed interrelationships and behaviors immediately surrounding a prime nucleus. While the physicist processes his nuclear problems with nonconceptual mathematics, the conceptual isotropic vector matrix equilibria model provides a means of comprehending all the electromagnetic and nonelectromagnetic energy valving and angular shunting controls of the solid state transistors.

"With one layer of spheres around the nuclear sphere we will get one set of angular interrelationships of the surrounding spheres"

- Cite bYr.ErtGETiCS draft at bees. 427.03-04, 13 t-ay'73

"with the nucleus and with one another. With two layers of spheres around the nuclear sphere a different angular relationship between the nuclear sphere and its intersurrounding spheres occurs. ...At the third layer of enclosure some of the angular interrelationship patternings begin to repeat themselves. Thus we are able to inventory what we are going to call a nuclear set of unique interrelationship patterns.

"The isotropic vector matrix multiplies concentrically. But because vectors are discrete the isotropic vector matrix's lines do not go to infinity. Their length must always represent sumtotally the total energy of eternally regenerative physical Universe. No matter how high the internal frequency of the finite Universe the overall vector equilibrium is of unit magnitude. This magnitude corresponds to that of the speed of radiation uninterfered with in vacuo. We find that the different frequencies in their phases of symmetry identify precisely with what we now call the i-agic Numbers identifying the successively reoccurring five peaks in relative abundance of atomic isotopes.

- Cite bYiUHGLTICS draft At Secs. 427.04-05, 13 i'ay'73 "I am confident that I have discovered and developed the conceptual insights governing the complete family of variables involved in realization by humanity of usable access to the ultimate computer— ultimate, meaning here: the most comprehensive, incisive, and swiftest possible, information-storing, retrieving, and variably processing facility with the least possible physical involvement and the least possible investment of human initiative and cosmic energisation.

"Science evolved the name 'solid state' physics when, immediately after World War II, the partial conductors and partial resistors— later termed 'transistors'— were discovered. The phenomena were called 'solid state' because without human devising of the electronic circuitry certain small metallic substances accidentally disclosed electromagnetic pattern-holding, shunting, routeswitching, and frequency-valving regularities, assumedly produced by the invisible-to-humans, atomic complexes

constituting those substances. Further experiment disclosed unique electromagnetic circuitry characteristics of various substances without any conceptual model of the 'subvisible apparatus.' Ergo, the whole development of the use of these invisible behaviors was »»

- Cite bYUEKGETiCo draft at bees. 427.06-0?, 1J hay'73

- 'conducted as an intelligently resourceful trial-and-error strategy in exploiting invisible and uncharted-by-humans natural behavior within the commonsensically 'solid' substances. The addition of the word 'state' to the word 'solid' implied 'regularities'm an otherwise assumedly random conglomerate.

./hat I have discovered goes incisively and conceptually deeper than the blindfolded assumptions and strategies of solid state physics— whose transistors' solid state regularities seemingly defied discrete conceptuality and scientific generalization and kinetic omnigramming.”

”We have here the disclosure of a new phase of geometry employing the invisible circuitry of nature. The computer based on such a design could be no bigger than the subvisibly dimensioned domain of a pinhead's glitter, with closures and pulsations which interconnect at the vector equilibrium stage and disconnect at the icosahedron stage in Milky-Way-like remoteness from one another of individual energy stars.

”As we get into cryogenics— taking energy-as-heat out of the system— the geometries become more regular and less asymmetric,”

- Cite bfKEHULTICS draft at bees. 47.07+11-12, 13 I-ay'73

"thus fortifying the assumptions of synergetics because the geometrically 'twinkling' asymmetries of kinetics progressively subside and approach, but do not quite attain, absolute cessation at the isotropic vector equilibrium state.

"The atomically furnished isotropic vector matrix can be described as an omnidirectional matrix of 'lights,' as the four-dimensional counterpart of the two-dimensional light-bulb matrix of the Broadway- and Forty-Fourth Street, New York City billboards with their fields of powerful little light bulbs at each vertex which are controlled remotely

off-and-on in intensity as well as in color, cur four-dimensional, isotropic vector matrix will display all the atom'stars' concentrically matrixed around each isotropic vector equilibrium's nuclear vertex. By 'lighting' the atoms of which they consist your innermost guts could be illustrated and illuminated. Automatically turning on all the right lights at the right time, atomically constituted 'you' could move through space in a multidimensional way just by synchronously moving the lights from one isotropic vector matrix vertex to the next,"

- Cite SYNERGETICS draft at Secss. 427.12-13, 13 May'73

RBF DEFINITIONS

"By 'lighting'¹ the atoms of which they consist, hamans* innermost 'guts' could be illustrated and illuminated. Automatically turning on all the right lights at the right time, atomically constituted, center-of-being light, 'you,' with all its organically arranged 'body' of lights om-nisurround!ng 'you,' could move through space in a multidimensional way Just by synchronously activating the same number of lights in the same you-surrounding pattern, with all the four-dimensional optical effect (as with two-dimensional, planar movies), by successively activating each of the lights from one isotropic vector matrix vertex to the next, with small, local 'movement' variations of 'you' accomplished by special local matrix sequence programings

Cite RBF rewrite of SYNERGETICS galley at Sec. 427.13, 2 Nov'73

A.tamlc Computer Complex: (?)

**We could progressively and discretely activate each of the atoms of such a four-dimensioaal isotropic vector matrix to become `lights,' and could move a multidimensional control 'form' through the isotropic multidimensional circuitry activating field. The control form could be a'sphere', a `vector equilibrium,' or any other system.

This multidimensional scanning of points can be programmed multidimensionally on a computer in such a manner that a concentric spherical cluster of four-dimensional 'light' points can be progressively 'turned on' to comprise a 'substance' which seemingly moves from here to there.

`` This may be what Universe is doing. Employing a scanner of each of our atoms this is one way humans could have been radio-transmitted and put aboard earth from any place in Universe. The naked human eye cannot differentiate visually the separate dots of a matrix when their frequency of uniform- modulated space-occurrence is greater than 100 to the linear inch, or ten thousand to the square inch, or one million to the cubic inch. Let us radiantly activate isotropically

and modularly grouped local atoms of human's physical organism"

- Cite LYL's urtGhTICS draft at Secs. 427.14-I5, 1J iay'73

"in such a manner that only one million per cubic inch out of all the multibillions of actual atoms per cubic inch of which humans consist, are radiationally. ergo visibly, activated. The human, thus omni-internally illumined by the local one-million atomic 'street lamps,' could be realistically scanned by discrete 'depth-sounding' uevices and programmed to move 'visibly' through an omnidimensional, high-frequency, light matrix 'mass.'

"Employing as broadcastable channels the 25 great circles of the vector equilibrium all of which pass through all the * K* (kissing) points of tangency of all uniform radius, closest-packed spheres of all isotropic vector matrixes; and employing as local holding patterns the 12 great circles of the icosahedron; and employing as a resonance field all the intertransforming spheres and between-sphere spaces; and employing the myriadly selectable, noninterfering frequencies

of such propagatable intertransformation resonance; it is evidenced that the isotropic vector matrixes of various atomic elements may be programmed to receive, store, retrieve, and uniquely constellate to provide computer functioning of"

'•The smallest known orderly phenomenon in the Universe is the atom. The diameter of the atom's nucleus is the smallest known distance measurement in the Universe, The diameter of the outer shell of the atom is approximately 10,000 times that of its nuclear diameter. The ratio of diameter sizes of the atomic nucleus and the diameter of its outer electron orbit (shell) is 1 to 10,000. This also is somewhat the same order of magnitude as the 8000-mile diameter of the Earth in relation to its own Sun-orbiting diameter of 184 million mile, i.e., 1 to 23,000. But the Earth is not the solar system's nucleus. The Sun is the planetary nucleus. The Earth orbits the Sun at a diameter that is only 230 times the diameter of the Sun. Pluto, however, is the outermost known planet, ergo, it is the Sun-nucleated system's outershell-describing planet, and Pluto's orbital diameter is 9000 times the diameter of the Sun. Thus, the solar system discloses approximately the same nucleus-to-shell diameters ratio as that of the atoms, and may indeed do so exactly, for there are new calculations suggesting a tenth planet at possibly the exact 10,000-Sun diameter's distance."

Automation:

"By automation I refer to orderly behaviors of inanimate complexes which operate independently of human guidance."

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, p. 158, Dec '69
Automation:

"Getting hungry is an automated function, as is breathing. So also are the spontaneous self-guarding and regenerative responses to any threatened impairment of our physiological equipment."

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, pp 158-159, Dec '69
Automation:

"Our presumptive ignorance has led humans to regard automation, for instance, as a fearfully threatening innovation when, in fact, along with the invention of all his tools, automation constitutes an externalization and separation out of the integrally operative organic processes of humanity's special sets of what originally were, exclusively, internally functioning processes, utterly unique to humans' regenerative beings.

"All of nature's regenerative events are and always have been automated with inclusively considerate and exquisite precision. Our human brain consists of quadrillions of atoms, all operating in superb coordination--- in none of which activity have we any conscious participation. ...No one knows cosmically how or why they make babies. They only know what buttons they accidentally pushed before the whole automated process occurred."

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, pp. 151-152, Do. '69
MttPWaUQIV

"We hear a great deal about automation as something very threatening . . . something new. I'm going to try to define automation. By automation I would mean any regulatory pattern or control operative independent of man's controlling it: that would be automated. I'll point out to you that the orbiting about Earth and all the pulsing of the Sun--- this is all automated. I point out that none of you know what you're doing with your lunch right now-- this is all automated. "You're not consciously saying, 'I'm going to send this off to make hair for tomorrow, and I'm going to have curly hair,' or whatever it is. You haven't the slightest idea why you were born at seven pounds, and why you went to 170, and why you stopped. People learned accidentally that they pushed some buttons and made babies, but all the rest is automated. They haven't the slightest idea why. I point out to you that we have never had anything but automation."

- Cite RBF to World Game at NY Studio School, 12 Jun-Jul'69, Satrun Film transcript, Sound 1, Reel 1, pp.83-84.

Automation:

"by automation I refer to any reciprocally interacting system operating independently of conscious human guidance."

Senate Select Committee on Technology, 4 Mar *69

- Cite HEARINGS,
p. 13.

Automation:

"I hear humanity talking about automation as if it were something new and something ominous. And I discover that man has always had automation: that the way you were born is completely automated. that parents don't know how to make babies--- they just push buttons and all the rest is automated.

"You don't know what pxirfta you're doing with your lunch right now. . . to which glands you're going to send it. and how much you're going to use to rake hair, and how much to make skin, and how much to use for emergency work--- when you get a scratch--- none of this do you know. So you're really 99.9 per cent automated.

"Man is very meagerly conscious in the total process. None of you knows how you went from seven pounds to seventy, and none of you knows why you did."

- Cite THIS IS YOUR GRAND STRATEGY, 4 Feb '63, p. 4.
A9RaUQIb

"Humanity has been only inadvertently saved from extinction. The surprise factor is the fallout from the weapons support system. The new fallout technology which displaced man as a specialist (professional, scientist, or craftsman) is the new computer-monitored automation Industry."

- Citation and context at Suicide of Humanity. Jun'66
Automation:

"••hen we refer to the computer and automation taking over, we refer really to man's externalization of his internal and organic functions into a total organic system which we call industrialization."

- Citation at Industrialization. Mar*66

"All of nature's regenerative events are and always have been automated with inclusively considerate and exquisite precision. Our human brains consist of quadrillions of atoms, all operating in superb coordination--- in none of which activity have we any conscious participation. No one knows what he is doing chemically and organically with the last meal he loaded into his stomach. No one is consciously routing the corn flakes to this gland and carrots to another to grow hair on his head, nor other food items sent purposefully to manufacture the coloring of his eyes. No one has the slightest idea how or why he was born, weighed in at seven pounds, grew to 170 pounds, and then stopped growing. No one knows cosmically how or why they make babies. They only know what buttons they accidentally pushed before the whole automated process occurred."

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, pp. 151-152, Dec '69

"Getting hungry is an automated process, as is breathing. So also are the spontaneous self-guiding and regenerative responses to any threatened impairment of our physiological equipment. While man's consciously elective participation in all that goes on is almost negligible, he argues the pros and cons of today's problems and conducts election in the belief that he and other humans are primarily responsible for all that occurs. Nature is usually disdained by man as consisting of an easily controlled and as yet unattended set of disorderly happenstances. Too much Sun? Put on glasses! Too many bugs? Use the DDT gun!"

- Cite ARCHITECTURE AS ULTRA INVISIBLE REALITY, pp. 158-159, Dec '69

"To such an extent does man believe in man's importance that he doesn't realise that he is himself almost completely automated, that he is subconsciously coordinated and motivated and also part of an immensely evolving totally new era gestation process to be realized in

magnitude beyond man's conception. Nobody knows how his breakfast is being processed into gland-stored energies. He cuts his hand and it heals. He does not know how. His hair grows, or doesn't grow and he knows not how or why. We go from seven pounds to 170 so relatively slowly we don't think of this as evolutionary. But between World Wars I and II American men unexpectedly increased their height by three inches. Up to and including my father's life, the average distance covered by man in his lifetime, was 30,000 miles. In my lifetime, thus far, I have covered three million miles a 100-fold increase. Astronauts knock off that distance in three days flight. I don't think we tend to accord at all the fact that we might go on to have some other form of living in the Universe,"

Automobile:

"An automobile cannot go over the open fields. The highway is part of an automobile. You must realise that an automobile is really like a little runner on a monkey wrench. These two parts are again the synergetics of one another. And because the automobile company can't afford to produce all the highways, all they do then is to produce a very beautify! car, put it in an automobile show, get the local banker to buy one, and it gets to be very showy. People get very excited at the idea that they don't have to walk from here to there; they might be able to ride from here to there. And they have automobile races on a little track and it gets to be very exciting. And so finally there gets to be such a hunger of people to ride that the politician, who hasn't even gone to school at all, finds the way to get elected is to build highways."

- Cite Univ, of Chicago Address, pp.9-10, 5 May'72

Automobile:

"It is perfectly practical to think about taking the metals out of obsolete automobiles, taking all the two-ton automobiles off the road, melting them up and making twice as many higher performance one-ton automobiles from the same metal. You may say that you don't want more automobiles--- that the parking problems are too great.

In speaking of automobiles I am speaking of a familiar industrial tool. I am not advocating more autos. I am simply considering the feasibility of the principles involved through which we can take care of twice as many people in a given function with a given obsolete scrap resource.'*

Ajffira£fi_Man: 0 >

"So there really are quite a number of friends here. There are those whom I've not met, and I'd like to start in on the kind of thinking I`m going to do--- thinking out loud--- by letting you have a little idea of how I think about myself, because I consider myself my own private guinea pig. . .

"I've often found myself being introduced in really

quite lavish welcome as if I were some special kind of a creature. And I'm absolutely convinced that the most significant aspect of me is that I couldn't be more average. I'm quite confident that I haven't been able, that I haven't done anything, that anybody cannot do. I'm sure that everybody is gifted with these capabilities, and I just simply became terribly interested in seeing how I could develop what I thought was our comprehensive inventory of innate faculties because I feel I certainly could recall--- as you must, when you're young, how very sensitive you really felt about that kitten, the first kitten you ever saw. How you felt about the first time you can really remember seeing a flower. . . . The delicacy of the human relationship which, as time went on . . . people saying, darling, it's a pretty tough world and you've got to get over that sensitiveness. You've got to harden up. And how"

Average Man: (2)

"we learn to close off those valves. And I began to wonder what would happen if I opened them up again. If I could;

I would try. So I'll simply say that whatever ...I'm very glad that I have some kind of a record to show because then I think it's a very clear demonstration of what can be done. Because I've always said that if anybody else had ever undertaken to do what I did I don't think you'd ever have heard of me because I would have come in second. Not first. And simply to have a record--- because I had no competition whatsoever.

"Now if I go on in a lucid manner I think you'll begin to agree with me in my premises--- because I'd like to make clear to you why I'm convinced that I'm only employing what is available to all of us. But I find it very important at the outset of any thinking out loud to introduce a special word with a special meaning that I find is not popular. / Synergy_7" "I am confident of the results of my having discovered some of the potentials of a truly average man. I am confident that the only important thing about me is that I am a truly average roan and that all average healthy humans have extraordinary abilities which are as yet unrecognized by society.'*

Avogadro:

"Avogadro accounts volume with number in a much better way than just putting water in a cube."

- Citation 4c context at Geometry of Vectors f 2? Jan'75

Avogadro:

"Reviewing chemical science history I became intuitively aware that the clue to vectorial, volumetric, geometrical coordination might be found in Avogadro¹'s experimental proof of his earlier hypothesis which stated that all gases under identical conditions of heat and pressure will always disclose the same number of molecules per given volume. I felt intuitively that inasmuch as these gases often consist of one unique chemical element, such as hydrogen or helium, and that inasmuch as these gases could be liquefied, and inasmuch as most of the elements are susceptible to some heat- or pressure-produced transformation between their liquid; crystalline, and vapor, or incandescent states, it might also be reasonable to hypothetically generalize Avogadro's hypothesis by assuming that 'under identical energy conditions all elements may

disclose the same number of "somethings" per given volume."

Axiom:

"We also no longer can overlook the fact that science has found no solids, no continuous surfaces, no infinity, no straight lines, no 180-degree angular continuums. To the best of our experimentally informed knowledge, all such formerly accepted axiomatic concepts are false. Axiomatic meant 'self-evident.' The seemingly obvious quality in most cases of yesterday's ajjns was permitted only by

the lack of knowledge of that which would be disclosed by microscopic inspection, We must desist from further imposition of such pre-microscope-telescope assumed, but now knowledgeably false, premises upon our children. We have been tolerating the fictions only because they were included in yesterday's textbooks which we say, also ignorantly, we cannot afford to replace. The time has come and there is little left of it, within which to effect entirely new world-around educational strategies.'*

- Cite NEHRU SPEECH, 13 Nov '09, pp. 15-16

Axiom:

"I find almost all the axioms of mathematics to be experimentally nondemonstrable. The dictionary defines axioms as self-evident truths. Post-Greek electron-microscopy and Heisenberg's indeterminism show that the seemingly self-evident is always superficial and utterly deceptive and that truth is at best inexact. Pure mathematics' axiomatic concepts of straight lines are completely invalid."

- Cite NASA Speech, p.44, Jun'66

Axiom:

Regarding those mathematicians working in geometries, they don't impress me at all. As far as I am concerned, all of their axioms are wrong. An axiom by definition defies the concepts of experimental science. These mathematicians insist that what is self-evident is not subject to further experimental demonstration; and therefore, as far as I am concerned, they are working with concepts which have no experimental foundation. I believe that about 90 per cent of all mathematics relates to games that have no valid relationship to real physical experience."

- Citation & context at Llne, 1y Jun'71

Axial of Spin:

"Any two vertexes may be selected as the axis of spin whether or not the axis described by them is immediately conceivable as the axis of spinability, i.e., the axis need not be statically symmetrical. (You can take hold of a boy by his two hands and spin him centrifugally around you although his two hands do not represent the symmetrical static axis of the boy.)

- Cite RBF to EJA. 3200 Idaho, Washington DC, 23 Jan '72 Incorporated in SYNERGETICS at Sec. 223.01, Jan '72.

Asfl. Spin: (1)

"Euler said that every pattern in the Universe is characterized where the lines cross (the vertexes) and areas (where three lines cross giving any closed set.) And we found that for all polyhedron the number of vertexes plus the number of faces equals the number of edges plus two.

`` I thought this plus twoness over and the fact that I found two extra spheres in every layer of closest packing had probably some significance. So I said, one thing we have learned about all systems when isolated from other systems, is that they have the ability to be rotated or for things to rotate around them. Therefore there are axes of spin. Every system has to have some kind of axis.

"We look at the reel of your tape recorder here and we look at the top of that reel which is going eastward and the bottom is going westward. And the top is going quite fast to the eastward. If I go in from the center, the speed from the top is going slower as it goes close to center, and the bottom is going slower and slower eastward as you go close to the center. Finally at some point in the center"

- Cite RBF to Verner Smythe, NYC, Reel 2, p.4., 11 Mar'69

Axlg. Pf spin: (2)

"they can't be going the other way. There must be a neutral axis but you can't see it. This shows up time and time again in mathematics. Brouwer's mathematical theorem really shows this...you have a large number aggregate of points very randomly disposed and you stir all those points. It's easy to prove mathematically that one of the points never moves in respect to the total mass.

"There is always a neutral axis because every must have the two faces, obverse and reverse. So there must be another point in the southern hemisphere that also didn't move. So those two points are always in any matrix of seeming total disorder: two will not have moved.

"So these are the axes of spin of systems. If I need an axis of spin, therefore, I find it very interesting that in agglomerating these layers and allowing for the really very large- size numbers that would be accounted for in the masses of Earth. And Newton working in the gravitation of mass defines it in terms of the second power of the relative proximity of the masses. And that second power is in terms of the diameters'*

__ Cite KBF to Verner Smythe, NYC, Reel 2, pp 4-5, 11 Mar'69

"of the respective masses, using one or the other as a criterion, ./hich means that if I have two balls the same size and I halve the distance between them, that wil fourfold the attraction of one for the other. And then I gave you the converse of that, the radiation one of Einstein, which is also second powering. Both of these deal in energies which are so large that the the discrete two for any layer in terms of atoms would be lost. But when we come to make the true model, I found out that in the closest packing of spheres there were the two always there. So we could describe it, but you really couldn't discover it experimentally because it's too negligible a figure. But there it is and it allows for the axis of spin.

"So 1 said, all right, so I'm going to redo all those formulas. For every vertex in any polyhedron I am going to take two out of that polyhedron and assign them the function of the axis of spin. Two vertexes always are poles. This means that I will subtract from the left-hand side Euler's formula. For instance the tetrahedron is four vertexes plus four faces - six edges plus two. I take out two vertexes on the left-hand side which I give the function of being poles. That leaves me"

- Cite RBF to Verner Smythe, NYC Reel 2, p.5, 11 Kar'69 ''**two nonpolar vertexes in the inventory. This means I will have to put plus two over my equation over here. I am using the sign of theta because it has the fundamental twoness. a top and a bottom. So I have the plus two. I have two plus, taking it out of every one of these vertexes. This means I can take away the two on the other side of the equation, where I had epees plus two ($E + 2$), in order to accommodate this extra twoness, which was over here, which really had the polar effect. So I have two poles plus these nonpolar vertexes in here. I have taken that out of all of Euler's topological description of all this hierarchy of polyhedra, which is done in the hierarchy of relative volumes of oneness, fourness. The '1' gets back down to a *2* later on, 2, 3, 5, and so forth.**

"This tells us then that where we take out the two poles, the spin, there is a constant relative abundance for every vertex in the Universe. There will always be two faces and there will always be three edges. Which is to say then, that from every event in the Universe, the number of lines (which are the vectors, the energy actions) will always be three--- or multiples of three."

CSee Vector: Threeness of the Vector_7

- Cite RBF to Verner Smythe, NYC, Reel 2, pp.5-6, 11 Far'69

Axis of Spin:

(5)

' 'This brings us to an identification. I have two kinds of twoness here. There was the polar twoness, the two in every layer. . .

"There is another kind of twoness--- because remember in this formula we have in the first layer, 12 balls, then 42 balls, then 92 around one ball. And I said the center, the top ball there, was just one ball all by itself. Let us take our formula for how many balls there are in a layer. Quite clearly, the first ball has no layers--- no outside layer, does it? So the frequency is zero. You can't have frequency without two to give it some integral. So our single ball, as nucleus per se, doesn't have any layers around it, so it is zero. So frequency is zero. Frequency to the second power is zero times ten, which is zero, and plus two is two. So the center ball always has a value of two. Because the exterior is convex and the interior is concave, and because convex and concave are not the same--- because one is an energy diffuser and one is an energy concentrator--- this means then that every ball has two kinds of qualities of two. It has an additive twoness of the balls plus an insideness-and-outsideness twonee8.ⁿ

- Cite RUF to Verner Smythe, NYC, Reel 2, p»7, 11 I%ar*69

"That was a multiplicative twoness. So I have a formula here where there are two balls multiplied by the constant relative abundance. Once the poles are taken out there is a constant relative abundance of vertexes to base edge. For every vertex, for every event in the Universe, for each star, there has to be two face and three edges (or three lines or three vectors. . . in absolute constant relative abundance, and the only difference all the way down through here is then, there is a multiplicative twoness, outwardness and inwardness, plus one of the prime numbers: 1, 2, 3» and 5 are the prime numbers. There is a very great regularity showing up. And it was then at the top of the five that we goit our 92. . . . uraniumi/hether the regularities go inside or out you get the same thing,"

- Cite RBF to Verner Smythe, NYC, Heel 2, p.7, 11 tar'69

RBF DEFINITIONS

"Every system has axial spin-ability. Just pick up anything and toss it around. Everything can and must be spun. Every system has a spin axis. Every axis has two poles. There are two of the vertexes of every system that must always be assigned to the function of implementing the system's spinning, for every system in universe is always free to spin and must in effect, spin in respect to all other systems •due to the experimentally demonstrated, omni-intercausative precessional accelerations of all components of all systems and of all systems in respect to one another."

Background ^NQthinpiflaa:

"When you draw the triangle on the Earth's surface It shows how our mathematics is really pre-Euler. The triangle also demonstrates self and otherness. The spherical triangle is the first awareness: there is an inherent 'twoness' in the triangle's insideness and outsideness and the axis of the two poles constitute the two points of self and otherness. The background nothingness of these two points represents an area not contained by a line. Euler did not realise that there could be an area not contained by a line,

"One spherical triangle on the Earth's surface ` ` four triangles because that's the only way you can define a triangle. Euler did not recognise the background nothingness of the outside triangles." ~

"If you take one sphere, it can, in a sense, go anywhere in the Universe. I have another sphere in the Universe and the two come together. They can do anything in the Universe except go through each other. If they become tangent they roll around on each other very tightly.

"Now I have a third sphere here. I had one sphere first and it was all alone; then I have two; they can roll around on each other. From the distance you' see just the profile of a dumbbell, but they are very free to roll. Now along comes a third sphere and it nests in the valley. This makes a train of gears with each one geared to the next one. Even numbers of gears will always reciprocate and the odd numbers will always block. This way--- a plus or minus, or whatever it is--- it is going to block. So no longer can those balls roll in a plane on the triangle which they form. If one tries to go one way it will make the next go the other way; and one can't be moving in two different ways, so odd numbers will always block."

"Therefore, all it can do is evolve. The three balls can evolve . . . like a rubber doughnut. I could have it open as a torus. They could open its top and come in at the bottom, so they have a degree of freedom. Now I have a fourth ball that comes around in there and it nests on top of these. Now it can no longer even evolve and, for the first time, all motion is blocked. This makes a tetrahedron: I connect the centers of these spheres as a tetrahedron. This is where stability begins. The tetrahedron is where the triangle gives what we call a 'structure' or something that doesn't change its pattern any more. It was dynamic up to that time."

- Ate. tStTSTI

Balloon:

(a)

"People think spontaneously of a balloon as a continuous skin, or a solidly impervious, unitary, and spherically closed membrane holding the gas. They say that because the gas can't get out and because it is under pressure, the pressure makes the balloon spheroidal. This means the gas is pushing the skin outwardly in all directions.

"But if we look at this skin with a microscope we find that it is not a continuous film at all. It is full of holes.

Instead it is in fact a net. If we look at the net atomically we will see that the tensional net's threads are discontinuous, being in reality "Milky-Way-like" constellations, great energy aggregates cohering only 'gravitationally' to act as the 'webbing' of the pneumatic ball's net.

"In a gas balloon we do not have a continuous membrane of film. There is no such thing as a continuous 'solid' skin or 'solid' anything in Universe. But we do have a network pattern, a network of energy actions that is interspersed with vast spaces or lack of energy events. But the spaces between the energy action net are smaller than Wfc are the internally captivated and mutually interrepelled gas molecules, wherefore"

"the gas molecules, which are complex local, low-frequency energy events interfere with the higher frequency net webbing events. The pattern is similar to that of fish, crowded in a net, and therefore running tangentially outward into the net in approximately all directions.

"A gas balloon' exterior tension 'net' has the shape that it has because some of the molecules are too large to escape and--- crowded by the other molecules--- are hitting the balloon. But the molecules do not huddle together at the center and then simultaneously explode outwardly to hit the balloon skin in one omnidirectionally-outbound shock wave. The molecules near the surface are coursing in chordally ricocheting patterns all around the inner net's surface. I therefore saw that--- because every action has its reaction--- that it would be possible to pair all the molecules so that they would behave as can two swimmers who dive into a swimming tank from opposite ends, meet in the middle of the tank and then, employing each other's inertia, shove off from each other's feet in opposite-directions. This pattern indicated that we could have each and all of the paired molecules bounce off*

Balloon: (A)

"All of you have experienced a child's balloon and footballs full of air. The idea of a ballon as a pneumatic bag is a very familiar one. . . that it tends to take certain shapes like,sausages or spheres. It doesn't take a flat disc: it wants to become a sphere. If you took two discs of rubber and joined them together at the edge, and filled them with air, if it doesn't become a lozenge, it becomes a sphere.

A sphere contains the most volume and the least surface aand is the most comfortable condition. These energy patterns are always the most comfortable and the most ecobomical conditions. Think about the pneumatic bag then. People have always thought of it as if you put air under pressure and there's sort of a solid mass of air and you jammed it in, and it's in a solid bag and can't get out. The fact is that if you look at a pneumatic bag with a micijpcope you will find that it is full of holes. It is made of molecules and molecules are fairly remote from one another, and atomically it is full of holes. It is not solid and in fact the components are wot even touching each other atomically."

(B)

Balloon:

'They are like the tensegrities, In the tensegrities you either have gravity, electromagnetism, and you don't have any strings at all. The pneumatic bag then is full of holes and you can see them under a microscope. Therefore, it is not What we used to talk about as a solid membrane. Our concept 'solid' gets to be less and less reliable the more we think about it, and the more we experiment. So if it is full of holes it is a net and not a bag, so let us call it a net. It is a net in which the holes are so small that the molecules are larger than the holes and they can't get out. The molecules are gas and there is an integrity of the molecule of gas and it is one of these tensegrity kinds of integrity also, but it has a minimum dimension and it can't get out those holes. The next thing we discover is what we call the pressure of the gases as explained by what we call the kinetics of gases. That is, the molecules are in motion. They are not rigid. There is nothing static here at all pushing against that net--- but they are hitting it like projectiles. Not only is there a critical proximity that shows up physically, but there are critical proximities tensionally and critical proximities compressionally, that is, there are repellings, "

Lecture » • '«

Balloon;

**as we would find out in electromagnetics: so there are domains of actions, and these molecules want certain sizes, 'Then you pressure too many of these patterns into the same area there is not room enough and they develop a very high speed. And speed makes up for the crowding. How can you do that ?

(C)

"I spoke to you the other day about the airplanes coming in for a landing and while they're in the sky they seem to be great distances apart. The minute they land they are slowed down and they are much closer to each other. It is fairly simple to work this out. If you have something at a very high speed, the amount of time at any one point is a very short time. The amount of time that it would be at any one point for something to hit it would be very much lessened by the speed. The higher the velocity, the lesser the possibility of interference in any one local. So we have the patterns making themselves comfortable inside the

Cite Oregon Lecture #5, pp. 186-187 July *62

pneumatic bag by increasing the velocity so that it can take care of the interferences that are developing. This velocity then, gives us what we call pressure or heat; it can be read either way— and if you feel the pneumatic"

"you find it getting hotter. What makes the net take the shape that it does is simply the molecules that happen to hit it. The molecules that are not hitting it have nothing to do with its shape. There is potential that other molecules might hit the network, but that is not what we are talking about. The shape it has is by virtue of the ones that happen to hit it.

"One of the things I saw, of course, was that when we are crowding them in that one pattern, it was using the other pattern as action, reaction, and resultant. Therefore we can see that when one is going out to hit it; it is pushing another one inwardly, or some other direction. But we discover mathematically that it would be impossible to get all of them to go to an absolute common center because that would require a lot more pressure. It would have to be a smaller space so the patterns are not all from center outwardly against the bag. Each one

of the patterns are ricocheting around the bag, and so one hits the bag like this, and then the reaction causes another one to hit the bag on the other side. Then we have some that are inside there, in movement and hitting and changing the angles of"

- a-Cite .OrftKqn Lecture #5, p. 187, July *62 ' 'the others, and precessing them but not hitting the bag. I saw thatfwe can have two swimmers and they can jump off the same end of the swimming tank together, go to the other end, and use the inertia of the tank to shove off, to go in the other direction and build up their velocity. If you could start the two swimmers at opposite ends of the tank and they could get to the middle of the tank and push off from each other's feet, then they would go off and hit the other end of the tank. If the tank was pretty small and they did that, they could shove off from each other's feet and hit the end of the tank pretty hard. So we could have conditions where these molecules shoving off from one another, and very close to the hag, would make simply a chord and ricochet off. . . You could study the ways these are hitting and the patterns they are making, and when they hit they ricochet off and make another angle, so they are the ones that are accounting for all the work. . . So this pattern of the swimmers, of the two meeting each other and they bounce off like that, hit the bag, and then run into another pair. You begin to find that they are pairable. So we discover that all we are accounting for can be paired. The chord of an arc is always less distance than the length of the arc itself." - Cite Oregon Lecture "5, p. 188,9 July *62

(F)

balloon;

' 'These actions are less than the distance of the net, so they will push the net out and try to straighten out those arcs. . . They become mathematically pairable. . . , The tensegrity events that made the spheres were the ones where the events happened to aim at each other at approximately 180 degrees. It was only approximately, and we find then that the ones that do give you the actual pattern.

"/here we realize what occasions the shaping of the pneumatic bag is really the complex of the molecules going into these kinds of patterns. All the other molecules, and there are lots of others, have nothing to do with that shape."

(For follow-on text see Snow Mound)

- Cite Oregon Lecture #5, p.<p88, July '62

"If we make a microscopic inspection of a pneumatic balloon, we will find that the balloon skin is full of holes between its molecular chains, with a secondary and far smaller space continuity of 'all holes' or 'continuous space' between the remotely islanded energetic components of each molecule's respective atomic nuclear constellations. All these humanly invisible balloon 'holes' are too small for molecules of gas to escape through. Because the balloon's skin is full of holes, it is really a subvisible spherical netting, rather than a 'flexibly solid film,* within which the gaseous element molecules are crowded into lesser volume than required by their respective energetic, ecological domains, like fish within a seiner's net. The resultants of forces of all these net-frustrated molecular actions is angularly outward of the balloon's geometrical center--- each surface molecule of the interior group of pressured gas has a vectorial action and reaction pattern identical to a spherical chord. In such enclosure of pressured gas, random sixes of molecules, each too large for the spherical molecular netting's holes, impinge randomly upon the interior webbing of the spherically

,br LiEFIMThuiiu,

tensioned net. There are, therefore, more outwardly pressing molecules and more inwardly restraining net components than are necessary to the structurally resultant balloon pattern integrity, However, in the geodesic, tensional interrrity spherical nets the □

islands of interior compressional chordal struts impinge in discrete order at the exact vertexes of the enclosing finite tensional network. My independent satellite or moon structures are then the most economical, frequency modulated, dynamic balances between outward bound resultants of force and inward bound resultants of force, The exterior tensional net is a finite system successfully binding the otherwise randomly entropic infinity of outbound, self-disassociative forces."

Balloon:

"If the frequency is high enough the size of the interstices of the tensegrity net may become so relatively small as to arrest the passage of any phenomena larger than the holes. If frequency is high enough, neither water nor air molecules can pass through. They may be made to keep out the,weathercomplex while admitting radar's microwaves and light,etc. If we 'up' the frequency sufficiently, we will decrease the residual compressions! islands to the microscopic magnitude of atoms, which only serves to disclose that the atoms and their nuclei are themselves geodesic tensegrity structures, ergo compatible with this ultimate, frequency limit, a fact that is now swiftly looming into the nuclear physicists' ken<

"Wo now comprehend that the tensegrity geodesic structuring provides the first true and visualizable model of pneumatic structures in which the relative thickness of the enclosing films, in proportion to diameter, rapidly decreases with the increasing size of the balloons."

- Cite "Tensegrity, Art News Portfolio," p. 124. Dec'61

Balloon? (4)

"In the case of the geodesic tensegrity structures, however, no overcrowding of interior gas molecules, imprisoned within a submolecular mesh net, is necessary to thrust the net's structure outward from its spherical geocentric center, because the compressional struts, locally isolated, as outward thrusting struts at both their ends, push the spherical net outwardly at every vertexial advantage of network convergence. Geodesic tensegrities are then "hollowed out" balloons, discarding their redundantly 'solid' air core.

"The geodesic tensegrity is a hollowed out balloon in which those specific molecules of gas which happen to be impinging from within against the skin at any one moment (thus pushing it outwardly) are replaced by the isolated geodesic struts. It is possible then to sew pockets on the inside surface of a balloon skin corresponding in pattern to the isolated geodesic struts and to insert stiff battens into those pockets which cause the otherwise limp balloon

bag to take spherical shape as it would if filled with a pressured-in gas."

Bar.?. Maxlaui: (A)

. .We found that the only way we could really show that we could make the world work for 100 percent of humanity was to show that we could provide the energy needs, externally and internally, to every human-being on Earth. That was the only way wo could, in a sense ... measure that we had provided for the world's needs. So we started off and tried to figure out exactly what would be bare maximum. . . How much had to be provided to every human being as fast as possible to give them their high standard of living and totally reinvestable time in the sense that all of the survival needs were taken care of and they would be able to invest all their time in their own lives/

"We made these two charts to give a graphic representation of how we want to move to that bare maximum in external metabolics and kilowatt hours and internal metabolics meaning calories and protein. And if you see the chart. . . this is the increase in our kilowatt hours and that's population. So as these curves rise, you see them going more and more horizontal towards bare maximum. In 1965 the majority of the population is below the kilowatt hours

- Cite Saturn Film Transcript, Tape #1, Jun'69

Bare Maximum:

(B)

'necessary. In 1980 everyone is above their minimum which is 3000 kilowatt hours and by 1990 the majority are over

5000 hours... These are the scenarios we have designed, supported by the research we have done.**

- Cite Saturn Film Transcript, Tape #1, Jun'69

Bar? (1)

"When we get enough power for agriculture, in 1980, we will be able to accelerate the production of food a great deal more. Our acceleration is going to increase. The number of Seople that are fed with a certain diet is increasing.

espite the increasing population, and the inefficiency of the system people are getting better and better fed all the time. By 1954--- on the graph--- the majority of the people on the Earth are receiving approximately 1800 calories. This sets you below our bare minimum level: the level at which you can function at all . . . way below our bare maximum_f which is the level at which you can be truly human. But the bare minimum is really a sub-human level of existence. It's an extremely low level of consciousness. But in 1967, the level at which the greatest number of people on Earth, in other words over 50 percent of the people on Earth, are receiving over 2,000 calories, or about 2,400, which gets the majority of humans above the bare minimum. So the majority of world man is presently conscious, conscious of himself as a physical beibg, but not yet able to function well until he gets up to the bare maximum level."

• Cite RBF to World Gme, Jun-Jul'69

Bare Maximum: (2)

"Until we get everybody up to the bare maximum level we really won't be able to function as a worldwide organization. So we've got a pressure building up here. We've got people that are conscious of themselves physically but who can't truly function on the level of efficiency of mankind. So the pressure is building up to get rid of this inefficiency in agriculture. You can probably get efficiency up from 10 percent to 50 percent or 75 percent of the agricultural system. When you get over 50 percent of the people say, above 3,000 calories, man is going to really begin to be on a high level of consciousness, as a world organism; and it's going to be very quickly that the entire world is going to be able to be at the bare maximum.¹¹

Barrel:

"I give the explanation of a barrel* In a barrel you have a number of staves parallel to one another. These staves make a cross cut through the barrel. You'll find each of these staves looks like a keystone in an arch. Each a stave is a truncated section of a triangle whose interior apex would be at the center of the barrel. So you just cut the beautiful triangular wedges, but you cut off the inner part which isn't necessary. You still have a wedge where the outer part of it is a greater chord than

the inner part. Therefore, it can't fall in between the others. So all these staves are in line and parallel to one another, bound in a circle. There are comprehensive tension straps to hold them inwardly. They can't move outwardly due to the finiteness of the straps coming back upon themselves, and they can't fall inwardly on each other because their external chords are bigger than their internal. So the barrel seems to be pretty stable, but the tension bands don't touch one another--- they're in parallel to one another and the staves are in parallel. They don't cross or give you any triangulation whatsoever. In fact, they let infinity in to the system because the staves go on and on to infinity,**

- Cite RBF in Hans Meyer Interview, Dome Book Two, p. 90. Dec'70

"So you take a blowtorch and burn out one of the wooden staves of the barrel and the whole thing collapses because that leaves enough room so that the outer part can fall in through the smaller inner part, because what the blowtorch does is let infinity into the system. . . or the nothingness of the Universe gets into the system.

' • Let me now make a wooden geodesic- sphere in which each of the triangular facets are external faces of a tetrahedron whose interior apex will be at the center of the sphere, and I'm going to truncate those, so I will now see really a wooden barrel-- a spherical barrel and it has tension straps. But its tension straps are triangulated, they are not just in parallel. They cross one another. And once we get a crossing of two lines that cross each other like a pair of shears. . . they are unstable angularly. « . once you get the third one, suddenly it takes hold of the ends of the shears and stabilizes the opposite angle. So now we have an omnitriangulated geodesic sphere of wooden triangular plugs, corks, each one pressed against the other one, each with exterior chords larger than its interior chords and they can't fall inwardly. When the straps have great circles going completely around they won't come off and the straps are fastened to each other as they cross

TtNiFCen Y - Jec, 4-5'." S'!

Barreli (3)

"each other. Therefore, they hold themselves in position. They can't slip off the sphere. Everything is held as a beautiful harness on the omnitriangulated. . . Great circles are the shortest distance around spheres and they are intertriangulated so they're in the most comfortable position they could possibly get into. Now let me take a blowtorch and I burn out one of those wooden corks, and nothing happens. It doesn't collapse as did the wooden barrel. Why? Because it leaves an opening there all right, but it is a triangular opening and a triangular opening is a stable opening. If I burn out four of these adjacent to each other and make a larger triangle it is still a triangle and it continually frames the opening with a great circle. Hence, she will not collapse. In fact I burn out very large amounts without the thing collapsing. This suddenly gives me a fantastic realization of the fundamentals. This is really the fundamental of compound curvature. . . this three-wayness of finiteness crossing itself up and it all being most economical. Great \square circles are then the most economical distance between points on spheres, as against the expression that a straight line is the shortest distance between two points."

TtUSfGAn y-

Barrel:

"Barrels and cask. which fhave great `container advantage¹ in the past, due to the finite closure of the tension circles, were limited in usefulness efficiency by the infiniteness of the extended ends of the truncated triangle sectioned staves and by the infinity which Intruded between the barrels' parallel sets of circular bands."

TfHSet'nt- S F i

Barrell:

(A)

"A barrel represents an advanced phase of the Roman Arch or principle of stability accomplished by simple curvature. The parallel barrel staves constitute a ring held together in compression by encompassing tension bands. Thus compression, which tends to curve, is favored in that tendency until the curving line of compression closes itself to thrust against itself. The tension line, which tends to pull true, forms itself in a finite closure of short true chords--- because tension members may be flexed while they are in tension without tendency to failure.

' • The tension ends are united to pull against one another. Thus we have closed circuits of tension archbundling compression in dynamic stability. Tension lines may also be flexed while under load, without tendency to failure, as a compound corollary of the principle to pull true and the ability to tolerate bending while tensed.. Pressures exerted either outside or inside of the barrel result in outward thrust of the staves against the tension members. Thus, the latter absorb the working or random loads. . .

See 53p 1 I - Cite I&I, 1 Apr*49

Baxxcl: (B)

"When we press against a barrel, the stress is satisfied by the tension hoop. Each hoop represents the circle of a single plane. Thus it is seen that simple curvature stresses act in a single plane, ultimately articulating that stress in diametric opposition of a line within the plane. The stresses are then ultimately focused to the infinite poles of parallels, because the latter are unaided in interstabilization."

Spherical Tetrahedron. Ik Noy'52 Yin-yang, 2d Jin'75* » 11J(2J

Baaie Event;

"A basic event consists of three vectorial lines: the action, the reaction, and the resultant. This is the fundamental tripartite component of Universe. One positive and one negative event together make one tetrahedron, or one quantum. The number of vectors (or force lines) cohering each and every subsystem of Universe is always a number subdivisible by six, i.e., consisting of one positive and one negative event on each of three vectors, which adds up to six. This holds true topologically in all abstract patterning in Universe as well as in fundamental physics.

"The six vectors represent the fundamental six, and only six, degrees of freedom in Universe. Each of these six, however, has a positive and a negative direction, and we can therefore speak of a total of 12 degrees of freedom. These 12 degrees of freedom can be conceptually visualized as the radial lines connecting the centers of gravity of the 12 spheres, closest packed around one sphere, to the center of gravity of that central sphere. The 12 degrees of freedom are also identified by the push-pull alternative directions of the tetrahedron's six edges,"

Basic Nestable Configurations: Hierarchy Of:

"There are three basic nestable possibilities shown in Fig. C. They are (1) the regular tetrahedron of four spheres; (2) the one-eighth octahedron of seven spheres; and (3) the quarter tetrahedron, with a 16th sphere nesting on a planar layer of 15 spheres. Note That this 'nesting*' is only possible on triangular arrays that have no sphere at their respective centroids. This series is a prime hierarchy. One sphere on three is the first possibility with a central nest available. One sphere on six is the next possibility with an empty central nest available. One sphere on 10 is impossible as a ball is already occupying the geometrical center. The next possibility is one on 15 with a central empty nest available."

"The largest number of identical triangles in a sphere that unity will accommodate is 120: 60 positive and 60 negative.

We can subdivide the surface of a sphere into 120 equilateral triangles by dividing the base of each of the 20 original triangles which made up the icosahedron, into six triangles. Being spherical, they are positive and negative, consisting of areas which cannot hinge back. One is inside, concave, and the other is outside, convex. So 60 positive and 60 negative triangles are the largest common denominator of unity."

Baolc Triangle; Basic Equilibrium LB LCD Triangle:

"Because each of the octahedron's eight faces are subdivided by their respective six sets of spherical 'right* triangles (three positive-three negative), whose total of $6 \times 8 = 48$ W triangles are the 48 LCD's vector-equilibrium, syunetric- phase triangles, and because $120/48 = 2j$, it

means that each of the vector equilibrium's 48 triangles has superimposed upon it 2j positively askew and 2\$ negatively askew triangle# from out of the total inventory of 120 LCD asymnetric triangles of each of the two sets, respectively, of the two alternate phases of the icosahedron's limit of rotational aberrating of the vector equilibrium.

"This 2i positive superimposed upon the 2\$ negative, 120-LCD picture is somewhat like a Picasso duo-face painting with half a front view superimposed unon half a side view. It is then in transforming from a positive two-and-one-halfness to a negative two-and-one-halfness that the intertransformable vector-equilibrium-to-icosahedron, icosahedron-to-vector- equilibrium, equilibrious-to-disequilibriousness attains sumtotally and only dynamically a spherical fiveness.**

RHF DEFINITIONS

Bathroom as Symbolism and Association;

"This is part of what the intuition of young people today says: that 'We don't want the symbolism of distinction.«• And it's perfectly reasonable... His father wanted it for his kids, because that's the way he associated it and as he envisioned poverty he didn't want his kids to feel that way. Therefore he got his little quarter of an acre estate, emulating what the tran of success had yesterday.. .

"There really is pathos in here, you know. The point is that building the architecture of the present is a great antipriority holdover... 1 look at things in a highly analytical way. Human beings have so much association with this kind of a bathroom they have in that particular house. That's where they remember crawling around and being loved by their

mother, and of being wanted... So terrific association; that's the way a bathroom Should be. That's to such an extent that when as a kid you go into somebody else's house and say, 'I don't like bathrooms like that--- this is the only kind of a bathroom, the way I" have it.' The association thing is very, very powerful. In 1927 society didn't want to listen at all; they were terribly annoyed by my being analytical about housing. It was pure symbolism and pure association.'

Berry PXsUng; (B)

"water with my tongue, and I found that I couldn't take water in nearly so fast as I could get it if I put in my handm and cupped it, and then I found that two hands were even better than one, and I could pour it down like- kloope!

"Supposing then that our ancient man has repeated this same process time and again and now has his water--- he's still very hungry and must go after berries. And he says, 'Everytime I go after berries I keep losing my water. I wish I could bring this water along with me; yet, if I keep my hands full, this water will probably spill and I can't pick berries.²⁰ So among the very earliest of all artifacts of man on Earth we find vessels or containers of various kinds. From the very

20 Cite RBF in Franklin Address, Auburn, Ala., 1970

beginning, theta were men who were able to control environment by taking some of the environment here and moving it to another place so as to have it with them. They were altering the environment in a preferred way to their own advantage.

"Once man Invents that vessel, several interesting observations can be made. When he was not using it himself, somebody else could use it. He could make the vessel by scrapings

PttT flttlMS (C)

"out stones, or by scraping out wood, and finally by forming things together--- baling clay, weaving baskets, and so forth. Once you develop the vessel, you can also begin to make it of materials that can stand up under heat that your hands couldn't stand. You can make your tool hands much bigger than they had been. You can make then stand acids that your real hands couldn't. In other words, there is a definite basic function for this tool, but you can greatly extend the limits of that functioning--- sometimes to such a degree that you don't readily recognise it as an extension of the integral function, as when we get to great tanks and reservoirs. This is something that it is very important to remember about tools.

'Thus, man has not been unique in his having developed tools, but he is unique in the extent to which he employs them. And all of this comes out of his recognising repeated experiences and realizing that he can anticipate certain conditions and alter them favorably by making such a thing as a vessel.

"As I compare man with other creatures in relation to specialization, I observe that man discovers principles that are*

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970
B.?jry risking • (D) •

"operative in his environment and he makes use of those principles. For example, we have the flying bird as a specialist; and the bird does fly beautifully; but when the bird wants to walk, it folds up its wings and therefore has to walk quite awkwardly. The fish swims superbly but can't walk on land. Man can walk on the land, but he also learns the principle of flight, and he puts on his wings and then flies. Then he takes them off so as not to be encumbered by them when he wants to walk again. He can put on his scales and go into the sea, but he is not encumbered by them when he doesn't want to use them. So man has the ability to put on and take off much more than other creatures--- which seems to be unique. This is what I mean when I speak about man's general adaptability: the fact that his functions seem to be as little encumbered as possible.

"What is really unique is that man is about halfway in the range of size among all creatures--- halfway, in the middle of them-- and he has extensibility in a great many directions. This, then, says that the specialisation should be in the tools and not integral to man himself. The dinosaur had a one-ton tail to knock down bananas when he came to them, but"

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970
 Berry Picking:

"he didn't come to enough bananas to make pulling that one- ton tail around pay off for him. Man invents a ladder that can be left near the trees and out of the way when not in use, And we invent extensible hands and clippers with which to cut things down. We can do all those remote things beautifully,*

(E)
 - Cite RBF in Franklin Lecture, Auburn, Ala., 1970
 Berry Piling: (1)

"The more specialised you are. the less generally adaptable. What's very unique about man is his general adaptability . . . his metaphysical capability ... to disembarass himself of the equipment when he's not using it.

"Our studies here have dealt with the externalised functions of man. I'll give you, then, an integral function of man.

He doesn't invent thirst. He doesn't invent his hunger. He's a berry picker. He doesn't know anything about his spaceship Earth, except that he's hungry. He goes around experimenting with things to keep him going--- to satisfy this thing. He may need water. . . terribly thirsty. Luckily he finds some water and he sticks his head in up to his nose and tries lapping like a cat. He finds the quickest way is to take his hand and dip it. He finds that two hands are better than one and then he can pour it down his throat. He says: now I want to go berry picking again and every time I do kept losing sight of my water. I get into trouble. I wish I could take this water with me. If I carry it in my hands I can't pick berries.

I could put it in my mouth— it's going' to spill anyway."

s&rry PjttXMt (2)

"Amongst the very earliest of the artifacts you find in all the great heaps of artifacts are vessels, or controls of the environment by which you could take this part of the environment here with you and move it to where you are going. Until finally when you go to the Moon you are taking your controlled environment with you, taking what you need. So the Moon is simply an extension of man's making that vessel, a vessel he can get inside of, his controlled environment.

"Now once you've made that cup that can take this liquid, then you can use my hands when I'm not using them. Those are my hands. I've got an extra pair of hands. You can have my hands. You've got interchangeable hands. This begins to be extraordinary--- our synergistic regeneration coming along. Once I've made this cup I can make it out of a material that will take heat that my hands can't take. I can make it so I can put it over the fire to cauterize and boil and change. I can make it out of material that can handle acids my hands can't handle. I can make it ten thousand times the size of my hands. Once you have the principle you can then extend, and we do-- that's what all our tools are, simply extensions, original complementations of our integral function. But they get to"

"be sometimes so enlarged, they seem to be so remote, we don't tend to realize they are part of us--- but they are. None of these tools, then, exist on Earth, except by virtue of man. They are part of the ecological manifestation of man. Then we get into large quantities. For instance, the steel . . . I find the average American is wearing ten tons of steel. He weighs around 30 tons of concrete. He's one of us. Yet we're able to divest that part of ourselves we leave over here. We're going to become a separated-out organism. It is very extraordinary that it re-assemble itself and use itself whenever it wants,"

"I spoke about the early days in the Mediterranean area . . . when man thought the world was an infinite plane and that the Greek geometry was axiomatically logical. They defined a circle or a triangle as an area bound by a closed line of unit radius, or by three edges and three angles. They only accredited the area which is bound on one side of the line, simply because the area outside of the line was extended in all planar directions to infinity and was therefore undefinable. We have all been brought up at school to accredit only the integrity and identity of the area on one side of tmBai a line, which

is to assume a fundamentally biased attitude towards all problems. That conditioned reflexing of bias is unnatural but is rampant in world society due to its early inculcation as the very base of what is thought of as geometrically reliable education."

- Cite BEIRUT Address, p.23, 4-6 May'67

Bias on One Side of the Line:

"The Greeks defined a triangle as an area bound by a perimeter of three angles and three edges. At one time, the Greeks thought of the Earth as only horizontally extended; their planes and lines went to infinity. The bound area of the triangle was finite. The 'outside' beyond the perimeter line was unbouhdid, infinite, occupied by barbarians, then unknown chaos. Today we know that all systems, as with Earth, are finite and return upon themselves in all directions, so that the triangle divides the definite surface of the AMW sphere into two different areas, both definite and both bound by the same three vertexes and thvee edges, ergo, two spherical triangles. Both sides of the line are now validly definite,"

"The reflexively deep bias of men for 'their side' is built into man's whole educational experience as relayed through generations since the Greek accrediting of only one side of the line. • . Men as yet speak of flat Earth in respect to which there is as yet an 'up' and 'down'--- where the Sun goes down. Mena as yet see the Sun 'rising*' and 'setting*' and t hey as yet see only one side of a line of big patterns as valid or positive, ergo the inability to deal logically in resolving major world political biases."

Biological Design:

"Biological designs apriori to human alteration contriving are directly reproducible in frequency design magnitude. Blades of grass are reproduced on planet Earth in vast quantities due to the universal inadequacy of Sun and other star photosynthetic impoundment to maximum dry land occupation for the terrestrial impoundment

of the cosmic radiation. Daisies, peanuts, glow worms, et. al., are reproduced in direct complement to their design complexity, which involves biological and eternal environmental interplay of chemical element simplexes and compounds under a complex of energy, heat, and pressure conditions critical to the complex of chemical associating and disassociating involved. Humans thus far evolved the industrial complex designing which is only of kindergarten magnitude as compared to the complexity of the biological success of our Planet Earth. In its complexities of design integrity the

universe is technology.”

Q: Do you think there will be habitable satellites with their own atmosphere?

RBF: "i/hy not? I don't see how we can help it."

Q: How do you think they will affect the Earth?

RBF: ' 'Very,very greatly. Only recently have we known that there was some mystical element called air and that it broke down into oxygen and other parts, and that oxygen was necessary for the lungs and knowing what it does to the blood. The point is that there was this a priori inventory of rescue and behaviors of nature that made it possible for man to be born absolutely helpless and ignorant. With beautiful equipment, but helpless. Therefore, part of the invention of having a species born absolutely helpless was that it had to be looked out for. And so the air was the way

you could breathe. A mother wouldn't have known how to invent a breast, or how to invent the oxygen" for her baby. "So we did have all these things and they've been so plentiful, they have permitted man to be really very ignorant, and also his being very wasteful."

- Cite WATTS TAPE, pp. 1-2, 19 Oct '70

Bjp, sphere:

"He was given enough cushion of resources, and so by trial and error he could gradually discover that his mind was much more important than his muscle; and that his probable functioning was metaphysical and not physical. We are all of us thatEhat extraordinary moment where the totality of humanity is beginning to realize these things. Rather than a few leaders leading ignorant and helpless humanity. When we have man in great fear, when he is ignorant and also fearful, he can panic officially and war has been an enormous official panic: great mandates to effrjloy that which mind has already discovered . . . to build up weapons. Under the aegis of the great mandate of fear. The only way the administration really has any great powers is war powers; then they can really undertake anything. If evolution really wanted man to acquire these capabilities, he could only be really motivated to do these things through fear. I hope we are coming to a breakthrough point where we are beginning to do things for logical reasons— and it is in longing rather than fear. The scientists were making such guns that an ignoramus could be trained to fire it; but they didn't do anything about the man because the air was waiting there for him to breathe it. You have to find some way to

Bird'i Hwt Al A twl< (1)

“...A bird Alters environment by Baking a neat, and thia ia related to ita ability to fly, If a bird had to goatata little blrda in ita womb, it would become no heavy that it would bo unable to Uy. So we find the bird developing the proceea of the neat and then leaning forth new life in the form of an egg encasing both the embryo and all the nutriment that is going to be necessary to develop the embryo until it hatches ae a chick. There is only one thing to be added: a very discrete amount of heat has to be given to that egg to keep it going along so that the embryo will develop.

”In designing that nest birds demonstrate an interesting adjustment to the delicacy of the process. With a great many migrating birds, the males migrate north earlier than the females and, from their flight advantage, pick areas of the trees where there is going to be the kind of food that that type of bird needs to live— insects or worms or whatever it may be. The males come into the trees and pick positions where nests are going to go. We are familiar with soldiers standing in a tight line and then taking room on the line, spreading out until each man has adequate elbow room. The birds do this in an omniWBB~^N

Bird’s Nest As A Tool: (B)

”directional way. Sometimes you see two birds of the same species out on the lawn, and you wonder why they seem to bo fighting. What they are doing la taking positions in the trees and then making trial flights to find the nearest insect: they come together, they hit each other, they get interference, and then they spread out in their positions before the time comes to build nests. The males pick domains for their nests and sing their song, and soon the females come along. The female doesn’t just stop at the first male she comes to; she waits until she finds the right song and then she comes in. And now they both get busy and build tha nest. By the time the eggs are laid in the nest, it is a beat if ul £ insulating device; the mother bird sits on top of it making a total enclosure with high insulation; mother giving off just exactly the right amount of heat to make the egg work. They have situated the nest

so that the mother bird is in good position to fly to an insect or a worts, without interference from any other bird, and to get back in time, before the egg goes below the critical heat. All in all, it is an extraordinarily well-balanced design, essential to the successful flight of birds. We have here, then, an externalised function,*

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970

"in that the nest is really part of the womb function. I mention all this in order to make clear that a process, such as the bird, being in several parts which are not integral to one another, can be disassociated from part of its function."

Bird*a Neat As A Tool: (1)

"When any of the creatures alter the environment in preferred ways it is complementary to their direct regeneration pattern. I call this a tool. So we find the bird making a neat. In order for the bird to be able to fly it can't hare the extra weight of gestating the new bird in its womb. Therefore, it gives out new life very fast, and the egg, with all its nutriment, all its needs from here on, has the right chemistry. It needs one more thing— energy— in the form of heat; and the bird supplies that, the mother bird, and the nest insulates it so he doesn't lose it. So the bird, in order to be able to fly, has to take on very small amounts of energy at one time, as food. The mother bird has to be able to reach, to go from her nest and reach the worm and get back just before the egg gets below the critical heat. At any rate the bird is able to keep on flying in that way. The nest becomes a tool invented and employed by the bird. That's what I mean by a tool: an orderly alteration of the environment to complement the integral organic process. Man is not unique then as a tool maker. The spider is a toolmaker. i-iany creatures are tool makers. But man is unique in the extent to which he uses the tools. That is the"

Bird's Nest As A Tool: "impressive thing. You find all the living creatures are, relative to man, much more specialised. The bird is a very good flier, but the bird can't get rid of its wings when it's not flying; therefore it has a very hard time walking. And the fish can get on beautifully as a specialist, but it can't walk at all. We find that all the species that have become extinct have all become extinct by virtue of overspecialisation

"The spider makes a web and that is a tool, and the bird makes his nest which is a tool. We find that all life carries on some kind of external environment-altering operation which, when importantly persistent and specific, detaches some or the environment from the rest of the environment and fashions the detached increment into a multifold complex which we identify as a tool with which the living species effect much greater repetitive alterations of other aspects of the environmental processes. For instance, a man takes part of a tree and shapes it into an axe handle with which he chops down other trees in order to concentrate lumber from those trees so densely that they will shed the rain. Man has developed his tool making capability to a far greater degree than has any other biological species."

Bite: Bitting:

"The mathematician's . . . straight line is not a straight line but is an ultra-visible high frequency, linearly articulated event. This binary mathematics methodology of halving or cybernetic* 'bitting,' not (only explains linear wave phenomena but also identifies ---Pythagoras's halving a music string to gain an exact musical octave. The computer programmed to employ the cybernetic bits of binary mathematics progressively * subdivides until one of its peak or valley parts gets into congruence with the else and position of the unit we seek. This identification process is accounted for in the terms of how many bits it takes to locate the answer, that is, to 'tune in.'"

Itfp<e-n>u Vt Sirs- J«> t - Cit« IAS* Spo.ch, pp 47,48, Ju.,£4
Bits: (1)

"Starting with whole Universe we quickly reach any local system within the totality by differentiating it out temporarily from the whole for intimate consideration, we do so by the process of reduction by bits.

"Bits is the tens used in the binary mathematics of computer operation. Once you state what your realistic, optimum recognition of totality consists of, then you find how many bits or subdivision stages it will take to isolate any items within that totality.

"It is like the childhood game of Twenty Questions in which you start by saying, 'Is it physical or metaphysical?*' Next: 'Is it animate or inanimate?' (fine bit.) 'Is it big or little?' (Two bits.) 'Is it hot or cold?' (Three bits.) It takes only a few bits to find what you want. When we use bit subdivision to ferret out the components of our problems, we do exactly what the computer is designed to do, for the computer's mechanism consists of simple go-no go, or yes-and-no circuit valves, or binary math, valves."

Boats at Anchor Retard the River*a Flow:

"... No matter how meager the network of zonal relationships of the residually considered star set of holding-pattern relevancy, the latter shuntingly impedes in some degree the velocity of omnidirectional universal information traffic, forced by geometrical surroundment to pass through the zonal constellation. If a squadron of boats enters a river's mouth and passes upstream and anchors, their presence and the friction of their hulls will mildly retard or choke the river's flow. Thus do the constellation of considered events mildly choke the otherwise unimpeded universal and gedesically- inter-routed communication traffic which they have ' separated into the two (micro-macro) realms. As Heisenberg shows in the principle of ultimate indeterminism the physical act of measurement always alters the behavior of the measured phenomenon."

Bplypann <¹)

"There 18 another generalised cosmic law known as Boltsgann'B law, which is relevant to the stars as cosmic energy storehouses which, though long-lived, eventually dissipate all their energy by radiational export. Boltsmann'e law states in effect that `within a closed system--- in this instance the Universe itself--- there are oscillations and evolutions between high and low energy concentrations and diffusions. This holds true all the way from the Universe itself to the smallest atomic nucleus components--- and energy is never lost from the total system. While the Sun may be feeding energy to each of its planets, we do not know that they have means of storing it and sorting it to the degree that we do know Indeed that the Sun is being impounded on our planet Earth by the refraction of the atmosphere,

by the refraction of the water, with the Sun heating the oceans, and all the vegetation growing and impounding the radiations by photosynthesis, and with all the hydrocarbons we call fossil fuels being buried deeply within Earth's crystalline mantle. The planet Earth is one place we know with empirical certitude to be collecting, sorting, and storing energies in chemically orderly ways. As with the weather, there are cosmic high pressures and low pressures."

- Cite RBF in Michael Ben-Eli Interview, AD, Dec'72

"Earth is a cosmic low pressure center, drinking in the radiation from the cosmic 'high pressure' Sun and other stars--- someday itself to become a star. All this recycling of energy, packaged as matter and re-distributed as radiation, is done on such a grand scale in the Universe that it is able to eternally conserve and meet all complex evolutionary transformation requirements in an infinitely competent manner--- forever.

"I have introduced this big-scheme thinking because it was in just such terms that I found my 1927 resolution forcing me to think--- in order to be truly omniconsiderate. I had always to think about the fact that the Earth is a tiny planet where energy is supposed to be stored and saved, and that we must learn to operate it successfully for all humanity to come and do so within our natural cosmic energy income. This made it clear that good design on behalf of our fellow humans and all their generations to come must be considerate of the fact that Earth is a place where energy is being sent primarily for storage, wherefore we are only cosmically, which is realistically, entitled to use energy out of our energy income in what must be very meager amounts, which must be very efficiently"

- Cite RBF in Michael Ben-Eli Interview, AD, Dec'72

"used in order not to frustrate what evolution is trying to do. To make the Earth a place where energy is being successfully stored we must stop burning those fossil

fuels. It's all right to use a little of it as a selfstarter to link in with the main engines of Universe. We use storage batteries to power our automobile self-starters with which in turn we get our main engines going which in turn regenerate and we Wfill our batteries.

"Demonstrating the Boltzmann principle. the main engines of our Universe are celestially and eternally pulsed between the gravitational concentration of energy and the radiational exporting of the stars. Physics' gravitational constant is greater than the radiational constant by a very small percentage. The eternal integrity of the Universe seems vested in the fractional supremacy of cosmic coherence over its disintegrative proclivities.

"Now these are the kind of comprehensive principles and patterns I found, in 1927, that the little individual could be concerned with--- in contrast to the Mayor of New Ton\$ for"

- Cite RBF to Michael Ben-Eli, interviewed in AD, Dec'72

"instance. who is forced to preoccupation with this year's budget and is not allowed by circumstances to think about events and problems in an inclusive way to really see the problems, whatever their minimum time of solution may be in cosmic reality. And I find mayors, governors, prime ministers, and dictators all preoccupied in the utterly inadequate myopia of yesterday. Most of our society is thus myopically preoccupied.

"When in 1927 I began to consider what the little Individual could do on behalf of his fellow man that governments and corporations could not do, it became evident that the individual was the only one that could deliberately find the time to think in a cosmically adequate man-

ner. Each human has his lifetime to invest. If he commits it to operations in cosmic integrities he will find himself participating in nature's own VDHI formulations and will realize theflH potentials of her various freedoms and choices, to be employed to the advantage of all human beings to come, in order that humans may fulfill their cosmic functioning on board of our planet. That important function is to use our minds here locally on board our planet, and to heed only all the principles"

- Cite RBF in Michael Ben-Eli interview, AD, Dec'72

"we discover only in total cosmic context, as does the Universe---else, countering the Universe, we be dismayingly frustrated.

"All stars radiate energy in a random manner. Randomness begets increasing disorder which is self-expansive. Boltzmann's law and the principles of nonreflective complementarity both require a cosmic countering of the expansive disorder by an increasing orderliness of local cosmic concentrations of energy. We find energy being received on our planet and being beautifully refracted by the atmosphere in orderly frequencies of red, orange, yellow, green, blue, and violet. Next, the Sun-exported radiation is refracted by the water and impounded as orderly heat, and the vegetation impounds the Sun radiatgion by exquisitely orderly photosynthesis and produces beautiful orderly molecular structures, thus converting very random, cloud-interrupted radiation into orderly molecular growths as little seeds, transforming into trees, lambs, and a myriad of other highly regular organic species.

"I call this proliferating orderliness 'syntropy' in contradistinction to 'entropy' (the giving off ofl energy in multi-"

"If baby Tim were never again to be curious regarding the object designated by the sound book beyond tearing its nice- to-tear pages and dropping them from the hammock to the grass in primary, untutored, flutter-flutter-plop experiments in tensile strength, gravity, sound, and air-resistance effects, he would never know that the audible word-symbol book designates but an indirect means or an instrument to a certain vital objective, namely, the communication of ideas by its author to other minds in a referential form more permanent than if they were to be just orally expressed; a method of broadcast beyond the power of human speech. It would be almost preposterous (though provocative of deep consideration) for Mrs. Ilirphy to suggest to her child that h'ewton's 'Optics' and 'Bringing Up Father' are one and the same article, just book."

Boole: George Boole; {1815-1864)

"Boole gave scientists a powerful tool for attacking problems when the obvious approaches refused to yield informative results. Boole employed reductio ad absurdum He exhausted all the impossibles and thereby isolated a 'very probable' answer. Charles Fort, failing to gain the publisher's--- and thereby society's--- consideration of his positive theories left the world with a Boolean-like confrontation of illogical events. Charles Fort as a man of true vision purposefully inverted the equations. By getting the publishers to publish the absurd he proved his point that the publishers published only the absurd."

RBF DEFINITIUNS

Sow Tie:

"Ab we play our 'bow tie¹ strategy in synergetics, we open our dividers and weld them open so that we only have one module to deal with. That module does not represent vacant space. It is a vector of discrete length: the product of its mass times the velocity of

its force,

"Automatically, the bow tie is a plane, but they did not so recognize it."

- Cite RBF SYNERGETICS draft Modelability pp. 14/15, Sept. 1971.

(Deleted by RBF as not to be introduced at that place.)

Bow Ties:

"The sum of the areas of the four great circle discs elegantly equals the surfacearea of the sphere they define. The area of one circle is πr^2 . The area of the surface of a sphere is $4 \pi r^2$. The four folded great circle planes all go through the exact center of the sphere and contain no volume at all. The sphere contains the most volume with the least surface enclosure of any form. Here we witness the same surface with no volume at WBMHHb which qualifies the vector equilibrium as the most economic nuclear 'nothingness' whose coordinate conceptual-ity rationally accommodates all radiational and gravitational interper-turbational transformation accounting."

- Cite SYNERGETICS draft Sec. 455.02, 6 Oct*72

Bow Ties:

"Now we come to a very interesting discovery and that is that we can take a disc of paper at 360 degrees and we can do the trigonometry of the 31 great circles and the 25 great circles, the way they interfere with one another, and we will find that they are all omnitriangulated and we find what the spherical arcs are between them. HeifipSer that spherical arc always subtends a central angle. /we know what the central angles are and so therefore we can lay this out and we find that it is possible to take whole triangles and fold them in such a way that they HMM form sort of bow knot things-- they are folded and make kind of conic things. The cones come together and fasten edge-to-edge with no duplication. And they form the same great circles. This is an important phenomenon because it is a basic characteristic of wave phenomena that really acts like a propeller blade. That is, all waves always come back upon themselves. We have then a perfect wave control by dealing in 360 degrees--- and it comes back on itself, yet we have precessional interferences with itself where it makes itself into little local bow ties--- actually folded up like a great circle."

_____ • Cite Oregon Lecture #7., p. 268. 11 Jul*62

- SFO 55.01 - .oil

P?w readability of Great Circles:

"This may be a pure accident but I could say something to you now categorically that is really very fascinating, that is, I found that you could fold and make all the 25 and 31 great circles. There are no other circles thought that I know how to fold and make any other kind of great circle patterns on spheres. They and they alone seem to be foldable into these conditions. This seems to be a very strange kind of control because if they did they all relate, they are the ways of the grand central station and all the shortest, most economical railroad tracks between all the points in Universe--- flying either concave or convex."

- Cite Oregon Lecture /7, p. 271. 11 Jul*62

rets

BQW Ties: Genesis of Bow Tie:

"First move: a quasi-sphere as the vectorial radius of construction. Second move: to establish the center. Third move: a surface circle. The radius is uniform and the lesser circle is uniform. The dividers are welded at a fixed angle. . . From the triangle to the tetrahedron, the dividers go to direct opposites to make two tetrahedra with a common vertex at the center. Two tetrahedra have six internal faces - Hexagon » Genesis of the Bow Tie - Genesis of modelability - vector equilibrium. Only the dividers are used. You start with two events any distance apart: Only one module with no subdivisions. Ergo, timeless, Ergo, eternal. Ergo, no frequency. Playing the game in a timeless manner. You have to have division of the line to have frequency, ergo to have time."

"We may insist that we see each other out in the field. But all vision actually
 operates inside the brain in organic, neuron-transistored, TV sets."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 801.21, 22 Nov'73

"...I am convinced of the weightlessness of all metaphysics, which weigh&essness
 in turn implies immortality. Because the human's tactile sense has been operative
 months before birth as the only communication means between the pregnant mother
 and the live child she is bearing, the tactile sense becomes the comparative base

for all the post-natally and successively acquired sensibilities. After birth, first the olfactoral sense comes into play, as the child breathes in its own oxygen and sucks in its own nutriment. Considerably later the sound tuning is added to the apprehending-comprehending teleologic conversion of information from subjective awareness to objective use in the ever developing capability to adjust and cope with environmental events. Lastly, the optical tuning and scanning capability comes into play in the human imaginations 'TV Studio.' Because primitive sensing is tactile, man measures his distances horizontally in feet, vertically in hands. Because light's speed of 700 million miles per hour is too fast for man to sense tactilely, he has misinterpreted the visual received information as being instantaneous, thus he mistakenly thinks he 'sees' objects and events occurring outside his physical organism, whereas radiation has bounced off and relayed the information through the human's optical"

- Cite Ltr. to Jose Arguelles, 6 Jun'69

Brain's TV Studio; (2)

"system through to the brain's TV studio where the information is scanned on one TV set to be tactically compared with the documentary recall playbacks in another TV set— almost instantly, followed by the imagination's authoring of a proposed action scenario involving safe and advantageous teleologic employment of previous experience or information to cope with the evolving challenges.

"As a consequence of humans* mistaken assumption of instantaneity, man not only thinks he sees objects outside himself, but also identifies the external objects by their tactile surfaces. Thus men tend to 'think' of one another in the form of their tactile modeling. Men do not think of one another, as do dogs, in the forms of their smellable stature, or in the terms of their hearable dimension. Nonetheless, when we hear the word 'atom*' we are hearing Democritus, for it was he who evolved the sound word 'atom' to identify his unique metaphysical conclusions in regard to the nature of the physical world. Democritus is as large and as persistent in time dimension as may the word 'atom*' persist in man's communicable thought. Because concept 'atom' provides our cognition of metaphysically immortal Democritus, the more we"

- Cite RBF Ltr. to Jose Arguelles, 6 Jun'69

"think of it the more astonishing it is that we identify man only as the clothes-bedecked chemistry complex through which metaphysical subconsciousness communicates to consciousness of self or others. The error of our spontaneous behavior and cognition is equivalent to our identifying those with whom we communicate via the telephone as being the telephone itself."

- Cite RBF Ltr. to Jodo Arguelles, 6 Jun'69

Praino TV Stujlp:

"Generalized systematic conceptuality's omnidirectional relationships are only angularly configured and are independent of size or Ml dimension. No man has ever 'seen' outside himself. His brain is a multifrequency (four sensory ranges) scanning TV integrator continually operating in coordination with a multitude of memory, kinescope-taped, TV scanners. The whole array of new and memory TV's is frequently monitored by an angular and-frequency modulated pattern commonality scoring and score-predicting conceptual coordination capability. The TV coordinating conceptual cility includes a score-guessing and score-guess testing faculty, as well as a strategic-tests-contriving- pattern considerator, all of which conceptual patterning proclivities are self-started and regenerated by synergetical intellection."

Brouwer's Thgprgn;

- Another very powerful mathematician was Brouwer. Hie theorem demonstrates that if a number of points on a plane are stirred around, it will be found after all the stirring that one of the points did not move relative to all the others. One point is always the center of the total

movement of all the points, but the mathematicians oversimplified the planar concept. In synergetics the plane has to be the surface of a system that not only has insideness and outsideness but also has an obverse and re-exterior. Therefore, in view of Brouwer, there must also always be another point on the opposite side of the system stirring that also does not move.

system has two opposed polar points two polar points identify the
 "Every fluidly bestirred that do not move. These system's neutral axis."

 Bfguwr'g Thegren:

"Brouwer'* theorem shows that when £ number of points are stirred randomly on a plane, it can be proved mathematically--- when the stirring is stopped--- that one of the points was always at the center of the total stirring, and was therefore never disturbed in respect to all the others. It is also demonstrable that any plane surface suitable for stirring things upon, must be part of a system that has an obverse surface polarly opposite to that used for the stirring; and the two produce poles in any bestirred complex system."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 703.12, 10 Nov»73
 KtiF D&FIkITIUNS

"Brouwer's mathematical theorem states that if any number of points on a plane are stirred around an x amount, on cessation of the stirring, one of the points may be shown to have been the center point of the stirring--- and never to have moved in relation to the others. In order to be 'stirred,' these points must have multidimensionality and the cluster of stirred points must have obverse and reverse sides. Therefore, the obverse-reverse sides must each have visible points that were the centers of the stirring and, short though the

distance between the obverse-reverse surface neutral center points, the short line between the obverse-reverse visible central points' obverse-reverse poles constitutes a neutral axis of the system of points and isolates two points for axial functioning in every point system swarm. Pauli's exclusion principle verifies that each of the stirred points in Brouwer's theorem and the point which did not move have their inherently separate counterpart points which discloses both the neutral axis formed by the two points that do not move and the obverse and reverse sets of moving points. Thus we discover that even a point's angular topological difference between its definiteness and its finiteness is 720° ."

Bubbles: (1)

"Here is a structure that is a three-frequency of modular subdivision, they are six-frequency octahedra. We truncate its corners and we get six little squares and we get eight hexagons, and that is called the tetrakaidecahedron. a fourteen-faceted figure, and it is called Lord Kelvin's 'solid.' Lord Kelvin discovered that this was an all-space filler. There are three (regular) all-space fillers in geometry: the cube, the rhombic dodecahedron, and the tetrakaidecahedron. The volume of the tetrakaidecahedron is 96. It again is a nice even number, but it is a very complex frequency phenomenon. There are various coincidences of our geometry, our mathematical accounting, with that of the viruses and the algae and the radiolaria--- but then we get into all the living phenomena and all the living phenomena are characterised by life cells. And all life cells are little chambers. Life cells and bubbles have the same fundamental characteristic with one another. If you take a glass jar and put a little glycerin in with some soap and get them all homogenised . . .**

- Cite Oregon Lecture #6, p. 224. 10 Jul'62

Bubbles: (2)

"• • . Living phenomena are characterized by life cells and all life cells are little chambers. Life cells and bubbles have the same fundamental characteristic. A glass jar with a little glycerin in with some soap well homogenized makes bubbles which hold their shape very nicely. The top layer of bubbles when there is air above them are

round but where the bubbles are adjacent to one another and there is no free space or air around them, they will have flat membranes between the individual bubbles. The top layer tends to round like bubbles do but in between them their facets are stretched tensional membranes. A characteristic of all the bubbles and all the life cells is that while they are quite asymmetrical chambers, some facets are big and some are small and some are hexagons and strange polygons, they are all fourteen faceted. The fourteen faces correspond to the tetrafluoridecappedhedron or to the vector equilibrium. The vector equilibrium has six square faces and eight triangular faces, so $8 + 6 = 14$. A tetrahedron has four vertexes, four faces, and six edges, and $4 + 4 + 6 = 14$ they correspond to the fourteen facets

Bybbllf Bursting:

"Bubble bursting is not a mechanical breakage at all. As we know, liquids are bivalent, hinge-connected. . . the liquid bubble surface is stretched as one single layer of the octet truss, which single truss layer accommodates two layers of closest packed spheres in which the atoms appear in critical proximity.

"When the critical proximity of the atoms is severed, and the atoms separate into single spheres, we have the single-bonded, corner-tethered condition of gases with holes in between the atoms, ergo there is still gas, but there is no longer any membrane. In this condition the gas molecules equal what they call particles, separate energy packages too diffuse to form a structural membrane. Separate gas particles are thus mixed up and nontunable with other systems. Each particle behaves like the isolated tetrahedron that connects any two points in Universe across what they call space and what we call nontunable."

Bubbles in the Wake of a Ship:

"I remember looking at the ship's wake which was all white. The wake is white because of different refractions of light, and that whiteness was refracted by bubbles. I said, 'How many bubbles am I looking at?*' I made some quick estimates. I tried to count the bubbles in a spoonful. I found I was getting into the multi-billions, into astronomical numbers.

"So then I said, 'Each one of these little bubbles is a sphere, and I have been taught that in order to design a sphere I have to employ π .' I had learned by mathematical logic that π is a transcendental irrational and can't be resolved. I said, 'To how many places does nature carry out π as she manufactures each bubble before deciding that because she cannot get a final answer she must make an arbitrary or artificial cut off and thus attempt to sneak out a fake or imperfect bubble.' I said, 'I don't think nature is using π .' Nature is too elegant to put up with such hidden tricks."

- Cite RBF marginalia in old Chap. 2, "Synergy," 1.12, 18 Mar'69

"If the XYZ-90 degree coordinate system were not the one employed by nature, then the awkward roughness of the XYZ's irrational constants would be understandable. This was made evident to me while I was in the Navy. Looking back at the wake of my ship one day in 1917 I became interested in its beautiful white path. I said to myself, 'That path is white because of the different refractions of light by the bubbles of water--- H_2O (not $H_{\pi}O$). The bubbles are beautiful little spheres, I wonder how many bubbles I am looking at stretching miles astern?'

"I began to make calculations of how many bubbles there were per cubic foot of water. I began to find that in calculating the ship's white wake I was dealing in quintillions to the fourth power or some such fantastically absurd number of bubbles. And nature was making these bubbles in sublimely swift ease!

"Any time one looks carefully at a bubble one is impressed with the beauty of its structure, its beautiful sphericity glinting with the colors of the spectrum. It is ephemeral---"

Bubbles in the Wake of a Ship Sequence: (2)

"elegantly conceived, beautifully manufactured, and readily broken.

"Inasmuch as the kind of mathematics I had learned of in school required the use of the XYZ coordinate system and the necessity of employing pi in calculating the spheres, I wondered 'to how many decimal places does nature carry out pi before she decides that the computation can't be

concluded?' Next I wondered, 'to how many arbitrary decimal places does nature carry out the transcendental irrational before she decides to say it's a bad job and call it off?' If nature uses pi she has to do what we call fudging of her design which means improvising, compromisingly. I thought sympathetically of nature's having to make all those myriad frustrated decisions each time she makes a bubble. I didn't see how she managed to formulate the wake of every ship while managing the rest of the Universe if she had to make all those decisions. So I said to myself, 'I don't think nature uses pi. I think she has some other mathematical way of coordinating her undertakings.'

"It seemed preposterous to go on trying to force nature to"

Building Business: (1) .

"I don't want to dwell on the negatives. I feel that the answer to the question of how urban sprawl happened is that there is no social organisation. Though there are a great many studies and planners, planners have no authority and they find the plans for communities continually overridden by people with ingenious ways for making money. And we've seen orchard after orchard belonging to a fanner go out of farming because the real estate man came along and showed that he could make some money out of it. And so he gets an option on it and all kinds of federal help with which he can manipulate to get in the sewers, and so forth... not making a very large amount of money. It's entirely a matter of individual ingenuity and how to make money: that's why we have urban sprawl.

"I would like to talk a little on the positive side here. I've been thinking about and concerned with this problem since back in the early 20s---fully half a century---and I've been... In the building arts we have very great lags in the rate of realisation of inventions. In the electronic arts there is only a two-year lag between invention and industrial use. There's a five-year . lag in aeronautics. A ten-year lag in automobile building.

A 15-year lag in railroading. A 25-year lag in large buildings And a 50-year lag in individual homes."

- Cite RBF to "Town Meeting of the Air," Wash, DC; 10 Sep'75

Building business: (2)

**We had world War I. It became a world war because it involved not just the agricultural advantages of the different countries, but suddenly the realization that taking metals and tins from the Malay Straits and throwing it thinly onto steel sheets to make tin cans which would hermetically seal food, and food that used to rot and never reach mouths, could suddenly feed people around the world. An entirely new world resource was the metals that came into use. That's why it was called World War I, rather than the local fanning identities of individual nations,

"We have then in World War I the development of enormous production capability. After the war the production capability, the buildings, did not go away. And it was invested in two main ways. Producing automobiles, which the banks did not like because they did not like that kind of mortgage. But later they went into farm machinery and sold the farm machinery to the farmer on time payments; and the banks did like that because they took in not only chattel mortgages on the machinery but mortgages on the farms as well. In the bad year, 1926, the farmers could not pay their instalments on the machinery and gradually all the farms were taken in on foreclosed mortgages. This would be the whole basis of the great '29 crash." - Cite HUF to "Town Meeting of the Air," V/ash., DC: 10 Sep'75

Building Business: (3)

"When the United States New Deal came in and they found that the banks really did not have any money but they had a lot of mortgages... and we the people had to rehabilitate our economy, we then tried first to rehabilitate those mortgages. So we started---even with negative interest loans---to get people to put on a new roof, or to put a bathroom in the house, which they didn't have before, Any way, to Improve the value of those equities which the government was then underwriting.

"And the United States undertook to underwrite the inequities of the building arts when the priority was for weapons--- that's the whole building industry. Now the building industry in contradistinction to weaponry industry---there has to be a priority and every priority has its antipriority. Priority has always been for the weaponry industry on the assumption that there is not enough to go around for all and that would lead to war. The antipriority was always on the home front. And in contradistinction to the kind of structures we build to go into the skies---like a Boeing 747, fantastic kinds of structures, what goes into the building of homes has really been what was left over, what was not wanted for other kinds"

Building Industries <¹)

"At the time of the 1929 crash and following depression and at the beginning of the New Deal in 1933, the United States government took over the underwriting of the obsolete building industry. Cutting loose from the historical earned-savings purchasing capability, and instituting purchasing-capability based on future earnings of the people, The U.S. Government instituted 20-, 30- and 40-year mortgages that need, in effect, never be reduced so long as the periodically renegotiated obligations' interest was being paid.

"If the buildings were as efficient as airspace technology could render them, they would have paid for themselves in five years or better---as does all good machinery. What the government financed was continuation and multiplication of inefficiency, as manifest today---1976---in the fact that out of every 100 units of energy consumed in the U.S. only five units of effective life-supporting physical work is realised; that is, our 'system' has an overall techno- economic efficiency of only five percent.

"People can have incomes only through employment. Seventy percent of all the jobs in the U.S.A, are invented and" - Cite ACCOM. ODA TING HUMAN UNSET' LEI .NT, p.17; ?O Sep'76

PttWlnr. Indqavry: (2)

"produce no life support whatever. The last quarter century's vast transformation of cities all around the world to skyscraper clusters has produced space within which no life support is produced and only to accommodate job-making and money-making, 'le have all around the world the typewriters sleeping with the good plumbing and the people sleeping in the slums---fancy and otherwise. All the money-making drives toward omni-automation and complete unemployment. Politics keeps inventing the jobs by law.

"Forty-three years of post-1913 housing finance has shown that when the price of the median house goes above three times the median annual family income (wage) the median family cannot demonstrate creditable capability to purchase their homes. A general condition of such inability has now been reached.

"Since the median family's life expectancy is 70 years and since the age of the median family's earners is 35 years, they have only 35 years of life ahead but only 25 years before mandatory retirement, ergo, have no more life-expectancy years, ergo no more future earning years to hypothecate for home 'buying' on the installment plan which"

building Industry: (6)

"So-called private individual homes are only superficially individual, for the hydraulic wash-away of the Earth surrounding their foundations discloses the private houses to be only fancy terminal boxes mounted on the ends of pipes with the whole community functionally a unit mechanical organism.

"Not only has the progressive unsettlement of humanity completely upset all the historical expectancy, but as with the individual median family's inability ever again to but its homes, so, too, have we exhausted the possibility of any way in which the future possibility of its people and its businesses to pay for any further government's underwriting of the obsolete building industry. When I became 21 years of age we had no US national debt whatever. We now have a debt of almost \$700 billion dollars demanding an annual Interest of \$40 billion dollars,

"Starting with Nix®on we had the first annual negative federal budget, admitting in advance that at the end of the year, the government would be in greater debt by \$250, or 70 billion dollars. These negative budgets have since persisted." - Cite ACCOMODATING HUMAN UNSETTELEMENT, p.19; 20 Sep'76

Building Industry: (7)

"The government can no longer pay the debt service to the banks on the monies they have borrowed to underwrite the utterly obsolete building industry. The banks themselves had loaded themselves up with an additional half-trillion dollars of second mortgages in order to pyramid the moneymaking advantage extended to them by the fundamental federal underwriting.

"Like icebergs whose greater part is underwater, all the water, sewage, and electric services of cities and suburbs are underground while the markets, stores, streets, and parking areas essential to those who dwell there, as well as the police, firemen, hospitals, and their management, are vital and integral parts of the ability to live in such a manner. The banks have realised that these individual properties aggregated to more per capita than the value of the individual homes, ergo the banks have 'invested* heavily in municipal loans and long-term bonds, all of which cities themselves have become obsolete and necessitous of ever longer time to pay off their obligations. These formidable facts take us back to the beginning of our report on Vancouver.

Building Industry: (8)

Despite that they were going to have to move out of town and then out of state within only five years and would have preferred to be allowed to rent acceptably built and furnished homes in acceptable localities, these humans necessitous of getting to and holding their jobs while providing their families with favorable living, learning, playing, and growing conditions. have been forced to buy the acceptable homes by the speculative builders, who for the last half-century have been escalating land costs which priced the houses at figures that would require a minimum of 30- and 40-years to 'pay off* all of which required continual refinancing in which only the obtaining of guaranteed deed business within the USA runs into seven-billion-dollars-a-year expense.

"Humanity in the nonsocialistic world is now being propagandized, coerced, and often forced to purchase all the immobile home properties, which gave rise to condominium or cooperative offices, apartment houses, and owned single-family dwellings. The great industrial corporations have, however, found such immobility to be untenable. Having now become transnational, they are concerned only with investments in service industries which rent---rather than sell-telephones,"

Building Industry; (10)

"With general world disarmament and the release to life-promoting account of the fabulous production capacity of the world's industrial complexes will come the one-day air-delivery of whole cities similar to the Old Ilan River .Project wherein the operating energy efficiencies will be significantly multiplied and the social conditions provided by the omni-visible central community and the completely private, deployed dwelling areas, or the air-delivery of single family dwelling machines to the remotest of sites, or of whole clusters of single-family dwelling machines to near or far sites.

"Before 1985 we will have abandoned the concept of having to earn a living. We will have given life-long scholarships to everyone. We will have converted all the big city buildings to apartments and will have eliminated 70 percent of local commuting while vastly increasing long-distance travel.

"In Vancouver in June 1976, the young world, in its own right, in contradistinction to the strategic more-with-lessing of the weaponry industry--or of a few individuals like myself---opened the chapter of human society itself becoming committed realistically to doing more with less. Long before the end of the 20th century we will find all of humanity"

building Industry: (11)

"doing so much more with bo much less that it will be enjoying a higher, legitimately richer and ethically decent standard of living than has ever been experienced by any humans before us. With economic, physical, and environmental success for all will come completely new economic accounting. We now have the metals comprehensively recirculating and the know-how to accomplish all these tasks within the limits of already-mined metals.

"Since all political systems are predicated upon the misconception of fundamental inadequacy of human life support on our planet, their premise will have been proven invalid. We know how to live entirely within the scope of our daily star-emanating radiation and gravity energies income, ergo, within a 10-year world program we can provide all humanity with an equal amount of energy annually to that enjoyed exclusively by North Americans in 1972, while concurrently phasing out all use of fossil fuels. Nor need we longer have recourse to burning up oUr Spaceship Earth's capital inventory of atoms."

RBF DEFINITIONS

"While buildings expand and contract physically between summer's heat and winter's cold, and even between night and day temperatures, those site changings are Invisible to the human eye. >"/hiLe buildings are stressed Importantly by great wind loads and snow loads— great skyscrapers sway as much as a foot, but relatively slowly— the deflective motions are invisible to man. Invisible also are the motions of the hands of the clock, or of atomic components of matter, though the latter hither-and-yon radiationally and locally, as matter, at 700 million mph, speeds. So also invisible to man are the vast high speed motions of the stars and the relatively slow growth of trees, ./hen man cannot see the motion, he rarely chinks realistically about it. He is not prone to be usefully critical of the invisible, yet real kinetics of design function suitability, nor of relative performance efficiency. I. or are humans inclined to put their experience to inventive advan*age for others until they have had a long series of personal inconveniences and accidents to prompt them into comprehending the involved critical events which they cannot see." - Lite LwONArtDO TfPE, 13 Nov'69, p.79

'Humans tend to identify as machines only those complex devices which they can see move. Unable to see their buildings* seasonally slow energy transformations functioning as machines, which indeed they are, humans fail to design their buildings with the same degree of scientific integrity with which, for instance, they conduct the 10 million discrete, but mostly invisible, tasks that have to be completed from the outset of countdown to the successful blast-off of a rocketed, humanly manned, extraterrestrially traveling capsule. As a consequence of man's inability to see the energy transformation motions involved, the structural design of his land buildings and his livingry mechanics, such as plumbing equipment, lag three thousand years behind the evolution in airspace technology standards. Humanity's housing structures and livingry in general are, to a high degreee, only nuperstit- iously-evolved economic prowess symbols, inefficiently repetitious of all yesterday's make-do mistakes."

Buildings aa Machines:

See Machines vs.

Structures

"We see all these enormous numbers of office buildings being built because we have laws in all the cities that you can't live and work and sleep in the same place; so we see all the plumbing sleeping with all the typewriters and all the people sleeping in the slums. The minute we get over this nonsqe--- all those buildings just being built to make money rather than to serve humanity--- then you won't really have to have a job any more. We can really convert all those buildings with all their plumbing into family houses, or apartment hotels, or whatever you want, while you are in the city coming together to do what you and I are doing, to have a metaphysical exchange. You can deploy into the country for physical development and then converge for the metaphysical. Suddenly all those buildings that are empty out there all night would be full of people qnd being used and you really wouldn't need all those jobs."

Calculus: (1)

"To implement the invention of the calculus, man has used the XYZ coordinate system formalized by Descartes out of the Greeks' 90-degree symmetrical 'crosstree' of three supposedly straight and supposedly continuous'infinite lines.' We have learned to reason only in terms of these experimentally demonstrated fallacious suppositions and only in three dimensions: of width (X), breadth (Y), and depth (Z), But width, depth, and breadth do not include consideration of how hot a local structural event may be, not how long it has been there, nor how much it weighs. There are a lot of other aspects of Nature which the ghostly Greek kind of geometry did not accommodate, as for instance, the experimental information that two actions cannot take place through the same point at the same time— i.e., two lines cannot run simultaneously through the same point. In the Greeks' three-dimensional conception- ings, 90-degree perpendicularity and nonparallelism to a plane already established, were essential to

qualification as a new dimension. Thus in the development of the XYZ coordinate system, we have found only three unique 90-degree line convergences in a common 'point.' All our analytical geometry, and the technically difficult structures we build with it, are translated through the XYZ coordinate system."

- ;ite Kepes: CONCEPTUALITY,Etc. p.68, 1965

Calculus: (?)

"The calculus is used to figure the relative acceleration curves in the drag tank pattern tests for a ship like the Queen Mary. Then the points along the curves are graphically accommodated by translation through analytical geometry and geometrical identification of the relative positions of the various points in a three-dimensional grid cube of XYZ coordinates.

"By 1913 I saw that man had come to regard the three-dimensional coordinate system as exclusively fundamental. But, I thought, that while the XYZ coordination served useful purposes, it might also be possible that nature had some other quite superior, rational, and comprehensive kind of coordinate system.

This occurred to me because the XYZ coordinate system inherently requires recognition of such irrationalities as π and the paradoxical recognition that we cannot finitely subdivide the circumference of a finite circle by its radius. There are a great many irrational numbers occurring as 'fundamental' constants in the mathematical coordination between mutually remote scientific disciplines which I thought might be the consequence of our arbitrary use of the XYZ coordinate system. Chemistry seemed to laugh at our coordinate awkwardness as"

Capitalism:

'•The capitalist comes to a situation where all the others are specializing and he alone integrates their intelligence. He comes upon the synergies before the others of society. Realizing that society does not identify the synergetic augmentations with the parts in which they deal, he sees that he can claim the synergetic, ergo unexpected, benefit of his proprty and right. This is the basis of the profit system. Those who can see the prize before the others--- they act as if it were theirs, when it is a product of nature and not of their own, ergo had 'earned' his profit. The augmentation is inherent in nature. That's the point! Herein lies much of the fallacy of so-called capitalism.'

rtBF UEFINiThuNS

"After the censuses of 1790 and 1810, Congress decided it would be a good idea to have an economic census of the country. As the beautiful document in Washington shows, there were one million human families in the United States in 1810. There were also one million human slaves, a formidable figure, obviously all the families didn't have slaves. Very few did, but the point is that the one-for-one ratio must be recognized.

"The census found that the average homestead was worth \$350 and the average slave was estimated to be worth \$440; so the human machine was deemed more valuable than the homestead.

"Taking the total valuation, including canals, highways, and so forth, and the estimated value of the wilderness at \$1500 per family, the U.S. Treasury came to the conclusion that the value of the United States in 1810 was \$3 billion.

"despite many inflation-deflation fluctuations since 1810, there is relative magnitude significance in the fact that last"

Cartliar, vs. Bona:

"Here we have nature's own trick of local stiffening as accomplished by the higher frequency 'closest packing' pattern of isotropically modulated, local cartilages and even higher frequency local bone structuring, as related to the frequency of tissue cells of animal flesh."

- Citation in context at Tensar's: Unlimited Frequency Of Geodesic Tensar's T31, Derivative frequency j.

"The geometric constants or controls of all conventional projections are predicated upon a three-dimensional coordinate system--- comprised of an admixture of great circles with a variety of nonuniform lesser circles-- that the constants which provide the original reference controls inherently are broken open and their finite quality converted to infinite--- in respect to some part of their transformation data.

"The internal Earth lines formed in the intersection of all three-dimensional coordinate planes of all predecessor world projection methods represents a hodge-podge of lengths and angles-of-incidence to the Earth's external surface.

When the surfaces are stripped off the Earth and arranged in projected planar condition, these lines and angles look like a runover porcupine."

- Cite Undated Sheet: DYKAXIUN AIROCEAN WORLD FULLER PROJECTIVE-TRANSFORMATION

Cartography:

(2)

"The lack of coincidence of three-dimensional coordinates with the spherical radii and nonuniform radial length of the three-dimensional coordinate and nonperpendicular incidence of three-dimensional radials upon the spherical surfaces, has caused

a heterogeneity of angles and lengths in respect to all conventional projections, which in turn has added frustration and entirely unnecessary awkwardness and complexity to the trigonometric problems of navigational science.

"This unnecessary awkwardness of three-dimensionality has also promoted the 'calculus-blind' calculations, where visual transformations might otherwise have accrued to a simplified multidimensional spherical trigonometry

Central Amice feSurfflce Aml*g:

"The tetrahedral integrity of internal (central) angles and external (surface) angles of systems permits the integration of the topological and quantum hierarchies. It is exciting that the three internal radii give us three edges of the tetrahedron's six edges; while the arc chords give us the three other of the tetrahedron's six relationships; and the center of the spheric system and the surface triangle's three cornervertexes give us the four-vertex-events having the inherent six system relationships; which six are our coincidentally six-positive, six-negative, equieconomical vectorial freedoms. The central angles give us what we call the chords of the central-angle arcs. Thus all-system-embracing geodesic lines are expressible in angular fractions of whole circles or cycles."

"Speaking of structures, we have in chrome-nickel-steel an example of symetry in alloys. The chromium per se, the iron per se, about 60,000 p.s.i. tensile strength ultimate; the chromium about 70,000 pounds ultimate; the nickel 80,000 pounds ultimate. People used to say a chain is no stronger than its weakest link. So you see whichever

is the weakest one ought to adulterate it. For instance, if you took peanuts and sugar and made sugar candy with nuts in it, whatever dissolves the easiest--- and the whole thing comes apart. The weakest tells you, like the weakest link in the chain. So we ought to say then of chrome-nickel-steel that it couldn't be any stronger than the 60,000 pounds of the iron. In fact this chrome-nickel-steel is very much stronger. You may say I'm being unreasonable, maybe this chain is $\frac{1}{2}$ as strong as its strongest link. So that says out of the 80,000 the chrome still has 350,000. Well, maybe I better add up the strength of the chain. So I'm going to have a new kind of law: the chain is as strong as the sum of the strengths of all its links. So I'm going to add 60,000 iron to 70,000 chromium and that gives me 130,000; to which I add 80,000 for the nickel. That comes to 210,000. Then I add in the manganese-- 250,000 total. But chromenickel steel is 350,000, or 50 percent stronger than the sum"

Change ?

"People are afraid of change and I find that these conditioned reflexes of fear are just overwhelming. People don't like to admit fear because they are so full of fear. And they are full of fear because of the unknown, of how little man really knows, and so afraid that those dependent on them are going to be in jeopardy. So we have a really basic fear of change and it's very very difficult to cope with that conditioned reflex.

"Hence, we have to be comprehensive in our thinking, to be infinitely tolerant, to understand rates of change, to understand the inertia, to understand the fear. We must avoid doing things that will excite the fear and do everything that will eliminate it. I don't mean then to eliminate challenge** - for challenge we must have. We will continue to have challenge because the Universe is continually changing and we are going to continue to be confronted with the new. We are here to be problem-solvers; that's our function in the Universe. And we have the capability and the responsibility....

"Clearly, if something needs to be done, it really can be done."

- Cite RBF draft introduction to "Abet Innovation," by Naimark & Barba, 2 Nov'73.

Change:

"We learn there is individuality and magnitude change: then we learn that due to the energy losses and gains of systems occasioned by the continual variations of omnidirectional proximities and omnivariability of expansioncontraction system accumulating rates, that there is a degree of freedom phenomena rate as well as a terminal condition."

Chaos: Myth That Scientists Wrest Order From Chaos?

. . . scientists point out . . . that there never could have been chaos. There had perforce always to have been the orderly fundamental complementarity. All the legendary ways of taking at universe as having had a beginning in disofHer have/for the three last years/ been completely upset by the astrophysical inventorying of the relative abundance of the fundamental atomic Isotopes and their intertransformational accounting on a cosmic scale. We find we are now confronted with an apparently eternal a priori order. The idea of probability gradually converting a disorder to order is invalidated."

Charity;

"And I don't want you to think that keeping a one hundred percent majority of humanity alive with a high standard of living is in any way linked to those preconceptions of society's which we label ¹ charity.¹ One of the myths of the moment suggests that wealth comes from individual bankers and capitalists. This concept is manifest in the myriad of charities that have to beg alms for the poor, disabled, and helpless, young and old in general. These charities are a holdover from the old pirate days when it was thought that there would never be enough to go around. Counseled by our bankers, our politicians say we can't afford the warring and the Great Society too. And because of the mythical concept that the wealth which is dispersed is coming from some magically secret private source, no free and healthy individual wants that 'handout' from the other man, whoever he may be, nor does the individual wish to be p on the publicly degrading dole."

Charting Alternating Experiences of Man & Nature: (1)

Man has been lacking in comprehensive disciplines and the developed ability to synthesize, essentially because of the bewildering arrays of complex behavior items of natural phenomena. Man shows synergetic genius inferior to Nature's regeneration.

"Only by recourse to fundamental principles may man possibly comprehend (aware of the significance of his own species in the world of species, and of the significance of all his experience to all Universe) to realize comprehensive advantage for his species, as a function of Universe, by employment of the mathematical principles with which complex groups may be handled comprehensively by man, as a responsible anticipatory designer of his own evolutionary mutations.

"The mental processes may run as follows:

"Consciously or unconsciously, life is systematically pulsive. The heart pulses without conscious authority. It propagates.

"Continuity of conscious life becomes personality and is a product of complex periodic interactions known as cycles, or"

- Cite TOTAL THINKING, 1*1, pp.226-227, Fay*49

"periodic recurrences of a higher frequency order.

"Primarily, as the trending of men's lives and their spontaneous actions, as well as their premeditated undertakings in establishment and conservation of technical advantage seem, retrospectively, only to have been subjectively motivated and steered by the ricocheting succession of randomly willed impulses and unpredictable repulsions of maximum and minimum experience, by the push-pulling alternations of scarcity and plenty, heat and cold, wetness and dryness, joy and sorrow, loving and hating, longing and fear, sum totally operating on cyclic frequencies so transcendental to man's limited experience as almost to preclude attempts to analyze and predict the intercessional recurrences.

"Gradually apprehending the reciprocal and integrated nature of alternating experience, man has learned to measure and to plot relative degrees and magnitudes of nature's behavior (including his own) and also, therefrom, to plot, not informative but provocative curves, so designated provocative because only possibly containing secondary keys which might unlock the doors*

- Cite TOTAL THINKING, I&I, p.227, Kay'49

Charting Alternating Experiences of Man & Nature: U)

"to laws partially governing the non-self-requested experience of life.

"The keys are only possible keys because the directional causes are not evidenced in the first order of plotted curves (only the latest maxima and minima of record are) without any indication whatsoever that the thus-far-experienced extremes constitute Inherent limits of the variable. Limits would, if detected, constitute the possible turning points of trend.

'•Only after sufficient measurement gained by his intuitive probing in the direction of causes, with toolsbf assumption, may informed questions be asked by man, and calculated answers potentially be had. As with the waves of progressive advantage obtainable in the successive operations of the calculus, has man only now come in his evolution, as by the second and subsequent derivatives of his historical experience-equating, to the ability to identify in principle the systematic chemistry of his personal-process-continuity and his position on and the direction of the curves of his trending, and the rates of acceleration thereon."

- Cite TOTAL THINKING, I&I, pp. 227-228, Kay*49

Charting Alternating Experiences of Man & Nature: (4 J

"Man first applied his newly won tools, of derived superior advantage of measurement-in-principle by realizing the predictable behavior of energy interactions, in shaping the designs of his accelerated velocity and magnitude extensions, his hurled, rolled, levered devices, his shots and ships. This priority of application was natural to man's having in boyhood thrown stones and sticks, hour after hour, into water, against rocks, through membranes and having later tried progressive acceleration in slingshots, archery, and guns, and still later in propelled carriers in general.

"The second derivative advantage accrued initially to the plotting of the data relative not only to the records of his running and jumping, but to his javelin-throwing sports, as well as accelerated mechanical novelties of impelled, flown, floated, wheeled, slid, levered, and geared devices.

"Turning to gain momentum, he could, unencumbered, jump over a six-foot bar; then, paradoxically, encumbering himself with a long pole, he could run with the same speed to vault over a twelve-foot bar. A regeneratively excited sense of perspective accrued to the relatively remote yet personally significant"

- Cite TOTAL THINKING, I&I, p.2.28, May'49

Charting Alternating Experiences of Man fc Nature: (5)

"events of further extension--- personal because the events were not only self-witnessed or experienced, but also were selfdesigned and self-executed--- and proved on trial of the imagined conception to be accelerations to velocities and magnitudes greater than attainable by man's personal propulsion mechanics alone.

"Thus, man accelerated extended communication to unexpected distances and with unexpected speed. Next he accelerated his personal conveyance, accelerating the evolution of his own extension from, for instance, the echoed voice of a poling raftsman to the forwardly informative radar manipulations of the stratojet piloting airman.

"In order to apply the same degrees of skillfully interpolated advantage of knowledge in principle: of position, direction, and relative acceleration, to man's immediate, everyday, and far less 'exciting' environment-shaping, he must be able to write the cogent formula of comprehensive functions of the coordinate system of his own physical complex--- of his life (personal, family, and species) as reciprocally embraced by the complex of dynamic Universe. This requires in essence : (a) the comprehensive-intuitive, that is, total subjective-"

- Cite TOTAL THINKING, 14,1, pp. 228-229, Fay'49

Charting Alternating Experiences of I-»an &. Nature; (6)

"objective thinking; (b) the assumption of the systematic or comprehensive special idea in view of its reciprocal implications; and (c) the rigorous test, of physical trial, by precision tools and under the family of possible-and-probable variable conditions accelerated and amplified beyond working requirements.

"Not having as yet applied scientific advantage to anticipatory design of the immediate environment continuities, the environment runs the man. Men may take at first none, and secondarily but little credit for their personal survival. Even in their nature years, primarily pitting themselves against other men, but few of the species may claim conscious participation in the survival of the species and none for the conscious contribution to the continuity of Universe."

Chemical Bonds;

"We find Euler and Gibbs coming together in the vertexial bonds, or polyhedrMal 'corners,* or point convergency of polyhedrmal lines. The bonds have nothing to do with 'faces and 'edges,' per se. Two bonds provide the hinge which is an edge bonding. One bond gives a universal joint. Triple or areal bonding gives rigidity.

"J>ss attraction is always involved in bonding. You may not have a bond without attraction, mass or magnetic (integral or induced), all of which are precessional effects. As the Sun's pull on the Earth produces orbiting, orbiting electrons produce directional field pulls. This was not considered by Euler because he was dealing with aspects of a single system.

"Gibbs requires the mass attraction without saying so. Kass attraction is necessary to produce a bond. Gases may be tetrahedrally bonded singly, corner-to-corner, or as a universal joint. Gibbs does not say this. But Ido."

Chemical Bonds: (1)

"While tension and compression always and only coexist their respective structural behaviors differ greatly. Structural columns function most predominantly in compression of inherent limit of length to cross section, whereas tension cables or rods have no cross section diameter-to-length ratio*

"Pass attraction is always involved in bonding. There may not be atomic bonding without either electromagnetic or mass attraction: either will suffice.

"As man's knowledge of chemical element interalloying improves it becomes apparent that critically effective mass attractive atomic proximities are intensified by symmetrical congruence. The mass attractions increase as of the second power with each halving of the distance of atomic interstices-- the length of structural tensile members, such as those of suspension bridge cables, relative to a given cross section of cable diameter, or of any given stress. The overall length trends to amplify in ever multiplying degree thus approaching infinite lengths with no cross section at all. Incredible? No!"

__ Cite NASA. SPEECH, pp. 61-62 , Jun '66

KBF DEFINITIONS

Chemical Bonds:

"in 1885 van't Hoff demonstrated to organic chemists that all organic chemistry is tetrahedrally configured. We have tetrahedra vertex to vertex: single bond. A constellation of tetrahedra linked together entirely by such universal jointing, which is called single bonded, uses lots of space and is very characteristic of the gases. Engineers speak of a single bond as 'pin ended.' Double vertex: double bond. Two vertexes line up to form what engineers call a 'hinge.* A constellation of tetrahedra interlinked only with double or hinge bonding is as yet flexible, but sum-totally as an aggregation and space-filling complex, is noncompressible--- as are liquids.

"When tetrahedra are attached to one another by three vertexes they are triple bonded. Engineers call triple bonds 'fixed ends.' They are rigid--- or they are stable like three-point landings of airplanes, or like three-legged stools on uneven ground, or, like camera tripods. Quadrivalent: four bonded--- as when soft light weight carbon contracts to form dense diamond. All four vertexes are congruent."

sfc.

- Cite NASA Speech, pp. 56-57. Jun '66

Chemical Bonds: Metals:

"But metallurgists found no vertexial bonds in metals. Fifty years later came x-ray diffraction. In 1932 Linus Pauling made x-ray diffraction analysis of the structures of many metals. All of the metals thus far x-ray diffraction analyzed, 35 years later, have proven to be tetrahedrally coordinated but in a great variety of nonvertexial associa-

tions Instead of the tetrahedra being coordinated vertex to vertex in the metallic assemblages, their centers of gravity are usually congruently coordinate. Sometimes the metals are also mid-edge coordinated. Those are the metals."

- Cite NASA Speech, p, 57» Jun '66

Chemical Bonds;

"The openaoat condition or single bonding corresponds in flexibility or Mutability witji the behavior of gases. The medium packed condition or double bonded hinged arrangement corresponds to the behaviors of liquid aggregates. The closest packing triple bonded fixed-end arrangement corresponds with rigid structural molecular compounds; the closest packing concept which was developed in respect to spherical aggregates only with their concave octa and vector equilibrium spaces between spheres, overlooks a much closer packed condition of energy structures, which however had been comprehended in organic chemistry, that of quadrivalente and four-fold bonding which corresponds to outright congruence of the octahedra or tetrahedra with themselves. When carbon transforms from its soft, pressed ckke, carbon-black powder, ofc charcoal arrangement to its diamond arrangement it converts from triple bonding km or so-called closest arrangement to quadrivalence. We might call this self-congruence packing, as a single tetrahedron arrangement in contradistinction to closest packing as a neighboring group arrangement of spheres."

"You come then to the very extraordinary mystery of what is life. For Instance, it does seem to manifest me. Physical abstractions. The principles themselves could not be principles in having beginnings and endings; they are inherently eternal. We have discovered a number of principles operating in Universe none of which contradict the others, and all of which are interaccommodative. So that there is such an integrity of interaccommodation in these eternal, weightless abstract principles. . . Something which can only be discovered by intellect and it apparently implies an a priori intellect, because you discover the reliabilities. This is all that I mean by an a priori intellect, testing the validity of its principles, that it invents a game called 'life' where part of the Xinciples are that there are no straight lines, only waves. It would be a fantastic kind of a game, like chess, where it's

not just in a plane but omnidirectionally played and it can double back on itself, where every move has six moves. There are six parts to every move. And if you are playing it at a different frequency from the other moves, then"

"There's no question about it: Man is looking for meaning. I think our young world is discontented with what they were told by religions, and their dogmatic interpretations, and the assumed identity of the significance of the experience which came along with religion. They're getting out from under, very much as a child. A little child and a great scientist both want experimental information, they don't want axioms, they don't want dogma, they want to find out their own.

(Tearing a piece of tissue paper)... Does this hold together? Can I hold on to that when I'm falling? No I can't. I've got to find out. A child is apt to find out very directly and personally. He's not going to believe anything anybody says. •You just hold on to that and it won't tear.' The child says. 'I'm going to find out whether it tears or not by ripping it.' So the child is a scientist. Society in its great ignorance has been subject to the most powerful leader. The leader said, 'All right, gentlemen, I'm running this place. These are the rules and you've got

to get on, and I like this minister and he's got a religion that suits me fine. And you all catch on.' In the past people have buckled down in an extraordinary way and are more or less accustomed to not doing their own thinking. They've found that thinking got"

"them into trouble. They had this wonderful capability and capacity a little child uses until the grownups say 'Darling, it just doesn't pay to use that little brain of yours; you catch on to this is the way the rules are because I'd like you to survive. I don't want you to get in a lot of trouble. Every one of my friends when I was young that carried on the way you are got into trouble, so you stop that. At any rate, the young world is getting out from under, and it is looking for its own meanings. It is really a child that has not been discouraged too much and is out seeking very very vigorously.

"The fact is you don't have to teach being truthful. The child by itself says. "TAJit's what I see. That's what I smell,' because that's the equipment he has and that's the reaction he's

getting. And that is the truth. I find that lying and prevarication to get on with the system proliferates very very rapidly but has to be taught. It's taught when the children are quite young, and then once when people begin to get on, everyone's playing poker and playing politics, in corporations and governments, how to get on, look after your family. The game from then on is not the truth. We get so involve! with prevarication that it seems as though truth would be alvery"

- Cite RBF interview in "Friends" (London), 14 Apr'70

Child Sequence: (3)

"difficult matter to learn--- that people have to learn to be truthful. What excited me is that I've discovered that truth is innate, and the lying is superficial, superimposed* and the young world I find is making out, is holding with its innate truthfulness, and it no longer wants to go along with the symbols of power structures. They really dare to get out from under and have also been attracted by moving pictures. Moving pictures have made visible the visualisations you had just through the novel of yesterday or through history, and it's very appealing to see this character, whether it's an imaginary Sir Galahad, or it's an interpretation of Genghis Khan, or whoever it is. Billions and billions have been spent on getting these images in the heads of children because they would like for the moment to try out being a Genghis Khan looking character, or to be Sir Galahad. Well, why not?

I certainly as a little child enjoyed this sort of thing tremendously, and pretty soon the grownups said, 'You've got to stop.'

"I was taking great tea boxes lined with beautiful foil, very heavy foil, I could make armour when I was young, that's"

- Cite RBF interview in "Friends" (London), 14 Apr'70

ChUd Sfqueng?:

"all right up to four years' old. Then they said. •You'd better take off all that armour now darling, you're going to have to go to school and make some sense.' And I find the young world enjoying costume and what feels good, in contradistinction to what are considered the clothes of distinction, the superficial thing, is very important. In other words I find truth is sticking out all over and it's very surprising to an older world to see nonconformity.

I have very very great encouragement from everything I see.

ShllAAa Momon: (i)

`` People of the older world are so apprehensive for the young. They see the young are going to encounter the pains that they have encountered. They are continually cautioning. As the new life reaches out, they say 'Darling, you'll get burnt. You better not do that,' And so we find the valves getting shut off in all our love. Then when the parents don't say to the child, 'You better not do that,' and the child is exploring, trying to understand tension and pulling on a cable and suddenly the lamp comes off the table on to their head. And they say, 'Why didn't somebody say "Don't"?' Or 'Why is that there?' So that they get discouraged, either by the grownups or the kind of environment the grownups have organised about themselves with loose lamps,,, and so forth.

"I'm quite confident it could all be avoided. But we have to realize that every little child is a superb laboratory. Watch the child tearing paper. It tears all kinds of paper. And having torn some fairly common newspaper and wrapping paper, it's then liable to get into your best books in the library and wanting to tear them. Because your child has to find out what it is when he holds on to it--- and what's not going to tear when he really needs it."

- Cite RBF in Ed Newman TV Interview, Feb*73

Child As Laboratory?

(2)

"That child is very aware of gravity, to start off with. The child tries to stand up, and gravity brings it back down again--- very vehemently. And he learns this sliding out of bed, having gravity act as a brake while he's horizontal and how gravity acts as an accelerator when he's vertical. He wants to have some way to rest himself, but he can't get back to the horizontal, so he has a feeling for that tension, something he can hold on to. So I find every child, then, is really a brilliantly designed laboratory, trying to find out what the reliable behaviors are in order to be able to employ them methodically. I would think--- in view of the fact that there really are fundamentals of structure, of tensions and compressions; there are fundamentals of mechanics--- that we ought to be able to really make available to the child exactly what it needs to get the very best information, in way where they won't get hurt and where nobody will be tempted to say 'Don't.*

"My idea or education is really highly inductive. The child must experience gravity many, many ways before you give him the word-- gravity. He doesn't need the word--- gravity--- he really learning how the thing works."

- Citation in context at World Game. 15 Jun'74

'Then a little child pushes a spoon to the edge of the table and it falls off and the parents pick it up and put it back. And then the child does it again. . . And if after it does it about ten times, the parents say, 'Maybe I've got a dumb child here. But the child is so normal to Universe that if he did this out in space the spoon would just stay where he put it. it wouldn't fall off at all. This child has a very healthy surprise at this phenomenon going on, Nothing is quite so prominent in a child's life. His mother is not always around but gravity is always there. And every time he tries to stand up--- Boom! Down he goes again! Everything keeps going this way. Now I find that because our earth is so big we don't seem to see this thing being pulled toward that. Because the Earth's mass is so very great and this little mass here (on the table) is so tiny. That's the prominent one, so friction is dominant. But we don't tend to see it, to experience this falling-in.'^t

Children¹a Picture of the Sun And the Moon? (1)

"The age-long fallacious propensity which has frustrated adult man's adequate conception of Universe is that of spontaneously assuming that Universe must consist of a simultaneously unit conceptuality--- ergo, of simultaneous geometry or shape, i.e., a simultaneous structure. What is the shape of the Universe? What are its boundaries? These are unitary, simultaneous, static questions. They have no logical answer for Universe, though finite, is a nonsimultaneous structure. Children know this better than their parents through their innate conception as yet unspoiled by erroneous logic. They remember the Juggler putting a simultaneous array in the sky with nonsimultaneous tosses.

The childhood representational pictures depict their dynamically arrayed concept of the 'whole world' inventory, of mentally juggled arrays of nonsimultaneously occurring experiences agglomerated without any intended geometrical interrelationships. In all lands the children's spontaneous pictures contain 'the* house, trees, birds,

dogs, flowers, grass, clouds, stars, the Sun and the Moon. The parents say, 'Darling a nice picture, but we don't have both the Moon and the Sun at the same time.' The parents are wrong--- both the Sun and the Moon coexist at all times whether temporarily"

"The number one characteristic of life is awareness. The child has access only to a priori cognitions. The perception of children is innately naive: they explore and experiment spontaneously, with the urge first to sort out, and then to find order In, and finally to integratively comprehend the harvests of their daily experiences. Thus children emerge as the only rigorous, pure, physical scientists.

"Although they have the most superb imaginative faculties, when children explore they rely strategically only upon their own direct recalls of experimental evidence. With anticipatory imagination they may venture to ask: 'foppose I do so and so---what then?*'---projecting a physical experiment that they know entails pure, unprecedented risk, which they may Intuitively appraise as being 'barely possible,* as for instance a ditch over which they may conceivably jump today even though it is wider than any over which they have previously leapt, and.only to be attempted now because they also have learned experientially that, as they grow older and bigger, they often find that they can jump further and higher than before. 'How do I feel about it?' and 'Shall T or shall I not try' become exquisitely aesthetic questions"

"Let yourself be a child, . . . Do the drawings have meaning for a child? The greatest scientists are children. They want to experience everything for themselves, You say the paint is wet, and they still want to touch it. It looks wet, smells wet, but is it wet?

"•Tetrascroll* is the distillation of everything I think and feel in mathematics.,.. But it is all told through the mouth of Goldylocks., and the story of the Three Bears in Goldy's words.

"It all boils down to a new way of looking at the Universe. The tetrahedron---not the cube, as we were taught in school--- is the basic pattern. A cube will collapse under pressure, a tetrahedron never, since each side pushes against and holds up the other---like a lever. There are 30 different relationships in a tetrahedron, among faces, edges, and corners. So there are 30 different ways of looking at anything.

"Tetrahedrons, like people or snakes, when they move forward, do so from side to side, not straight ahead. So the way to look for solutions is to your side, not to the front of you.,..

China:

"By 1977 after only 25 years, China will have switched ever from a
land of flB independent, corrupt, and military anarchies to 800 million
people coordinated in an organic whole bound together in common
cause.*

- Cite YORTY LTR draft, p. 7, 1 Apr '71

China: (.

"Of all the complex forces operating, one of the most powerful of all is
the fact that China, in order to pull 750 million people together, sepa-
rated over thousands of years--- nothing would possibly do but to get
out of the agricultural economy. That is the essence of what Russia
took on with its 25-year plans. Russia had 00 million people die of
starvation during the first two five-year plans. How do you hold peo-
ple together over a long time? The only way you can do it is to exclude
subversives. You have to go on the offensive and become a subver-
sive outside: all the rest of the world is your enemy. Russia had only
125 million to do it when she started it; and China had 750 million and
she saw that Russia had made a great mistake by pouring its energies

into armaments. So China has been very determined not to do that. So they've gone in for psychological warfare in the very, very biggest way. The idea is to go out and keep everybody so preoccupied with their own mess as to leave them alone.

"The psycho-guerrilla warfare is fantastic and it takes many, many forms. And all the kids get involved in it because it's so brilliantly done psychologically that they don't know what they're doing

- Cite transcript of RBF tape to Barry Farrel, Tape #1, Side A, p.2; Bear Island, 10 Aug'70

China:

"The Latin America world is still an agricultural world; it's still a hacienda world. And it's not until you get into this other plan of industrialisation--- that China is now doing, and Russia, where you go in for 25-year long pulls and a great deal of suffering and austerity-- but in the end you're going to take care of a great many more people. Very much higher standards are coming. My only hope for Latin America is that China will convince the entire world that success is possible for all men everywhere. China is going to be much more successful much earlier than anybody expected her to be. That's one of the most fortunate things I can see in history. They are going to accomplish their industrialization really very rapidly. And they are brilliant; the Chinese are just inherently brilliant. They have a fantastic amount of experience gathered over thousands and thousands of years and they really are philosophically very powerful people. Any students I've ever had who were Chinese I've found to be fantastically keen. Once China gets off this business of protecting herself against being corrupted from outside and becomes successful, she'll completely stop the offensive against the other fellow and will begin to disseminate technology and information in a very brilliant way."

China; (C)

"I'm running into this in India. India could very easily be put upon by the sword and thought to be inferior. I find their courage about good thinking very strong. I think they will start doing very logical things in a hurry. Both China and India. And it will get the Latin Americans over the hump while they get industrialised. The trouble is that Latin America is still completely immersed in agriculture which is the thing that doesn't work.

"But the largest patterns of industrialization will never be done in terms of countries. The idea of 'countries' was never more than a convenience to the Great Pirates, the men of power who divide and conquer. The Great Pirate is glad to have everyone speaking different languages and all those things. That's all breaking up and we'll have the young people out of the Third World mixing with World Fan everywhere and they will simply become successful along with an ever-larger proportion of world man. None of these economies can be self-supporting in the terms of industrialization, because the chemical elements which are necessary aren't present in any one place. China, Russia, and the US are large enough continental masses to have"

- Cite transcript of RBF tape to Barry Farrell, Tape #3, Side A, p.8; Bwr Island, 12 Aug'70

"a very large number of resources; enough to be fairly independent. but not completely. They've all had to go into the underdeveloped countries to get what they needed. America had to get manganese from Russia through all our times. And I'm sure you can find China and the US interexchanging today... Very critical materials, very secretly. In fact, subversively. But the little countries can't possibly do it.

C|

"We are very tiny. We are only 200 million and" in China "one deals with billions. Our own interpretation of our own experience is not even mildly adequate, I find it so affected by bias that we view it * only as the inside of our own triangle. China is the big triangle; we are the small one. They are liable to be a little bigger than we are about our misunderstandings and differences

in general, because they have had more experience. The Orient's social and intellectual process has been going on in continuity for a longer time than has our 'Euro-American' transplant, though we probably have all been on the Earth for the same amount of time. In

their 5.000 years of continuously recorded experience * the Chinese have been seeking for those generalized principles constituting natural law, in respect to which they might hopefully develop social conventions or law. There is an intuitive objection on their part to all that is artificially frustrating to the success of all mankind. The erroneously taught Creek bias, which characterizes 'our side's¹ superiority complex, seems invalid to China,"

- RBF in AAU'J Journal, p. 177, Fay '65

China:

"Then we Westerners learn more of the East's brilliant scientific and philosophical history and commit ourselves to trust intellectual integrity, China, who in the meantime will have risen to powerful automated industrial stature, will greet us warmly.

"Host children like to collect things. At four I started to collect documents of my own development as correlated with world patterns of developing technology. Beginning in 1917, I determined to employ my already rich case history, as objectively as possible, in documenting the life of a suburban hew Englander, born in the Gay Nineties (1895) --- the year automobiles were introduced, the wireless tie-graph and the automatic screw machine were invented, and X-rays were discovered; having his boyhood in the turn of the century; and maturing during humanity's epochal graduation from the inert, materialistic 19th into the dynamic 20th century. I named my documentation the Chronofile.

"As the era of this case history loomed into greater perspective for me, as readable in the Chronofile, it became more accurately identifiable as that which, on the one hand, terminated Sir Isaac Newton's normally 'at rest' world of myriadly and remotely isolated hybrid cultures, to which change was anathema; and, on the other, opened Einstein's normally 'dynamic' omni-integrating world culture to which change has come to seem evolutionarily inevitable."

"By 1917 I was convinced that, unannounced by any authority, a much greater environmental transformation was beginning to take place in our generation's unfolding experience than had occurred, for instance, between my father's, grandfather's, great-grandfather's, and great-great grandfather's successive generations. Their writings contain glimpses of their lives in their successive undergraduate days in the classes of 1760, 1801, 1840, and 1883 at Harvard. They tell of day-long trips walking or driving from Cambridge to Boston via Watertown Bridge.

"As in 1913, in Fair Harvard's 'Age that is past/Surrendered her o'er (once more)/ To the age that' was 'waiting before,* I felt intuitively in our Freshman year that the subway, which then opened to connect Cambridge and Boston by a seven- minute ride, was a harbinger of an entirely new distance-time relationship of humanity and its transforming environment."

Chronofile:

(1)

"I had a task during World War I of beinz secret aide to the admiral in command of the cruiser transports that carried the troops across the Atlantic and I had all the secret records of all the movements of all the ships and all the people who were on them. And when the war was over I had the task of putting those into shape for the official records for the U.S. Navy. The kind of record keeping we had to keep was chronological; I thought it was quite interesting that my experience before the Navy was that people kept kind of static kinds of files

in terms of names and topics, but in the Navy important records were kept chronologically. I thought it might be interesting if I took my own private papers concerning the troubles I had had at Harvard, and everything, not just culling out the attractive aspects of my life, but really keeping the whole record--- most of which was not so attractive--- and putting it all into chronological order. I did so; and I asked my mother for any papers she had regarding me and I put them all into order.

"If somebody kept a very accurate record of a human being, going through the era from the Gay'90's, from a very different"

- Cite Oregon Lecture p.J24, 12 Jul'62

"kind of world through the turn of the century--- as far into the twentieth century as you might live. I decided to make myself a good case history of such a human being and it meant that I could not be the judge of what was valid to put in or not. I must put everything in, so I started a very rigorous record.

"There were times when if I received a bill twenty times

I didn't have to put it in twenty times, just two or three -- and then I would put in the letter from the lawyer concerning the case. I found that the language of lawyers about overdue bills was very interesting. I think it has changed as the years have gone on. I have kept the record faithfully, and there are now about 500 volumes... I am quite certain, looking at it, that it has made it possible for me to see myself, and to see myself very objectively."

City;

Even the cities, viewed presently as the congested victims of our increasing mobility, will prove in the future to be •no more than "a present way station phase of man's Increasing deployment pattern.**

- Context and quotation from RBF by William Kuhns in "The Post Industrial Prophets: interpretations of Technology," Harper-Colophon, New York, p.232. 1971

£Ali: (A) *

"Why do we want a city? We don't start off with cities being a priori to man on our planet. It's something that has evolved. Most things about our cities are completely obsolete. • • I'll have to say how the cities occurred: They really started with wars. If you go around Europe you'll still find yourself going through the city wall gates. . . They started being places where goods are bought, where caravans and trading ships began to find themselves in confluence by nature, where they could be in anchorage. And they develop great warehouses and it really gets to be a kind of exploitation trap.

"Then Henry Ford found that it costs you money to have things in warehouses. They were unnecessary. You could have your goods stored in transit. . . Everybody's trying to get out from under all the monopolies and all the exploitations. . . In the Greek time the thinkers were in the mountains and on the beaches, and the city was occupied with the goods and warehouses controlled by the fighters and walls. All that has changed but man had the metaphysical

deployed and the physical concentrated in the city."

- Cite RDF at i-IXC Address, Dubuque* 15 Dec. '71

(B) *

"Now what has happened is that all the physical has gone out of the city and all of the people are coming together to exchange ideas and to exchange equities, so that New York City is becoming a great University/. It's getting to be a place where people go to get information. So I say the old city has really disappeared and the city does have a new function: people converge on libraries and get together to think rather than to make. The city becomes an information center."

- Cite RBF, KXC Address, Dubuque, IA. 15 Dec. '71

Clty;

"It is the essentially mobile nature of man that makes the modern city an anachronism because it is a stable phenomenon trying to adapt itself to the mobile needs of men..* "The first towns or cities grew up as interference patterns of one path of communication with another.

"A city is, in essence, nothing but a great service establishment created to serve the needs of the transient. As such the city has basically nothing to do with the production of food or goods, but only to arrange for their transfer. Man deploys from the city for his physical life and to the city for his metaphysical life. The parts of the city such as the docks and the wharves and rail terminals are incidental to the main business of the city which is the transfer of information (credit is a perfect example). The wharves and the terminals are there because of the coincidence of the interference patterns of their transport and the physical mobility of man reinforced by the fact that man before the days of credit most often traveled with the goods that he manufactured and owned. Transshipment of goods took place physically in the city because*

- Cite Mergers and Acquisitions, Vol 1, No.4> p.29» Summer'66

City: (2)

"of this early requirement which has now been totally offset by the development of credit devices and newer transportation media. In the future the use of a city for the physical transfer of goods will be silly. Cans and frozen food packs can take food from any place to any other place on Earth. Satellites can gather and transmit information as to the total food supply on Earth and can tell where it's in surplus and where it is lacking. The redistribution process, logically, would never take it through a city.

"The same holds for the processing of goods, but with an added reason: technology. For most of the technological improvements were and still are a product of the intellectual communication between men that takes place in a city. Thus the tanning of leather took place because of the coincidence of technology, hides, and *chemicals. But with the technique mastered, there is no need to haul all that stuff into the crowded city and then move it back out again.

"Thus the city has another purpose: it is there that the intellectual engagement takes place technologically. And since*

- Cite Mergers & Acquisition, Vol 1, No. 4» p.30, Summer'66

City: (3)

"technological activity takes place in the main area of an institute of higher education, the next and most proper function of a city is as research laboratory and as university. I predict that the great urban centers of the world will deploy all of their physical activity to the suburbs or the countryside and will concentrate on fulfilling the intellectual needs of men. New York City within 25 years if not sooner, will become one big information center dealing in research, education, and information (credit). If there is manufacture it will be an anachronism. The only manufacture that should be left in New York City should be the manufacture of assemblages of information such as typewritten letters, which today in cost outnumber the physical manufactures of the cities by many tens of millions of dollars. Mayor Lindsay's program to hold what industry they have and to attract more is a mistake of enormous proportions.

"... Already the transshipment function is beginning to take place outside the city. The city is effectively bypassed by the warehouses which used to be downtown and are all now in the suburbs or even beyond. Million-dollar-an-acre real estate*

- Cite Mergers & Acquisitions, Vol1, No.4, p.31, Summer'66

City:

"should be used for important things, not to store goods in transit."

« Cite Mergers and Acquisition, Vol 1, No.4, p.31, Summer'66

City:

"We find then that men began to try to carry the energies outwardly from the center and they found there were frictions in the line so that it would deploy from the center a certain distance and then the efficiency went down and you couldn't go any further so there was a natural economic limit to the size of towns and cities."

- Cote Orbn Lecture #1, p. 4. 1 Jul'62

City:

"Cities and towns will tend to become airocean bottom

cloverleafs integrating highways. Airways will become a unitary world network. Sea and waterport cities will trend to diminishing cargo interchange significance and

increasing recreational and abstract process significance."

City as Center of Abstract Intercourse: (1)

"Today in New York you have exactly the opposite of the Greek city of many centuries ago. Then the thinker lived out of the city, and all the metaphysical 'weightless*' activities such as thinking were conducted off in the remote places like Delphi, and the thinker only came into the city to speak once in a while, as Socrates did. Then and up until our own time cities were places where the physical, as opposed to the

metaphysical, was concentrated-- all the warehousing, all the manufacturing, all the wealth. This was really a very bad situation because of the power the exploitative gangster-rulers held over the people who lacked mobility and therefore had to stay in one place and work for very menial wages. Then Henry Ford broke this monopoly with the mass production of wheels. Now you have all the manufacturing and warehousing being deployed outside the city, and all the metaphysical functions being concentrated inside. That is what is happening in New York, It is becoming a metaphysical abstract communications center. The only things that are being produced are with typewriters and calculating machines, a lot of figures, a lot of 'weightless,* or practically 'weightless,* things

"And you are getting this tremendous mobility. It is silly for planners and architects to want to design a place where people"

- Cite RBF quoted in New York magazine, p«30, 30 Far*70
City as Center of Abstract Intercourse: (2)

"will go and stay. World society is not doing that. The average American moves every four years. Today you have all the Puerto Ricans moving Into New York, but New York is really just a launching pad for them to become world men, because from New York they will go on to another place and then some other place again. With the deployment of the physical outside the city and the concentration of the metaphysical within, you will also get an oscillating dynamism with the same people shuttling back and forth between the two."

- Cite RBF quoted in New York magazine, p.30, 30 Mar*70
KBF DfFlhl'i'IOKS

"... So we have then the manufacturers going off deep into the country to be able to institute new automation, very far away from the semblance of their vast labor group. We have warehouses going out of the city. We have all the things which are heavy and physical which used to be in the city going away. In our earlier cities the city was a confluence of the physical; the metaphysical, the thinking of man was going on off in the remote places, in mountains, the proverbial * scholar, when he really wanted to do thinking, went off into Shangri La. ... Whereas the metaphysical used to be deployed and the physical was convergent in the city, now all the physical has gone out of the city and what is happening is that the people who go into the city go in there for the metaphysical--- for the abstract. The only manufacturing going in there is typewriters making symbols on paper: tickertapes. «'e have then the city becoming the center of the abstract intercourse of man, where he goes in either to exchange equities for goods. . . . cities are now where everybody is coming together and the automation and the technology has gone out completely onto the farm."

"Now I'll give you something we can talk about like 'might makes right.' And this stone and compressiveness was really the might. Big massiveness did the trick. And really to understand how man over the ages was moved by this rather than his tensile ability... I.e. or less his intellectual ability. And that was very inferior; at best it was only one-tenth of the compressor. Now man gradually learned to make metal out of the stone and the first thing he made was daggers. That's all he had. Then he could make some of the bigger swords, and then maybe armour. Armour for the head man and then a little armour for several of the soldiers. But it was still rather negligible.

"It is not until we get to production of steel in 1851, only a little more than a century ago, that we suddenly have steel available in a big way. Production of steel was 1851... what is called common steel at that time. Common steel came up to 50,000 pounds tensile strength. In 1851 tension came to parity with compression. And with this ability then to have much longer spans to hold walls together. So men used then not stone walls but steel beams. Or they might use a long wooden beam with a steel rod below it to keep it up in the middle. You saw stone building with iron stars out here."

- Cite Univ, of Alaska, pp.13-14, 20 Apr '72

Civil War: (2)

"We have a rod across to keep the walls from bursting out. We see how to do away with having to have stone buttresses. So we have tension suddenly coming in only about a little over a century ago. Tensile came of importance. And there have been higher tensile abilities on the sea with fiber- made ropes, but they rotted pretty quickly. They were too stretchable to use in building on the land. With that tension coming to parity with compression, men suddenly had much bigger span. And that's the beginning of his doing a lot of work inside--- indoors. This came along exactly the same time as the dynamo. This is why Abraham Lincoln... the Civil War was really the beginning of men being able to do things in the colder North, where they had steel for boilers and where they could begin to control the heat inside. They are beginning to do things which produce wealth, or higher advantage for man, under cover, under controlled conditions, as he had been doing out in the fields up to then. That's why we really had the Civil War: the only difference between people doing things for the North under controlled conditions versus people who were doing things in the South with their agriculture out in the open. From this time on tensile strength begins to increase very rapidly."

Clams:

"... This is beginning to give us ways of seeing the complementarity at all times. Incidentally, when clams get hard in the mud and the clam in there is probably eaten out by the little water spiders and worms, we find clams in great matrices of old clay breaking open on the beach--- and we find that we are getting all the concave surfaces on the outside. This is the kind of aspect where the spherical thing has disappeared and you get only the concaves. . . "

RdF DEFINITIONS

CUmatfft & Intellect-

"Where, Geographically speaking, of a priori unique environment continuities, the inherent periodicity of the occurrence of interference is at a relatively low frequency, then the rate of dissipation of ignorance is proportionally low, and vice versa.

"The relatively lowest inherent periodicity of interference of forceful variables--- of experience in the dynamic environment (geography)--- occurs in the dry land near sea level in the region of the equator. The periodic frequency of interferences by physical variables increases outwardly from the Earth's center into the colder climates of mountain and toward the Earth poles.... Sum totally on Earth the residual vanities and superstitions of the ego bulk up most obviously in the warm and mild climates, originally most favorable to the naked, ignorant man, and are most rapidly dispersed and replaced with intellectual ordering in the environments of highest frequency of unprecedented intensities of interference penetrated now by man at will by virtue of his contriving or realizations in complex principles."

Closest Packing of Rods:

"Just as six balls may be closest packed around a nuclear ball in a plane, six rods or wires may be closest packed around a nuclear rod or wire in a cluster, when the seven wires are thus compacted in a parallel bunch they may be twisted to form a cable of hexagonal cross-section, with the nuclear wire surrounded by the other six. The hexagonal pattern of cross section persists as additional layers may be symmetrically added to the cluster. This demonstrates a circumferentially finite system in universal geometry."

(i)

"The most economical spherical agglomerations, i.e., 'the closest packing of spheres,' we now find to hold the mathematical clues to the principles of coordination governing natural structure— governing the dynamic, vectorial geometry of the atomic nucleus as well as of the atoms themselves. Over and over again we are confronted by nature obviously formulating her structures with beautiful spherical agglomerations. This began to interest me very much. I found that spheres coordinate, not in 90 degreeeness,

but in 60 degreeeness. Just take three billiard balls and you will find that they pack beautifully into a triangle. If you arrange four of them on the billiard table in a square they tend to be restless and to roll around on each other and if compacted to a condition of stability they form a 60-degree angled diamond shape made of two triangles.

"The physicists find that spheres always form omnitriangulated structures in their closest packing. The frequency phenomena studied in quantum mechanics are all predicated upon agglomerations of spheres of given— i.e., known— radii. All the coordinating is done in spheres of given sizes whose radii are²²

Closest Packing of Spheres Sequence: "subdivided finitely in modular wavelengths of discrete frequencies. Furthermore, spheres of given sizes are always compacted in omnitriangulation of 60 degreeeness, so that six spheres pack most tightly around one sphere on a billiard table and 12 spheres around one in omnidirectional compacting. Additional rings of spheres may be tightly compacted around the sphere on the billiard table as symmetrical hexagon patterns and additional layers may be added omnidirectionally around one nuclear sphere in symmetrical vector equilibrium growth. The number of spheres in the successively enclosing shells are 12, 42, 92, 162, 252, and so on, which calculates as ten times the frequency (of radial or circumferential modular subdivisions) to the second power, plus two.

Closest Packing of Spheres: Concave Octahedra and Concave Vector Equilibria:

"We find that in closest packed spheres there are only two shape spaces, what we call the concave vector equilibrium and the concave octahedron, « . One is an open condition of the vector equilibrium and the other is a contracted one of the octahedron. ... We could take the original vector equilibrium and bend the edges inwardly and make it concave, or I could bend it outwardly and make spheres. It has possibly the first degree of contraction from vector equilibrium: it becomes a sphere or a space. If it bends inwardly it becomes spaces; and if it bends outwardly, they become spheres. We can then begin to call a space a concave vector equilibrium and we can call a sphere a convex vector equilibrium. Or we can call a space a concave octahedron--- which is one of the other kinds of transformations."

- Cite Oregon Lecture #7, pp. 257-258. 11 Jul'62

Closest Packing of Spheres: Concave Octahedra and Concave Vector Equilibria:

"Every vector equilibrium became an octahedron and ever* octahedron became a vector equilibrium. Which is to say that every space became a sphere, and every sphere became a space. But it is not just a one-to-one transfer. It is a two-to-one. There is also an interesting precessional play which will spiral one way or the other because there are two tetrahedra involved. There are two kind of octahedra involved and you have two kinds of spaces.

I couldn't just say that a sphere became a space and a space becomes a sphere because there are two shapes of spaces. One was an octahedral space and the other was a vector equilibrium space, so in this transformation some of it is going into one kind and one into the other. At any rate, we see for the first time a really complete change which would be something like our dropping a stone in the water. . . "

(A)

"At the opening press conference of... Habitat, I was asked to make a public statement regarding the Club of Rome and its 1973 publication of 'The Limits to Growth.' I made the statement that the Club of Rome had a few weeks earlier---April 1976---issued a complete public reversal of its limits-to-growth concept. It had done so in a meeting in Philadelphia at the University of Pennsylvania Museum. There had been so many contradictions of the Club of Rome's 1972 pronouncement of the limits to growth that they had completely reconsidered their position. I said at the press conference that I felt that the Club of Rome's first statement was schemingly funded by vastly wealthy interests who were continuing to do what money had done in the past: i.e., to rationalize selfishness. Assuming the political concept of fundamental inadequacy of life-support for all the humans around our planet, selfishness had been able to say, *1 have those for whom I'm responsible and because there is not enough life-support for all, I am obliged to do various things that are utterly and completely selfish.'

"I felt that the Club of Rome's pronouncement of the 'Limits to Growth' represented history's last attempt on the part of"

"organized capitalists' selfishness to justify to the world public why their wealth would be unable to do anything about the third world. The initial Smithsonian Institution announcement of the 'Limits to Growth' was based on work done by an MIT professor of computer sciences who was given his input data by other MIT specialists. I and many others, particularly our World Game group, were able to make well- documented and fortunately effective public announcement that the Club of Rome's 'Limits to Growth' pronouncement was a sadly ignorant statement. For instance, its computer programmers cited only the very small remaining percentages of the world's unmined metal ore reserves and were manifestly unaware that the metals on our Earth are continually being melted out of their last use and being recirculated in amounts greatly exceeding the tonnage of metals being newly mined and added into the cumulative circulatory system approximately 3 to 1, while all the while the interim gains in technological 'know how' take care of ever greater numbers of humans per each pound of recirculating metal or other chemical substance into which technology invests its ever improving know-how, with the result that it is now engineeringly feasible to take care of all humanity at an unprecedentedly"

Club of Rome: Limits to Growth: (C)

'high standard of living without mining any more metals.

"I told the general news conference at Vancouver that the Club of Rome's ignorance was occasioned by the overspecialization of scientists. I then told the press conference that I thought the Club of Rome had this year manifested extraordinary courage and integrity in being willing to completely reverse their public position---when they announced in Philadelphia that they had found on reinspection that their data was inadequate, ergo, their resulting conclusions were wrong.

"Later that week I received an invitation to lunch with Kr. Peccei, president of the Club of Rome, and at the luncheon he personally verified their reversed position. I applauded his integrity."

- Cite ACCOillODATIL'G HU1AN UNSETTLEIEHT, p.5; 20 Sep'76

"You must understand that I'm not playing at all the same kind of game that was played by the Club of Rome where they took the well-known data regarding all the inefficient ways that people do things— that's all they knew about. They did not know that metals recirculate. They did not know that every time the metals recirculate I can get two times as much performance for twice as many people with the same metal. They didn't have the right information to start off with. I wouldn't be at all surprised if we used their formula and their model but gave them my data, they would come out with the same conclusion I have: that the world will work.

"Forrester and I both received or Doctor's at Notre Dame last weekend and I had some very pleasant words with him. He agreed that we should have a considerable talk. He told me he had lectured for the first time in 1949 at MIT and that he's heard a lot about me, particularly since his report came out... And people have asked me in public what I think about the Club of Rome and I've had to say that I felt the data they had was inadequate and inept... Forrester is a computer man."

- Tape transcript, pp.2-3; RBF to B. Brooks, in auto, 29 Apr'74

"I would assume that my of input with the Forrester models might really come out with a reversal to what they've traditionally taken there. But even if they dk we'd still have to get to all the people of the world, China, and Russian, and so forth. I think they would be favorably impressed. I think my kind of data could be put on the television through our World Game and make it visible to human beings... then the rates at which you could sake those buildings and they could be delivered

by air, what they would weigh and how much material in the world it takes to produce them, and what kinds of standards of living you'd be able to get with them. Russia and China would probably not want to ban any kind of television program of that coming in over the satellites. I would be glad to have the MIT-Club of Rome group employ my data. In a sense I'm rather surprised they didn't."

"Christopher Morley used to be plagued by a feeling that 0.0. (Odd) McIntyre was plagiarising Christopher's verses. The evidence frequently seemed incontrovertible. Such couplings of identical articulations have frequently occurred and seem now to be as plentiful as the double star population of the heave*--- some natural, some counterfeit.

"However, science has theoretical explanation of the natural phenomenon.

"The mathematician Brouwer demonstrated (Brouwer's Theorem) that when a random set of points are randomly stirred, that one of the points will at completion of stirring be proven not to have moved in respect to the total motions of all the other points, i.e., one point will have remained the center of gravity (reference - ? Ed.) of the total complex movement. If the total motion were terminated earlier, or later, another point might prove to have been the central point of the total motion."

- Cite RBF Ltr. to Roscoe McGowen, 11 May'58

"When Pauli, the physicist, developed what is known as Pauli's Exclusion Principle which freed atomic explorers from a dilemma imposed by Bohr's model of the atom's electron behavior and greatly advanced the understanding of the atom. Pauli suggested and was proven by experiment to have been cogent as follows: each electron has its exact counterpart cofunctioning with it in an opposite hemisphere of its system. Pauli's Exclusion Principle has since been found to be operative beyond the realm of the atom: it apparently applies to all systems investigated, large or small. It has become the basic mathematical theorem central to quantum and wave mechanics and an important tool of scientific probing. Pauli's generalized principle indicates that every action, point, or subsystem foci (as a component system of a larger system has a counterpart— me and my shadow— action, point, or subsystem foci) somewhere operative in Universe. And when the other or counterpart has been found the area of its functioning will prove to be the 'other side' of the system of operation involved, thus isolating and discovering the system unique to any point. The other side could be the light side vs. the serious side of any question, and the size of the question could be discovered by the relative positioning"

- Cite RBF Ltr. to Roscoe McGowen, 11 Kay*58

"of the two: for example, the day and night side of Earth.

"Now we discover that Pauli's Principle and Brouwer's Theorem are neatly combinable, for each hemispherical aspect of any system has one point which is central or polar to any and all random action events within that hemisphere as of any one moment of observation. That is, one point in the hemisphere seems to be constantly identifiable as central to the events of any one moment of inventory (a typical viewpoint of any observer of Universe); and Pauli's principle shows that the other hemisphere must contain a counterpart of that neutralized action center: and these two hemispherical counterparts despite other permitted random idiosyncrasies of their respective hemispheres, become the inherent neutral axis terminals of their mutual system. Around the axis of these two coupled and 'motionless' ob-

server points, their system or world of total and randomly populated yet dynamically equilibrated events revolves--- even though each of the two identically behaving observers in their respective and otherwise seemingly differently behaving hemispheres may be unaware of the other because of the other's invisibility on the opposite side of their seemingly**

- Cite RBF Ltr. to Roscoe McGowan, 11 May'58

"respectively different, and ergo unrelated, worlds; which seeming'two worlds' are however in fact one and the same mutually induced dynamically equilibrated and sumtotally identical world.

"So, Roscoe McGowan, it does not come to me as a scientifically unpredicted surprise that you, somewhere on the other side of •my own' world of prosaic occupation with structures, mechanics, and industrial logistics, should naturally have conceived of and articulated approximately the same words set to the same music, which I had written and sung (croak-yodeled), "Roam Home to a Dome' at Yale University in December 1951 , and published a year later in Yale's architectural magazine Ferspecta.. I have penned in a second verse which I added to my rendition in 1952, as I thought you might also enjoy humming over this one.

"I am adding the McGowan verses to my own infrequent public dome singing. --- Faithfully yours, R. Buckminster Fuller.

Cold & Vacuum;

"One way you ought to talk about the phenomena house and cold is that cold and vacuum are in physics almost identical, that is you have energy in the oresence of cold and in the presence of vacuum, and when you energy-, either as heat of kinetically accelerated gases or as radiation--- is eliminated cold or vacuum alone remain. That is the best way for you to look at it.

"You see, when they say *cold is coming in,¹ it is because energy-as-heat is dissipating so fast as to leave cold gases in your presence. Air that is cold because low in energy content moves to you so that you seem to feel cold draft, but there is no physical entity ·cold*. Temperature should be thought of as relative heat concentrations or dissinations."

"The microscopically observed structures of 'worked* steel and tree trunks are, alike, comprised of myriads of sausage- balloon-fibrous units. The science of the determination of the electrical-frictional affinities of molecules in lubricants, cohesives and aggregates, and the ratios of those agglomerations is known as colloidal chemistry. Colloidal chemistry, coupled with thermodynamics in its advanced stage (comprehending general characteristics of the energy phenomena in crystalline, liquid, and gaseous states) currently constitutes the central objective of science which seeks structurally to employ the primary electrical polarity specifics of radiation.

"In compression, a tangential agglomeration of spheroids is structurally the most satisfactory cellular arrangement since cellular elongations under compression tend to wedge and split asunder their agglomerations. In tension, however, fibrous crystalline surfaced elongations of the globular cells are most frictionally cohesive."

"Cone-and-Go" Triangulation Pattern Strip:

"This continuous triangulation pattern strip is a 60- degree angular 'come-and-go¹ alternation of very high- frequency energy events of unit wavelength. This strip, folded back on itself, becomes a series of octahedra. The octahedra strips then combine to form a space-filling array of octahedra and tetrahedra, with all lines or vectors being of identical length, and all the triangles equilateral, and all the vertexes being omnidirectionally evenly spaced from one another. This is the pattern of closest packing of spheres."

"Throughout the last 20 years I have been meeting with and speaking to 1500 or 2000 people three or four times a week. As a consequence, I am absolutely confident that what is going on between me and an audience, as I think out loud, is absolutely metaphysical and

weightless. It is understanding and meaning and has nothing to do with the length of the site of the words I am using, or the sound-wave disturbance I am making in the air, or the language I am employing. If we had no air to make sounds with, we would have to communicate with other tools. We could use electronic flash instruments and talk by dot-and-dash Morse code, or we could write and read one another. Each of us could use many telephone instruments. We could make color movie talkies and videocassetted j-D documentaries of ourselves 'thinking out loud,¹ our seemingly live images appearing on our respective TV screens, but we would not be the TV sets. We would be, as we are now, only what each of us is communicating to one another in spoken words, gestures, postures, and flashes of the eye. We can't see one another; we can see only our respective communications devices. I am quite confident that life is inherently immortal."

Communicating: (2)

"If you and I.-are developing any understanding, it is only by virtue of our being able to employ the generalised principles so far discovered. We are communicating in terms of eternity. Considering the most prominent historical data, we can say that we humans were obviously given conditioned reflexes so that we would be certain to regenerate and prosper on planet Earth, And in due course we could discover that our minds are everything and our muscles apparently naught, and we could discover

further that humanity has an essential function in the Universe--- in the macro-micro ranges of the great design scenario and its realisation in time. An intuition is dawning in us of the integrity and Immortality of the individual. Awareness is terminable, but knowledge is eternal. Comprehending and knowing are eternal."

- Cite THINKING OUT LOUD (3): PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES, World Mag., 11 Sep*73

"The means of communication is physical. That which is communicated, i.e., understood, is metaphysical. The symbols with which mathematics are communicatingly described are physical. A mathematical principle is metaphysically and independent of whether X,T or A,B are symbolically employed."

- Citation and context at Metaphysical Experience. 13 Mar*73

(SCc. Ifc3)

Communication:

"I do not allow myself what's called the luxury of a short cut. People say 'Why don't you cut It short?' Because I've got to take you from an experience to the thing. There's no use talking about It unless you feel it yourself.*

- Citation at Short Cut, 10 Jun*71

Communication:

"... The invisible reality integrity's are infinitely reliable. It can only be comprehended by metaphysical mind, guided by bearings toward something sensed as truth. Only metaphysical mind can communicate. Brain is only an information storing and retrieving instrument. Telephones cannot communicate: only the humans who use the instruments, mind is metaphysical mind. No mind: no communication: no man. Physical transactions without mind--- Yes. Communication---

No. Man is a self-contained micro-communicating system. Humanity is a macro-communicating system. Universe is a serial communicating system: a scenario of only partially overlapping, nonsimultaneous, irreversible, transformative events."

- Cite RBF Introduction to Gene Youngblood's EXPANDED CINEMA,
P. 26. Oet' TO

Communication:

"Voice to ear communications between all peoples anywhere around the world is approximately 186,000 miles per second. In terms of mores, language, politics they are as yet months, years and generations apart. In terms of human needs and longing for understanding they are as one.

"In the swiftly accelerating range and frequency of world peoples' comings and goings, the inherent barriers of mores, politics and language will swiftly dwindle out and disappear. *11 of the pattern of world affairs will become visible to all its people. Ambitions of individuals or of minorities to seize dominance of the Airocean World are inherently 'spot news.' Democratic mastery of the whole pattern is inherent and inevitable. The intellectual and technological integration accelerates the constant trend to serve more needs of more people with higher standards with ever more efficient investment of overall resources per given function."

- Cite Caption to Figure 182, Synergetics draft chapter, Djma>11in Airocean World. 1967

Communication:

"It is found in cybernetics that original questions, asked either by humans or by computers, are always produced by unexpected interferences. In lines we see that earliest man's social experience began with trail-making and trailremembering. The connecting trail 'line' was the basis of his establishment of coiaunlcation. Today it is the essence of communication theory. Understanding involves the discovery of all the linears or interconnecting lines, the $N^2 - N$ connections."

"Now, when we begin to think about comtn unity and the very words, 'Habitable City,' we are finding megalopolis is occurring, so the city is almost getting to be 'city¹ everywhere around the world. There is a world city. There is a 'city* as man goes into various places, and many of those continuous cities are coming together as megalopolis, so the man comes into the city for his onformation, then he deploys from the city. We find then as the physical went out. the manufacturing the mining, the archaeology, he deploys also then for his skiing, the water skiing, the mountain skiing. The physical then, is done remotely, and the metaphysical is centralised. And he oscillates IBM between the two. He doesn't stay put. No citizen stays put anywhere. And we have a great deal of talk about community and how wonderful community used to be, and that we are now lacking it. This is not so, but the pattern is different. Of necessity, different. I spent a good deal of my life on an island remote in Penobscot Bay in Maine. The nearest human beings were two miles away. . . You knew the characteristics of your neighbors, though you didn't see them directly--- you would see their boat, you didn't see their body. . . The thoughtfulness of this kindpf neighbor,

- Cite RBF Address, THE HABITABLE CITY, U Oct. '69

Community: "was very great, the one for the other. The same was true out in the great western spaces. But you get in to New York City, and you get into the subways, and you are jammed bodily against ten people— touching you— you just couldn't be tighter, and you just can't be neighborly. There is an error that says proximity means neighborliness. There are fundamentals of what is a tolerable range within which you really can become usefully intimate with another human being, he having his degrees of freedom, not trespassing on one another, yet really getting to know each other because you choose to know each other, not because you are being forced together. So I find that every individual today has just as many friends as any human being ever had, and probably more, but they don't live next door. They don't necessarily even live on the same street. They live halfway across town, or in the next town, or halfway around the world.. That's where they are. Everybody has their communities . . . It is a wonderful kind of community, it is really knitting together as a world understanding." - Cite KBF Address THE HABITABLE CITY, U Oct. '69.

Competition;

□Competition will be, after all, like mountain climbing, where everybody must get to the top. It's not to leave somebody half-way where he can fall of and die. This is a different kind of a game. There are two kinds of games--- you or me and you and me. They are equally good games. The competition in the you and me is to see who can help the other most effectively--- that's the connatition.

Who can understand most effectively on behalf of this other man. That if you really understand it better, I'm going to honor you better. We won't be doing it on the basis of you have to do it to survive but because it's a joy to underetand and it's an inspiration to understand on behalf of the other man. I live in that world realistically.

I am 76, but you can see I am as excited about life as when I was four years old.*

CpfflpleqenWitr "There la also the word gPMPlWfW 1VY- We cannot have
one phenomenon complemented By lees than one other phenomenon. The words
complementarity and relativity Do not identify identical physical phenomena

And we find that the ponderable physical energy Universe

Does embrace both complementarity and relativity."

~~IT P.IWH~~, Illy - Citation Ac context at Relativity_f May'72

Complementarity:

"Physics has found That every fundamental Behavioral patterning in Universe
Always and only coZexists With a complementary But non-mirror-imaged patterning.

The non-simultaneity and dis-similarity Of the complementary inter-patterning
Produce what we sense to be reality, Otherwise they would cancel one another And
there would be no sensoriality.*

Cite Rraft,

BRAIN ft MIND, p.12,

13

CMPlffOTWtty:

"Complementarity requires that where there is conceptuality there must be nonconceptuality. The explicable requires the inexplicable. Experience requires the nonexperiential.

The obvious requires the mystical. This is a powerful group of paired concepts generated by the complementarity of conceptuality. Ergo, we can have annihilation and yet have no energy lost.*

- Cite RBF to EJA, Beverly Hotel, NYC, 12 Sep'71 Incorporated in SYNERGETICS text at Sec. 501.13

Complementarity:

~~**We are not in a geometrical doorway~~ • Mt a small closed line figure such as a triangle or square or circle drawn on the surface of a closed system such as the Earth, inadvertently produces a large triangle, square or circle, respectively, on the system's surface which complements the small one."

- Cite NEHRU SPEECH, p. 42, 1J Nov'69

Complementarity:

"Only in the mid-twentieth century did it become scientifically clear that unity is plural--- and, at minimum, two--- that all experimentally detectable phenomena have their unique opposites, and that the complementary opposite behaviors are never mirror images of one another.

"Science is remiss and unnecessarily prejudicial in calling one of a pair of complementary behaviors "negative." There are always much better descriptive terms. In structural systems¹ phenomena we have "compression" and "tension." As we tense a rope it tautens--- that is, its girth contracts. This means that the rope is also compressing in a

plane at 90 degrees to its tensed axis. But tension and compression always and only coexist, as do all the fundamental complementarities such as concave and convex, or associative and disassociative, proton and neutron, male and female."

- Cite GODUEfSiiS, Sat. Review, 2 Kar 68

Complementarity:

"Every news reporter tries to talk about physics in terms of 'finding the building blocks of universe.* But the physicists keep trying to tell society, 'It takes fundamental complementarity, that is to say two different an complementary building blocks.' They are the proton and the neutron. The two are intertransformable. But if one transforms to the other, the other does likewise. But they are always unique in themselves. We cannot build universe with just the rightness or leftness 'blocks' exclusively of one another."

3?,

Compression:

"Compression is a limited structural principle and inherently local both in time and space."

- Cite RBF Holograph, Beverly Hotel stationery, Spring, 1971

Compression:

"To make a local Island of compression, with a cigar you have to load it" until it becomes a squash and then a sphere. "As a condition of the sphere for the first

time, any axis is the neutral axis, in the spherical condition, it has antititude in any direction to withdraw the forces on it; it is not surprising that ball bearings become the most efficient compression member ever designed by man. I am not surprised to find more or less spherical planets in the heavens tensionally cohered, compression at its most effective."

--- Cite LEDGEbiONT, p, 32, 15 Oct*64

Compression:

"Compression member are tending always to arcs of decreasing radius. As we loaded it it got smaller and smaller radius, sometimes it broke into two arcs. We find that compression members tend to do the small local things in universe ... and to account for the local small pattern integrity.

Compressions are always local and they are always tending towards dichotomy, breaking into two radii. Local compressions are continually subdivisible. , ."

- Cite UkttGCK Lx£TURE ff 5 - pp. 157-158, 9 Jul*62

Compression:

"Throughout the ages man was United In his structuring to the processing and manipulation only of the compressive functions and components of structure. Stone afforded 20,000 pounds of compressive strength to the square inch. It was relatively imperishable. , , Tensile strength of wood or fiber could not be counted on for more than 5,000 pounds to the square inch. Stone was almost imperishable. The wood and fiber were perishable. Stone and masonry could be counted upon to afford no more than 50 pounds tensile strength to the square inch.

Jan's structural ability seemingly favored compressive organizations on a four to one or better basis--- width and weight were amplified to increase the stabilities. That his primary philosophic reference was inert and pressive was inevitable."

Ifcl, pp. 210,211, 1 Apr'49
rite PREVIEW.

Compression:

"Compression is lateral or circumferential and is

electrostatic; tension is radial and is electromagnetic.

Compression is expressive internal to the octave and is limited to the mathematical properties and harmonic laws internal to the octave, it builds up potential. As demonstrated in the arch, compression is limited to absolute phenomena and fixed relationships of one spherical system."

Computer:

"The computer is simply a brain, in contradistinction to the mind. It always deals with the storage of a special case experience, , . What we do with the brain is a method of storing information and retrieving it--- that's the big story there. So a computer is simply another one of

those tools; it is a larger storage, and by virtue of the fact that you can add energy into the system, you can retrieve faster, • It can hold a number of patterns, and they're really quite complex ones, so we get the inherent synergetic results from the fact that we're getting all the juxtaposed information almost simultaneously, which our mind picks up synergetically as we get it from the computer,

"The computer isn't really synergetic, but it confronts us with synergetic aspects."

(Slightly edited.)

Computer:

"One of our most important tools is the development of the computer. The computer is just an extension of our brain functioning. All this cybernetics is worked out simply on what are the feedbacks of the brain, so it is simply an addition to the brain, but you can make it have a very much larger storage. And it can operate in cold and heats that we can't; and it doesn't get tired. Therefore it can give us enormous supplemental capabilities, undoubtedly, but it is not something new in Universe."

Computer: (1)

"The computer can spend all day and all night separating the greens from the blues and never get tired. This means that it is the most highly developed specialised 'organism' that we know. The computer, as man's most recent and probably most important lever with which to move the world, will take over the specialist jobs. This is important for the future man who in pre-computer days was certainly tending to become overspecialized--- and we know that any species to which this happens becomes extinct. We are certainly well on the way to becoming extinct when our greatest brains are concerned with the narrowest tasks, as we see in Whitehead's dilemma. The world's problems do require generalists of extraordinary ability and in large numbers because man's Universe now is composed of many of his artifacts and he has created a complex world. While computers can ask questions, they are the questions of the specialist, and to date we don't see how they can ask, let alone answer, one as complex as, say, how do nations disarm? It must never be forgotten that man's brain is the product of a billion-plus years of evolution, of billions of tries which resulted in billions of failures and billions of successes. It will be many, many years before it is ever"

Cogpuyr? As specialist:

"There is now a strong intuition of democratic society that compre-
 hensivity must be regained wherefore general studies programs are
 emerging in strength. At the Jecember 1962 annual meeting of the
 American Association for the Advancement of Science a research
 paper was read which showed that biological species and nations
 which have become extinct aid so because of their becoming over-
 specialized. It has now developed that a prime distinction between
 humans and computers as intelligence machines is that the comput-
 ers can easily excel as specialistswhereas the unique characteristic
 of the human intellect which may never be approached is that of the
 Universe-long complexity of feedback comprehensivity which could
 only be matched by a complex computer which had been building up
 its regeneratively introduced variable strands braiding for a period
 of several billion Earth years. This temporary human advantage of a
 few billion years' lead is about to be widely discovered and will be
 one of the prime strategic considerations of man's meager conscious
 contribution to forv.'ard events of universal evolution.'

"There is a trending of the computer development which is a swiftly accelerating phase of human ecology evolution. In order to understand the logistical evolution of

human artifacts and their sumtotal feedback transforming effects on human ecology's total environmental transition and the letter's reciprocal modification of man's evolutionary patterning in Universe, you have to recognise that the computer can choose to do only what man can choose to do within the limits of variables of mathematical strategy. There are two strategically fundamental and diametrically opposite operations of the mathematics. One is differentiating out, and the other is integrating. Differentiation and integration--- those are really the two great diametric limit functions. Those who are expert in the development of the computer point out that it is very clear that the computer is already making man obsolete as a differentiator, that is as a 'specialist.' The computer and its very sensitive controlling subsidiary organisms which we call automation can very clearly pick out the green from the red and pick it out very much faster than the human can pick it out. It can do it all night long at 2000 degrees heat, where the human can't operate at all. So the machine as computer--- as automation--- is about to make man extinct as a specialist. '64

- Cite UTOPIA uR OdLlVlbn, ' 'h.usic of the New Life,Pp.35-36, 10 Dec
- ap Original Question: ^{(Bi}

"The other--- diametric--- function of the computer is integration. And the probability is that the computer and its subsidiary automation will will not make man obsolete as an integrator for several million years--- possibly never. We introduce great complexities into integration, many variables, and the interrelationships of which we wish to comprehends, and that is what the human mind is doing all the time. I can tell you quickly why the computer is never, or not for a long time, going to displace man as the integrator. The total variables that we deal with integratively all deal with a series of original questions which we have asked ourselves. Furthermore, those original questions and their discovered answers are relayed from generation to generation by chromosomic instructions which implement our appropriate, survival-accomplishing, subconscious reflexing to myriad variations of environment stimuli. We have at least two million tfears and possibly vast aeons more of cumulative instructions for relaying our various question-askings and constant answer-relationships. Philosophers used to say that the computers would not be able to ask an original question. But it is now some time since a computer first asked an original question when it hadn't been told to ask an original question."

Computer Ask. an Original Question:

(C)

"All of a sudden as a consequence of variables in the environment and in the machine itself which had not been anticipated by the machine's designers and operators it went ahead and asked an original question. That occurrence requires explanation. Computers can play games, and the same computers can play two games. The same computer can play chess, backgammon, and checkers. How I am going

to have a computer playing backgammon and checkers at the same time. The things you have to do in order to be able to make a move in backgammon are much more complex than the things you have to do in order to make a move in checkers. Therefore, the checker moves get played a little more rapidly than do the backgammon moves. So the checker moves are going like this (taps table rapidly) and the backgammon moves (taps more slowly) more slowly. The fast moves are not wholenumber multiples of the time lapses of the slower (bigger) moves, Every onwe in a while these movement rates get to the point where one is catching up to the other and suddenly the two come momentarily together in seeming synchronization. You get this synchronization hum in variable-speed motors such as the twin motors of an airplane or a boat, 'hen the computer's two game moves get into the synchronization phase"

* 1 Aaka an Original Queetion: (D)

"and the time span for solution action by the computer is too short for the computer's solution of both {approximately simultaneously) there develops a momentary blockage interference, whereat the computer must decide to which of the two games it accord right-of-way priority. To answer--- its own original.y conceived question--- the computer asks itself which, by the computer's stored information, of the two games, backgammon or checkers, is the most important to man's psychological equanimity maintenance. And the answer comes back * backgammon,' because, though not as yet as popular as checkers, backgammon is the rich man's game and people are swiftly trending toward comprehensive opulence, ergo will need universal backgammon capability and will drop plebian checkers.

Here then is an original question: born through occurrence of unexpected interference in experiential interpatternings. Original questions of computers or humans probably are, always, products of unexpected interferences. Once asked, the therefor original question becomes an additional brain-inventory item to be passed on to the next generation in the chromosomic inventory. All old questions were once original questions. The human brain stored questions and answers of each unique individual's life, plus all the individual's heritage of chromo-

- Cite Utopia or Oblivion, pp. 37, 10 Dec'64

MB Computer Asks an Original Question: "somic-administered, subconsciously operative experience responses, represent, in progressive sum total, the uniquely variant integral known as individual man. The integral man will always be far more complex than any systematically organized set of variables conceivable by man and introduceable into the computer. Computers cannot in millions of years generate enough interferences to occasion enough original questions to be ^v-<~ilnexpected> further integrated to approximate even an average individual let alone each of a trillion individuals' lives and their half a septillion interrelationships and the unpredictable interferences thereby to be generated.

(E)

"While the computer will not replace man as an integrator in the foreseeable future, it will undoubtedly replace man as a differentiator. There is good historical precedence for this prognostication. It is to be found in natural history.

Cflgm?r....Aakg *n Original QwwUorp (D

"There are now in the world several thousand powerful high- capacity, information-storage, electronic computers. The number of them approximately doubles yearly. That means a quartermillion of them by 1970, 250 million by 1980, and 8 billion by 1985— more than two computers per world human,

"The computers, both large and small, are machines for mathematical pattern cognition and recognition storage, retrieval, and coordination; the human brain is the prototype. As with the human brain, all pattern processing consists of two main classes: differentiation and integration; i.e., specialisation and generalization. Differentiation identifies, evaluates, selects, and separates the uniquely developing patterns. Integration ratiocinates comprehensively the coordination rates and magnitudes of complex interactions, developments, or transformations.

"To appreciate our state-of-computer affairs, we must first be aware that throughout the last 15 years many philosophers have been disturbed by the claims of some cyberneticists that computers are soon to displace the human intellect. If, instead, they had confined their prediction to the effectiveness"

- Cite THE PROSPECTS FOR HUMANITY, Sat. Review, 29 Aug»64

"of the human brain in respect to the computer, some of their claims might in time prove valid. For a long time philosophers assumed that the computer could not ask original questions.

They said that the computer could only re-ask a question man has taught it to ask.

"Despite the philosophers' wishful predictions, the computer has now demonstrated its ability to ask an original question— and it did so without being instructed. Otherwise the question could not be assessed as 'original.' The surprise demonstration came about approximately as follows: You can teach a computer to play games, for instance to play checkers. You can also teach a computer to play backgammon. You also can build a computer with enough parts to permit it to play both backgammon and checkers at the same time.

"Now, both backgammon and checkers are played at different rates. Furthermore, the checker moves are simple and direct. Backgammon is complex. Therefore the same computer, playing both games concurrently, completes the checker moves far more rapidly than the backgammon moves. The backgammon rate is" not an even wavelength multiple of the checker rate."

- Cite THE PROSPECTS FOR HUMANITY, Sat. Review, 29 Aug'64 "Therefore, as with disynchronous, high-frequency twin motors, there develops a secondary low-frequency, intermittent recurrence of coincident cycles, or interferences. Suddenly the machine has to make both the checkers and the backgammon moves at the same time. Because the computer has a given wavelength interval within which to make moves, and because the latter is too short to accommodate both moves, the machine has to decide which it will play first. It has to ask itself and then decide, 'Which is more important, checkers or backgammon?*' If the machine has stored enough information on variable factors, including previous decisions, it may soliloquize: 'Poor people play checkers and rich people play backgammon. I'd better cast my vote for the priority of backgammon because my memory storage also tells me that all the poor people are becoming rich and will emulate their conditioned-JHB reflex image of being rich.' From this moment, rightly or wrongly, the machine's storage contains this prospero-proletarian predilection.

"'Which is more important, checkers or backgammon?'" is an original question that had never been asked by man of himself or of the machine. We find that the asking of original questions is a consequence of interferences, whether in the computer or the human brain."

- Cite THE PROSPECT FOR HUMANITY, Sat. Review, 29 Aug'64
filmputer...Ask an Original Question: (4)

"As far as the computer's differentiating function as judged by experts is concerned, it can be said that the computer is about to make man obsolete as a specialist because the machine can differentiate and seek out much more accurately, swiftly, and persistently than man can. The computer can stay up all night, night after night, selecting the greens from the blues under humanly intolerable conditions of heat, cold, smells, etc., yet never tire. That the machine is to replace man as a specialist, either

in craft, muscle, or brain work, is an epochal event. The computer as superspecialist produces, multiplies, and administers 'automation,* Because the is superior to man as specialist, comprehensive world automation has always been developing inexorably and is now inexorably imminent.

"The scientist-philosophers of computer integration say that because the asking of original questions is a consequence of interferences, and because interferences are products of time sequences, it follows that original questions are both functions and products of time. There must be a great number of moves and a vast number of computer components before enough time can elapse to develop new types of secondary or tertiary inter- •

- Cite THE PROSPECT FOR HUMANITY, Sat. Review, 29 Aug'64

"interferences that in turn may from time to time provoke original questions. The human brain as a computer mechanism consists of approximately a quadrillion times a quadrillion atoms in coordinate inter patterning. It will be a very long time before man will be able to develop an extracorporeal computer with that many transistors, storage cells, and other components. The experts also point out that, dealing in integrative complexity as a function of time, the human brain has always been dealing in complexity and has also been integrating comprehensive, historical continuity of human-experience-reflexed, design evolution relayed by human genes. Therefore, the experts say, we would have to have man-made computers running for 1 million years or so in order for them to develop an equivalently integrated complexity. The experts do not see any immediate, or even far distant, competition by the machine computer with the human brain in the functions of complex integration."

Conceptuality Independent of Size & Time:

"Synergetic® identifies topology with conceptuality. You have prime conceptuality independent of size when you deal with a tetrahedron with its edge not subdivided. Not until the edge is subdivided, not until it becomes frequency, does it become time or size. In other words, we have complete topological conceptuality independent of size. This is an utter abstraction.

"This is the abstraction of mathematics which the mathematician felt was there, but he did not like to identify it with experience because he thought experience was going to be what he called imaginary. We've gotten clear of that now by the absolute isolating of conceptuality.

"Conceptuality is always pretime or prefrequency. The minute frequency come in, or time comes in, it is special case.

This is what mathematics intuitively tried to adhere to, but they've gotten into a trap, like the axioms."

See Intellect, 21 Jun'77

ggncgpml *rtolg:

"The real break between science and the public occurred when science found that invisible behaviors of nature could be ferreted out by instruments and computationally mastered without recourse to conceptual models, which had become seemingly invalid due to the inability to model fourth dimensionality with XYZ 90-degree coordination which, however, could be readily computed mathematically. With the wholesale migration of science into the world of invisibility without any conceptual models of reference, the literary man who depended upon conceptual models or analogies for his verbal pattern relaying was automatically excluded from either rightside participation or backrow glimpsing of the significant affairs of science.

"The natural four axis, 60-degree, tetrahedral coordinate system... returns 'conceptuality' of dynamic structural principles to scientific validity."

-Cite CONCEPTUALITY OF FUNDAMENTAL STRUCTURES, Ed. Kepes 1965, p. 80. '

Conceptual Mathematics:

(1)

"Because synergetics is conceptual, it will make it possible for people to teach themselves in a very Montessori-like way. The present mathematics of science has to be taught because it is so incredibly complex and utterly devoid of conceptuality. It is just formulas, formulas, formulas, consisting of symbols utterly unfamiliar to any of the public in any language. It consists then of invisible games played with unfamiliar objects which can only be taught by others: nothing is self-evident.

"Inasmuch as I am challenging the whole of academic science, acceptance is not going to come from them.... It is only going to come from a young world who find that synergetics opens the whole of physics to their own observational discovery.

"It is interesting to me that there was... a professor of engineering at one of New York's large universities... who said that he had found my energetic geometry... the key to swift conceptual-by-self discovery for his students.... In the 1950s when I was teaching at MIT there was only one department that saw the immediate application and significance*

- Cite RBF Ltr. to Kaud Morgan, Boston, MA; 15 Sep'76
Conceptual Mathematics; (?)

•of energetic geometry.... The one department that understood me spontaneously and saw the immediate application was the Department of Electrical Engineering. The physicists were so used to operating in a nonconceptual, purely abstract mathematics method that they had no faith in their own conceptuality and tended to be afraid of their being intrigued by synergetics. Electrical engineers deal with the realities of physics and have to understand what it is doing.... The electrical engineers clearly encouraged me to hope that the practical public acceptance will come within the critical period necessary for humanity to veer away from its course to self-extinction.

"When Max Planck discovered his famous constant for the conversion of the awkward XTZ-axis mathematics to provide agreement with the energy increments as physically discovered, he said, 'The opposition never yields, they just die off.' I am not worried about the opposition; I am only concerned about the present of humanity who need to be able to teach themselves, as you and I both taught ourselves to ride a bike and earlier taught ourselves to stand.**

"The spheric experience is a high-frequency omnidirectional complex of events and their relatedness. Since it is concerned with the most economical relatedness we can also speak of it as a BBHB geodesic spherical experience. This is where the importance of chords comes in. A chord is abstract, yet tensive. A chord hae pull: we would probably not think about the connections unless there was some pull between them. The function of the chords is to relate. The event is the vertex. The reaction is the chord, the pulling away. And the resultant is the inadvertent definition of the nothingness of the areal and volumetric spaces. The sequence is: Events; Chords; No-events. No-events = Novents. Areas do not create themselves. They are incidental to the lines between the events. The faces are the bounding of nothingness. Areas and volumes are incidental resultants to finding the connections between the events of experience."

(Corollary of Principle of Angular Topology)

•We may call this synergetic phenomenon--- the synergetic principle of conservation of Universe--- which continually simplifies and contracts the generalised description of principles apparently operative in all special-case experiences, the •Law of Decreasing Confusion,' or 'Law of Contracting Universe,' or 'law of Diminishing Chaos, or •Law of Progressive Order, or 'Law of Contractively Orderly Generalisations.'

"Metaphysics and physics are seen to cofunction, to conserve progressively the self-regeneration of nonsimultaneously and overlappingly evolving Universe. Man's function in Universe is metaphysical and antientropic. He is essential to the conservation of Universe, which is in itself an intellectual conception.

- Cite RBF Ltr. to Doxiadis, pp.310-311, 20 Jun'66

Principle Of:

Conservation Finite Universe:

(Corollary of Principle of Angular Topology)

"By our systematic accounting of angularly definable, concave-convex local systems we discover that the sum of the angles around each of every local system's geodesically interrelated vertexes is always two vertexial unities less than universal nondefined finite totality. We call this discovery the law of finite Universe conservation. Therefore, mathematically" *pealtng_t all defined conceptioning' always equals finite Universe minus two. The indefinable quality of finite Universe inscrutability is exactly accountable as two."

- Citation At Angular Topology: Principle Of. 1960 , incorporated - in SYNERGETICS text at sec.

Principle Of;

Conservation-""—lllllll " I

(Corollary of Principle of Angular Topology)

"Synergetic a c count injfid vantage is extended by our law of nonsimultaneous finite Universe pattern conservation to embrace definitive consideration of any and all experiences, physical or metaphysical. The latter strategically equatable accounting advantage derives from a corollary of synergy which shows that systematic accounting of the behavior of whole aggregates may disclose discretely predictable angle and frequency magnitudes required of some unknown components in respect to certain known component behaviors of the total and known synergetic aggregate. Therefore the definitive identification permitted by the law of finite Universe conservation may implement conscious synergetic definition strategies with incisive prediction effectiveness, possibly of epoch-initiating magnitude."

RBF DEFINITIONS

MB Csninugus, Man:

"I think we may be coming into a phase now where there is only one Universe, only one lifetime. I see a regenerative awareness coming on where in the next age we'll be not only looking out for the living life of everybody but also for everybody to come. . . Maybe we'll be able to leave this planet, and get on to other planets and fix them up as each one gets ready to be a star."

- Cite RBF in Barry Farrell Playboy Interview, 1971, Draft* p. 4.

HI>F DEFINITIONS

"I have given the name 'continuous man' to the slowly accumulating total world experience and total literate knowledge regarding all the discovered physical resources and generalised patterning principles-- in contradistinction to the illiterate, discontinuous man. local in time and geography, whose nonrelayed, experience-won knowledge limited his tool capabilities to devices which any one individual might invent entirely on his own initiative, starting nakedly in the wilderness. My definition of industry is a tool-regenerating complex in which none of the tools could be produced, operated, or used by one man--- for example, the Queen Mary, Grand Coulee dam, the Pennsylvania Turnpike, etc.

"All around the world are found unbelievably large heaps of artifacts of discontinuous man, each, in effect, starting all over again learning a little, incorporating the little in hand-crafted tools, dying without comprehension of aught but the local limitations and inadequacies of his infinitely surrounded and apparently exclusive local reality."

- Cite CONTINUOUS MAN, I&I, pp.282-283, 1963

Continuous h.an: (2)

"Though one-third of our time is pre-allotted to the discontinuance of consciousness as sleep, the rotation of night as a shadow around the Earth results in a rotating wave of shadow sleepers, while two thirds of all mankind are at all times continuously awake. My continuous man represents a world- around .interlinked and continuously intercommunicating continuity of consciousness, which with the spoken word and the invention of mathematics and discovery of generalized principles operative in Universe and the discovery of the total resources of Earth and the character of the total resources of Universe, constitute a continuous extracorporeal memory and a continuously enlightening experience, continuously translated into continuously improving extracorporeal rearrangements of the total resource of unique pattern behaviors of physical Universe within which only individual man is engulfed in an inherent island of physical discontinuity. The individual is linked, however, to continuous rran by the extracorporeal intellects recognized by individual intellect.

"Continuous extracorporeal or industrial man is an extracorporeal tool or pattern inducing continuity which renders industrialization^{1*}

- Cite CUKTIUUOUS MAN, loci, p.283, '963

"identifiable as an extracorporeal universal chromosome common to all men's post-natal evolutionary transforming beyond the patterning corporeally induced by the integral genes and chromosomes. The latter having so far failed to disclose any integral memory capable of inhibiting new pattern-conceiving potentials; therefore industrialization may well be the second derivative, synergetic-surprise capability to remember and teleologically realize evolutionary pattern controlling.

"Continuous man's intellectual capability multiplies geometrically as his experiences accumulate and their observed data are recorded and converted to the extracorporeal chromosomic function of anticipatory patterning. Industrialization, or our continuous man, knows no national or political favorites. Continuous man's laws are of the Universe and are only realizable through its comprehensively integratable and multipliable world and Universe resources. The intellectual integrity of the industrial equation utterly reverses the history of inherent inadequacies of local agricultural and craftable resources.

- Cite CONTINUOUS IAN, IJcI, pp.283-284, 1963

"As a result, the enormous energy-relaying patterns of Universe are continuously shunted by consciously continuous man in greater magnitude into the man-world patterning and applied to the ends of increasing numbers and lengths of levers. This tooling is in itself regenerative as man stands apart from and surveys and critically appraises and improves its working. There tooling rearranges universal energy flow patternings from which physical man can detach himself and enjoy new degrees of a priori energy environmental patterns control. In satisfaction of man's consciously apprehended needs and desires, his time is freed by the tooling to be invested in more perspective for realization of more tool invention. Tool capability becomes reinvested in improved tool birth and mass tool reproductability.

`` So enormous is the energy wealth of Universe and so great is the memory and intellectual wisdom of continuous man: in respect to his previous experiences, and so fundamentally has he intertooled his advantages, that it is completely clear that all men may now be successful in living in a progressively satisfactory enjoyment of total Earth. This was unthinkable at the time of"

"..You all went to school being taught the XYZ coordinates of parallels and perpendiculars.But Universe is not operating that way. Universe is operating in radiatlional- divergence and gravitational-convergence. Divergent and convergent: that's the way Universe operates. This is nothing like the XYZ coordinates and all that--- they have nothing to do with the way Universe works. Things in parallel never get resolved. Convergent things get beautiful ly resolved, they get exactly... they get nature into a corner.... That's why you couldn't have a nucleus in a perpendicular or or a parallel system. You can only have nuclei when you have convergence. And that's why I say how far out our schooling really is.'*

A_b SYNERGETICS makes clear, nature does converge and diverge, else there would be no radiation nor gravity nor propagation.

Convergence & Divergence:

"We do not arrive at dimensionality by virtue of perpendicular or parallel assembly. Dimensionality in synergetics provides for assembly only by convergence and divergence. This accounts for the spontaneous and continued frustration of conventional mathematical accounting when confronted with the problem of assembling a nonpolarized omnisymmetrical object by joining two identical halves of the multifrequenced, closest-sphere- packed tetrahedra, each of which has five similar facets; two of which are equiangled triangles; two of which are trapezois; and the fifth being a non-equi-edged parallelogram. Matching any of these faces produces asymmetrical polarized objects.

One of the non-equi-edged parallelograms must be precessionally rotated to cross the other at 90 degrees when it will be seen that the converging-diverging patterns of the two halves are symmetrically realized."

"All exclusively three-dimensional matrixes, consisting only of par-
allel lines and perpendicular rectilinear interactions--- like parallel
railroad tracks---inherently fall to accommodate any terminal con-
vergence. Such matrixes fail to accommodate the inherent strategy of
range-finding: the fact that the linear-distance relationship between
our two human eyes---and also those of other optically equipped
creatures---was designed to provide the base line of a triangle whose
opposite apex occurs at the position of a sighted object. The conver-
gent apex angle of the object provides the human brain's computer
circuitry with a limited, distance-to-object-magnitude appraising,

or range-finding perceptivity, whose maximum terrestrial range is the horizon. Beyond the horizon the distances apart of remote objects are reduced to optically nontunable angle- size-or-frequency discernability. Ergo, at the maximum tunability of differential-wavelength-perceptivity our range-finding optical system produces a false image of a seemingly convergent pair of parallel railroad tracks. It is not that the tracks or the ties are coming together but that the distance between them is subtunable."

Copper:

"Copper is the bellwether; steel follows the pattern of scrap,*

- Cite ft HF at-Jnn Bell eldest amjEdalpMM. }Oihnr+75
- Citation ec context at Mines Above Grade, 30 Jan'75

"Now I was assistant to the director of research for Phelps- Dodge and it wqs just at the time of World War I that MHNHB flotation came in and the electrolytic refining of the copper. This so speeded up and reduced the cost of production of the copper that they found that the gold and silver occurring with the copper paid for the complete cost of mining and refining and bringing to market. Therefore the copper itself cost you nothing. You would only take it out of the ground when you could get the highest price; so it was a war price.

"Now, World War I then--- we'd just gotten electromagnetics, enough to really amount to something. In the one year, 19>7, man refined and put on the market in one year more copper than he had mined and refined sumtotally in all the years before. And for years after that we

stayed at this new magnitude. Copper was the handmaiden of energy, both in generation and delivery. Showing then what an energy war it was, was this extraordinary jump. And when the war was over--- all the wars up till this time had been agricultural in the agricultural accounting system of nature-- and when the war was over you had taken all the farm boys, and used up all of the farm products, and you trampled all the farms down, and bore it, and everybody"

- Cite RBF to Arthur Anderson & Co., (p.5) New York, 13 Mar'74

lost. In World War I a great many people said it really must have been very immoral because there were a lot of fortunes made here. What happened was— all over— that the copper had not rotted, and it didn't go back in the mines: it stayed right where it was generating power and conducting power from Niagara Falls, from here to there. And so suddenly it was the first war where we came out wealthier than when we went in. The wealth was in the production capability. But this was not put on the books this way at all. There was not a great accounting change at this time. And the land was still it. The physical assets and not the know-how. This power thing was all know-how....

"Now this is what we really mean by the words 'know-how.' And we went through this copper business. The first telephone: one wire, one message was all we could get over one cross section; that's all we knew about it. It came as a tremendous surprise when--- about 15 years later--- you could get two messages over the same cross section. And then suddenly we found you could get 10 or 12 (I've forgotten which it was); and then it went up to 28 with the same cross section. 230:--- same cross section. 2000:--- same cross section... the frequency modulation over that wire. In 1930 the chief engineer of the Bell System said"

- Cite RBF to Arthur Anderson & Co. (p.6), New York, 13 Mar'74

Copper Sequence: (III)

"we'd be able to go from 10 percent of humanity having the telephone to 100 percent--- without the telephone company mining or buying another pound of copper. They'd be sellers, all the way. And they have been. Now just think with this more-with-lessing what we're saying. You're doing your accounting on the basis of the physical. You're missing something. This is what we really mean by my way of thinking about wealth. Wealth is not being properly accounted.

"And now, next thing: Now we're at the point where one communications satellite weighing a quarter of a ton outperforming 175,000 tons of copper cable. Transoceanic communications--- much higher--- and we get a much higher step-up of what we're really in--- and I don't find any of this on the books at all...."

"While I was in Phelps-Dodge I made a fantastic discovery. I was assistant to the director of research, and Louis Cates (?) who was the president of Phelps-Dodge at the time had been at M.I.T., and he was a mining man and mining men were running things. I came to Phelps-Dodge in '36, which was a very interesting time. We were then just seven years out of the Great Crash. And Phelps-

- Cite RBF to Arthur Anderson Co., (pp.6,9), New York, 13 Mar'74

SCPPST gMUCPGfi (IV)

"Dodge, like many of the great corporations, were just absolutely dominated by J.P. Morgan. What the S.E.C. did, with the beginning of the New Deal coming in, was to break up the depositing and investing, and the gambling of common stocks, whatever it might be. At any rate, J.P. Morgan really got severed from corporations. All the great corporations--- their board and their management had represented very much a banker's control of the situation. And that banker's control broke down. And Phelps-Dodge was a very interesting one to be in, because they had dominated up to that time and they were

no longer dominating. In order for the copper companies to be able to exploit World War I, they had to really produce copper--- and not just take it out of the mines. They found their customers were too small and small-headed. So the great copper companies bought all these small fabricators, their customer's businesses, armature, wire, whatever it might be, and then they operated the whole show and made the end product for the government.

"In order to make a quick amalgamation like that, they promised the president of Habirshaw a very big job. That was called Phelps-Dodge Copper Products had the management of the fabricators in opposition to the mining men and mining engineers."

- Cite RBF to Arthur Anderson & Co., (p.9), New York, 13 Mar'74
Phipps v. Wadsworth (v)

"And we had a man named Brown who was pressing very hard in selling the stuff. With management out of the way, because there was no longer a banker running it, then there was nobody to put management in or out and if they made a profit then their stockholders would reelect them. What we call finance capitalism into managerial capitalism. This is really a very severe jump.

"But what was bothering the old management--- which was still the mining world, they had really the great monopoly--- was that scrap was beginning to be sold and that bothered them very much. They produced the same copper. And banks had great bundles of copper, and they had yards, grading as copper scrap. Trying to keep it out of the way. Louis Cates brought me in, through Bill Osborne, to make a study of world industrialization--- way, way ahead--- to see what the function of copper would be as the various stages would unfold. In doing that I became really a deep student of copper and other metals that they were interested in, the tins, and the history of those. And in do-

ing the history, I would always go th the very earliest known history. I never started at 1900, or anything like that; I wanted to look at the total big picture. And I saw how copper had actually been used and I saw that there was a copper--- a bronze age. "

- Cite RBF to Arthur Anderson Co., (p.9), New York, 13 Far'74

"And we got into weapons and pins and fastenings of ships; and later on they found that wrought iron would do it, so they took copper out of that. It opened up one industry after another.

At first, railroading--- you couldn't have any rusting--- therefore an enormous amount of brass and bronze. And just as fast as you could find some other way of doing that, cheaper metal--- any of the irons did that. So copper dropped out there. The cost of--- great utilities... In automobiles they kept down copper because it cost so much--- about 30 pounds in an automobile. But you did have to have it in the sparking equipment and in the engine, and so forth.

"But I followed ay copper very closely. And in the building industry there were great copper roofs and an enormous amount of plumbing, and so forth. And I got into something else which was very fascinating: nature's gestation rates in various arts. In electronics there is only two years between invention and use, because it is actually entirely mathematically evidenced whether it's better or not. It didn't matter whether you liked the looks of it--- you were working in-aninvisible world. So it gets in fast. Aeronautics: in aeronautical production it is

- Cite ftiiF to Arthur Anderson & Co., (pp.9-10) New York, 13 Ear'74

Cggpej.S.gquSnC8:

(VII

"five years between invention and actual use because you had to be careful about those lives. There is a 10-year lag in the automobile improvement; and there is a 15-year lag between the invention in the railroading art; 25 years in big buildings; and 50 years in snail houses.

"So then I took the inventory of the metals, of copper in each of these categories. The building industry, and so forth. This whole thing averaged at every 22 years--- every 22 years--- the total metals really came out of the last generation of design and went into the new design.

"In the electronic world you are dealing with invisible reality. That's why we have electronics. So at any rate there were those different categories. I find nobody realizes the gestation rates of that kind of art. Taking the inventory of the coppers I found that 22½ years would be when it would come out. And I say the whole copper industry was completely bewildered by the scrappers showing up. So here in 1917 we got this fantastic new production. I went back to 1917 because in 1936 that was 19 years back. I took my 22½ years and found, sure enough, the "

- Cite R3F to Arthur Andersen & Co., (p.11), New York, 13 Feb *74
gqpw SOTMOTCB • (VIII)

"the scrap was coming in. The scrap of each year was really equalling the new production of 22½ years earlier. So I said I think that is really working here. That being so. I told Phelps-Dodge--- 22½ plus 1917--- that mid-July of 1939 you're going to be overwhelmed with scrap. And I told them that in 1936. In 1938 I left and went over to Fortune magazine where I was science and technology editor for the next two years. In July of 1939. Bill Osborne called me, he was director of research at Phelps-Dodge and he said 'Bucky, this happened.'

"And this really made some impression in that industry because

- I. really had foretold that, in mid-1939 we went down to the New York docks in lower Manhattan— and the lighters were everywhere, just high with metal. Because whatever copper did, iron followed it; but copper is a sensitive lead. The mine group, realising they were overwhelmed with this scrap— and World War
- II. was looming— they literally sold it all to Germany and Japan to fire back at us, which wasn't a very moral thing to do, but that's exactly what taught Japan how to get along without mines. Their whole industry has been built on this ever since.... Every time we run the same metals around, we load more performance on it, and that's what we mean by wealth— the ability to take care of more lives.”

Copper:

"Though it was readily discernible long before the war It was only publicly acknowledged after the war That the copper mined, refined and shaped into wire In the emergency

Did not unrefine itself
And return as ore into the mountain
After the war was over,
But remained in the dynamo winding
And in the high-voltage transmission lines,
To keep on delivering
Electrically converted water power

To distant places
 To help humanity do its work,
 To refrigerate the foods that used to perish
 Before reaching the world's mouths
 To regenerate life.
 Man had simply rearranged the scenery
 To support more humans
 For more days of their lives.
 Despite its being
 Only negatively entered
 In the ignorantly applied

"Copper is so relatively abundant that it can be functionally used and its functions
 are very important. Next to gold it is the highest conductor. Its reflectivity is next to
 gold. It has great workability; it doesn't harden the way steels do. Its nonrustability
 lets you put it into alloys and make forgings that are very strong. All these things
 mean that it has a great many functional uses. And it has a nonsparking quality;
 you get the sparks with the steels and the ferrous. All the ferrous have sparks and
 the nonferrous don't spark.

"There are so many functional uses of copper and it's relatively abundant. So while its functionally used, it is scarce enough that its cautiously used, because it costs so much more than the ferrous. It is the most sensitive indicator I can find of all the metals. Iron is so much cheaper that it gets carelessly used many times where the copper doesn't. Iron will follow whatever copper does. Copper, then, is my lead metal to tell me things."

.fogger: (A)

"The beginning is really World War I— the first big industrial war using big industrial tools. Here nan shunted energy into the ends of levers in an enormous way. The way you get the most energy from one place to another in the greatest amount and in the greatest hurry is by wire, which is much faster than by pipeline or tanker. In World War I copper was used because it was the most plentiful of the metals and was a good conductor. In Just one year, 1917, nan mined and put to work more copper than he had in the whole of man's history before— an idea of the magnitude of the energy undertakings in World War I. He had two new technical capabilities, flotation and electrolytics, refinements that made it possible to get that copper to work very much faster. Since that time, man has been using copper in new magnitudes. But when the war was over and that wire was mounted on those poles it kept right on conducting electricity. What we have done was to rearrange the environment. We had taken the copper out of the Earth and we put it to use where we wanted.

"Because we had developed a production capability by landing energies on the ends of those levers, we were generating great"

"wealth— and we kept right on doing so when the war was over. America and the rest of the world didn't quite understand all that wealth. Many said that there must be a lot of corruption in America because here the war was over and suddenly there were a lot of millionaires. During World War II, too, America was lend-leasing, etc., using and giving away all manner of things, but still we came out of the war vastly

richer than we had been, despite all the things we had done, all the ships sunk and the rest. But even from those sunken ships we have been recovering the metals used to make them. This is an entirely new aspect to our world: that all metals that get mined, even if they are used to make something that becomes obsolete, are scrapped and then put right back into circulation. Of all the copper mined in the history of man, in fact, only about 14 percent has gone out of circulation. The rest gets melted up and used over and over again. And every time we use it, the wire carries more messages-per-cross-section than it did before. We continually up the performance per pound as we resuse those metals.”

Coral Reef:

"The little coral animal that throws off chemical excretions that incidentally form its little house. It is totally unaware of shaping this intricate dwelling-sieve mechanism which lets in the micro sea organisms it requires for metabolic sustenance and excludes all that is deleterious to it. I am quite confident that the coral animal is unaware of its participation in the building of a vast coral animal apartment house, the coral frond, or the result of its subconsciously coordinate building of a coral reef, or of the effect of the coral reef in changing the ocean's warm currents and the ecological effects of this wobbling of the great hot water heating system of life in the biosphere and thereby in turn on the pattern of great continental masses. Man similarly does not think of himself as an essential and unself-consciously operative function of the Universe, but that he is."

Coring:

"If you are dealing with a polyhedron, it is eeparate from Universe, having an inside and an outside.... Tou can put a hole through it; if you do that, you find that $V + ? \square L$.

"Somebody did not realize that in putting the hole through it you had removed the poles, the axis. Two points must always be involved in every system."

- Citation Ac context at Topology: Synergetics. Eulerlan. 2 Jun*74

Coring:

"Euler found that when we put a hole through a system and core it as in a doughnut, the number of the vertexes plus the number of the areas always equalthe number of the lines. The number two dropped out. Coring dropped out the balancing integer two from the right hand

side of the equation. I, therefore, said to myself that the integer two, which was dropped out from the right hand side of the equation was thought of by Euler and the topologists who followed him as being an empty integer necessary for balancing the equation, did in fact represent another conceptual or distinguishable pattern consideration, which was the twoness representing the poles of the core which had been removed."

Coring:

"If the pattern has a hole through it like a doughnut then we don't have plus anything. We leave out the two from the solid. When we leave out the two from the solid M it is really a doughnut and we are cutting out the axis which is to say that the axis is two. . . The plus two which Euler found has to be added to vertexes plus faces equals edges plus two, when it is a structure in the round; but when we put a hole through it, we find we drop off the two and then it is vertexes plus faces equals edges. The plus two comes from coring, like coring an apple, which is to take out the axis. My identification of plus twoness is verified as it has been shown up as the number of balls in any layer. In the round affair the two related to the axis of spin is inherent for any system, so we now allow the energy to account for the spinning."

"When I was a young man in New York I did a lot of work for both Time and Fortune as their science and technology consultant. One of the offshoots of this was that the Chrysler Company asked me to come to Detroit and write a book about their company.

"One of the interesting things I put in the draft of the book was a description of how their staff engineers had developed breakthroughs that saved the company a great deal of money. Later, when I was going over this passage with the top Chrysler officials, they said, 'Oh You can't put that in, it'll just make those fellows ask for more money!'

"This was just one typical illustration of how corporations seem to prefer an adversary role with their employees. They really don't seem to care if their employees are happy."

"The time-energy cosmic accounting and maximum-efficiency alternative technologies, as exclusively employed by Scenario Universe--- and spoken of by us as 'nature'---will be instituted in all human affairs and will be Integratively operated by the world-around, satellite-interlinked computers,

"With the computers's integrative examination of the physical and metaphysical resources available to human beings it will be discovered that we are incredibly wealthy, Wealth, as stated before, being predicated on the degree of organised competence to nurture, protect, and accommodate today's and tomorrow's human lives. It will be clearly manifest that we have aboard Spaceship Earth four billion billionaires---heirsapparent who have never been notified of their magnificent inheritance, which has been over-long hidden within the world's probate courts of obsolete laws, customs, and fee- hungry fiduciary administrators, whose ignorant divorcement of money from wealth has altogether hidden from the fiduciary administrators themselves as well as the rest of the world, the late-20th-century-realised existence of omni-humanity- sustaining, inexhaustible wealth."

- CltCCOHiOUATIHG HU.'Ail Ui.SETTLEiNT, p.22; 20 Sep'7b

Cosmic Accounting:

"Nature is going from the physical to the metaphysical.

The physical, being a closed system, suddenly starts to all go into one pocket in Arabia. They are sitting on top of all the physical energy and so all the gold got to them. They had the ability to buy everything. But the way the game is played through gold nobody has the ability to but what they have. They were suddenly stymied; really in checkmate.

"This is when the Arabs suddenly said: We see there's a game here and so they asked David Rockefeller to come in to Arabia with the Chase Bank and show them how to run their bank for them. And I said: What are you selling here?

"A1J the Arabs have is the physical. (This is what I said to DavAd Rockefeller's accountants.) You don't have any metaphysical in the books. And you're ever here selling 'know-how.' That's purely metaphysical. And the students asked David Rockefeller: What is the function of having a bank in China?

Why do they want you there?"

Cosmic Accounting;

"The cosmic accounting assumes omnivalidity."

- Citation and context at Earning A Living. Dec*72

"What we'll be talking about, I'm sure, will look... almost too much. But it isn't so, because if there's anybody who ought to be able to think about much, it's you. You've had just that kind of experience.

"And I've really been working on what I'm going to talk about for almost a half-century--- 47 years now. And I've been really quite confident that humanity would gradually get around to what I call cosmic costing--- getting real on to the energy balances of universe. If you get into, in a very big way, how you really handle your energies from here to there: Have you ever really studied the engineer's way of designing refineries? How much energy they keep investing in this column, and so forth, and the energy recoveries? Really very fascinating.

"Now what I'd really like to talk about here is what I call metabolic accounting. In other words, Universe really working in energy--- and how much she has invested. She's associating and disassociating. And as far as physics can find out, we are dealing in a Universe that is eternally regenerative. That is, there is no evidence of energy either being created or being lost. And an eternally regenerative system is quite a system.

- Cite RBF to Harvey Kapnick, Chmn, Arthur Anderson Sc. 60., New York, NY, 13 Feb '74

"Now vegetation is designed on the land and the plankton and the algae in the sea, to impound the Sun radiation and then by photosynthesis to convert it in beautiful orderly molecular structures: the hydrocarbons. We have then--- this is what I call instead of entropy; I call it syntropy--- and this is where the energies are being impounded and sorted and collected in the most orderly ways. All the biological organisms making these beautiful hydrocarbons. And one each to the other, and so the little insect gets big, and the trees get bigger, as the

hydrocarbons are continually being impounded, and getting buried more deeply and deeply. And so what we've been dealing in--- actually, oil-wise, and fossil fuels, and so forth--- is really exhausting some of the enormous savings account....

"One of my very great geologist friends, who is particularly an oil geologist of the highest order: and treating energy the way we do treat energy: work, lifting human weight against gravity a given height in a given amount of time--- which you can convert into kilowatt hours, or whatever it may be. I asked him to figure what it costs nature to make a gallon of petroleum. First, its impoundment, and then the shaking of the leaves off, and then broken into dust and what it takes in the way of time*

- Cite RBF to Harvey Kapnick, Chmn. Arthur Anderson k Co., New York, NY, (p.2 of transcript), 1J Kar'74

*and pressure and heat to make a gallon of petroleum. And he came out with the figure that it costs about a million dollars to make a gallon of petroleum.

"And I said to David /~Rockefeller_7, anybody ought to be able to sell a million dollars for fifty cents.

"And he got his geologists to check and he found out that it's the correct magnitude, all right. . , But I said then that when you give up the idea that you've got to earn a living--- and so we spend three million dollars a day to get 50 dollars--- it doesn't make much sense. And that's the kind of nonsense I began to run into when I got into this cosmic costing. Now I see then that the Universe is really trying to build up a savings account here. And we are operating at very low efficiency. If we really were doing well with that energy, we might just justify it for the moment on the basis that it could do better.

Society is obviously... and human beings are invented the way they are and they have to find their way and they have to learn by trial and error and they have to make a lot of mistakes. We have a very big cushion--- by trial and error--- to do things."

- Cite RBF to Harvey Kapnick, Chmn., of Arthur Anderson & co.. New York, NY, (p.3 of transcript), 13 Mar'74

"At any rate, the way we are using our energies then is very significant. And the reciprocating engine is inherently only 15 percent efficient. That's all the work we're getting out of it--- for really very obvious, simple reasons: The push on top of the piston sends it one way and the crankshaft contradicts it and sends it the other way--- so you've lost your direction altogether; there was a little momentum of the crankshaft having a little rotary--- it's called a 180-degree restraint. But we have a little explosion on the side here and the connecting rod--- or call it a turbine-- 90-degree restraint, and it goes from 15 to 30 percent efficiency... fundamentally. Then you get into no restraint at all in a jet engine and you get up to 00 percent. And with the new fuel cells of the space program we get up to 85 percent. (The equipment is expensive, but it's a fantastically efficient operation.

"Now I found that the way we are using our energies--- we've known about the gas turbine for a long time; and the automobile companies and many of the trucks are operated on them, but the tooling costs--- the automobile companies say: society, the hell with it! Though we've had it available, we've not done anything about it. This is fairly typical of why--- I can understand all"

- Cite RBF to Harvey Kapnick, Chmn., Arthur Anderson & flo., New York, NY, (p.3 of transcript), 13 Far'74

"the reasons why. But I find that at any one time in the United States, Mexico, and Canada, there are two million cars standing in front of red lights at all times with their engines going.

So the reason we're having wars around the world is so we'll have oil just to do that much! My gosh! So I find the overall efficiency of our economy, sumtotally, is about five percent.

So 95 out of 100 barrels goes down the flush. This is all really nonsense. So I really began to get very interested in how we could get humanity to see the nonsense.

^cpanic Flaking:

"The name, COSMIC FISHING, which Ed _/~Applewhite_7 uses in his book came about In the following way. Very frequently as I was working on the manuscript some special turn of thought brought me in full view of a magnificent new awareness. I would stop my work and call to Ed typing at a table behind me and say, 'Ed you are very good at writing things down quickly, please make a record of this/ and I would then describe the new vista of physics or mathematical relationship which to the best of my knowledge had heretofore never been discovered by humans within our known history. I described to Ed the fisherman fishing over the side of a boat with his bait, sinker, hook and line suspended motionlessly deep in the water when suddenly there comes a nibble. The competent fisherman learns to jerk the line Quickly enough to catch the fish's mouth, otherwise fish are very expert in nibbling away the bait from the hook without getting caught. Then the fisherman, if he can hook the fish, reels it in and some fish battle Very powerfully.

"I pointed out to Ed that the intuitions of humanity are the fishing equipment---that many,many people get the bright idea or nibble but then become Interested in some other matter,"

cpaolc ^FiShiXtf •

"turn away to light a cigarette, go for lunch, foget to write it down and it ie gone ana that fish never comes back.

"In a survey of the diaries, letters, and scientific notebooks of six historically celebrated great scientists* contributions to humanity (where the notes, letters, and diaries, were inspected only for a short period before the scientist made his great discovery as well as at the time he made the discovery and for a short period thereafter): it is common to all those scientists* great discoveries that all of them make it clear that the number one factor leading to their successful discovery was the intuition of the scientist--something that made them turn suddenly in the right direction from another preoccupation. Then they also make clear the second most important factor was the second intuition which came seconds later about what they ought to do about the mind- discovered phenomena in order to bring its significance to bear on human knowledge and to probably thereby enhance the survival advantage of humanity.

"I pointed out to Ed that the cosmic fisherman was always _w occupied in opposite directions when the delicate intuition

Cosmic law Family: (1)

* Progress in understandings harvested during the--- known to have occurred--- five and a half million years of accrued human experience aboard our planet Earth have been reviewed, integratively and progressively by mind, until there now exists a confident awareness regarding the reliable persistence of a certain number of members of the family of a priori eternal laws which govern Universe both integratively and differentially. It is now understood also that human discovery of additional scientifically generalized principles may, in time, increase the now humanly known members of the Cosmic law Family.

"Starting life in absolute ignorance, no human can know in advance what the size of the a priori family of cosmic laws may be. He may in time discover what that size is, but discoveries are inherently unpredictable."

Cite Dreyfuss Preface, "Decease of i'eaning" 28 April 1971, pp. 5-6.

BBF DhFIMTluNS

Cosmic Law Family:

"As each of the entirely unexpected discoveries of the utterly unforeseen existence of the thus far discovered generalized principles was made, their discovery, only momentarily, seemed to complete the cosmic family. More and yet more have been discovered, however, and each discovery synergetically modifies humanity's cosmological understanding." . • •

"As the roster of known members of the family of a cosmic laws is expanded, the progressively greater whole produces inherently synergetic surprise and requires new cosmological comprehensions of the overall intersignificances of the expanded awareness."

- Cite Dreyfuss Preface, "Decease of Meaning" 28 April 1971, p. 7

Cosmic Limit Point:

"Let ua consider a tetrahedron, which also always has an externality and anjflkternality. At its internal center is ita terminal turn-around-and-come-outward-again condition. This is exactly why in physics there is a cosmic limit noin at which systems turn themselves inside out.They get to the outside and they turn themselves inside out and come the other way. This is why radiation does not go off into a higher

velocity. Radiation gets to a maximum velocity unrestrained in vacuo and then turns itself inward again--- it becomes gravity. Then gravity comes to a maximum concentration and turns itself around and goes outward--- becomes radiation again.*

Cosmic Speed:

See Gravity: Speed Of, 21 Oct*72

"Thank you for your lovely letter, I congratulate you and thank you for your identification of the Bible's 'firmament' with my use of the concept cosmic structuring. When my math book. SYNERGETICS, comes out next October, you will find it elucidating what appears to be fundamentals of cosmic structuring.

"Because sound has speed, we do not see the jet plane in the sky in the direction in which we hear it. The speed of sound is approximately 700 m.p.h., while the speed of light is 700 million m.p.h. The further things are away from us, the further they will be from where the sound or

light was transmitted at the time we receive that light or sound event.

"one of two adjacent stars in the Big Dipper's handle is 200 light years away from us and the other one is 100 light years away. A light year is six trillion miles. Therefore, the nearest one is 600 trillion miles away and the other one is one quadrillion two hundred trillion miles distant. Both are moving through the firmangt in opposite directions at speeds greater than 100 thousand m.p.h. Yet they seem to us not to be changing their relative interpositioning."

- Cite RBF Ltr. to Mrs. Pearl Horn, 21 Feb'73
SflSttLC (2)

"Where any stars of the heavens may be in respect to any of the others at any given moment is as yet uncalculated by astronomers* If we could have an instant or simultaneous location of all the visible stars, we might witness a very regular celestial geometry* Who knows? To appreciate how difficult such a calculation would be, we must appreciate that with our naked eyes we are able to see the nebula in the constellation Andromeda, which is a live show just reaching us which was taking place two million years ago, and that was twelve quintillion miles away from us at that time.

Where that nebula may be today in relation to all the other stars and nebula would take extraordinarily complex calculating. There are a billion galaxies of one hundred billion stars each in our thus far telescopically observed Universe, many of whose 'live shows' reaching us tonight took place eleven billion years ago.

"Galaxies revolve at peripheral speeds of a million miles an hour and stars within galaxies travel locally at lesser speeds of hundreds of thousands of miles an hour.

"I would appreciate your writing me more about what it was"

•Cosmic accounting contradict* humanly-invented terrestrial accounting.... Terrestrial accohnting is founded entirely on physical property wealth whose deeds of *ownership* derive exclusively from undisputed coups of might. Overlord

ship of lands were proclaimed by invincibly armed men, often accompanied by priests who solemnly affirmed the warriors* claims as being blessed by God's pleasure that the proclaimed sovereignties be so established. Cosmic accounting is exclusively metaphysical.

- None of the economic accounting books list metaphysical assets. Metaphysics are held to be unsubstantial, meaning in Latin, 'nothing on which to stand*.

- Patents can only be granted for .special cases, i.e., limited, physical practice applications of abstract generalized principles, which principles alone are inherently metaphysical and unpatentable--- being only discovered and not invented. Physical patents are capital. *

- Energy in either of its states--- associative as matter or dis- associative as radiation--- being physical, can be entered into the capital account ledgers."

- Cite RBF Ltr to Neva Kaiser; pp.1-2, 10 Jun'74

Cosmic Y3» Terrestrial Accounting;

(2)

"In cosmic accounting we find that it costs nature one million dollars to produce one gallon of petroleum as calculated in the astrophysicist's and astrochemist's respective energy terms accounted for in kilowatt-hour equivalents at the going 1974 US public utility retail selling rates to the consumers as expressed in dollars per kilowatt hours for the following cosmic services calculated at net cosmic energy investment and expenditure costs without cosmic overhead or cosmic profit:

- (a) The quantity of energy involved in the photosynthetic conversion of Sun radiation into hydrocarbon molecules and their subsequent vast multiplication incident to the building, operation, and regeneration of all the organic bodies of all the other biospecies of the intricate intercomplexities of the ecological complex of our planet;
- (b) The vast amount of Sun energy impounded by the biosphere's one billion cubic miles of Earth's

atmosphere always exposed to the Sun whose energies are articulated in work as the critical terrestrial temperature control of its biospheric ecology and as winds and storms and atomization of the waters"

- Cite RBF Ltr. to Neva Kaiser; pp.2-3, 10 Jtn'74

Cosmic vs. Terrestrial Accounting: (3)

"elevated outwardly into the sky as clouds to be distributed around the Earth to be precipitated and rained inwardly ever and again to water the vegetation, and to shake off its leaves, and to knock down its old trees, and to gradually wind-cover their composite residues ever more deeply; and subsequently to drainflow them into the seas or Earth crust until they attain the specific critical heat and pressure conditions at which petroleum or coal are formed;

- (c) As specific pressure and heat magnitudes energetically maintained for given critical time durations essential to fossil fuelization.

"Evolution is now confronting the world's politicians, businessmen, and their master bankers with the residual fact that only the metaphysical truths can produce the commonwealth realities of human life support....

"For millions of years possession, or 'legally' covenanted occupation of the lethally scarce life-support producing lands —meant life or death. All revolutions of the past have been"

- Cite RBF Ltr. to Neva Kaiser; pp. 3,6, t 7, 10 Jun*74
Collect. Terrestrial Accounting: (4)
"fought in dispute over physical property 'rights'.

"The industrial proliferation of mass production tools and managerial techniques as well as proliferation of food preserving and world-around distributing means has brought about the withdrawal of the 90 percent of humanity who heretofore occupied and operated farms. That pattern is now spreading to embrace the whole planet's life-support operation. Possession of the land is no longer synonymous with economic success nor with general life support of humanity.... All large industry is trending to provide rentable services instead of trying to sell technological products. Services are primarily metaphysical know-how systems. Here again evolution trends to the metaphysical wealth which has not been on the capital account books."

°paalc VftGMua °IMmor:

"A comet is a celestial itinerant, a cosmic skyways vacuum cleaner trying to accommodate an aggregation of stardust as it travels successively through the orbital neighborhoods of planets, stars, and other comets. The radiation pressures from the nearest stars, however, tend to blow the vacuum cleaner's stardust gleanings out into a 'dustbag,' causing what we erroneously speak of as the comet's tail. These 'tail*' displays should be spoken of as Sun-radiation blowoff trajectories. As the comet comes into critical proximity of syntropically Importing planets, the stardust aggregates of their inverted 'tails' are gravitationally depleted by the planets they pass as much of that stardust falls into the planets or moons to become Dart of those import centers' syntropic build-up in a multibillions-of-years syntropic preparation of their stored energy aggregates to be converted into the state of an entropically exporting star."

"The largest patterns of industrialization will never be done in terms of countries. The idea of * countries' was never more than a convenience to the Great Pirates, the men of power who divide and conquer. The Great Pirate is glad to have everyone speaking different languages and all those things....

"The little countries can't possibly do it. It's very nice in a sense for their inferiority complexes for these countries to be recognized-- to get in the UN and get a democratic voice. But the UN is really quite pathetic.... While they are doing everything parliamentarily, they are just inching. They are glacial; they can't keep up at all with what is necessary to make our world work.... Their talking and procedures will just be years behind the emergencies and unable to cope with them."

Coupler:

"So you have 70° J2' and 109° 28*. The coupler fills allspace with a unity of 24 - $1/24$ tetra. Two spheres kiss in the coupler. It provides 92 basic rearrangements of the A and B Modules to accommodate the 92 chemical elements.

"All number relationships are covered by the octant, insideouting, plus-minusIng. and so forth. What are all the variables of the system? That is the question to ask. All of the variables of the system are in the coupler."

- Citation A context at Veetorlal St. Vertaxial Geometry (1) 27 Jan'75

Coupler:

"The Coupler is the asynnetric octahedron to be elucidated in Secs. 954.20 through 954.70. The Coupler has one of the most profound integral functionings in metaphysical Universe, and probably so in physical Universe, because its integral complexities consist entirely of integral rearrangeability within the same space of the same plus and/or minus Mites, rfe will now inspect the characteristics and properties of those Mites as they function in the Coupler.**

- Cite RBF insert to SYNERGETICS galley at Sec. 954.01, 20 Dec'73
Coupler;

"Lach of the 12 rhombic dodecahedra *r.e completely and syninetrically omni surrounded by--- and daiaond-face-bonded with--- 12 other such rhombic dodecahedra, each representing one closest-packed sphere and that sphere's unique, cosmic, inters|>here-space domain lying exactly between the centers of their 12 surrounding rhombic dodecahedra--- the couplers of those closest-packed-sphere domains having obviously unique cosmic functioning.

- Cite RBF insert to STNLXGhTICS galley at Sec. 954.21, 20 Dec*73

Coupler;

"...There is a rhombic dodecahedron around every point in the isotropic vector matrix. I explained my billboard model successively activating each point in an isotropic vector matrix... The center of the face of the rhombic dodecahedron is congruent with the center of volume of the asymnetric octahedrmal coupler. It has eight faces and brings in the octave system, with the value of one... The interior octahedron of the vector equilibrium made up entirely of energy-conserving A Quanta Modules..."

- Citation and context at Fuller, R.B.: Meeting With FcnrendM-Mgran (2), 5 Apr'7j

Coupler: (j)

"The basic complementarity of our octahedron and tetrahedron, which always share the disparate \square numbers 1 and 4 in our topological analysis (despite its being double or 4 in relation to tetra - 1), is explained by the uniquely asymmetrical octahedron which is always constituted by the many different admixtures of AAB Quanta Modules, the Kites, which asymmetric octahedra are like the 4A's-2B's, the Sites, also allspace fillers, as are the cube (72 AB's), the rhombic dodecahedron (144 AB's) (spherics).

"There are always 24 A's or B's in our uniquely asymmetrical octahedron (same as 1 tetra) which we will tentatively name the coupler because it occurs between the adjacently matching diamond faces of all the symmetrical allspace-filling rhombic dodecahedra (of 144 A's and B's). The rhombic dodecahedron is the most faceted, identical faceted (diamond) polyhedra and accounts, congruently and symmetrically, for all the isotropic-vector-matrix vertexes in closest-packed spheres and their 'tween' spaces. Each rhombic dodecahedron's diamond face is at the long-axis center of each coupler (Vol. ` ` 1) asymmetrical octahedron, with each of the rhombic"

Creation;

"Ko I don't like to use the word 'creativity',¹ and I don't even like the word 'creation',¹ The mind is properly concerned with generalized principles and to qualify as generalized principles they must be devoid of exceptions—i.e., eternal.

"Ilan does not create he only discovers and employs. He did not create the lever, nor did he invent the lever..#, he can invent new uses for the lever but not its principle.

"What humans refer to as creation involves a beginning and an end. Human beings deal only with apprehending special case, inherently terminable, phenomena. Only brains ask for beginnings and endings. Human mind discovers the eternal interrelationships existing between special case phenomena that are not predicted... and characteristics of system's parts when each is considered only separately. Since human mind deals with the eternal, original 'creation' is an untenable concept, -that people mean by creative is special case inventive use of eternal principles."

BBF DEFINITIONS

Crwunkr (D

• I reserve creativity for that which came before nan. I think of god not as a superman but as the great comprehensive a priori integrity of the Universe within which man finds himself to be operative* • •

"Now there is, in the Universe, a vast order. It never lets you down. I throw a coin into the air and it returns and hits the floor every time. Nature is never at a loss what to do when she takes over after you and I sign off. Nature never vacillates in her decisions. The rolling oceans cover three- fourths of the Earth. Along the beaches, the surf is continually pounding on the shore. No two successive local surf-poundings have ever been the same, nor will they ever be the same. They typify the infinitude of Individualism of every special-case event in the Universe. While there is great music in the pounding of the surf, as the infinite creative integrity of the Universe is manifest, I cannot identify man, who hears this music, as the creator. I therefore do not use the word creativity in man's employment of a priori infinite variety.

"True, men have been endowed with very extraordinary faculties." • Cite Mergers 4 Acquisitions, Vol 1, No.3, pp.42-44, Spring'66

CMftUXltXi (2)

"The Universe is endowed with very extraordinary principles. The principles are discoverable. When nan fulfills his extraordinary abilities and does discover, or really un-cover the mysteries of the ordered Universe, some very strong interactions become available to society. Humanity is constantly being surprised by these Interactions. But, as for the 'discovery. • it was always there, waiting to be uncovered. "

"When you talk about 'creative men you are really talking about men who know and understand something of the Universe, and who, regardless of public acceptance or rejection, know.

"I certainly worry about the teaching of creativity that so many talk about today. In science and technology, teaching creativity is. in reality, teaching about the Universe. If you understand the laws that govern its working,

you. ipso facto, must be creative, for you cannot help but apply those laws in a new way— in your language, a 'creative*' way, in my language, an 'extraordinary' way." - Cite Mergers & Acquisitions, Vol.1, No.3, pp.43-44, Spring'66

Creativity of Children:

"I think that every one of ue has had the experience of hearing a little child suddenly, saying, or asking a question, or making a statement that is so lucid that we are astonished. There have been hundreds of millions of little children--- one after another saying these extraordinarily beautiful things, ijnerson spoke of poetry as saying the most important things in the simplest way and children are continually saying these important things in simple ways. I think that is what society in general talks about as creative, as if you were just being a little child and retaining that quality when you are older, when you have had more experience and can still see

elderly and lucidly and say things economically. That is what man has been caljng creativity. About creativity as a word, 1 would not myself feel that men aspire to add to the Universe, but they discover the great extraordinary principles within it and can employ them from time to time in very novel ways quite clearly moving forward to greater understanding.*

Critical Proximity:

"Though lines can't go through the same point at the same time, sometimes they can get nearer or further away from one another. They can get into what I call critical proximity. Critical proximity would be, for instance, the relative positioning of the moon and the Earth where in there is a mass attraction hook-up. If there is a mass takeover attraction, they operate thereafter as a universal joint. Either body is quite free to carry on all kinds of individual motions and transformations by itself, such as revolving and precessing. But they cannot escape their critical proximity to one another as they orbit together around the sun with which they are jointly in critical proximity."

Crowd-reflexing:

"Chagrin and mortification caused by their progrssively selfdiscovered quadrillions of errors would have given humanity such an inferiority complex that it would have become too dis- ccp'aged to continue with the life experience. To offset this, humans were designedly given a pride and vanity which can---ana usually does--- tend to self-deception. Witnessing the mistakes of others, the preconditioned crowd-reflex!ng says. 'Why did that individual make such a stupid mistake?... We knew the answer all the time.'... So effective has been the nonthinking group self-deceit of humanity that it now says, 'Nobody should make mistakes,' and punishes people for making mistakes. In love-bred fear for their children's future life in the days to come beyond that of their own survival, parents train their children to avoid making mistakes lest they be put to social disadvantage."

"All the crystallography is done through the vector equilibrium relationships where there is turbinizing. There is an accumulation of right and left turbinizing--- positive and negative, inside and out--- not stopping at equilibrium and therefore always relatively asymmetrical*

"The first photographs through a field emission microscope actually show the discrete atoms themselves. The point of a tungsten needle shows a stapling of oranges or whole cannon balls, laying bare layers of whole balls and they are graduated... You'd have to pile them approximately a mile high to come out as the beautiful surface you see on a needle. The atoms are never fractionated; they always come out whole atoms, whole protons and neutrons. Photographs made of the nuclei of whole atoms always come out in that beautiful vector equilibrium pattern."

Cube: (jj)

"If the cube is an entity it has 15 structural lines.

If a dodecahedron is an entity, it has 32 vertexes, 60 faces, and 90 structural lines. (The primes 5 and 3 show up here to produce our icosahedronal friend 15.)

"Whenever we refer to an entity it has to be structurally valid and therefore it has to be triangulated. This does not throw topology out.

"A nonstructurally-triangulated cube exists only by self- deceptive topological accounting: someone shows you a paper or sheet-metal cube and says, 'Here is a structurally stable cube without any face diagonalising.' And you say what do you call that sheet-metal or paper which is occupying the square faces without violating the cube would not exist. The sheet-metal or paper does diagonal the square but overdoes it redundantly.

"a blackboard drawing of a 12-line cube is only an imaginary, impossible structure which could not exist in this part of Universe. It could temporarily hold its shape in gravity low regions of space or in another, imaginary Universe.

"Cubes take three times as much space as tetrahedra.

- Cite P. PEARCE, Inventory of Concepts, June 1967

Cube:

"Because the cube is the basic three, if we asses space in the terms of the cube as volumetric unity, we will take three times as much space as would be occupied by the tetrahedron as volumetric unity. The arithmetical-geometrical coordination in terms of cubes is threefold inefficient for we are always dealing with physical experience and the structural systems whose edges consist of events whose actions, reactions and resultants consist of one basic energy vectors; therefore the cube requires threefold the energy to structure it as compared with the tetrahedron, rfe thus understand why nature uses the tetrahedron as the unit of energy, as its energy quantum, because it is three times as efficient. All the physicists' experiments show that nature always employs the most energy-economical tactics."

Cube:

. We have trouble with the vectorially fashioned cube; it collapses, it doesn't hold its shape. Cubes and squares will not hold their shapes. MB¹ they lack structural integrity. To hold its shape a square must be divided into two triangles. But because two vectors cannot go through the same point at the same time the two diagonals of the (quasi) square are tangent and thus form a flattish tetrahedron. To hold its shape a cube has to have a tetrahedron in it. There are eight small or two large tetrahedra in every cube. Either one of the big tetra or four of the little tetra will maintain the cube's shape."

Jun'66 NAS*

Cube;

"Experiment shows that cubes are invalid as structural devices, although the building industry and society in general commonly think of buildings in terms of cubes or quadrangular coordination. If you make a little cube of twelve toothpicks, and join their ends with soft rubber balls you will find that the cube wobbles and collapses whereas a tetrahedron made in the same way, with six toothpicks and soft rubber ball vertexial jointing is utterly stable. The cube becomes rhombic. Each little square will flatten down very readily. The tetrahedron is made up entirely of triangles which are the only inherently stable polygons."

pMte DiWnal gf Cyfr?:

"Synergetics has discovered that the vectorially most economical control line of nature is the diagonal of the cube's face and not its edge; that this diagonal connects two spheres of the isotropic-vector-matrix field: and that those spherical centers are congruent with the two only-diagonally-interconnected corners of the cube. Recognizing that these cube-diagonal-connected spheres are members of the closest packed, allspacecoordinating, unit radius spheres field, whose radii • 1 (unity), we see that the isotropic vector matrix's field-occur- ring-cube's diagonal edge has the value of 2, being the line interconnecting the centers of the two spheres, with each half of the line being the radius of one sphere, and each of the whole radii perpendicular to the same points of intersphere tangency."

tfave action is illustrated by "a steel cube mounted on a frame with a diagonal axis running from one corner of the cube to an opposite corner. (See Illustration 64.) . . . We see the triangle rotate ... in such a manner that it goes from being congruent with the positive tetrahedron of the cube" to being congruent with "the negative tetrahedron of the cube. » * With an oscillating system . . . we find that each one of the little triangles rotates as if it were swelling locally. There is a lag in it . . . exactly like our dropping the stone into the water and

getting a planar pattern for a wave but in this one we get an omnidirectional wave. We can see the electromagnetic wave pattern as clearly demonstrated by one energy action in the system. This is the first time I think a man has been able to have a conceptual picture of a local disturbance. We must remember that in the local water where we drop the stone the molecules run inwardly and outwardly towards the center of the earth gravitationally; the water does not move. It accommodates a wave moving through it. We see that a wave is a pure principle accommodated locally to be broadcast.

Cube: Two Tetra as Cube:

"The accomplishment of experienceable, structurally stabilised cubes with a minimum of nonredundant structural components will always and only consist of one equiangular and equiedged 'regular tetrahedron on each of whose four faces are congruently superimposed asymmetrical tetrahedra, one of whose four faces is equiangular and therefore congruently superimposable on each of the four faces of the regular tetrahedron; while the four asymmetrical tetrahedra's other three triangular---and outwardly exposed---faces

are all similar isosceles triangles, each with two 45-degree-angle corners and one corner of yO degrees. Wherefore around each of the outermost exposed corners of the asymmetrical tetrahedra, we also find three yO -degree angles which account for four of the cube's eight corners; while the other four yO -degree surrounded corners of the cube consist of pairs of 45-degree corners of the four asymmetric tetrahedra that[®] were superimposed upon the central regular tetrahedron to form the stabilised cube. More complex cubes that will stand structurally may be compounded by redundant strutting or tensioning triangles, but redundancies introduce micro-invisible, high- and low-frequency, self-disintegrative accelerations, which will always affect structural enterprises that overlook or disregard these principles.**

Cube & YE as Wave Propaation Model;

"Both the cube and the vector equilibrium's flexible, necklacelike, six-square-face instabilities can be nonredundantly stabilized as structural integrity systems only by one of the other of two possible diagonals of each of their six square faces, which diagonals are not the same length as the unit vector length. The alternate diagonalizing brings about positive or negative symmetry of structure. Thus we have two alternate cubes or icosahedra, using either the red diagonal or the blue diagonal. These alternate structural symmetries constitute typical positive or negative, non-mirror-imaged inter-complementation and their systematic, alternating proclivity, which inherently propagate the gamut of frequencies uniquely characterizing the radiated entropy of all the self-regenerative chemical elements of Universe, including their inside-out, invisibly negative, Universe provokat, split-second-observable imports of transuranium, non-self-regenerative chemical elements."

Curvature: Sianle; (1}

"We can demonstrate the great structural gain inherent in the principle of simple curvature over rectilinear structures when we take a limp sheet of paper and curve it into a tube. Previously an amorphous diagram of little structural advantage, it afford dramatic structural ability in the form of a tube. When the paper is curved, the concave side forms an arch of infinitely minute parallel compression staves, fulcrums of pinched rows of atoms. The convex surface of the curved paper is stretched around the compression arch of parallel fulcrum lines— tensed atoms.

"The paper may be reversed so that what has been the inside of the cylinder's surface becomes the outside surface. Thus it is seen that the simple curvature structure is a principle and not a unique characteristic of the atoms constituting one surface or the other. The stability of simple curvature is enhanced by the length of the parallel lines. As the lines shorten to approach 'points,' the compression of the arch approaches the ball joint which then tends to curve in any direction. The curved compression in the barrel or cylinder was confined to"

"articulate its tendency to curvature within one plane by the compression (strutted) positioning of every point of the line of curvature afforded by the parallelism of the staves and their inertia.

"In a staple curvature tube of paper all the circles of tension, including all the circles of compression, are parallel to one another and give one another no help. Therefore a cylinder be flattened— in which case each circle becomes a double line. In order to do this, we see that the tension circles exert all their pull in levering the many compression points within to compress exquisitely the two opposite, or polar, compression point. This is then, the genesis of the ultimate, two-way focussing compression tension line resulting from stressing simple curvature."

Curved Space:

"A sphere is unit, but a line is not because the terminals of a line must represent arbitrary cut-offs. All lines, except when abstractly considered as 'direction,' are somewhat curved, and all curved lines must eventually intersect--- no matter how remotely. Not even a graphed spiral is forever possible because the errors in a graphed line constantly dislocate the line and insist upon an ultimate intersecting contact. This, quite simply, is the essential concept in Einstein's 'curved space.' • The only possible symbol of unity in plane geometry is the circle."

Custom: Lest One Good Custom Corrupt the World? (A)

Q. "Individuals do not survive, but the species does

survive through all the environmental stresses, ` •hat are the ethical and moral standards should we use in determining the environment that humanity must choose?"

RBF: "I do not hink of any kind of (social or philosoph

ical) 'movement.* We are all born in the presence of the truth. We do have this enormous cultural yearning—but it is so remote from what Universe is trying to do. Human mind is everything: credos and culture are not it.

"Poets, being sensitive, feel the significance of events more than do scientists. Scientists, beginning with Lavoisier and Priestley, have found out about thermodynamics and its second law of entropy bringing about increasing disorder. This is what Tennyson is saying—it all happened in his lifetime. Tennyson accepts the idea of entropy, the operation of inexorability in human affairs. His 'Korte 'Arthur, the Death of King Arthur says—

cmæ: food Cuatm corrupt tht,WgrX<b

*We all know the lines

'The old order changeth, yielding place to the new, And God fulfils himself in many ways,'

- But we're not so familiar with the next line, which is:
'Lest one good custom should corrupt the world.'

□That's the point about one good custom--- if change is inexorable-- holding on to a custom which was satisfactory yesterday, may be an obstacle to evolution today.

"We are now at a point where all of humanity is coming into a new fundamental relationship in Universe. . . It's man's mind that has access to those eternal principles. There are no exceptions to the principles therefore they are inherently eternal. The larger complex of Universe is never predicted by the lesser. It is grand strategies of working from the whole to the particular which will characterise our education in the future, abandoning any thought that the parts are going to tell you about the whole. That's what Tennyson was trying to get at<

RBF JtFILITIGLS

Custom: Lest One Good Custom Corrupt the World:

"In the time of Tennyson tradition was about as strong as it could be; change was abput at its lowest in social affairs. Technology had not yet taken over. Still, Tennyson was able to conceive of the approaching industry-- even to consider flight. In Korte O'Arthur he said

'The old order changeth, yielding place to the new As God Fulfills himself in many ways...'

And then he says something that is unfamiliar to most people:
'Lest one good custom should corrupt the world.'

"He realized that a habit that was once completely satisfactory to man may be maintained after its time. As entropy is always operative and the Universe is altering, change is inexorable. Therefore, holding on to a good custom is equivalent to damming up the Universe and so the flood will only be worse when the dam does break. It is really the most pleasing traditions of yesterday that bring about the greatest social revolutions. At the moment we are finding a great many seemingly satisfactory kinds of custom from yesterday---ⁿ

Cybernet!eg:

"Cybernetics, the Greek nene for the steering of a boat we first employed by Norbert WMner to Identify the human process of gaining and employing Information. When the rudder of a ship is angled to one side or the other of the ship's keel line, the ship's hull begins to rotate around its pivot or deepest keel point. Since ships have great weight—usually in ton magnitudes—frequently in thousands of ton magnitudes— the momentum of that tonnage's pivotong tends to keep rotating the ship beyond the helmsman's intention. He therefore has to 'meet' that ship's altering of its course which he does by putting the rudder over into the opposite angular direction, which always produces a momentum contradiction and a resultant course alteration to the opposite side of the desired ship's course. It is impossible to altogether eliminate the ship's course re-alterations. It is possible only to reduce the degree of angular errors by ever moro sensitive, frequent, and gentle corrections.

"Through successively sensed visual information, the ship's helmsman discovers that he has oversteered first on one side and then on the other side of the compass course he is desirous of maintaining in order to reach his unseeable, faraway destination

RBF DEFINITIONS

"All through the years Daddy was the authority. Daddy came home, brought home the food, brought home the killings; he was the hunter and the soldier; he was the farmer protecting the family.

"And Daddy saw the other people, the iWher soldiers and farmers; he saw the king and he was able to tell the kids what the authority says outside his authority and what the rules are.

This is what his Pa taught him; this is how you handle the tools. Daddy is an authority about everything. This is the way Dad says it is and that's the way you emulate the way he says it is.

"So that was how language evolved.

"When I was 32, in 1927, suddenly Daddy came home and the kids said, 'Daddy, a man's just flown across the Atlantic. Lindbergh.* And Daddy says: 'How do you know that?' 'It's coming over the radio, Daddy.* Daddy didn't bring that news home and he hasn't brought it since.

"So a completely new thing happened as a consequence of World War I. And World War II brought us to the point where television*

Daddy: (2)

"came in.

"Most important of all we had to invent languages. All those languages are so different; but sight is a universal language, what you see. What this did was to bring the world together in a way it had never been put together before.

"It's not really what the npcaster is saying; it's what the kids are really seeing out there anywaprwhere. Kids look at the way things work. They see everbody around the world now. They are being educated together; nobody's going to put some tricks over them politically. Now this wasn't predicted. But the kids see that Dad and Mum are absolutely a minor authority.

They can tell you what's going on in the shoe stores, tell you a little bit of local news, but it's all absolutely irrelevant. Dad's not telling us about Man's getting to the Moon. Man's been her for three and a half million years and Daddy's been the authority all that time. Suddenly nature has gotten enough information and the tools for communication and there's a young world here. She's cut the metaphysical cord, the metabilical cord.

Darwin: Charles Robert: (1809-1832)

"Since experience is finite it can be stored, studied, directed and turned with conscious effort to human advantage. This means that evolution pivots on the conscious selective use of cumulative human experience and not on Darwin's hypothesis of chance adaptation to survival nor on his assumption of evolution independent of individual will and design."

Daryin: Evolution May Be Going the Other Way:

"...There is no breeding experience of Earthians which suggests that the limited inventory of different chemical elements constituting amoebas could be progressively amplified and complexed to produce the wide variety of chemical elements constituting the unique information-harvesting organisms employed by metaphysical humanity.... It is implicit that amoebas and other simple organisms can

be progressively, sub-divisionally isolated out of complex organisms such as those of humans and introduced into an intercomplementary environment-sustaining complex, but not vice versa.... Darwin's evolutionary sequence was brilliantly conceived, but its occurrence programming was in reverse of reality,"

- Citation in context at Human Mind vs Physical Evolution. (2)(3) 5 Jun'75

•I've been recently supported by scientific developments which suggest that I may prove to be correct in assuming that Darwin's theory of evolution is in reverse. Darwin assumed evolution proceeding from the simplex to the complex. I am evident that the Universe works the other way, developing simplexes to accommodate the a priori of a Universe in which there are 92 regenerative chemical elements. There are too many chemical elements involved in humans to be able to go from amoeba to man. Man is not born a specialist. He can't fly or swim very far, or anything. But he can use his mind to discover and employ the principle of negative pressure, which is called 'lift'; and he accomplishes flight and flies ten times as fast as the bird, then takes off his wings when he's not using them and lets others use them. So humans have the capability to understand abstract 'weightless' eternal principles and we have the maximum number of sensitivities with which to gain information and employ in principle. You can't come to this maximum complex of human sensitivities and information handling from just a hydrogen atom. There's a lot of hydrogen in us but at the time of Darwin, Dalton was the great physicist and he thought all atoms of higher number"

- Cite KBF quoted in HOUSTON AC GARDEN Interview, p. 202, May '92
Evolution fav Be Colne the Other Way:

"Were comprised of hydrogen atoms. So with this buildingblock idea Darwin built a science of evolution. Now it's very easy to inbreed by concentrating parental genes and a special type--- that is to breed a faster running

(B)

horse by mating two fast runners. Inbreeding is always accomplished by breeding out general adaptability. It is easy to go from a man to a monkey by inbreeding butthere's no indication, nothing in the history of breeding anywhere, that suggests being able to go the other way." *

Darwin- Evolution KAY Bg taint tho Qthgr ys

"So I began to see that so-called evolution had been really inversed. About 1935 I had the advantage of Meeting Henry Fairfield Osborne who was at that time head of the Natural History Museum in New York and author of three volumes updating Darwin. . . I asked him if there was anything in Darwin's data that said that the patterning could not have been in reverse. There was no question about the integrity of the interrelatedness of the VBB patterning--- that this one is very close to that one and that there is an evolution between them--- but could the evolution not have been that of separating out, rather than associating? Might you not then have had another way the Universe came out which would have been like us ... I am talking about . . . defining man as one way the Universe could have come out. . . "

"Comprehending and knowing are eternal. Little children know this fact intuitively. The child can play ¹ shoot grandmother,* because he knows that her love is eternal. You can't kill graryn other. Grandma, grandpa, and everyone else are eternal. A true storv: Father, mother, and little boy are driving along the freeway en route to grandmother's house. Little boy keeps talking about grandpa and how he is going to play with grandpa. Finally his mother says. 'Darling, you have forgotten that grandpa is dead.' Little boy: 'What! Again?' Only residual ignorance of temporality dulls the growing comprehension and allows fear to corrupt the child's innately absolute trust in love."

Death;

•When early navigating man was separated from his group by a storm, he would rarely find them again. He would discover unfamiliar places. Out of this sprung a fatalistic philosophy--- I see you now but soon I may never see you again. Thus death itself was not to be abhorred. God became the prevailing winds and currents which seemed to be leading you away. He carried you forward. One learned to release the old and take on the new. There was no basis for grief or nostalgia because you never touched upon the past again. This is the reason that the oriental feels so differently about death."

Deliberately Non-Straight Line: (A)

"My deliberately non-straight line gets straighter and straighter by having less and less diameter whereas your attempted straight line gets worse and worse. With my deliberate non-straighter of very high frequency, you can keep carry on all the geometrical proofs of the Greeks and Egyptians and all the geometries since that time with confidence that my deliberately non-continuous high frequency event tracery is much straighter than any of the lines employed by the geometers up till now. I said my deliberately non-straight line was also discontinuous as each of the thousands of fibers overlapping each other in my dacron rope consisted of molecules which consisted of myriads of atoms and each atom consisted of a plurality of separate electrons and nuclear components, the electrons being as remote from the nucleus as the Moon from our Earth, therefore discontinuous and cohered only by the mass attraction and electromagnetic laws. In a fundamental way my deliberately non-straight line, when viewed through a field emission microscope, looks like the milky way as a tracery of stars in critical proximity to one another, that is affecting one another and each holding the others as part of a system, the galactic nebula. You can think of my circlet of rope as the same fundamental pattern as the

RBF DEFINITIONS

Deliberately Non-Straight Line:

Quasi 'straight' lines are deliberately non-straight lines. See Illustration #13x7

"As we double the frequency and halve the wave length of positive and negative waves we approach relative straightness. Proof that two deliberately non-straight lines between points A - C approach relative straightness to more effective degree than attainable by an assumed straight construction."

- Cite SYNERGETICS ILLUSTRATIONS, caption #13, May'67

Deliberately Non-Straight Line (1)

"Pure mathematics* axiomatic concepts of straight lines are completely invalid. The pure mathematicians' straight line must be infinitely, instantly and all its parts simultaneously existent. It must avoid being progressively generated or drawn as an experimentally-produced actiontrajectory of one system modifying another. Any actiontrajectory's trail-width would not bear microscopic inspection without disclosing gross Irregularities. Progressively closer inspections of experimentally attempted demonstrations by the pure mathematicians of their allegedly 'straight' lines always disclose increasing angular digressions from straightness.

"While the mathematicians' 'straight' lines get less straight, with ever closer inspections the 'Quasi straight line' as a deliberately non-straight line does progressively straighter. It does provide all the Finite geometric functions heretofore served by the mathematicians* alleged but unprovable straight line.

"Progressively doubled frequency of modular subdivision of deliberately non-straight line swiftly approaches an

Deliberately Nonstraighjt Line:

"Approaches an 'apparently' straight, but known-to-be-non- straight line. Each 'V*' is converted into an equilinear distance 'W.' This single wave 'W' becomes an equal-energy value 'W' or two half-sixe waves. As the frequency of the wave subdivisions are multiplied, the quasis- straight line swiftly approaches 'straight' behaviors.

(2)

•'Lines of sight' taken with transits are truer than string lines or pencil lines. Sight approaches 'staright* behaviors. Lines of sight are high-frequency energy wave interactions. Because the truest lines of sight are energetic wave quanta, they are always finite.

"Light reaching, us from the Sun... is geodesic."

- Cite NASA Speech, pp.44-45, Jun'66

"What the mathematician thought was a straight line is not a straight line but is an ultra-visible high frequency, linearly articulated event. This binary mathematics methodology of halving, or cybernetic 'bitting' not only explains linear wave phenomena but also identifies Pythagoras's halving of a music string to gain an exact musical octave. The computer programmed to employ the cybernetic bits of binary

mathematics progressively subdivides until one of its peak or valley parts gets into congruence with the size and position of the unit we seek. This identification process is accounted for in the terms of how many bits it takes to locate the answer, that is, to 'tune in.**'

RBF DEFINITIONS

Deliberate Non-Straight Lina:

"Nature abhors an equilibrium as much as she abhors a perfect vacuum or a perfect anything. For instance, when an airplane in flight comes to equilibrium, we call it a stall, and the plane become unmanageable and goes swiftly out of equilibrium and into a plunging field of gravity. But I saw that we could approach or employ an almost perfect equilibrium as we employed a crooked line which swiftly approached but never reached the perfect or exact. I saw that a comprehensive structural svstem would have to involve all thpositive and negative tendencies either side of equilibrium. The comprehjnsive system would have also to involve all the topological pattern components and as a quasi-equilibrial structure would have to be approximately the same length; therefore, all the angulation would have to be in increments of sixty degrees."

Democritus:

*... When we hear the word 'atom' we are hearing Democritus, for it was he who evolved the sound word 'atom' to identify his unique metaphysical conclusions in regard to the nature of the physical world. Democritus is as large and as persistent in time dimension as may the word 'atom' persist in man's communicable thought. Because concept 'atom' provides our cognition of metaphysically immortal Democritus, the more we think of it the more astonishing it is that we identify man only as the clothes-bedecked chemistry complex through which metaphysical subconsciousness communicates to consciousness of self or others. The error of our spontaneous behavior and cognition is equivalent to our identifying those with whom we communicate via the telephone as being the telephone itself."

Q. Is the recession of 1975 at *11 like the great

depression of the 1930's?

RBF: "Not at all. It is quite different. My book 4-0

was written two years before the crash but its content predicted what cooing. It's funny that not that many people owned stocks and bonds anyway.... Society was just naive.... It was depressing: people stopped being communicative..• they were just sitting in rooms. There were no protests down the street and the politicians--- like Nixon--- were just saying: There's nothing wrong here.

"But there has new been much more education. And the issues are different. The Forgotten !<an is very much in today. In 1929 there was an enormous respect for power per se. The old people were supposed to knew everything. And when the working man did get money he wanted to see things like the older people. But in 1975 the young people are purged. The base is different.

"You hear that things are awful in England, but it really couldn't be nicer in England.

- Cite RBF at videotaping Session Philadelphia, PA., 1 Feb'75
Pearggelgn: Groat UeprefioXon of

"In 1929 people wanted a leader, but politics are not essential. You don't have to have a government. It's like the crew of a ship: everyone knows exactly what to do in spontaneous coordination. Ships rescue each other but people pass you up on the street. If there is anything anathema to the sailor it is a sea-going politician.

(2)

"It's been the money-makers vs. labor. Look at the way the kcDonald's Hamburger stands exploit the young people who work for them. But in England people still love their jobs. Our businessmen are too hard and it takes all the joy out of work. And so we just disconnect.

Once we get out of the clutches of the money-makers people are going to want to work. It can be very informative to wait on tables. Now we have all these big office buildings half-empty. In the 1930's the churches paid no attention."

Descartes: (1596-1650.)

"Descartes is the first of record to have discovered that the subs of the angles of a polyhedron is always 720° less than the number of vertexes times 360° . Descartes did not equate the 720 with the tetrahedron, nor with the one unit of energy quantum which it vectorially

constitutes. He did not recognise the difference between the visibly definite system and the invisibly finite universe, which is one finite invisible tetrahedron outwardly and one finite invisible tetrahedron inwardly."

RBF DET INITIOKS

Design:

"The word design is used in contradistinction to random happenstance. Design is intellectually deliberate. Design means that all the components of the composition are intercon- siderately arranged; i.e., the component behaviors, proclivities, and mathematical integrities are internecommodatively arranged. Ergo, the family of thus-far-discovered scientifically generalised principles which are omniintersccobmodative and omniconcurrent inherently constitute a design, an eternal cosmic design whose eternal interrelationships are expressible only in abstract mathematical terms. Being exclusively mathematical, they are inherently metaphysical, weightless, abstractions, which metaphysics can only be conceived of and dealt with by intellect, and being thus far apuarently eternal and discoverable only by human intellect, they altogether manifest an a priori cosmic intellect of absolute integrity."

Design: (1)

``To me the word design can mean either a weightless metaphysical conception or a physical pattern. I tend to differentiate between design as a subjective experience, i.e., designs which affect me and produce involuntary and often subconscious reactions, in contradistinction to the designs which I undertake objectively in response to stimuli. What I elect to do consciously is objective design. When we say there is a design, it indicates that an intellect has organized events into discrete and conceptual interpatternings. Snowflakes are design;

crystals are design; music is design; and the electromagnetic spectrum of which the rainbow colors are but one-millionth of its range, is design; planets, stars, galaxies, and their contained behaviors, such as the periodic regularities of the chemical elements are all design-accomplishments. If a DNA-RNA genetic code programs the design of roses, elephants and bees, we will have to ask what intellect designed the DNA-RNA code, as well as the atoms and molecules which implement the coded programs.

"The opposite of design is chaos. Design is intelligent or intelligible. Most of the design subjectively experienced"

Psalm Reyal.tUIQn: Pulling the Bottom UP Sequence; (1)

"The changes taking place are very unfamiliar to everybody, even those who expect change. And these eladerly people have- all of them-- probably given themselves in very big ways, very generous and very dedicated ways; but they are baffled and afraid. And I think it's unnecessary. That's one of the things I'm absolutely convinced of.

"In terms of yesterday's misconceptions there wasn't enough to go around and somebody had to go down: you really did pull the top down. I'm now absolutely convinced we must pull the bottom up and not lower standards.

"One of the most interesting fundamental discoveries I've made relates to that. When Malthus, as an economist, received his data he was the first economist receiving total data from the total Earth as a closed system. And he found that apparently people were reproducing themselves more rapidly than they were producing goods. And then Darwin followed with his explanation of evolution as survival of only the fittest. These two compounded. Not only did the masses of these men agree that all this was correct, but they said that they were the fittest."

Design Revolution: Pulling the Bottom Up Seouengq: (2)

"We have Karl Marx then running the same jargon, agreeing with the Darwinist argument--- survival of the fittest--- and saying that the fittest was the worker because the worker knew how to cope with nature. He knew how to cultivate, and handle the chisel, and so forth; and the other people were parasites. Marx had an absolutely firm conviction that this was logical; he was assuming that there was no where nearly enough to go around.

"I'm going to jump back now to the earliest days of humans on our planet and I'm going to note that amongst the mammals, or advanced mammals such as horses, we can see a stallion born amongst other stallions and he's a little bigger and tougher and he is a challenge to the speediest and most powerful. There's a fight between these two great stallions and the one who wins inseminates the others. And nature seems to have picked this way of having fights between the leading males to see which will inseminate the group. The other males can just go hump. And the big one doesn't ask for it--- he just suddenly finds himself in that position. He fights and if he is the superior one, he carries on.

"Imagine this happening with men, men in very great ignorance,"

- Cite transcript of RBF tape to Barry Farrell, Tape #3, Side A, pp.1-2; Bear Island, 12 Aug'70

"hungry, born with hunger, born with the need to regenerate, not knowing whether he will survive at all, very ignorant of what will really support him. And he began observing people who ate roots and berries and very often got killed by them--- poisoned. And he saw that the animals who didn't eat all those things didn't get poisoned. So he killed them and their flesh was very safe and gave him a whole lot of food in a great hurry. The most powerful men tended to group together and control that meat. And we find that tendency very powerfully organised in what we call the nobles--- when all the hunting and the animals belonged to the nobles. As late as 1815 in England a commoner caught killing a rabbit could be hung on the spot without a trial. Those animals belonged to the nobles and the king. So we have these most powerful men eating meat and the other people having to make do with what was left over: and eating what they could find, in a great ignorance about what they should eat and what is good nourishment, and having no real knowledge of this. We have a few, then, who are powerful and eat well and can rule by the sword. Their proportion of the total number of people was so small that everybody assumed there was some mystical reason that god had chosen these people specially. And we have"

- Cite RBF tape transcript with Barry Farrell, Tape #3, Side A. p.2; Bear Island, 12 Aug'70

"the kings then having their sons and daughters having to marry a king's son or daughter, even though they were enemies, just so long as it was a special strain. It was recognised or thought of as hereditary; there was something hereditarily powerful and it was ordained by god and had to be protected by god and everybody respected it.

The common people and everybody agreed about this. And the nobility, who were often bastards (so there was a sort of smile spread on this blood), were absolutely astonished at this good fortune and had to protect their position with the sword.

"So there was an assumption of a hereditary thing and it's still absolutely operative. The fact is that there is still a hereditary group; still a hereditary Queen of England; still there. Karl Marx quite clearly recognized this as a cause of what he called class warfare. There was this class of parasites who were genetically wrong; and if there was no where near enough to go around, the workers were the fittest and they would have to be sure to kill off this special breed of trouble-makers. Therefore the Russian Revolution was exactly what you had: the attempt to kill off this special breed."

- Cite transcript of RUF tape to Barry Farrel, Tape #3, side A, pp.2-3; Bear Island, 12 Aug'70

RBF DEFINITIONS

"Now it's very evident to everybody that not only were the poor people illiterate and ill-clothed, and so forth, but they were also quite dumb. They seemed to be dumb. That was one thing that hurt me very much when I was a kid: I was brought up with this class thing, this hereditary supremacy. And I didn't think it was so but I couldn't get over this thing that confronted me: that poor people seemed to be dumb. I worked with them and loved them; but they were dumb. I was trying to help them because they seemed to be so dumb. I think Karl Marx accepted this very much; so he gave you class warfare. These people, while they were the fittest in their dumbness, it didn't bother them to give in to the nobles. They simply had an innate capability with the seed, as they had an innate capability to make babies. So he didn't discount their capability because they were dumb. So here

was class warfare: where they were dumb and you had to work out something to save them. You had to have a very powerful party and powerful rules so the dogma of communism was made very powerful. People absolutely had to follow the rules. Never mind about thinking, because they don't think. Every once in a while there was a genius born among these poor people and he does some good thinking; and he codifies what you ought to do to look out for the people. That really was the" - Cite Transcript of RBF tape to Barry Farrel, Tape #3, Side A, p.4; Bear Island, 12 Aug*70

"way it was happening. It was very fundamental after the revolution that the leaders of the communist party must be followed automatically because you're going to pull the top down; and your people are dumb and there have to be standards and you stick to those standards. Therefore you wear very baggy and stupid clothes; and that's really an accoutrement to these people because they also are unaesthetic, and coarse. And if you wear coarse clothes and are unaesthetic, you don't put on any nonsense. A great many young people were feeling tremendously simpatico with this ideal--- as I did at Harvard. They'd like to join up with the underdog and therefore they'd wear his clothes. They wanted to be coarse and give up their good standard of living, or whatever it might be.

"Well, it is just in the past 10 years that we've had the first scientific proof that malnutrition during the child's time in the womb-- his gestation period, and during the first four years of life--- causes permanent brain damage. And so this dumbness is purely the damaged brain of malnutrition. Now this is a very important matter; what I'm saying. It has an enormous amount to do with the proliferation of new methods--- new methods of not just gaining energy impoundment by agriculture and by nature's own

- Cite RBF tape to Barry Farrel, Side A, Tape J, p.5; 12 Aug*70 processes, like the fish, and so forth, but being able to increase enormously the energy reserves, and learning our chemistry, and how you really have proper nutrition— and also with adding energy by harnessing our water power. And the result of it all is that there are very large numbers of people who are properly nourished today and the brightness is very general. So you see a whole lot of kids who are very intelligent and who are very simpatico; and not feeling smart or better— they hate the idea of class. They think it's all wrong; and they're really going into low standards because they think it's unfair to do anything else. So you still have the idea of lowering standards.

"I'm saying that the real changes come about by increasing the standards. What I'm really confident of here is that now I know that it really is feasible to take care of everybody and that makes the whole socialist dogrra invalid. Obviously, there is no such thing as class. This is clear as hell. And I find that a very exciting, fundamental difference to realize this. But how many know that? I think very few know that. How quickly can we disseminate that idea? How quickly can we get people to realize that it is a matter of pullinh the bottom up. very truly, and not"

• Cite transcript of RBF tape to Barry Farrel, Tape f3, Side A, p.5; Bear Island, 12 Aug'70

"pulling the too down. This really changes the whole strategy of socialism--- the whole attitude that begins with karx's acceptance of Darwin's notion of the survival of the fittest. This is the truth; this is the great potential. I see no reason for pulling the top down.

"There are those who are obsolete or who have been the victims of the specialization of yesterday, victims of all the things that nature had to do. Evolution had to do things her own way, I guess, because man didn't know enough in the beginning. Now he's gotten to the point where he does know better. The amount of information you all have is just magnificent, a fantastic thing. It could n|have been available to you yesterday, but you do have it now,

"Therefore I can still understand yesterday's rampant feeling that the people who are not in gear ought to be done away with--- the idea of pulling the too down in order to have enough to go around. And someone always needs punishing... and others feel they are the de-servers. But I don't think any of us know nearly enough to do that. I don't believe anybody should be punished."

- Cite RBr tape transcript with Barry Farrel, Tape *3, Side A, p.6; Bear Idland, 12 Aug'70

"I don't think our ideas are even mildly valid about what is wrong, what is a crime. I don't think there are any bad people. I see a great many people who have been fantastic victims of circumstances, twisted into knots, and that's totally society's responsibility, not theirs. I don't agree with the young's intolerance for older people. The contributions made by people in the past are marvelous, even when they don't remember what they've done. The most important things people do they don't remember. Almost everybody who seems to be on the shelf and obsolete has probably done something extraordinary and wonderful for his fellow men and given a very great deal."

KBF DEFINITIONS

"I am committed to the "theory.* of competent participation in evolution's inexorable transformations and the employment of the multiple degrees of freedoms and options governing the inexorable transformations. My discipline is to reform the environment in ways favorable to the success of all of humanity with confidence that propitious environmental circumstances induce spontaneously pro-social behaviors. The most propitious environmental circumstances would be those which make it universally obvious that there is enough at hand of everything essential to support all humanity for all the foreseeable future. When it becomes commonly known that there is enough to go around, there will be no war. There is so much air for man to breathe that it has always been socialized.

"My whole life is committed to comprehensive anticipatory design science exploration which seeks to learn appropriate ways to employ the principles of nature to do so much more for ever more people with ever less investment in ounces of materials, kilowatts of energy and seconds of time per each unit of realized, desirable, functional performance, that the old ways become obsolete."

KBF DEFinitions

"I am confident that no political actions, no matter how well thought out, can eliminate war when the resources of the Earth are so ill employed as to fail to take care of all of humanity, "So long as many are going to die due to poverty, disease, and general inadequacy, while others prosper, there will always be cause for the have-nots to displace the haves. Under conditions of general inadequacy and dying prematurely either by poverty-induced ill health or by weapons, the have-nots have everything to win and nothing to lose in undertaking war.

"I now know by experimental evidence that it is technically and economically feasible to take care of all of humanity without anyone prospering at the expense of others, while only employing the world resources already mined and employing only the knowledge already acquired by humanity, all of which universal prosperity can be accomplished by 1985. For example, humanity does not even think of its buildings in terms of weight, but I have found it possible to reduce the weight of buildings to only one percent of the weight now employed, and I have now over 100,000 domes in half the countries around the world to prove the point."

World-Around Problems that Have to be Solved by Bloodless Design Science Revolution, 29 June'72

Palm Schwctf*^worlil fot: (A)

"Life--- number one--- is awareness; and I»ve discovered through the angles that an angle ia independent of also. A triangle is a triangle independent of aise. An angle ia cyclic, a fraction of a cycle. A tetrahedron is a tetrahedron independent of site: thus we have conceptuality independent of else and time.

"This is what, then, gave me the clue that I could really look, for instance at a nuclear arrangement independent of aise and that there would be data from experimental evidence that would give me a completely different way of looking at everything with experience as the base. And experience is always sensorial and so I can always get a sensorial base or model.

"And then I've gone on to get the best kind of miniature Earth model to show the resources as a function of the regeneration of life--- trying to see it that way... That's how I play my design science game: how do you employ the principles objectively to interexchange advantage so that you really can maintain all life? And how do you run the cosmic accounting in terms of the energies that have caused nature to have us on board of this planet, and at what rate does she replenish, and how can we stay"

- RBF to W. Wolf and B. Brooks, DSI Project, p.11, 28 Apr'74

"within our energy income? It seems to me to be a very clear kind of model there.

"It would follow that the same sort of interrelationships, the orderliness that we find in nature would apply to social values and social interrelationships, political groups and subsets, and things of that nature. Through my formula of frequency to the second power times 10 plus 2 I have come to really identifying this exponential interrelationship which I haven't

found in any of the data by itself. I feel this is very important because complete abstraction is a formidable force.

"Also here in relation to human behaviors, I did get to the precession, ecology, circulatory or orbital, and this might be one of the social behaviors we have to take into account. We noted that the social sciences and economics had not found any generalized principles, but this may be the way of really beginning to find some,

"So what we're really doing with World Game is going back to where people can see things holistically, synergetically,"

Design Science & World Game

Design vs. Technology

"Because our highest priority of all political systems is the preparation for Armageddon, the opposed major nations of the Earth together have been spending an average of \$200 billion each year for the last 20 years (a total of four trillion dollars) getting ready for the great showdown.

Highest priority of use of the highest performance material resources and highest performance tools and highest technology are all committed to preparation for war.

"Not only does every action have a reaction, as engineering recognizes, but so too does all priority have equal and opposite / antipriority. The great historical antipriority has

to be the home front. Science has never been asked to look at the home front. No scientist has ever looked scientifically at the plumbing.

"It was for this reason that I committed myself in 1927 to just such scientific consideration of the home problems and their scientifically arrived solutions and scientific industry production, distribution, and maintenance of the scientific results. I know now exactly what is needed and how to provide environment controls under all relevant conditions on our planet."

"I can state and prove that it is technically feasible to take care of all of humanity at higher standards of living than any have ever experienced and do so by 1985 while employing only proven methods and resources. Not only does this statement include all environment-controlling services for humanity but also the energies required to produce and maintain those life support, protection, travel, and communication accommodating services. Our World Game energy income studies make it perfectly clear that it is feasible to take care of all humanity with that higher standard of living than anybody has ever known, and do so by 1985 while concurrently phasing out all human use of

fossil fuels and atomic energy.' "Therefore I know the fundamental vital life support Inadequacy which is assumed by all the great political organizations on Earth is invalid and that there is indeed enough life support, protection, and freedom of communications accomodating to go around for all. That humanity has been committed for ages to a false premise is only because humanity had not as yet acquired enough experience to occasion its correction of its premises. "Now that I really know all this, I realize that it does not"

"have to be you-or-me and that Nature is quite clearly trying to make all humanity a success instead of a failure and that Nature is trying to integrate all humanity and integrate all its interests and thereby to provide universal recognition of the success for all that can only be realized by using all resources only for everyone.

"The whole of present socioeconomic direction which seeks to define even more sharply the separate interests of 150 sovereign nations in the United Nations, is a trend exactly opposing what evolution is trying to do. All the world's great corporations have found sovereign nations*' geographical confinement to be absolutely untenable; wherefore they have all become supranational operations. So, too, have all the great political ideologies become supranational. Only the people are left locked into 150 national pens. They are locked in by their passports. They are subject to conscription, taxation, and exploitation in an age of omnimobilization. Humans are experiencing exactly the opposite of political freedom.

"integrate humanity; (2) she has humanity here in Universe and aboard our Spaceship Earth for a very important purpose; (3) that humans are not here just to be pleased or displeased with the experience; we know of a billion galaxies of a hundred billion stars each; Universe is not just a decorative array of stars to please the eyes of little people aboard our planet; we are here for the Universe, not the other way; and (4) I am sure we are here to use our minds.

"Humans have an extraordinary capability which is able to discover so far that there are a billion galaxies of a hundred billion stars each, and to take inventory of the relative abundances of all the chemical elements within a radius of 11-billion-light- years distance of Earth. Only the minds of humans have such capabilities. Human muscle is cosmically negligible, yet human muscle is still as yet in the saddle of world affairs. Therefore, I say, humanity is now entered into its final cosmic examination.

"The great intellectual integrity and wisdom manifest in the omniteracomodative inventory of generalized scientific principles discovered thus far by human mind to be eternally operative and responsible for the integrity of eternally regenerative"

- Cite RBF in committee transcript, US Senate, 15 May*75 physical Universe, deliberately designed us to be born naked, helpless, and ignorant, yet hungry, thirsty, curious, and procreatively excitable; ergo, we were forced to find our way only by trial and error in order ultimately to discover the scientific principles; and thereafter to use those principles, such as 'leverage' or 'metallic alloys' in the development of artifacts which would so alter the environment of accomplished know-what and know-how as to permit us to graduate into functioning in the main affairs of regenerative Universe operating directly on cosmic principles.

"So I say we are here for problem-solving, for using our minds. But humans are not in the command saddle of human affairs. Kindless, exclusively brain-centered muscle is still in the saddle. Kind is trying to master muscle. That is why you are having such a hearing as this one. I think we have no more than the next 10 years within which to pass our final exam by mounting mind into the command saddle of human affairs. Only mind can accomplish integration of all human affairs--- which integration involves the dissolving of 150 sovereign nations and all their respective me-first-or-else attitudes,"

- Cite RBF in committee transcript, US Senate, 15 May*75

"No sovereignty relinquishment could be more difficult than that of the United States in which the President and all others are elected on the basis of supporting, above all, our national sovereignty. The President's oath of office commits him to looking out for his side above all others. In dictatorships, a dictator can agree with another dictator; that's up to them; or the controlling political party can commit its country to surrendering its sovereignty to others. But it is impossible for a whole democracy to agree unanimously on relinquishing any of its freedoms or its armaments. If any U.S. President said publicly that he advocated termination and renouncement of our sovereignty, he would soon be Impeached or precipitate a civil war waged with the opposing political party of the nation.

□ So the most difficult conditions for effecting desovereignization and world integration exist in the U.S.A. That is why this could not be a more important occasion for a senatorial foreign policy committee hearing. I think universal desovereignization is at the crux of whether humanity is going to continue on our planet. With desovereignization comes omnidisarmament, which must be accomplished if mind is to take the"

"saddle from muscle and we are to operate on the basis that there is ample life support to sustain suooort of all humanity for all forseeable time. If we are to successfully pass our cosmic exam, all humanity must discover why we are here in Universe.

"All humanity is now coming out of the common womb of permitted ignorance, which gestation period was given an enormous cushion of resources to be squandered only while learning through trial and error. But now humanity has acquired all the knowledge of scientific principles and technical know-how to render all humanity continually successful. Humanity is now being born into a new relationship with Universe--- a relationship in which 99 percent of the information resources necessary to sustain all humanity are only available within the invisible-to-human frequency ranges of the electromagnetic spectrum; ergo, are available only through mind's organized exploration, discovery, and use of the abstract generalized principles governing eternally regenerative Universe.

"This comprehensive unitary birth of all humanity as a single organism into the new world of inherent physical success for"

- Cite RBF in committee transcript, US Senate, 15 May*75

"all individuals may well be a stillbirth. Birth is life's most critical moment. It will be a stillbirth if humanity does not emerge with mind in permanent control of physical power.

"Considering how hard it is for people to get together and agree on anything, and considering the fact that they have agreed in the dictionary to 200,000 descriptions of nuances of experience. . . is a kind of testimony that represents a very great victory for humanity."

- Cite RBF to luncheon of White House Fellows, Watergate Hotel, Washington, DC, 19 Jul'76

Dictionary: (1

"All the words of all the vocabularies could be eaid to represent all the forsaalised attempts of men to communicate all their experiences. So we could set out to examine all the dictionaries of the world. We can pick up any one dictionary and discover that it is a nice finite package. We can open one page, but we cannot look at all the words at once. If we cannot look at all the words even on one page, we certainly cannot look at all the words of a whole dictionary at once. It does not make the dictionary infinite because we cannot look at all the wordd at once or think about all the words at once. The inability to think about everything at once does not mean that experience or consideration of experience is Infinite.

"It is perp<Lexlng that one of the most persistent contemplations of human beings has been predicated on a static concept of Universe, the kind of Universe that went out with classic Newtonian mechanics. We cannot think of Universe as a fixed, static picture, which we try to do when people ask where the outwardness of Universe ends. Humans try to get a finite unit package. We have a monological propensity for the thing, the key, the bwuilding block of Universe. What we discover"

DlpgngAonaX Growth=

"Dimensional growth Is not occasioned by an Increase In exponential powers. It Is brought about by Increasing subdivision of the constant whole of Universe to isolate a locally considerable increment. For instance, E - Mc^2 says that the amount of energy involved in the isolated 'mass' as a local event complex of Universe under consideration in this particular instance is to be determined by reference to the constant amount of cosmic energy involved in the constant rate of growth of a spherical, electromagnetic, wave surface, which constant is c^7 . Because the potential energy is in vector equilibrium packages, the centers of energy rebirth are accomodated by the isotropic vector matrix. The constant power is the frequency, $10F^2 + 2$, which accomodates all the exportive- importive, entropic-syntropic, regeneration patterning of Universe.

"The only dimension is time, the time dimension being the radial dimension outward from or inward toward any regenerative center, which may always be anywhere, yet characterised by always being at the center of system regeneration.

"The time dimension is frequency.^{1*}

Seo Truth as Progreessivo Diminution of Besidual Error

Dimpling:

"Any and all of the icosahedron's vertex*s pulsate individually and independently from the convex to eoneave state only in the form of local dimpling, because each only-from-outward-motlon restrained vertex--- being free to articulate inwardly toward its system center, and having done so--- becomes abruptly five-vector restrained by its Immediate neighboring vertexial event convergences; and the abrupt halting of its inward travel occurs before it reaches the system center. This means that one vertex cannot puls* inwardly more deeply than a local dimple similar to the popping in of a derby hat*^w

7

- Cite SYNERGETICS text at Sec. 9ft5TWh_r 16 Dec*73

Dimpling Effect:

(*)

"When a concentrated load is applied (toward the center) of any vertex of any triangulated system, it tends to cause a dimpling effect. As the frequency or complexity of successive structures increase, the dimpling becomes progressively more localised and proportionately less force is required to bring it about.

"To illustrate dimpling in various structures, we can visualise the tetrahedron, octahedron, and Icosahedron made out of steel rods with rubber joints. Being thin and flexible, they will bend and yield under pressure.

"Tetra: Beginning with the tetrahedron as the minimum system, it~clearly will require proportionately greater forces to create a 'dent.' In order to dimple, the tetrahedron will have to turn itself completely inside out with no localized effect in evidence. Thus the dimpling forces a complete change in the entire structure. The tetrahedron has the greatest resistance of any structure to externally applied concentrated load. It is the only system that can turn itself inside out. Other systems can have very large dimples, but they are still local. Even a hemispherical dimple is still a dimple and still local."

- Cite SYKhkGETICS text at Sec. 618.01 ; .02 10; Aug'7

Dimpling Effect:

(B)

"Octa: If we apply pressure to any one of the six vertexes of the octahedron, we will find that one half will fit into the other half of the octahedron, each being the shape of a square-based Egyptian pyramid. It will nest inside like a football being deflated, with one half nested in the other. Although the octahedron dimples locally, it reduces its volume considerably in doing so, implying that it still has a good resistance to concentrated load.

"Icosa: "When we press on the vertex of an icosahedron, five legs out of the 30 yield in dimpling locally. There remains a major part of the space in the icosahedron that is not pushed in. If we go into higher and higher triangulation---into geodesics----the dimpling becomes more local; there will be a pentagon or hexagon of five or six vectors that will refuse to yield in tension and will pop inwardly in compression, and not necessarily at the point where the pressure is applied."

- Cite SYNERGETICS text at Sec.s 618.20-.3Q; Aug'71

"When a concentrated load is applied to any vertex (towards the center) of any triangulated system it tends to cause a dimpling effect. Beginning with the tetrahedron as the minimum system, as the complexity (frequency) of successive structures increases, the dimpling becomes progressively more localized. As the dimpling becomes more localized proportionately less force is required to bring it about, i.e., in successively higher frequency systems it takes progressively less and less effort to create a 'dent.' The tetrahedron would have to turn itself completely inside out, and as this constitutes a complete change in the entire structure (with no localized effect in evidence) the tetrahedron clearly has the greatest resistance of any structure to externally applied concentrated load. The octahedron dimples in on itself, and the icosahedron, although dimpling locally, does reduce its volume considerably when doing so, implying that it still has a good resistance to concentrated load. The geodesic spheres exhibit 'very local' dimpling as the frequency increases, suggesting much less resistance to concentrated loads but a very high resistance to distributed loads."

- Cite SYNERGETICS Illustration f97 "Dimpling Effect: Distribution of Load Increases with Frequency." 1967

"Now I am going to press for the first time on the tetrahedron's vertex. It turns inside out. The dimple turns it inside out. Now it is the only one that turns inside out. The tetrahedron has two things: it can be asymmetrically altered and it is the only system that can turn itself inside out. The others have to be still positive with a local dimple. It can be a hemispherical dimple, but it is still a dimple.

"The ability to turn inside out in physics is really what is misidentified with something called annihilation. . . . Suddenly in the Universe it has appeared as another thing, then the physicist has annihilation, he doesn't really look for it--- he wants to see the direct connection. This

makes it really become temporarily invisible. Now we have something that suddenly becomes visible and so he says, well I just found something that I didn't know existed before. He doesn't find necessarily the connection--- it's just suddenly there is something over here. The point is, it didn't leave the Universe. It wasn't annihilated, It simply was literally inside out. Now what we kail"

Dimpling: Dimpling Effect: Octahedron:

*I am going to make a tetrahedron, octahedron and an icosahedron. You can visualize those you know. I am going to make them out of steel rods with rubber Joints. Steel rods have some flexibility in them. They are thin and if you press them hard they will bend, yield.

"I am going to press on the vertex, any one vertex of an octahedron--- it has six vertexes. And its legs being of steel are springy and will yield and the rubber joints will permit it, so it dimples. So if I dimple the octahedron, one-half the octahedron. If you look at the octahedron with a point we might call elevated, and a point lower, then we have four points around its equator. So I press in on this top one, the North Pole, and it now turns in, dimples in, and one-half of the octahedron fits into the other half of the octahedron, each being the shape of an Egyptian pyramid, a square-based pyramid. But it nests inside itself like a football being deflated, with one-half nested in the other half."

- Cite RBF tape transcript to B'OR, Carbondale Dome 1 May 1971 Pp. 6-7.

tV

Dimpling: Dimpling Effect: ® Icosahedron:

"An icosahedron, it now has. a North and South Pole ... and we have the two equinpcial limits of what we call the Tropic of Cancer and the Tropic of Capricorn. So I press on one of its vertexes, five legs out of thirty locally dimple. So it literally is dimpled then and there is a lot of space inside the icosahedron not filled in.

As I get higher and highentrianguiation. . . as I get into the geodesics, the higher the frequency of the geodesic- modular subdivision of the icosahedron--- and the more local the dimpling. The legs are spread out. There is a hexagon or a pentagon that refuses to yield in tension, so that the legs have to yield in compression, bending, and she pops inwardly. So the higher the frequency, the more local the dimple."

discovery:

"I have always been confident as I explored synergetics looking for nature's own coordinate system, that inasmuch as I was not inventing a coordinate system, but was trying to find one that nature had, nature \square had this all the time, and it seemed to me very logical that men long before us might really have discovered some of nature's coordinating, might have run into the same kind of phenomena. There it was, and it was not going to change through the ages at all because we are dealing with fundamental principles of Universe that are utterly timeless and independent of site, shape and time. I have often felt a strange curious feeling as I made a discovery that some one has known this before. Going around the world I watched for some kind of manifestation in the design of some object that would tell me that people in that part of the world had at some time known the things that I was discovering. You can see that I have a very definite kind of a pattern of world which I could recognize and I did begin to find some of the pattern in Burma and Thailand and I have been able to trace the relationship of these patterns into the world of navigation and building ships."

WHMBB Discovery of Generalised Principles:

"Discoveries are regenerative stimulation of the explorer. They occur whenever he discovers a generalized principle. When his mind discovers a generalized principle permeating whole fields of special-case experiences, the discovery of such a new relationship is not only excitingly new to him as an explorer, but to the best of his knowledge it is heretofore unknown by any others. The stimulation is not that of the discoverer of a diamond--- a physical entity which may be monopolized or exploited to the individual's advantage--- rather it is an elation over the realization that the newly discovered principle will increase the understandings of humanity and provide spontaneous logic for cooperation where confusion and controversy had hitherto prevailed."

Discovery of Generalized Principles:

"Men have been endowed with very extraordinary faculties. The universe is endowed with very extraordinary principles. These principles are discoverable. When man fulfills his extraordinary abilities and does discover or really uncover the mysteries of the ordered universe, some very strong interactions become available to society. Humanity is constantly being surprised by these interactions. But as for the 'discover,' it was always there, waiting to be uncovered."

- Cite MERGERS 4. ACQUISITIONS, Vol.1., No. 3. Pp. 43 Spring 1966.

0HMBW Discovery of Serialized Principles:

"I would say that there is going to be a general discovery of the general orderliness and the significance of the general orderliness which is a complex of abstract principles. It is a concept of intellectual conceptions. Everyone of them are intellectual conceptions. They are what the scientist calls elegant as he begins to discover it. As any one of these principles are discovered, the men discovering it are moved I am sure as no other human beings are moved. There is a very extraordinary sensation as you discover that Universe is operating on this principle and it has been there all the time. It is much more than discovering a brook when you are a child, and that is pretty exciting when you are a child to discover a brook, or to see the dew on the grass for the first time, but it is much more still when a scientist discovers an operating principle of Universe. They are complex and of very enormous intellectual conceptions. What we are discovering also is that these principles are anticipatory. There is nothing we can do which nature is not ready for us,"

Divide and Conquer:

The Principle of Univereal Integrity i® "an inverse corollary of the age-old Instinct to Divide and Conquer."

- Citation and context at Universal Integrity; Principle Of.

"By getting out from under the world of special!sation, which I feel was very clearly imposed on man due to the fact that every child manifests spontaneous interest in totality, and wants to be comprehensive. • despite our scientific information in biology that all the biological species that have become extinct have become extinct as a consequence of overspecialisation. Because specialization, biologically, means you can inbreed; but you inbreed at the cost of general adaptability. And with the general adaptability loss you can get along for a while, but it happens that the energy investment of nature on a wave quantum basis, that we have large waves with very large amounts of energy investments, but at low frequency, and very small amounts of energy, but at high frequency. So the big energy events, such as an earthquake, for instance, do not take place with a frequency of waves or ripples in the water... or mosquitoes. So in developing special capability you may get on very nicely for a period, but then suddenly along comes one of the big ones, with the result that, having lost the general adaptability: out goes the species!

"I'd say then that man. having quite clearly been designed to be a comprehensivist, to coordinate, and to understand,"

- Cite RBF at DSI Press Conference, ILYC, p.i., 28 Jun'72

"How did it happen that he became a specialist?"

"It becomes perfectly clear that in the early phases of man discovering himself, to be sure that he would regenerate himself, he's given the instinct to be hungry. If he says to breed, these are all built into him, so that there will be children., keep on regenerating himself, so that he has a functioning, and in doing that, he discovers quite early that the biggest guy can knock down the little guy. And that there's only enough for one to eat. And maybe the big man isn't too selfish, but he's got these kids over here and they're going to have to eat.. To look out for Ky People.

So the Big Ilan began to answer who was going to eat. And it's still that way. That's still the basis of our power structure. We think about the simple matter of a big man, like a big stallion in a herd of wild horses. There's a big young stallion born. He didn't have to be. but hes bigger than any of the others. And there's an older, gret big stallion, and he immediately challenges this young big stallion to battle, and the one that wins then disseminates the herd.

And that's the way that nature arranged to keep the most powerful of the breed going. "

- Cite RBF at DSI Press Conference, NYC, p.5, 28 Jun*72

Divide and Conquer Sequence; (3)

"I'm sure that with early physical man there was a young human born and the old king said... Young man, you're getting too big for yourself. And then they'd have it out. But the big young man learns instinctively; I can beat these other people, but don't let two of them come at me at once. Now this is what we call Divide and Conquer. Nothing could be more obvious.

And so the big powerful nan wanted some of these big men around to fight with him; so he said, I'll make you the Duke of this, and I'll make you the Duke of that. Now you Dukes stay good and far apart, and I'm going to watch to make sure that you really do stay good and far apart.

"And then there were the intellectuals, who really bothered them. They wouldn't fight him with their muscle and they were always sneaking around and stealing his things. So he'd catch hold of one and say. I'm going to cut off your head off!. And the man would say, Er. King, you'd make a great mistake to cut my head off. And the king would say, why? "I understand the language of your enemy over the hill and you don't. Well, you've got a pretty good idea, you know you report to me every day what my enemy is saying over the hill, and you can stay on. Furthermore, you're going to do something you never did before. You're going to eat; you don't have to steal

- Cite RBF at DSI Press Conference, NYC, 28 Jun'72 "any more. And then the king said to someone else, I'm going to cut your head off! Mr. King, big mistake. And the king said what. I know how to make— I know metallurgy and I know how to make better swords than anybody in the world. Can you prove it?... And you make me a beautiful sword, absolutely lovely. Then the king says, You just make swords, you understand? So this man: you just keep the accounts, you know how the mathematics goes. But you mind your business. You mind your business. And you mind your business. Is that good and clear? I'm the only one who minds everybody's business. This is simply how it went to divide and conquer the intellectuals. And it really became such a powerful matter, with the control of the big powerful men who would go and hunt with him, and then the intellectuals giving him all this information and producing beautiful tools.

"And then his kingdom got bigger and bigger. And he wanted to project that and let his son carry on. So he said, I see you're getting very old. Now I want you to teach something about that metallurgy; and I want you to teach something about that language.... And this is the foundation of Oxford University

- Cite RBF at DSI Press Conference, NYC, p.5> 28 Jun'72

"(I was made an honorary fellow of Oxford University about three years ago. And I had to give my first lecture there. And I said that, and I got a very large applause, 1*11 tell you. The students were in agreement.)

"Now I think this is all fairly evident.... We could have a man who was really a very bright professor, but he was really not sticking enough and the king was bothered about him.

So he said, Mister, you're getting off base a little over there. I'm going to really tie you up. I want to really tie you up: I'm going to give you tenure. Now, how do you like that! Don't do anything for anybody else. You're set for life! Nobody can ever take it away from you. But I want you to be an absolutely pure scientist. None of that nonsense about applied science. Pure scientist. You just lay eggs and I'll take them away from you... Today, this is just the way our University is...

"But now we have for the first time in history a condition where everybody is literate. Yesterday was just the king, who was mildly literate. And he had a literate Gu, and Vizier, and nobody else had to do anything but just be a librarian or use"

- Cite RBF at DSI Press Conference, p.6, 28 Jun'72

"their muscle machine. And now it's not that way any more. And this great transition that is going on here, with all of humanity literate and aware of total Earth and aware of one another. And all of these young people are just in, and they're not going to be put out..."

- Cite RBF at DSI Press Conference, p.6, 28 Jun'72

"Long ago we have the big man being born* He didn't ask to be bigger. And he becomes the king. And for obvious reasons, too, because he has the longest reach. As you know, many people are dying of starvation* The one who has the best reach can live* It is a very tough survival game.

"We have a number of other big young men saying, 'I think though I'm not quite as big as that young man, I think I'm brighter and I think I can lick him.'

"And they'd like to lick him because being king means you are going to eat. But they don't come at him two at a time, because then they wouldn't know which one is going to be king. They come at him one at a time. And he licks each one of them. Finally they are all fairly well convinced that he is the best fighter.

"So now he says, 'We all are pretty hungry after all this fighting. And one thing for certain I know is that I don't want two of you to come at me at once.'¹

"And they say, 'Well we aren't going to, because each one of us wants to be the king.'

"Everyone was very frank about it.

"So instinctively, this man who is the big one, finds himself being challenged by other big ones. He didn't invent

- Cite Univ, of Chicago Lecture, pp.1-2, 5 Fay'72

"that either. Instinctively the he said: Divide and Conquer. Very fundamental.

"now he says, 'We would like to go hunting and these animals are big and ferocious and I can't handle that animal all by myself. But what we can do is reverse divide-and- conquer and we'll gang up on the animal. See, the animal does not know how to divide us.'

"And that's what hunting was. So they all gang up on the animal and were able to kill him and then they had a great feast. They said, 'There is just enough for us big guys here. You other people eat roots.'

"This is history and you will find that the king and all the great nobles were always hunting and fighting. They claimed all the animals belonged to the king and the nobles. Other people were not allowed to touch them. Even up to 1810 in England, we find a man could still be hung without trial for killing a rabbit because it belonged to the king. This is true up until very recently. The animals belong to the strong.

"So we have this big man, and now they have had some good hunting, and he is a young king, and they say to him, 'Very frequently we have invaders trying to chisel in on our animals and our food here.'

- Cite Univ, of Chicago Lecture, pp.1-2, 5 May'72

"He says, 'I would like to have you around to help fight with me, and I would like to have you around to go hunting with me, and you are a pretty good guy so I am going to make you Duke of Hill 'A,* and you Duke of Hill 'B.' But I'm going to watch you two to make sure that you don't get together and gang up on me. And you have to pay me tribute because, naturally, there'll be a lot of stuff coming in here.'

"They found he had a pretty good system going but then he found that there were a lot of little people around who were not fighters at all, who began to steal his animals and make a lot -of trouble for him. They began telling Duke A about Duke B and plotting against the king.

"So the king brings in these characters and tells one of them, 'You're making a lot of trouble around here. You are much too bright. I am going to cut your head off.'

"The man says. 'You had better not cut my head off,' and the king said 'V«hy?'

""Because I happen to understand the language your enemy is talking over the hill, and you don't.'

"you have a pretty good idea there. You report to me everyday what my enemy is saying over the hill and your head is going to stay on and you are going to do something J ou never did before--- you are going to eat every day, How o you like that?'

- :(BF Univ, of Chicago, etc.

"That's great,* he tells the king.

"So you report to me pretty regularly.'

"Then the king says, I'm going to cut this other man's head off because he has been a troublemaker. But the man answered, 'You'd better not do that, Mister, because I know how to make swords better than anyone else. I understand metallurgy.*

"The king says, 'All right, prove it to me.'

"He does and it's a beautiful sword. So the king says, 'All right, you just make swords.'

"And then he says to another one, 'I'm going to cut your head off because I understand you have been stealing all my stuff. So this little guy says, 'I understand numbers and know how to do calculations and you don't and I could keep track of all the things you own and I could keep people from stealing your things.'

"Well,' says the king, 'That's a great idea. You just do that now. But you mind your business. But you mind your business, and you mind your business, and you mind your business. I'm the only one who minds everybody's business. Is that clear?'

"This, then, is how specialization began. The king"

- Cite Univ of Chicago Lecture, pp.4-5, 5 Kay'72

"now has all the strong, hunting, fighting men around him. and he has the information about his enemies over the hill, and he's got the best swords, and he has a good accounting system, and he has good logistics. So he overcomes the people on the other side of the hill and he has a big kingdom and he feels very great about his kingdom because he has everybody specialized. So he says, 'I have a beautiful son coming along here, I'm getting a little old and I see you all are getting a little old, and I want you to teach somebody about that language, and I want you to teach somebody about that metallurgy, and I want you to teach somebody about that mathematics of accounting.'

"I am now giving you the foundations of Oxford University.

"I am simply saying to you that specialization is the divide and conquer of the intellectuals by the muscle men. That's all. This is really very important for us to discover.

"So then the king said, 'I'm not really sure whether you are all really going to stick. I am going to give you something I've given nobody else in the kingdom. I am going to give you tenure. How do you like that? And I want you to be really great scientists. I don't want any of that cheap applied science. I want you to be pure scientists. You just'

- Cite Univ, of Chicago Lecture, pp.5-6, etc/

"lay eggs and then give them to me and never mind what I'm going to do with them.

"So this is where we are today. So the question is: Is there any other way to carry on. Because I think society really thinks that specialization has such fantastic virtues."

RBF DEFINITIONS

DNA-RNA:

"These cosmically originated, electromagnetic-photosynthetic programmings are exactly the same morphological control codings as those of the complexedly and uniquely intervariable sequences of the guanine-cytosine, thymine-adenine of the DNA-RNA tetrahelix assemblage programming codes and their subsequent operational proclivities, which structural and behavioral programmings... were recently discovered to be governing the unique design not only of all the biological species, but of all individuals within the species--- all the requisite chemical constituents for exactly complying with the coded design instructions are or were present on planet Earth at the time of the original electromagnetic wave reception at the terrestrial loci of species' inceptions, which are predetermined by the unique electromagnetic environment's complex tunability existing only at those loci."

- CIELoy context at Man: Interstellar Transmission of Man.

KBF DEFINITIONS

DNA:

"One of the main characteristics of DNA is that we have in its helix a structural patterning instruction, all four-dimensional patterning being controlled only by frequency and angle modulatability."

- Cite RBF rewrite of STNEKGKTICS galley at Sec. 932.02, Dec'73

DN'A-RNA:

"DNA-RNA genetics programming is precessionally helical with only a net axial linear resultant. The atoms and molecules are always polarized and their total interprecessional effects often produce overall linear resultants such as the stem of a plant. All the genetic drives of all the creatures on our Earth all interact through chemistry which, as with DNA-RNA, is linearly programable as a code, all of which is characterized by sequence and intervals which altogether are realized at various levels of intercomplexity. On the scale of complexity of ecology, for instance, we observe spherically orbiting relay systems of local discontinuities as one takes the pattern of regenerativity from the other to produce an omni-embracing, symmetrically interfunctioning, synergetic order. The basic nuclear symmetries and intertransformabilities of synergetics omni-accommodates the omni-directional, omni-frequencied, precessional integrity."

DNA-RNA;

"If a DNA-RNA genetic code programs the design of roses, elephants and bees, we will have to ask what intellect design the DNA-RNA code, as well as the atoms and molecules which implement the coded programs."

- Citation and context iat Design (1), 9 Apr*71
DNA:

"In recent years chemistry and physics together have been able to run down the variables in the design of nature down into as far as biology goes, life down into a very important area, DNA, what we call deoxyribonucleic acids inside the protein shell. Whatever goes on within there apparently controls all the design of nature and all the life formulations. It is the area where the chemistry could be called crystallography, it could be called metals or it could be called animate. It is the complete threshold of the two. Because it is the threshold, people who like to be prosaic and like to make man feel so small can say everything is just going to turn out to be inanimate chemistry and you are all the consequence of probabilities and you might as well jump in the river.

This area then of the threshold is where the DNA is found and the controls of the patterning of life are down to four compounds of chemistry which, somehow or other, develop a code and out of this code these four letters and all the designs occur."

- Cite Oregon Lecture #4, p. 135.6 Jul*62
DNA-KJU: Twenty-five Models of DNA-RNA Compounds:

"Furthermore the 2 O-o ph ere (atom). closest-pa eked, non- nucle-
 ared tetrahedron consists of five basic (because minimum limit), four-
 ball tetrahedra which, unlike their planar-faceted polyhearonal coun-
 terpart tetrahedra, can be closest-packmgly assembled without octa-
 hedronal complementation and because the octahedra are internal to
 the four- ball basic tetrahedra. it is further relevant to these consid-
 erations that the JNA-nNA code consists always and only of the four
 chemical compounds: guanidine, cytosine, adenine, and tniamine;
 and that the helix which they generate consists entirely of tetrahedra
 whose four constituents in all vast variety of combinations will always
 □ be the same tetrahelices."

Dodecahedron:

"The dodecahedron is not a structure; It la only a docain: Platonic."

- Cite MF at Penn Bell Studios videotaping narathon Question period, Philadelphia, PA., 1 F_eb'75

"In short, structurally stabilised (and otherwise unstable) cubes are always and only the most simply compact aggregation of one symmetrical and M four asymmetrical tetrahedra. Likew&'e considered, a dodecahedron may not be a cognizable entity-integrity, or may be rememberable or recognizable as a regenerative MNMB entity, unless it is omni stabilized by omnitriangulation of its systematic subdivision of all Universe into either and both insideness and outside-ness, with a small remainder of Universe to be discretely invested into the system-entity's structural integrity. No energy action in Universe would bring about a blackboard-suggested pentagonal necklace, let alone 12 pentagons collected edge to edge to superficially outline a dodecahedron. The dodecahedron is a demonstrable entity only hwen its 12 MB pentagonal faces are subdivided into five triangles, each of which is formed by introducing into each pentagon five struts radiating unitedly from the pentagons' centers into their five corner vertexes, of which vertexes the dodecahedron has 20 in all, to whose numbeer when structurally stabilized must be added the 12

new pentagonal corner vertexes. This gives the minimally, nonredundantly structural dodecahedron 32 vertexes, 60 faces, and 90 strut lines. In the same way a structural cube has 12 triangular vertexes, 8 faces, and 18 linear struts."

Doing What Needs to Be Done; (1)

Q. How is it that so little can be done to reverse many of the major problems of the day? Housing or the cities, for example.

A. "Well, everything that goes on is done either by government or money making businesses. Both the money-makers and the politicians have to shew something for a profit, either the political profit or the money profit in a short run of a couple of years or they lose their jobs. So all the things that need to be done don't get done. Politicians are merchants of woe, they get elected to do something about all the things that are bothering people and so the more woe they have the more issues. So they take up housing as an issue rather than as a probleip."

Q. The situation is not being met with problem-solving techniques?

A. "The building arts are 5,000 years behind the engineering and technology of the aerospace sciences. If you go to the island of Crete you will find water still running through the plumbing and we have the same system 3,400 years later. Mo improvements have been made with the exception of a few"

- Cite RbF to Kathryn Elliott, Wash. Star; 9 Nov'75

"terminals. No scientist has ever been engaged to look at plumbing, to see how you take the human wastes which are full of energy and turn it to the energy account. Absolutely nothing's been done about it."

Q. But couldn't the government do something on this, in the face of the energy situation and all?

A. "No congressman knows anything about it. I think someone new is just going to have to go out and invent the apparatus and go ahead and do it. None of the people in the horse and buggy industry could ever possibly have invented the automobile.

Q. But why is there not more action?

A. "It remains so because of society's world-around conviction that there's not nearly enough life support for everyone, therefore it has to be for you and me. Therefore we have politics and ideologies which say, 'You might not like my system but I have the fairest, most logical way of dealing with fundamental inadequacies.' Politically, we have the last resort thinking of the survival of the fittest. And the last"

- Cite RBF to Kathryn Elliott, . /ash. Star; 9 Nov'75

"recourse of that is that we have to have guns so that the fittest will survive. We have the major nations of the Earth spending on an average a total of \$200 billion a year on weapons and means of destruction. Under those conditions we also have the working assumption that because there's not enough for everyone therefore it's never said, 'What can we do to make life successful for people through technology just as we can make war more successful through technology.' There's a priority for access to the best resources, the best tools, the best people, the best brains. The antipriority has always been the home front, it had to make do with the materials that nobody else wanted for a battleship or an airplane or everything

- Cite RBF to Kathryn Elliott, Washintin Star-News; 9 Nov'75

When I decided, in 1927, to make my precessional peel-off. with only nature to support you*, and nobody to pay you or mark your paper, my theory was that if you were doing what nature want* i you to do, nature would support you. But you had to be very sensitive to follow nature, and not Just to this particular job for that particular return.*

Cite RBF at Bell etudlos videotaping, Phila. PA, 26 Jan*75

Doing 'hat Needs to be Done:

"I don't see myself as other than a fortunate, healthy human being. I saw a lot of things that had to be done.

I committed myself to doing what nature was trying to do, being less wasteful of resources--- using less to do more.

"You have to be on the oul vive to spot the things that need to be done. I have survived, although many times I was not doing very well financially, large amounts of money do flow back to me, but I put them back immediately into new projects.

"All children are full of ideas. It's a terribly exciting life for a child. I've retained that approach. Life is still exciting. When I gave up earning a living formally I found I could regain my childhood sensitivity. I started absolutely penniless and I have been able to get a whole lot done."

- Cite RBF to Australian journalist, Jane Ram; Hongkong, 17 Dec'74

"When I think of all the things I have experienced, the fact that all of my contemporaries— and at that time it was really absolutely universal to my contemporaries-- everybody had as the highest priority, absolutely number one: You have to earn a living! And they all seemed to think that this was absolutely logical and nobody even seemed to question the idea. And I said I think this is preposterous!

"I think we all ought to be looking around saying: What does my experience teach me to see that needs attention... that nobody's attending to... which my experience tells me that, if attended to, could be turned to everybody's advantage and which, if not attended to, would leave society at a very great disadvantage?

"Also, what more would you need to know from the kind of experience you have had to be able to be effective, to do something effective about that problem."

KBF DLFIBITIUhS

"Human beings' faulty number sense is being further confused ' by meaningless money magnitudes--- for instance, the combined war budgets of the United States, NATO, China, and Russia, which annually average about \$200 billion. People talk about these cost magnitudes without any sensorial identity of relative significances. Dollar bills are approximately seven inches long by three inches wide. If we stack them and glue their edges together as with a pad of paper, we get approximately \$200 in each one inch of stacking. If we keep adding to the pile it forms a column whose cross section is approximately three inches by seven inches. As we keep on adding to it, it gets too high to be stable, so we rotate it from the vertical to horizontal. It will begin to look like a beam: a seven-inch-by-three-inch beam. The lumber business has beam framings called four-by-eights.

Finished by planing, this prime lumber size dresses out at three inches by seven inches, but it is still called four-by-eight, So our structural four- by-eight of laminated dollar bills, when extended to ten feet in length has the shape of a beam, such as you nay see in"

19 Dec'73

"The domains of the rector edges are defined by interconnecting the two centers of area of the two surface areas divided by the line with the ends of the line. The edge dominates an area on either side of it up to the centers of area of the areas it divides. Therefore, they become diamonds, or, omnidirectionally octahedra. The domains of lines are two tetrahedra, not one octahedron.

"The domains of lines must be two triple-bonded (face-bonded) tetrahedra or one octahedron. There could be two tetrahedra base-to-base, but they would no longer be omni symmetrical. You can get two large spheres like Earth and Moon tangent to one another and they would seem superficially to yield to their mass attractiveness dimpling inward of themselves locally to have two cones base to base. But since spheres are really geodesics, and the simplest sphere is a tetrahedron, we would have two triangles base to base---ergo, two tetrahedra face-bonded and defined by their respective central angles around their two gravity centers."

Dgmc Over Manhattan?

"When the artist made an airbrush picture of the big dome over Manhattan I saw that the Queen Mary was clearly visible at her dock in the North River but the masts of the Queen i-ary were not visible at that distance. So I figured that if each compression rmemwber in the big dome spanning the island at 42nd street were just the site of the Queen Mary's mast, then all the struts would be approximately invisible from the ground and there would be enough steel in the Queen Mary to provide all the steel needed for the big dome."

- Cite RBF at Penn Bell Videotaping, Philadelphia, 2g -'an'75

Jome: Rationale for the Big none;

"in many of our cities and big centers--- the way cue consumption curves are going--- we are running out of energy. Therefore it is important for our government to Know if there are better ways of enclosing space in terms of materials, time ana energy, if there are better ways, society needs to Know it. . .

"The behavior of the geodesic dome was simply not predicted by engineering. The beam ana column formulas could not possibly anticipate it. . .

"...we are still making geodesic domes on compression formula* and thus they are ten times as strong as they need to be."

- Letter to the Editor, Bauhaus, U.S. News & World Report, 10 Feb '72.

2SWP» Nationals for the Dome:

(III)

"Getting to the Moon without losing a single human being--- there's never been anything like that. And all by really getting first things first with really the highest intelligence operating from the beginning. Never a compromise about money.

"Let's get to how people get killed in tornadoes. We are making houses square because the Earth seems to be flat. When we're making houses square and cubical, it's easy then to take a log that is straight and just lay it down that way... All these squares and cubicals are the criteria. When we have a tornado the atmosphere drops incredibly down. This means that the atmosphere trapped inside is much higher due to the vacuum on the outside; so much so that it explodes the buildings. What happens is that the walls are literally thrown into the sky; it really acts as though something has hit it like an OBB explosion.

"So I find that all you have to do is to have the right shape, which is spherical, such as my Wichita House which had a safety valve on the boiler so the pressure can blow off. I had an 18-foot-diameter ventilator in the top--- the whole thing lifted like a safety valve and came right back on."

- Cite tape transcript, p.29; RBF to W. Wolf, 28 Apr'74

P.Oflg? Nationals for the Dome: (IV)

"But as an omnitriangulated tensegrity geodesic dome, earthquakes don't bother it. Earthquakes shake buildings apart if they have no tensile strength. And they're now in cubical shapes that are not most comfortable. Once you use geodesic lines you have the shape that it most wants to be in: just like a bell buoy it floats and an earthquake can't bother it.

(These things Forrester didn't know.)

"I'll give you 300 buildings for one with omnitriangulated spheres as against all the other engineering strategies. Not only in terms of material but the other costs would come down the same. The time comes way down. I can deliver it by air instead of having people put things up in rain and snow and dust."

- Cite tape transcript, p.30; HBF to W. Wolf, 28 Apr'44

Dgffl.g: Rationale for the Big Dome; (A)

"I do not talk about innovations until I have reduced them to practice and am certain that the principles involved are eternal and reliable* If I have proved a structural principle to be safe and effectively realisable, I can consider larger and as yet unrealised ones because I and MSB also have experimentally proven my comprehension of the principles governing structural magnitudes. For instance, I know that the bigger geodesic domes become, the more efficient they are.

"There are several principles that integrate synergetically to produce the increasing efficiency with size-growth. When we double the size of a geometric object symmetrically, a cube for instance, we increase the edge measurement from one to two, this means that the surface area increases as two to the second power, which equals eight. This means that every time we double the size of a geodesic dome, the volume of atmosphere inside increases by eight, while the surface increases

by only four. This means that with each else doubling we have eight times the number of molecules inside but only four time the amount of enclosing surface or roof and side walls through which any given molecules of air, Inside or outside, can gain or lose heat."

- Cite RBF in Michael Ben-Eli Interview, AD, Dec'72

"This is why an iceberg melts so slowly. Its surface is so negligible in relation to its enormous volumetric mass and it can melt only as fast as it can get heat Inside the iceberg, through its surface from the outside Universe, to do the interior melting. But as the iceberg melts its volume gets smaller at a velocity of the second power. Therefore as it gets ever smaller by melting, it melts faster and faster, Tou can see the little ice cube accelerating its rate of site diminution and finally disappearing--- sip I

"While there are other chemical phenomena involved, this surface-volume ratio also explains why it is that the Sun, being of such extraordinary size that, despite its giving off radiation at a fantastic rate, its volumetric mass is so great and its surface, through which it loses its heat, is so negligible, that it, the Sun. has already lasted ten billions of years and will go on lasting for hundreds of millions of years more.

"This Is, then, one of the generalised principles of Universe entering Into 'my statement that the bigger the geodesic dome the more efficiently it conserves energy. This principle Ms?

OgBft: Batlwglg for tilff Pgag: (I)

"When we got to World War II everyone knew alloys were very important. All the aircraft plants had incredible vertical bins of different kinds of alloys of different metals, of different sizes, all extruded of different sections. Just forests of them and designers then designed in terms of what was in the book. Really more than 50 percent of the metals shipped to the aircraft companies went into scrap. They cut out the heart of the sheet; they said it was weak along the edges.

"This is the theory of Donald Douglas. I met him right after World War II and he was thinking about going into producing my Wichita house. Just as he had said of the DC-3: *I'm never again going to have a design engineer design anything if he hasn't also been a production engineer because the production engineer had to understand how to design airplanes. He would dare to change the design so it could be made with the most appropriate tools.

"Setting up the new critical paths for the space program... all the things that had to be done before a blast-off! We actually* got into designing alloys. We began to design a part with such a unique function in relation to others that it had to have"

- Cite tape transcript, pp.27a-28; Rbf to W. Wolf, 28 Apr'74

"its own alloy. We began designing the alloys with our final part and making just enough of that metal in the shape of the part as the end product. No machining was necessary.

(These are the kinds of things I know and I know Forrester doesn't know.)

"And so we have been make thousands and thousands of different kinds of alloys with absolutely unique functions: you couldn't get man into space if you didn't. The program at Cape Kennedy--- one of the worst problems they had there for months and months was very conscientious scientists and engineers saying, 'I'm not going to leave this; I'm going to do this myself.' They were so excited about it, the risk to the human beings out there. And they found those men could not do it as well as the instruments. So what they should do is to make the instruments themselves approximately infallible--- and have a number of standbys to check those instruments. They finally got to make the instruments so well that they were able to control the process all the way through."

RBF DEFINITIONS

"Thor* Is a phenomenon known as the Doppler effect, of which humans took much note in the early days of the locomotive. The high tone of the locomotive*e whistle as it approached changed to an increasingly low pitch as the locomotive went by. This is because the sound waves of the air coming toward us from the approaching locomotive at about 700 miles per hour are crowded together by the cocomotive's approaching speed of 60 miles per hour. Similarly, the waves are thinned by the locomotive's speeding away. □□ The Doppler effect may ba operating in our history so that the relative frequency

and wavelengths of approaching events are compacted, and receding ones thinned. It could be that by travelling mentally backward in history® as far as we have, any information about humans could--- like drawing a bowstring--- impel our thoughts effectively into the future."

Drawing:

"Drawing or scribing is an operational term. It is impossible to draw without an object upon which to draw. The drawing may be by depositing on, or by carving away, that is by creating a trajectory or tracery of the operational event. All the objects upon which drawing may be operationally accomplished are structural systems having insideness and outsideness. The drawn upon object may be symmetrical or asymmetrical. A piece of paper or blackboard are systems having insideness and outsideness."

Bear Island, 10 Aug'70

Dream:

"As they last awaken none can prove that they are the same beings that they seemed to think they were before they went to sleep. There may be thousands of ourselves, each awakening to different experiences. None can prove that life is not a dream. To support that provoking thought, it is also to be remembered that the physicists have discovered that every fundamental component of the Universe has its opposite. Negative weights and positive weights altogether cancel each other, and the average weight of all physical phenomena of the Universe is zero--- as is also the weight of thought 'zero',¹

"Furthermore, because Heisenberg's indeterminism makes it impossible for us to be exact, we can at best give only a sketchy tracery of the dream called reality."

HBF uEFILITIU.S

Dr earns i

"My definition of universe ... includes the fact that we dream, our dreams are certainly included. This doesn't have to be strictly reality. The furniture of the dreams are the realities of your experience. .

Bar DEFINITIONS

"Science, having been employed almost exclusively in weapons development. will find itself progressively unemployed. The weapons-producing companies and the weapons-support industries, having high capabilities but dwindling contracts, are going to struggle ruthlessly to find other profitable enterprises. They will move overnight into the living as opposed to the killing arts. We have already noted their probably move into education. Another probable move is onto the arts and services usually mistakenly spoken of housing.

"All you have to do is have a meeting with advanced industrial technology management to realise their inherent ineptitude in respect to the art and science governing the living service industry. Talk about a 'house*' and the industrialists immediately think about stamping out an aluminum or plastic replica of a Cotswold cottage, or they think about stamping out curtain walls or partitions: 'You have to stamp out something.* That is as far as their brains, conditioned by advertisements and traditions, permit them to go in the byways of categoryitis."

• The scientists* 'house*-catalyzed concepts are even less imaginative and useful. The carriage, railway, and steamship"

Dwelling Service Industry

(2)

"industries of 1904, and their financial backers, directors, and top industrial managements, did not invent the airplane; nor did the university professors or the scientific societies* There is nothing in the present pattern of building that gives a clue to the ramifications of the upcoming world-habitat service industry.

□ Just as prototype inventions were the keys to the establishment of the aeronautical industry, so will prototype inventions be the key to this vast new industry* Many of the prototype inventions are already on hand. Others are developing in the U.S. and Russian man-in-space programs. What is most needed now is a clear definition of the functions of the world service industry that must be established to accommodate the forthcoming world citizen, requiring, at some times, living facilities in culture centers around the world and, at others, rest in remote places all the way from the tropics to the poles, which permit man to be intimate with nature's every phase without being punished by the intimacy.

"If the professional architects of the world are too slow to support their architectural students' initiative in undertaking*

- Cite THE PROSPECT FOR HUMANITY, Sat. Review, 19 Sep'64

"scientific redesign, then both industry and science will begin to stumble into the living field and it will become a fiasco. That could easily happen within the next five years.

"The world architectural profession has Just about five years to start the architectural students and design-science students developing the capabilities to take, hold, and develop the world's design science initiative. Architects are going to have to give themselves powerful mathematical abilities. Fortunately, our research discovery of the omnirational arithmetic of the tetrahedrally coordinate mathematical system employed by nature in all her transformative

interaccommodations, has now become confirmed by many scientific events. It provides a mathematical means adequate to the historical design-science task of redesigning the world's tools and services.

"... We must now consider other powerfully favorable historical factors affecting establishment of the world-around living service. Between Russia and the United States, "\$6 billion has been appropriated to develop the little scientific house in which man will dwell in space or upon the Moon. But we note"

- Cite THE PROSPECTS FOR HUMANITY, Sat. Review, 19 Sep'64

"that, though architects profess to be raster solvers of space problems, thus far they have not been called into any part of the U.S. space program. The professionals who have been called in are space medicine specialists, physicists, mathematicians, geologists, psychologists, chemists, engineers, biologists;

but there are no architects.

"I am confident, from my experiments, that architects can be trained quickly enough and in such a way as to be much more effective in the space program than are those scientists and businessmen who are now handling the program. The architectural scientists will be especially effective in defining the ecological problem and its solution, thus forestalling the fiasco implicit in the scientists,* technologists*, and industrialists* esthetically-weighted, market-analysis misconceptions.

"I have familiarity with the space program in the United States and I have found that the big contracts given out so far have gone only to large corporations that have dressed themselves up with large staffs of scientists in order to substantiate their lobbying BBOKDIMB competitiveness with the universities.

- Cite THE PROSPECT FOR HUMANITY, Sat. Review, 19 Sep*64

"The space scientists, of the successful bidders for space contracts, are given the problem of how to develop the space dwelling. They are not design scientists--- they are subjective scientists. Design science must be objective.

"Scientists are inherently subjective operators. They are trained to make faithful observations and to theorise about the schemes of nature into which their data may fit, but not to consider the significance of their findings as objectively employable. They are too specialised to comprehend complex integration potentials and industrial realizations.. Alone among scientists, the medical man is objective. Chemical engineers but not chemists are objective. I have been amazed when I have been called in by the big corporations as a consultant to discover how little they understand of what seems to me to be proper statement of the scientific, structural, chemical, and mechanical, aspects of the scientific sky-dwellers problem and its implications for man on Earth. The problem is to reduce the dimensions of the ecological pattern from a vast tree-air-Earth-worm-bird-bee-rain-wind relay system to a three-foot diameter, closed-circuit system by which man is able*

- Cite THE PROSPECT FOR HUMANITY, Sat. Review, 19 Sep'64 • to sustain high health for 12 months without solar disposal or further input supply beside Sun radiation* . . .”

*. . • Industrial corporations are too nearsighted while scientists are usually infinitely too farsighted. Industrial corporations tend toward a plastic-flowered heaven with sexy- scented, plastic, call-girl angels. The scientists tend toward test-tube babies and the deflation of the reproductive urge on the psychiatrist's couch. On the other hand, architecture students are realistically idealistic and

have well-coordinated vision and a running start on what is needed. Industrial corporations are preoccupied with immediate profits and not with man's total success. They are interested in making money while architectural students are primarily interested in making man a total physical, cultural, and moral success.

"Architectural-science students will in due course realise that they are designing an entire family of complementary instruments of livingry--- similar in comprehensive functioning to the whole family of musical instruments. They will be willing to allow man the privilege of playing his own instruments and of composing not only one-instrument music but of composing

- Cite THE PROSPECTS FOR HUMANITY, Sat. Review, 19 Sep'64

"symphonies for the whole family of livingry instruments. The new architect will be wise enough to confine his design science to augmentation of the integral organic functioning of man so well that the external organics may be coordinated to operate as unselfconsciously as do healthy men's internal organisms. The design-science artists will leave man free to articulate the promptings of his soul in such a manner that each individual may enjoy his newly won and ever increasing degrees of exploratory and creative freedoms without trespassing on one another and thus frustrating one another."

- Cite THE PROSPECTS FOR HUMANITY, Sat. Review, 19 Sep'64

*It is a general dymaxion-concept-trend-history observation that in 1927, at dymaxion outset, the industrial logistics tool-up for realization of the inception of the mass production of industrially-reproducible, scientifically-prototyped, intermittently-autonomous, ever-higher-standards-of-performance- and-satisfaction-regenerating,

evolution-augmenting, individual's- integrity-safeguarding, understanding-promoting, intellectserving, sensorially-adjustable, harmonically-controlliable, and universally-economically-feasible, structure and mechanics of a dwelling service industry at the 1927 level of (a) integrated industrial technology and (b) state of advance of the general dymaxion art and experience in comprehensive designing, was indicated by painstaking estimate to be in the billion-dollar magnitude for the development of the then nonexistent, standard, new, tooling network coordination, et. al.

"By 1932 this figure had been reduced to 100-million dollars.

"By 1946 rforld-War-II- technological-standards-upping had been so great and general and the whole reproducible-scientific- dwelling-facility concept had also so advanced that both (a) and**

- Cite NOAH'S ARK, p.16, Summer'50

"(b) factors had integrated into the social complex to the extent that the firm industrial quotation for tooling up for inauguration of the new industrial preoccupation in advancement of the packaged advance of worldwide living standards inherent in the Dymaxion concept had reduce to TO million dollars; this was not because the overall cost was less but because so large a part of the originally estimated technological requirements and public education had been paid for in the interim at costs running a hundredfold what it would have cost to arrive at the same potential proximity to full realization had the project been originally undertaken at the date of conception.,.,

"And in 1946, after the standoff in inauguration of the new industry at Wichita (and the host of runaway tangential attempts to expolit the now clearly looming, but little understood and *«y underestimated, new major industrial preoccupation had spent the interim powerhead

momentum in ineffective but highly educational experiments, and had left an expectant and needful world dismayed and frustrating revertible to political contriving in negatives) it was deemed wise to assume that no further trial balances should or need be taken of the restating"

"The word 'dymaxion*' was invented at a time when Chicago was very much caught up in the dilemma of its commercial and artistic rivalry with New York. It was made up by the public relations and advertising people at Marshall Field & Co. Once in a while Marshall Field did some cultural projects: Putting an old Chinese Urn on display, or whatever it might be. Anyway they had arranged to display a model of my first house on a mast and they asked me what the name of it was. I said it doesn't have a name.

"Marshall Field had some very talented 'wordsmiths' as consultants--- they were the men who invented the word 'radio'. We had lunch and they asked me the philosophy of the house. After the lunch they compiled the main things they remembered. They took no notes while I was talking; it was mainly an exercise in what they could recall. They tried to remember the most prominent sentence; and then what were the most prominent words; and then what were the most prominent syllables. They kept at this for a week or so. What they were seeking was the most harmonic and graphic ways of bringing the pertinent syllables together. They explained that syllables were the pepper and salt of my speech."

aur **DuFB.ITIONS**

"They said I was a four-syllable nan. The name for the house had to have four syllables. They had a list of many words and syllables as sort of a portrait of Fuller. They confronted me with different ones: a pair at a time; I could reject the one I liked least from each of many pairs but the alternate had to survive. (This was at the time I was meeting --- Gurdieff?--- Korybski?--- in Chicago). </hen the exercise was completed 'dymaxion was the word that survived.

'Marshall Field copyrighted 'dymaxion' and presented the copyright to me as a present, but, of course, I had been giving a little talk beside that model I guess five or six times a day."

Dymaxion Airocean World:

"I made a chart using the vector equilibrium. I found

it possible to see our world, all the data of the Earth's surface at once, only a quarter of the Earth's surface being dry land. This is simply a point set transformation from the spherical to the planar. It does a very nice job You cannot detect any visual distortion in the relative shape or size of these components. We were able to do it in such a way that the sinuses all occur in the ocean, so you have one world island and one world ocean."

Dymaxion Airocean World; (I)

"... The industrial revolution's railroads and trucks were the beginning of the disappearance of the age-long dominance of the water borne traffic. Railroads and trucks represented shiploads 'sailing' over a new Landocean. With man's penetration to the North Pole, discovery of wireless communication and invention of trackless, omnidirectional, heavier-than-air air flights at the beginning of the twentieth century, the swift obsolescence of World One's Waterocean was certified. World War I and World War II and their 22-year interim represent the transitional period from a predominantly Waterocean World to an Airocean World. All the pain of this historic transition is inherent in the momentum of ignorance of man in general concerning the inexorableness of the fundamental reorientation of his life's experience. The operational principles of physical Universe persist throughout man's approximately ignorant endurance of the transition. But as man learns more of the persistent verities and integrities of Universe, they discover the fundamental necessity of reorientation of knowledge in respect to those verities. . . "

Dymaxion Airocean World Mao? (1)

*1 developed the map so that I could see the whole world at once without any visible distortion of the relative shape or size of any of the data; and also as a method of being able to see the whole world at once without any break in the continental contours.

*1 first tried to do this in the early 30s by employing the Mercator projection, by using the 90th meridian instead of the equator as the base line. This provided the One-world Island and the one-world ocean, as hoped for. This is the iMMMM basis for the projection I made in the end pages of NINE CHAINS TO THE MOON, published in 1938--- and as modeled for me by the puppeteer Bil Baird in 1936.

"When Life magazine decided to go with my map, their art editor insisted on orienting it around the north-south polar axis. My friend Ricky Harrison was given the task of producing the cartographic work and he did not understand that I had discovered a new mathematical method of projecting from a sphere to a planar surface. He used a conventional projection which produced a non-uniform boundary scale around the square and triangular components of which the Life Magazine edition of my map consists.

Dymaxion Airocean World Map: (2)

"In my projection method I hold uniform boundary scale, and all variation is internally symmetrical within the uniformly-edged- bound pieces,...Alteration consists of identical and symmetrical angular contraction in respect to each of the corners of the pieces as the spherical excess subsides. My topological transformation method can use any symmetrical geometry, whether it is tetrahedral, cubical, octahedral, icosahedral, et.al. What you speak about as the cubo-octahedron I speak of as the vector equilibrium, its radial and chordal vectors being of equal magnitude and abundance.... The

vector equilibrium has the virtue of having a boundary scale of 60 degrees for each of the pieces, and its spherical excess is slightly less than that of the icosahedron; ergo, the distortion is mildly less than that of the icosahedron ($72^{\circ}-60^{\circ}-12^{\circ}$ spherical excess).

"It took me two years after the Life Magazine presentation to find a way in which all the 12 sinuses involved in unpeeling a sphere and laying it flat would occur in one ocean. If you will look at what I call the Dymaxion Airocean World Edition you will find that I have one triangle spanning between the unitary Europe-Asia-Africa land mass, the triangle's three edges reaching between the Atlantic Ocean (off Norway), the Indian - Ocean and the Pacific Ocean. This required a greater than 60- - Cite RBF Ltr. to Martin Gardner, 26 Aug'75

Dymaxion Airocean World Map;

(3)

"degree-arc reach. The icosahedron¹ a edge is $63^{\circ} 26' 09.5''$ » which is just enough to provide water-to-water reach between the three great oceans. The icosahedron and its 12 vertices represents the denuded phase of the nucleated vector equilibrium with its 12 vertices....

"Having found the frame which permitted showing the one-world ocean and the one-world island without -any distortions or breaks in the continental contours, I settled upon this as being the most satisfactory means of humanity's seeing the whole Airocean World at once. The Waterocean World was an east-west world; the Airocean World is a north-south world; and it is going to change human relations altogether. On my one-world island in one-world ocean arrangement, 90 percent of humanity can reach each other on the shortest great-circle air routes without going near the Atlantic, Pacific, or Indian Oceans.... I have used this Airocean World Map

as a background for all world resource-and-population-distribution expositions for the simple reason that uniform scale percentum graphics always displays on a uniform scale background, which no other projection provides.

Dymaxion Airocean World Map: (4)

"Just as the Life Magazine publication of my map came off the press in 1943 and the first copies were distributed, Ricky Harrison told me he had a telephone call from Professor Irving Fischer at Yale who, excited by ray map, had asked Ricky to do the same kind of projecting for him on the icosahedron. Ricky did so and Professor Fischer published it in Look Magazine in competition with Life Magazine, Look being glad to parry the Life edition.

"Life told me at the time that they were able to sell more advertising space because of my map than they had ever sold before. It was the largest single edition of the magazine up to that time. I assure you that Professor Fischer was in no way responsible for any of the work I have done.

"In 1944, Science Magazine made the statement that my projection was the first and only projection to be granted a patent from the United States Patent Office. How this patent happened to be granted is an interesting story. When Life Magazine contemplated publishing my map (which they contemplated for over two years before the actual publication), they wanted to be sure that they were indeed publishing something that was new and valid. They consulted with Dr. Boggs, chief cartographer for"

"the U.S. Department of State and the chief cartographer for the American Geographical Society, and with two mathematicians who later became the authors of Mr. Hits. All three experts stated that ray presentation was 'pure invention',¹ using the term in a derogatory manner. They did so because it did not conform to any of the known methods of projection. My method of projection is based on a three-way grid of great circles which, as the patent shows, does occur with a 0-degree-edge-angle vector equilibrium. The mathematicians said a three-way grid of great circles was unknown, and in fact was impossible. I was able to make graphic demonstration of my three-way grid, finely etched on a 12-inch-diameter copper hemisphere using the great circle edge of a fine tolerance enclosing hemisphere as the great circle scribe guide. The three-way great circle grid sprang from a uniform boundary scale of one-degree increments. Because of my demonstration Life Magazine went ahead with the publishing. My patent attorney then informed me that the patent examiner had ruled circa 1900 that no new cartographic projections could be patented because all the mathematical variations had been ramified. My patent attorney confronted the patent examiner with the three authority's statements that what"

•I had done was 'pure invention. • As a consequence the patent examiner allowed his office to reconsider and I was allowed patent number 2,393,676.

"The airocean map has never been marketed by any of the map companies. They have too much of an investment in plates for other presentations. It has, however, been used in a large way. Almost every one of the major national corporations has asked permission to use it as, for instance, the cover of their annual reports to stockholders. It has been used very frequently in general advertising and the maps are obtainable by the public from my office in Philadelphia.

"Subscribing to the evolutionary checks and balances of nature's own gestation rates, I have never promoted the map nor solicited sales, but the world-around demand for them is rapidly increasing."

Dymaxion Airocean World Map; (a)

^wI am attaching a copy of the world map published by LIFE on my new universal-hinging projection. I have taken off the global map onto this new projection in several other ways, for instance, with the North Pole and again the magnetic North Pole, ana the pole of the ecliptic as centers of triangles instead of squares. And another takeoff, particularly useful for navigational purposes, is that in which the vertexes of squares and triangles coincide at the poles.

"The new projection method is also extremely useful in relating the astronomical map to the land map of the world. This is because the spherical angles are all proportionately or symmetrically reduced when translated to plane geometry and vice versa; furthermore, every point on my plane geometry projection is vertically above the universally deployed center of the earth. All interior points retain their symmetrical positioning whether graphed in spherical or plane geometry. Therefore points in the astronomical projections may be made to occur vertically above points on the earth when they are actually in zenith, with the triangulation of astronomical positions usefully related by direct graphical method to the terrestrial map."

- Cite RBF Ltr. to Gilbert Grosvenor, 'Washington, DC; 29 Apr'43

"The article in LIFE did not describe any of the mathematical properties of my projection method. I am sure that you would be interested to have it pointed out that the triangular sections of my projection method represent those unique spherical triangles whose several vertexes are each coincident with a vertex of another identical triangle of a system of eight triangles, altogether forming a spherical triangular lattice of great circle arcs of 60° completely enclosing the sphere. This spherical triangular lattice (with equilateral spherical quadrangle interstices) represents the surface coincidence with a sphere of a unique system of tetrahedral segments of a sphere, all of whose apexes coincide at the center of the sphere. It happens that these particular equiangular spherical triangles of the infinite number between 180° and 60° are the only spherical triangles whose chords together with their interior vertexal radii form a united system of lines describing uniform, unit size, equilateral 60° triangles whose interior apexes coincide with the center of the sphere.

"There is no set of spherical triangles which uniformly subdivides all the surface of a sphere {as with the eight 90° equiangular triangles or the faces of an icosahedron} whose central

- Cite RBF Ltr. to Gilbert Grosvener, Wash., DC; 29 Apr*43

"60° apexes also coincide at the center of the sphere. The apexes of all other spherical segment tetrahedra either fall beyond the center or fall short of the spherical center.

This particular spherical triangle and tetrahedral unit which I have used is the only exception.

"It happens, however, that this symmetrical subdivision of the surface of the sphere by my eight spherical tetrahedra leaves a void of six spherical squares whose chords and radii form spherical pyramids whose apexes also coincide with the center of the sphere. Thus this system provides uniform and symmetrical chords and radii, any right angle or diagonal subdivision of which on the spherical surface must be the intersection of a plane passing through the center of the sphere and is therefore a great circle. Thus it is possible by employing these unique spherical equiangular triangles and 'squares' (quadrangles) to provide a quadrangular grid of great circles in the square and unique symmetrical triangular grid of great circles in the triangle (great circle phenomena not found in any other symmetrical spherical triangle) both symmetrically and uniformly subdividing the enclosing boundaries that allows of universal plane geometry projection"

Dynaxion Airocean World Map; (d)

"in the terms of the same uniform and symmetrical subdivisions without defractions of angles of transferred data along the hinges of the necessarily sectional projections, required for universal direction of unwrapping of the spherical map.

"All the interior structural geometry of the model thus devised consists of universally symmetrical equilateral and equiangular inside truss structure, united individually at their external vertexes and all joined internally at a universal vertex center, represents the unique stabilized, nonredundant four-dimensional force diagram of any dynamically radiant or convergent spherical organization. It provides a mathematical module system 'tri-' and 'bi-'secting central angular unity an*i* graphic model of the decimal twelve, or duodecimal system, essential to mathematical facility in radionics. It relates simple geometry to dynamic graphical requirements of electronics.

"The respective interior triangular and quadrangular great circle grids which terminally intercept the enclosing sides of the eight spherical triangles and six spherical squares in mutually uniform linear intervals may be collapsed to plane"

- Cite RBF Ltr. to Gilbert Grosvener, Wash. DC; 29 Apr*43

"surface grids uniformly subdivided by interior triangles and squares. This collapsing may be accomplished by 'loosing*' the unit apex centers of the tetrahedrons and quadrahedrons while holding the vertex positions of the squares or triangles and allowing the radii to 'dangle*' parallel to one another with their loosed terminals in one place.

"Uniform subsidence of the spherical arc segments of the major spherical triangles and squares of the spherical projection lattice into plane geometry sections of squares and triangles is accomplished by concentric shrinking to the chordal plane in such a manner that the right-angle relationship of all interior points in respect to the enclosing sides remains intact. It is the retention of the interior perpendicularity of points to enclosing sides that makes the hinging of the triangles and squares possible in a manner that, at the same time, does not disproportionate or refract the contours of areas partially occurring on adjacent triangles or squares.

"It is also this method of uniformly progressive concentric correction by subsidence from spherical segment to plane geometry which provides the uniQue characteristic or this

- Cite RBP Ltr. to Gilbert Grosvenor, Wash. DC: 29 Apr* 43

"method of projection which distinguishes it from all other methods. The unique characteristic referred to is that the projected diagram retains true-measurement, shape, direction, and distance throughout all of the enclosing boundaries of the segments with mathematically controlled distortion • massaged* to the center of the projection areas. All other projections are true in measure, shaping, and direction only at an interior point or along one side or along one or several separated lines or arcs crossing the projection with progressive distortion articulated outwards towards one or more of the enclosing edges of the projected diagram. In other words, my new projection is uniformly corrected by internalization while all other projections are corrected by some systematic externalization of error. This allows of true external association of my projection units, which is impossible in all other methods demonstrated to date.

"Only in the case of the azimuthal or gnomonic projections where correction is radiantly distributed does this extermination of correction allow of uniform relationship of one portion of the spherical projection to another; but in the cases of the azimuthal or gnomonic hemispheres, there is only

- Cite HBF Ltr. to Gilbert Grosvenor, Wash., DC; 29 Apr'43 "the tangent contact point of the circles and no hinging line of contact as is provided by my internally corrected triangle and square projection, which latter allows several sectional units of continental areas of the world map to be reunited as a whole within a symmetrically representative contour.

"This triangle and square system may be thought of as one in which a special set of spherical 180-degree gores have been subdivided so that each gore is symmetrically separated into three parts, two triangular ends and one square center, of equilateral 60° great circle boundary arc dimensions.

"Thus the two irreconcilable geometrical conditions of (1) central parallelism and (2) terminal convergence, demonstrated by spherical gore segments are formally segregated and resolved, each to its symmetrical unity of plane geometry square and triangles respectively.

"This resolution into triangles and squares allows of the formalized sections of globe surfaces being reunited on a plan in such a manner as to unbandage the sphere in perpendicular, diagonal or triangular direction or any developed synthesis thereof. This potential translation is indicated by the" _ Cte HJF Ltr. to Gilbert Grosvenor, Wash.,DC; 29 Apr'43

Dvoraxion Airocean World Map; (h)

"graphic fact, that the spherical gres are doubly interwoven across their girths and triply interwoven at their ends.

"This system takes joint advantage of (1) the centrally satisfactory characteristic of the Mercator projection's tropical area and (2) the azimuthal or gnomonic projection's polar areas. It also combines the unit strip-diagram of the former with the inherently-separate circle diagrams of the latter into a universally joined synthesis of the preferable aspects of both.

"My system thus accomplishes the synthesis of merit of equatorial and polar systems which the polyconic accomplishes in highly specialized and compromised manner, prohibiting universal synthesis in any direction. The bO -arc trianglind square system accomplishes this long-desired synthesis of merit while reducing the unit limit of percentage of distortion growth below that of any unit world map projection system previously demonstrated.

"Despite the notion which had developed by custom of thought almost to the inflexible extent of becoming an assumed **

- Cite RJB Ltr. to Gilbert Grosvenor, Wash.,DC: 29 Apr'43 "universal law; i.e., 'that no new invention of a spherical projection could be made and therefore that no patent could be issued for projection inventions as all mapping was a design synthesis within the already demonstrated mathematical arts,' —this now discovered random element set of great circles, hitherto undetected by mathematicians permits of constructing and graphing a three-way great circle triangular systematically and infinitely subdividing the internal area while always symmetrically subdividing the enclosing arcs occurring within this particular equi-sixty-degree-great-circle-arc spherical triangle and within this triangle only.

"True surprise discovery of principle and useful means of interpolating its employment, which combination of Initiative we call invention, has thus occurred, which therefore permits of allowable patent claimage on my projection system.

"I thought you ought to have this information even though you may not contemplate any immediate employment of the principles.Your continual, up-to-date, re-editing of geographical data represents a factor of progress of incalculable proportion--- the kind of factor that can determine the degree of happy issue - Cite RJB Ltr. to Gilbert Grosvenor, Wash., DC: 29 Apr'43

Pypaxlon House;

"The 1927 Dymaxion House was my first tensegrity. The hub of the wire bicycle just becomes the mast. And the bicycle wheel itself was a transfer of sea technology.

"The ceiling was translucent reflecting light from the central mast which was perforated to draw heat down over the warm lights. The walls were shutterable membranes; there were no partitions or space dividers to say: You shall not pass. There were just natural barriers, like a kitchen or a tree.

"Light cells replaced door knobs because I found that door knobs were a major contact point for the transfer of disease.

"Opaque walls are difficult to let light through. There are four kinds of privacy: aural, tactile, visual and olfactory. Occulting--- cutting off the line of vision--- is better than opacity.

"Snelson gave me all the key, he gave me my great appreciation of how so much of tensegrity behaves; there is no thought of his 'stealing' my ideas."

Dymaxion House:

"Back in 1929 Vilhjalmur Stefansson arranged for me to have a dinner meeting with an engineer from the Soviet Amtorg office in New York. The Soviet engineer was in this country to arrange for a party of some 50 of his colleagues from Russia to visit the Ford Plant at River Rouge.

"The engineers told me that the soviet managers thought very well of my Dymaxion House. He said they were very familiar with it, but they had concluded that it must be kept secret from the Russian people for 50 years. The sacrifices of the people for the Five Year Plans were so great that the people must not know of the house as they would like it intuitively and they would all want it.

"At this time there was a world competition for the architectural design of the Palace of the Soviets. Corbusier would have won it but he would have introduced untenable standards for the use of new materials— as would the Dymaxion House. Ergo, the managers decreed that the Palace of Soviets and all Russian Architecture must be classical in style and be made of wood or stone. They had to use metals for more critical purposes than housing. No information would be allowed to come in and disturb this strategy."

- Cite RBF to Design Science Institute Mtg.. Aspen, Colorado, 13 Jul 7U

Q. What would a mass-produced Dymaxion house cost, allowing for inflation?

A. "If mass-produced, which means at a minimum of 500 per day per factory, Dymaxion houses should cost today about \$10,000 completely ready to occupy and live with at highest standards with all technical necessities included, needing only food supplies to be added. They would not be sold, but could be air-delivered and rented locally at \$100 monthly, with all maintenance guaranteed at no further costs—as with telephones.

Dynamic:

`` And while no sphere large enough for a flat surface to occur is imaginable, the projective transformation model seems to indicate that finite minima and finite maxima do exist because flat is a confined triangle phenomenon. The flat occurs at the inflection point between insideouts and vice versa. As has already been seen, at the sphere's minima size and at its maxima the momentum to flatness goes beyond approximate flatness, as at the minima phase to satisfy the four triangle minima momentum of transformation; thus inherently eliminating the paradox of static equilibrium concept--- of all the Universe subdivided into two parts, that inside of a sphere and that outside of it; the first being finite and the latter infinite, and the continually transforming from inside- out to butlsde-in, finitely, is consistent with dynamic experience."

Tensegrity: Interstabilisation of Local Stiifeners: Dec¹61 Tetrahedral Dynamics, (3)

"Education has now led us out and into a degree of meager awareness of Universe, somewhat as though we had been given spectators' seats commanding an improved view of the game-f- games called 'Universe.' It is, however, not as though we had been given better seats in the same old static stadium, within which the sports of extension of personal facility are tried, but more as though we had been given seats in a relay of refueled airplanes to command a view of a new kind of ocean race, a continuous around-and-around-the-world race of relay teams of deep sea craft. Both the frame of reference and the observed are in obvious continual motion and persist as individually composite dynamic continuities, though the separate men (invisible but implicit) and planes and boats and their component parts and sub-parts progressively shuttle or drop out and are eventually substituted for by inconsequentially increasing or decreasing numbers.

"The whole dynamic assemblage of race and observer relays are invisible even to an observer at a 30,000-foot altitude, let alone to an observer on Mars, or on another planet of another star who could only observe the motion of Earth relative to Sun, or the Sun relative to galaxy, etc."

- Cite TOTAL THINKING, I&I, p.2}1, Fay'49

"This schematically kinetic tapestry is the advanced concept of relativity---« now, at last, popularly significant,

because pivotal to the everywhere severe worldwide reorientation of all men's everyday affairs from a static to an a priori dynamic MKMB frame of reference. The reorientation is severe because it is more than an uprooting. Realization of relativity spontaneously evokes a springing, to dive from a then vanishing springboard into an infinite dynamic sea where man must learn to swim tirelessly, naturally, before he sinks, but only because what he used to think was that he ought to 'sink' rather than be attracted by dominant neighbors.

"As man learns to eliminate his preposterous one-, or two- or three-dimensional a priori references to a fixed level planar breadth and its inherent upwardness or downwardness of Universe and substitutes therefor the no*/ reliable sensation of an inwardness and outwardness relative to plural centers, he will come naturally to his new sustaining awareness of the impossibility of his doing aught but sustain his equilibrious and navigable position. If there is no inherent 'down' in Universe, man cannot sink.

- Cite TOTAL THINKING, IAJ, p.232, May*49 "This is not a semantic abstraction, 'What did man mean when he said, 'Up'? He meant two or more vertical and parallel lines perpendicular to the respective spots of a supposedly common plane whereon supposedly stood— fixedly in Universe— both himself and his addressee, with whom he would, avowedly, communicate meaningfully.

"But he is, in fact, employing non-sense. Unless one is standing on the other's shoulders, the direction of 'up' for any two men on the curved face of Earth is always geometrically different. They are respectively nonidentical radii of their commonly predominant energetic center, the Earth ball. It makes no difference what the local curvature of the Earth may be; they each balance, perpendicularly' independent, as 'radii' of the perfect sphere.

"By the time one man explains to the other by directional indication what he had meant by 'up' of a moment ago, the direction 'up' as registered in direction to the stars in Universe--- the other energy centers--- has shifted angularly to absurd non-identity. In the clock-time course of a sentence, his succession of complex 'ups' at Earth's level

- Cite TOTAL THINKING, Itl, p.232, May V 49

"has moved angularly thousands of miles; and the beam of his continuous, upin-pointing in the heavens, relative to the Sun and galaxy, has swept billions of miles. As he soon rockets toward the Moon he will find his feet pointing gradually and comfortably toward the Moon which he had just previously pointed to as 'up'.*

"If he persists in the up-and-down language m\$n may never conin-unicate accurately with other men for they do not employ the same meanings, either from moment to moment, or in respect to their indi-vidual 'ups' and 'downs.'

"Only when nan learns to say in and out relative to designated com-mon centers (for example, of Earth) is the meaning constantly reljrble. The sky is 'outward' to all men, at all places, at all times, on any planet. While enjoying an infinity of individual 'ins,' we, anywhere in the Uni-verse, also enjoy one connon nonsimultaneous, omnidirectional ag-gregate called 'out.'

"As the constantly relftible replaces the interrupted inaccuracy of the past moment, the yesterdays of inaccuracy dissolve

• . "

• 'The everywhere-relative velocities and momentums of interactions, of energetic phenomena of Universe, are central to the preoccupa-tions and realizations of the comprehensive designer.

The concept of relativity involves high frequency of reestablished awareness, and progressively integrating consideration of the re-spective, and also integrated, dynamic complexities of the moving and transforming frame of reference and of the integrated dynamic

complexities of the observed, as well as of the series of integrated sub-dynamic complexities, in respect to each of the major categories of the relatively moving frames of reference of the observer and the observed. It also involves constant reference of all the reciprocating sub-sets to the comprehensive totality of nonsimultaneous Universe, from which naught may be lost.

"We have on the one hand the multiplicity-of-the-component-structunes-and-moving-parts-of-the-airplane-carrying-the- ob-server, as an integrated whole, as he observes the set-of-

•When we make the geodesic subdivisions of symnetrlcally om-nitriangulated syfens, the three corner angles increase to add up to more tharf ISO degrees because they are on a sphere. If we deproject them back to the icosahedron, they become symmetrical again, adding to exactly 160 degrees. They are asymmetrical only because they are projected out onto the sphere. We know that each corner of a two-frequency spherical icosahedron has an isosceles triangle with an equilateral triangle in the center. In a four-frequency spherical icosahedron there are also six scalenes: three positive and three negative sets of scalenes, so they balance each other. That is, they are dynamically symmetrical. By themselves, the scalenes are asymmetrical. This is synergy. This is the very essence of our Universe. Everything that you and I can observe or sense is an asym-metrical aspect of only sum-totally and only nonunitarily conceptual, Omnisynr.etrllcal Universe.

"Geodesic sphere triangulation is the high-frequency subdivision of the surface of a sphere beyond the icosahedron. You cannot have omnisymmetrical, equiangular and equilateral, triangular, system subdivision in greater degree than that of the icosahedron's 20 similar triangles,"

- Cite SYNERGETICS text at Secs. 1031.11 to 1.12, 27 Dec*73

"As we have learned, there are only three prime structural systems of Universe: tetrahedron, octahedron, and icosahedron. When these are projected on to a sphere, they produce the spherical tetrahedron, the spherical octahedron, and the spherical icosahedron, all of whose corner angles are much larger than their chordal, flat-faceted, polyhedral counterpart corners. In all cases, the corners are isosceles triangles and, in the even frequencies, the central triangles are equilateral, and are surrounded by further symmetrically balanced sets of positive and negative scalenes. But since the positive and negative scalenes always appear in equal abundance, they always cancel one another out as dynamically complementarity equilateral. This is all due to the fact that they are projections outwardly onto a sphere of the original tetrahedron, octahedron, or icosahedron, which as planar surfaces could be subdivided into high-frequency triangles without losing any of their fundamental similarity and symmetry.

"In other words, the planar symmetrical is projected outwardly on the sphere. The sphere is simply a palpitation of what was the symmetrical vector equilibrium, an oscillatory pulsation,"

- Cite SYNLRC-TICS text at Secs. 1031.13 to 1.14, 27 Dec'73

Dynamic Symmetry: (3)

"inwardly and outwardly--- an extension onto an asymmetrical surface of what is inherently symmetrical, with the symmetricals going into higher frequency.

"What we are talking about as apparent asymmetry is typical of all life. Nature refuses to stop at the vector-equilibrium phase and always is caught in one of its asymmetric aspects: the positive and negative, inward and outward, or circumferentially askew alterations.

"Asymmetry is a consequence of the phenomenon time and time a consequence of the phenomenon we call afterimage, or 'double-take,' or reconsideration, with inherent lags of recallability rates in respect to various types of special-case experiences. Infrequently used names take longer to recall than do familiar actions. So the very consequence of only 'dawning' and evolving (never instantaneous) awareness is to impose the phenomenon time upon an otherwise timeless, ergo eternal Universe. Awareness itself is in all these asymmetries, and the pulsations are all the consequences of just thought itself: the ability of Universe to consider itself, and to reconsider itself."

- Cite SYNERGETICS text at Sec.s 1031.14,.15 • '<>', 27 Uec'73

"Within every equilateral triangle we can inscribe a three-bladed propeller going into the three corners and those propeller blades could be pear-shaped. Each of the blades is the same shape as the others. The pear shape is asymmetrical. We call this/dynamic syrtrnetrv.

(revol vafle omnibalanced asymmetry>

"We have three pears all; 120 from one another... The three perpendicular bisectors of an equilateral triangle cross each other at the triangle's center of gravity, dividing the total triangle into six right triangles, of which three are positive and three are negative. So there are six fundamentals of the triangle which make possible dynamic syn-

metry. One part may look like a scalene but it doesn't matter because it is always in balance. Each corner is balanced by its positive and negative-- like a street Corner. This is called dynamic balance. Literally all machinery is dynamically balanced in this manner."

- Cite RBF to EJA *It*. BO'R, tape transcript, Chicago, 31 May*71 "sviwrff- s?c.
50.16

"The difference between what I mean by symmetrical and omnisymmetrical is that in symmetrical I have no local asymmetries which I did have in any one of these propeller blades by itself. . . Let me take one propeller blade by itself. I'm going to split it longitudinally and get an 'S' curve, of which no power of the MB curve is the same . . . changing rates. So it's asymmetrical by itself: it's repeated six times; positive, negative, positive, negative . . . , and it comes around to dynamic symmetry. So the energy forces involved are in beautiful an.¹.¹ absolute balance. So we get energetic balance. This is asymmetry. And that's a vector equilibrium in the middle of all this. Not only is the propeller revolving on one axis only, but we have six axes with everything revolving in the vector equilibrium."

Early Man:

" 'The Roots of Civilisation' reveals an earnestly tested and exciting hypothesis of the significance of the Ishango Bone on the part of Alexander b'arsnhak. This book regenerates my own speculative drives that there seems to be increasing evidence in support of the assumption that man's intellectual capacity has been altered but little, if any, over vast years of his presence on this planet.

"certainly it is true that the earliest philosophical statements on record disclose a comprehensivity and profundity, and above all a simplicity, accompanied by great wisdom. The fact that the information sources available when they were written were almost negligible in contradistinction to the information sources of our own day, suggests that the intellect of man may readily have been at today's highest levels back in unknowable times. Kr. iarsnak's work contributes immeasurably to knowledge in this important field."

- Cite KBF jacket blurb for iarsnak book, J iars'7

"About, 25 years ago I began to say man is not descended from monkey. If that is so then we are liable to find better and better men, it is very interesting that in the time since I started my work a third of a century ago that we only knew of the existence of man a relatively short time ago and the findings of earlier man have extended that time,

it has been multiplied from a quarter of a million to a possibility of 10 million, so it has been a very large extension. But one of the things we continually discover as we find earlier man, is that the earlier man does not tend to be an inferior type man. There is some indication in talking about the capacity, the space for brain, of a larger pattern activity. I would not be surprised if we found much more about men during the time when you are alive, and if we do, I think you are going to find earlier man tending to be disclosed as of a very extraordinary integrity and of a high order patterning,

"in the way I am talking to you about man, there is... so clearly a pattern integrity-- that man--- as one way that universe might have come out, might have occurred, many other places in the"

"For many years I've had kids get very excited and work with me, and then at some point they'd say, 'Well, I'm sorry, I've got a family to support and I can't work with you any more. I'm different from you--- I've got to earn a living.' But I was no different. I was really dead bust most of the way. It was extremely hard to hold things together, to be responsible with money and yet not be ruled by it. I had the advantage of complete confidence that what I was saying was true, true in the largest sense of being in accord with Universe. And I trusted that as long as I was working on the side of evolution, evolution would take care of me. And that's the way it's worked out."

* 1?nnYCVaI¹SCr_pC fOr F «”el: passage omitted

from PLAYBOY Interview, p. 199; transcript pp. 45-46. Oct'71

•We are not operating logically. Everyone is being told or is already convinced that their alienation and violence exist give way to concern over how to earn a living. We hope to earn a living in a way that is pleasing but that can't be guaranteed. Earning a living has highest priority, We don't look at our environment and say: What is nature trying to do? We don't say: What needs to be done?"

- Cite Museums Keynote Address Denver, pp. 5-6, 2 Jun*71

"We must do away with the absolutely specious notion that everybody has to earn a living. It is a fact today that one in 10,000 of us can make a technological breakthrough capable of supporting all the rest. The youth of today are absolutely right in recognizing this nonsense of earning a living.

"We keep inventing jobs because of this false idea that everybody has to be employed at some kind of drudgery because, according to Malthusian-Darwinian theory, he must justify his right to exist. So we have inspectors of inspectors and people making instruments for inspectors to inspect inspectors. The true business of people should be to go back to school and think about whatever it was they were thinking about before somebody came along and told them they had to earn a living."

- Cite RBF quoted in New York magazine, p.30, 30 Mar'70
Earning A Living Sequence; (1)

"As we study industrialisation we see that we cannot have mass production unless we have mass consumption. This was effected evolutionary by the great social struggles of labor to increase wages and spread the benefits and prevent the reduction of the numbers of work-

ers employed. The labor movement made possible mass purchasing; ergo, mass production; ergo, low prices on vastly improved products and services which have altogether established entirely new and higher standards of humanity's living.

"Our labor world and all salaried workers, including school teachers and college professors, are now, at least subconsciously if not consciously, afraid that automation will take away their jobs. They are afraid they won't be able to do what is called 'earning a living.*' which is short for earning the right to live. This term implies that normally we are supposed to die prematurely and that it is abnormal to be able to earn a living. It is paradoxical that only the abnormal or exceptional are entitled to prosper. Yesterday the term even implied that success was so very abnormal that only divinely ordained kings and nobles were entitled to eat fairly regularly."

- Cite OPERATING MANUAL FOR SPACESHIP EARTH, pp. 117-118, 1969

Earning A Living Sequence: (2)

"It is easy to demonstrate to those who will take the time and the trouble to unbiased their thoughts that automation swiftly can multiply the physical energy part of wealth much more rapidly and profusely than can man's muscle and brain- reflexed, manually-controlled production. On the other hand humans alone can foresee, integrate, and anticipate the new tasks to be done by the progressively automated, wealthproducing machinery. To take advantage of the fabulous magnitudes of real wealth waiting to be employed intelligently by humans and unblock automation's postponement by organized labor we must give each human who is or becomes unemployed a life fellowship in research and development or in Just simple thinking. Man must be able to dare to think truthfully and to act accordingly without fear of losing his franchise to live. The use of mind fellowships will permit humans comprehensively to expand and

accelerate scientific exploration and experimental prototype development. For every 100,000 employed in research and development, or just plain thinking, one probably will make a breakthrough that will more than pay for the other 99,999 fellowships. Thus, production will no longer be impeded by humans trying to do what machines*

- Cite OPERATING MANUAL FOR SPACESHIP EARTH, pp. 118-119, 1969

"can do better* Contrariwise, omni-automated and inanimately powered production will unleash humanity's unique capability--- its metaphysical capability. Historically speaking, these steps will be taken within the next decade. There is no doubt about it. But not without much social crisis and consequent educational experience and discovery concerning the nature of our unlimited wealth."

Ecology:

"Now, forty-six years since my 1927 prediction that it would do so, th* whole of humanity is becoming deeply concerned with its environment and is particularly aware of the relevance of ¹ ecology.¹ without having as yet much detailed understanding of that science. If you look

at Shelter magazine which I published between 1930 and 1932, you will find that the title of the opening chapter is 'Ecology.* At that time I also felt that the word 'architecture' tended to make humans think only of classical orders rather than solving total humanity's evolutionary shelter problems by competent and comprehensively adequate anticipatory design of tools with which humanity could cope intelligently in solving their problems to everyone progressively highest advantage and satisfaction. I then decided to rename 'architecture' and called it 'Environmental Designing. '*

HBF DEFINITIONS

"All biological life on Earth is sustained exclusively by star (Sun) radiation. The radiation is vegetation-impounded by photosynthetic chemistry, which proliferates hydrocarbon molecule a. To avoid dehydration by Sun exposure the vegetation puts down roots through which, by osmosis, it draws water through its whole system, launching that water into the atmosphere to return some day as rain.

"The vegetation gives off gases that keep the animals going. The maxunals give off the gases that keep the vegetation going. Honey bees going after their honey only inadvertently cross-pollinate the vegetation, which vegetation being rooted, could not reach other vegetation to procreate its kind. In the same way the money-bee

humans, going after their profit inadvertently crossproliferated general production tooling but only for war making, which all inadvertently in due course provided swiftly amplifying, worM-around life support not foreseen by the money bee when underwriting the development of arms production.

"I saw that all living organisms were given genetically incisive"

 Ecology hequMice;

"drives which, in their accomplishment, inadvertently fed into the complex regenerative pattern of life on pataewn Earth which has now come to be known integratedly as ecology.**

- Citation and context at Fuller. R.B: Criaia at 1027 (b), 12 Jun'73

"One of the discovered generalised principles is that of complementarity; wherein, for instance, inherent local systems' energy exporting is known as entropy, the law of increasing randomness, which is comprehensively balanced by syntropy, the law of increasingly orderly importing and compounding. 'Non- mirronisjage, * i.e., dissimilar complementarity, is the conservation-producing principle.

"The ways in which energy are compacting syntropically in increasingly orderly manner is demonstrated by the structure of molecules and atoms. Boltzmann's law discloses a cosmic WMM conservation system: Wherever and whenever energy is being exported it is always being imported in other 'elsewheres' and 'elsewhens.' The importings and exportings are nonsimultaneous and nonidentical, but they are evolutionarily, overlappingly sequential.

"That the energies that are everywhere exported in disorderly ways are being imported and collected in omniorderly ways is now being dramatically realized by the astrophysicists as constituting the preposterously nicknamed 'black hole,' which"

- Cite "Ko Title," (Part I), WORLD Lag. p.14, 22 Kay*73
Eg?19Kr Sequent: (B)

"is just such an energy importer* Some astrophysicists estimate Cyngus X-1, 'the black hole,' to contain as much as half of all the matter of the Universe. The only locale in the Universe of which we know considerably more about energy being collected is our own planet. The planet Earth is a place where cosmic energies in general are being compounded in orderly ways. The Sun's radiation is refracted systematically by the atmosphere into the red, orange, yellow, green, ultraviolet spectrum and by the oceans as heat. The Sun's radiation is also impounded and photosynthetically converted into beautiful molecular structures by the vegetation on the dry land and algae in the sea, all of which are exquisitely orderly and are regenerated multiplyirigly into organic growth. The biological growth increases the rate at which radiation-energy importing is converted to multiply the productions of exquisitely ordered molecular structures. The hydrocarbons are continually multiplying and historically have been buried ever more deeply in ojr Earth's crust. And we find that human beings are functioning as the most important metaphysically syntropic factors operating on our planet, as they sort out their experiences to understand and employ the principles they discover. Mo other creature has"

- Cite "No Title," (Part 1), WUKLJJ Fag. p.34-b2, 22 Fay'73
"any such local syntropic capabilities.

"In the pattern of cosmic regeneration by disorderly energy exporting and orderly importing, in which our planet is one place where we humans can witness the Sun's radiation being impounded by the vegetation; it is also manifest that the vegetation, in order to avoid dehydration while exposing its leaves to so much Sun. has to be rooted so that it can be osmotically water-cooled through its antigravitationally

valved roots and capillaries. These root-inhibited waters provide the noncompressible, load-distributing structural integrity of the trees, finally atomize those waters into the skies to be rained back again onto the regenerative ecosystem.

"Because the individual vegetation systems are rooted, they cannot reach one another to procreate. Their essential regenerative function is accomplished by the mobile biological organisms, the caterpillars, insects, and birds that inadvertently cross-pollinate the vegetation. Each mobile organism is programmed to seek its special regenerative energy chemistries. The honeybee is programmed to go after its honey, while its humble tail, unbeknownst to the"

"Schematically, ecology 18 planetary encircling. The pine-tree and palm-tree belts encircle the Earth as the world-around winds interact with other ecological mechanisms. Each of the creatures is programmed linearly to seek targets. Each of the biologicals is reflexed

powerfully by gravity. All except humans are equipped to excel in special local environments. However, the whole terrestrial ecological system is only omniscircumferentially successful. Only the whole big system works. Like all well-designed, complexly intercomplementary, evolutionary systems, the self-regenerating terrestrial ecology has a plurality of alternate circuits, i.e., of failsafe mechanisms with a plurality of newly developing alternates and an equal number of progressively phasing-out components. Of all the biologicals, only humans are able consciously to discover this omniregenerative patterning in pure principle.

"only side effects! The propeller turns sideways to net forward motion. Humanity can only survive by complete regard for all of humanity. Humans are beginning to learn, 'No other, no me.'

"Great historical leaders have always hoped that we may be trending from 'might makes right' to 'right makes might' dominance, which means from a rooted, programmed creature, a 'specialist'--- just going after its own honey and stinging others who interfere with its program--- to an ecologically cognizant, spontaneously synergetic, omni-integration of cosmic functioning. I'any programmed plants have thorns and thistles; if you try to interfere with them, you get scratched or barbed. Humanity has acted as it has until now because it always has been, and is as yet, ignorant. Now, however, young humanity is gradually learning enough of the great principles to realize that we are not going to survive unless we become spherically integrated and go into cosmically normal, individual orbiting, which is always inherently considerate of the rest of the Universe. Knowledge is orbital. Earth is a very small item in a vast integral system."

- Cite "No Title," (Part II), JORLD Mag., p.40, 5 Jun'73

"There is now visible a precessing of humanity from being a dominantly hungry, sex-urged, programmed, special-function slave to a well informed, thoughtful, cosmically considerate being. Yesterday, only the pharaoh was informed; later, only the pharaoh and the nobles;

later still, only the king, nobles, and wealthy middle class were in on the information. Now, all of humanity is being illuminatingly informed and is discovering principles and beginning to realize that it must operate strictly on principles and not yield to the temptation just to go after its honey.

"The child in the womb is linearly connected to the mother by the umbilical cord. Exiting from the womb, the child graduates from the umbilical, linear dependency and goes into individual orbit. The umbilical cord becomes obsolete. There was nothing wrong with it. It was vital. But now it is obsolete, in the same vital-to-obsolete, 180-to-90-degree way 'money making' and its unilateral self-advantage-seeking competition have become obsolete. All the residual drives of humanity's moneymaking derives from ecologically programmed honey-seeking. It was always perfectly logical. That was the way we were first"

"Here we see the interplay of all the biological systems wherein all the 'life' accommodating organisms of Earth's biosphere are exclusively regenerated by energy sent to Earth by radio from the energy-broadcasting stars, but most importantly from the star Sun. by which design-science system the terrestrial vegetation and algae are the only energy radio receiving sets.

"You and I and all the other mammals cannot convert the Sun energy to direct life support. In the initial energy impound-ment of the powerful Sun energy radiation's exposure of its *leaves and photosynthesis, the vegetation would be swiftly dehydrated were it not watercooled. This is accomplished by the vegetation putting its roots into the ground and drawing the water by osmosis from the ground and throughout its whole system, finally to atomize it and send it into the atmosphere again to rain down upon the land and become available once more at the roots.

- Cite SYNERGETICS draft at Secs. 1005.21+22, 16 Feb*73

"Because the rooted vegetation cannot get from one place to another to procreate, all the insects, birds, and other creatures are given drives to cross-circulate amongst the vegetation as, for instance, does the bee go after the honey while inadvertently cross-pollinating and interfertilizing the vegetation. And all the mammals take on all the gases given off by the vegetation and convert it back to the gases essential for the vegetation. All this complex recirculatory system combined with and utterly dependent upon all the waters, rocks, soils, air, winds, Sun's radiation, and Earth's gravitational pull are what we have come to call ecology.

"As specialists we have thought of all this design programing separately and as linear drives, but the results are multi-orbitally regenerative and embrace the whole planet as does the wind blow the seeds completely around the Earth.

"Seen in their sky-returning functioning as recirculators of water, the ecological patterning of the trees is very much like a slow-motion tornado: an evolving-involuting pattern"

Economic Accounting System: (1)

"We will adopt new accountancy standards for all wealth. To account our success in terms of gold and various traditional banking practices is irrelevant. Real wealth is organised capability. One of its major characteristics is that it is irreversible. No matter how much wealth you have, you cannot change one iota of yesterday. Wealth can only be used now and in the future. What we really mean by wealth is how many days forward we have energy available and organised for work to keep the machines running, to keep the foods growing, the refrigeration, transportation, and so on. The basis for our new accounting system will be 'How many □□ forward days of organized capability do we have available to serve how many men.¹ We will be able to make the working assumption that it is normal for him to move as freely as he wishes without interfering with any other man. Our overall accounting assumption will be based on whatever amount of organized energy capability is required so as to make it possible for any man

to travel around and enjoy the whole Earth, and be completely supported in doing so. There will be no such thing as deficit accounting. You cannot eat deficitly, or drink water deficitly. What is to eat is there--- as the water is there.

Education:

"All those who have attained high scholarly capability assure us that real education is self-education. They also say that this self-disciplining is most often inspired by great teachers who make it seem apparent that it will be excitingly worthwhile to take the trouble to bring one's self to apprehend and then comprehend variously pertinent data, phenomena and derived principles. The intimate manuscript records of many great self-educated individuals show that they discern intuitively when and what it is that they want to learn. Thereafter they arrange to do so by four main strategies. The first is by selfconducted experiments, if they are scientists. The second is by going to those live humans whit have educated themselves from direct experiences. The third is to contact through books those who have discovered and learned by direct experience but are now dead. Fourthly, they sometimes have recourse to the esoteric and often exquisitely valuable information contained within the word of mouth information system relayed almost exclusively from generation to generation by the directly experienced craftsmen artists."

Education:

"We are also going to give you a 1 and 2 and 3. We give you what we call an elementary education that is to say consisting of elementary 'bits and pieces' of education. You can forget the universe. . . . With enough elements you may be able to build up a body of knowledge, but it will always be a small body and a poor exchange for the fascinating and progressively coordinated apprehension and comprehension of universe which you as a child had always been spontaneously prone to deal and reason with before we caught sight of your natural brilliance and snared you in our education trap."

"I propose that we now start our education exactly the other way. Let us return to the universe as our starting point in all problem consideration. We assiduously avoid all the imposed disciplines of progressive specialization. We depend entirely upon our innate facilities, the most important of which is our intuition and test our progressive intuitions with experiments."

- Cite NASA Speech, p. 90. Jun'66

Mugfign:

"The politicians did not realise that the education at the masters-- the 1/1000th of one percent of humanity who were physically and economically successful in the last half dozen millennia--- was one of private tutorial and self development of the comprehensively coordinating and integrating capabilities with which life is endowed."

- Cite NASA Speech, p. 20. Jun'66

Education:

"... Our educational process has been one of going from parts plus more parts towards the whole, but never reaching the whole, in contradistinction to the strategy that I have employed, working from the whole towards the parts. It is a complete reversing of processes--- not just a reversing of processes, but a different process. It has capabilities that were not inherent in the first system ... so that the elementary system of education to which everybody has been exposed just does not have inherent in it the ability to make the predictions that I am able to make from a strategy of dealing with the whole and then separating the whole into the parts."

- Cite Oregon Lecture #2, p. 37, 1 Jul'62

Education:

"Fan's desynergized conviction is that education and mathematical argument should start with simplest elements and a concentrated diet of these elements, unembarrassed by the necessity to identify them in the total scheme of experience. This conviction is so universal and so interwoven with man's notion that his routines with dealing with the young constitute a gratuity from the old to the young that I feel an urgency to reorient those who chance to read our book in such a manner that it becomes logical to readopt and rehabilitate the synergetic comprehension advantage of the child. It is logical

to start with universe and to discover therein a set of sublimely rational relationships whose omni-accommodative transformations and transactions are facile because the total accounting is never lost sight of."

Education: Evolutionary Touchdowns:

"What society applauds as 'creative' has been isolated out of an extraordinary set of coequal evolutionary events, most of which are invisible. Evolutionary 'touchdowns' are unpredictable, sometimes centuries apart. Who knows which child is to make the breakthrough? In the next decade society is going to be preoccupied with the child, because through the behavioral sciences and electrical exploration of brain functioning we find that, given the right environment and answers to its questions, the child has everything it needs educationally right from birth. Je have thought of education as the mature wisdom and overbrimming knowledge of the grownups injected by the discipline punwp into the otherwise 'empty' child's head."

Evolutionary Touchdowns:

See Organic Model: Biological World aa Model for Society.

Oct'66 "

Education: Trained kind:

"... Inasmuch as the great reality is all invisible, the only way man is able to treat with it is by the trained mind. ... The number of young people in the States in 1929 who were completing high school was negligible. We got through grammar school, but completing high school was a very, very low percentage. That is one of the curves that accelerated the ` `ost, going on and completing high school, going through college, then getting into masters and doctors, getting to be a mass production affair of doctors. So this all has to do with the fact that man, in order to be able to cope with reality, simply has to have that kind of a trained mind.

So nothing is more essential to our revolution right now than the trained mind.'*

Egos

"The way I learned to do my own thinking ia to learn how quickly I could get rid of the conditioned reflex that I knew what It was all about. There have been so many billions of people, they had to make quadrillions times quadrillions of mistakes. In fact they've had to

make so many mistakes that they've become discoured, they've developed such an inferiority complex over the mistake-making that nature has provided a vanity and ego to cover them up. If you really want to get anywhere, you've got to conquer your ego and pride and really admit your mistakes to find out what's going on."

"I really don't feel that society knows what's going on. They don't really know what they're doing when they make a baby the first time. The child doesn't know it's being born. Through that ego business, we kid ourselves into thinking the whole Universe is waiting for our decisions. We know now that there are a billion galaxies and our Sun is only one of 100 billion stars in our own galaxy. Obviously the Universe is not waiting to know whether the Republicans or the Democrats are going to come in."

Einstein:

"What did Einstein do and what had the other scientists not been doing that made it possible for him to •surprise them so? • • . You must remember that Einstein was a schoolteacher in Switzerland, but he also worked in the first patent office. You also know that Switzerland is very famous for watches and clocks, so as a patent examiner in the patent office he would be in many, many patent confrontations with watches and clocks and dealing with time. I am sure that Einstein began to think a great deal about time as just an occupational result. At any rate, you have people trying to make watches that are better than other watches, stop watches and so forth. So one of the things he saw clearly was that none of the watches really agreed. And so in an important race you «=would have two or three timers and you would take the average of their results. In other words, he said there was no exact time. He had chronometers being invented so that the navigators would have better and better results, but he found the navigators had to have three or four chronometers on board and they took the rates of change of their error and they averaged their error to give themselves something that was reliable time. Time was all unreliable. He saw that Newton had said .time was a very specific affair, that there was a specific and finite time that permeated the

"All chemico-physico-biological components and their behavior necessities seem originally invested. Any and all of the radiant, thermal, compressive-expansive, convergent-divergent, rotational, orbital, processional, valencial, polar, refractive, gravitational, vectorial, and reciprocal motivating factors, et. al., may be uniquely identified, quantitated, separated, subdivided, multiplied, or compounded empirically, in infinitely extensible directions--- and seemingly without loss of simple commensurability at any and all stages.

"This apparent claim to sublime commensurability and comprehensiveness continually challenges for a downward scaling by detection and exclusion of awkward factors. Despite earnest attempts to discover such shortcomings

the opposite result occurs on each occasion. The principles of further discovery were in fact developed through determination of a technique for detection of fault.

"This statement in no way implies invention of a comprehensive system, but alleges discovery of the existence of such a system.¹

Einstein: RBF Draft Letter To: (3)

"My work reports the history of its redifeovery. in which the whole bunch of keys are all required as original assumptions for unlocking the big door at once, rather than picking the locks of small compartments of knowledge separately with h&arpin assumptions (for pro-

gressive previews of areas of knowledge as seen from traditionally tolerated levels of ignorance* The attitude of re-exploration for an-organic-whole-or-nothing was adopted because it was noted that the successive exploitations of the picked- lock previews of relatively limited compartments of fundamental wealth have nonetheless precipitated economic preoccupation in avalanche proportions precluding immediate and formal re-entry of the original scene for precision design of the keys and scientific inventory-taking of the infinite wealth infinitely available to scientific procedure.

"Because the discovery is comprehensive and sublime, the nature of its properties may be demonstrated by simple geometrical and elementary mathematical techniques. All formulas derived are empirically cogent."

- Cite RBF holograph draft Ltr, to Dr. Einstein, 17 Jan*48
Einstein; RBF Draft Letter To; (4)

"I have documented the steps and phases of exploration to date by models, graphs, notes, drawings, tables, and formulas but the horizons of discovery constantly broaden till it becomes obvious that teamwork which amplifies and accelerates technical advantages into industrial commonwealth is now desirable for further development.

"Granted that I may have come upon important behavior mechanics of the truth, I am hesitant now to make disclosure to you only lest my ineptness betray this aspect of truth to re-obscurity and a redoubled remoteness from man's conduct of his survival affairs because of the infectious discouragement too frequently perpetrated through failures to attain new advantage under favorable auspices.

"Others more skillful or expertly informed might win, where I may lose because of personal limitations, but ... I know of none willing or qualified to assume the responsibility of demonstration.

"More closely identifying the area of exploration: I am informed by Preston Basset, President and formerly chief engineer of the Sperry Gyro Corporation, that when he was an assistant to Langmuir at General Electric, that the

"latter entered aspects of this field with what he named his octet system but that Langmuir did not pursue that subject to the stage of identity.

"I was also approached three years ago by another General Electric scientist who had heard of my work and asked me to inspect the work of a Russian-American's in New York City: this man's work postulated identity of tetrahedrons with atomic components. Neither the latter's nor Langmuir's work anticipates the discovery with which I have been engaged.

"In answer to your possible question that additional scrutiny would be advisable before your time, (lest it develop that I am retracing already well-explored territory) it should be noted that I have exposed the subject in considerable detail before scientists and academic groups on several occasions and, though appropriately cautious, they have verified the uniqueness of the discovery and have encouraged further efforts. The chemistry fellow of Oxford said in 1943 that the project transcended mere coincidental significance and he felt that it augured important possibilities."

- Cite RBF holograph draft Ltr. to Dr. Einstein, 17 Jan'48

^WA year ago I was asked to speak on the subject before the U.S. Air Corps Institute of Technology at Wright Field and no challenges of fallacy were vouchsafed. I have spoken recently before science department heads of several large colleges, such as Dartmouth, who asserted keen interest and credit in the discoveries. At one time I was

technical consultant on the staff of Fortune Magazine, at another assistant and director of research at Phelps Dodge Corporation; at another head mechanical engineer of the U.S. Board of Economic Warfare, In these undertakings I was under obligation to maintain wide coverage of scientific literature, and I am reasonably satisfied that there is no publication of parallel data. A year ago I was asked by the President of Sperry Co. to recount the subject to an officer of the mathematical society, and he confirmed my conjecture that I was not duplicating another's work. As you know, few academic scientists will make hasty affirmation of exploratory finding. The disclosure must detect tentative assent by lack of negatives coincident with manifest interest.

Einstein: flpf Prpfl Utttr to- (7)

"There exists the possibility that, if true, this discovery could be useful in dissipating in a measurable degree the manifold misunderstandings of a worldwide nature now now pyramided directly upon wholesale ignorance of fundamental factors at present too difficult to gear into elementary education. For this possibility, remote as it may be, I find myself required by conscience to apply full effort to the subject despite economic hazard, and for this reason alone believe myself justified in soliciting your attention.

"Increasing uncertainty as to my economic circumstances threatens the further adequacy of my sole custodianship of what appears to be an important close-up of truth. Wherefore, in view of your willingness to see me, I must risk a convincing disclosure while my records are in order and my mind in articulate focus upon the many facets of the subject.

"Inept at purely mathematical expression and awkward in prose I am unwilling to try the case on paper in advance of a personal meeting fortified with the paraphernalia of exposition and an atmosphere of taint responsibility toward the potential.

Faithfully yours, R. Buckminster Fuller,

in his daring concept of universal evolution as constant notion, as put forth and written into (unwitting) poetry by Einstein, we have then the greatest conception- ing and greatest communication by a human being to other human beings not only in the 20th Century but possibly in any other of the centuries, Therefore I see that Einstein is certainly the great artist of the 20th Century. Einstein becomes the prototype scientist-artist of not only the 20th Century but of the now looming 21st Century. The fact that Einstein did not profess being an artist does not mean that he was not one. The term artist is not really professable. It is a term which society alone can bestow and then only retrospectively,"

1BF DKFIMTTIOMS

"Margaret Mead said recently that god is rarely mentioned at scientific or social conferences. This is not so much a phenomenon of conferences as it is characteristic of our times. Many think of science and the age of Industrialisation as atheistic. Scientists frequently

have been asked by less educated men whether anything they observe through their microscopes or telescopes confirms religious dogma and the scriptures-- and, if not, must they not forsake scripture and religion as having no fundamental significance whatsoever? Surprised by the question and unconvinced that they are atheists, the scientific specialists, also avoiding philosophic speculation as treacherous ground for reasoning, have been notably ineffective in refuting their atheistic status.

"Cosmology and philosophy have been differentially dissipated in the era of increased specialisation. Total thinking is now almost completely legendary or speculative. For instance, it is a popular conception that the Universe must have been begun in chaos, out of which it has happened from time to time that probability, reversing its law of increase of the random element, has surprisingly accumulated increasing order. It seems that this illogical increase of order accredited by the"

Einstein: . Cosmic Religious Sense: (2)

"popular science cosmology has also since from time to time been aided by scientists who 'wrest order out of chaos.' finally, according to the legend, probability and science together have now provided us with an extraordinarily well-organised chemical, physical, and biological world within a Universe of gratifying regularities.

"The scientific record refutes this a priori chaos scheme. Every great scientist who has documented the events surrounding his major discovery has documented the fact that, in comparison to his crude hypothesising, his discovery has disclosed a sublime regularity of

nature. The regularities of nature are governed by pure mathematical principles. Thus, since principles are inherently weightless and infinite--- that is, endless--- the Universe could never have been chaotic and thus has no beginning.

"In 1930 Einstein wrote of the nonanthropomorphic conception of god and of the cosmic religious sense, asserting that the great scientists such as Kepler who had been called heretics were indeed the most profoundly religious men when appraised in a cosmic, nonanthropomorphic sense. Einstein said, 'that an*

****extraordinary faith in the orderliness of Universe must have inspired Kepler to spend the nights of his lifetime alone with the stars.'**

"Scientists, having developed double names for their overlapping work (biochemistry, biophysics, etc.), are now finding their total field interconnected and unitary. This is a general trend of science. And so many scientists are now being educated that it may be forecasted that within the next half-century not only science but much of educated society will have come naturally through its own explorations and experiences to discover the comprehensive order of the Universe. Thus they will inadvertently develop a regeneratively inspiring faith in the order and integrity of the Universe.

"And because the complexities of this Universe are only intellectually comprehensible, recognition of an intellect greater than and anticipatory to our own intellctions is inexorably emergent in the integrating totality of scientific exploration. This means the personal, firsthand discovery by increasing numbers of humanity of nonanthropomorphic god, the great intellectual integrity of universal evolution."

Emotion:

"I am so impressed with the importance of emotion that I say to myself, 'Be sure to entertain all your emotions,* even though I don't let them run me. On meeting a female for whom I suddenly and surprisingly discover that I have a strong attraction. I don't tell her and I do dismiss the inclination, but I don't pretend to myself that I had no such thought. If I get angry, I let it be so, but I have learned to get anger under control in a split second. I know how devastating anger let loose can be, but I don't try to say, 'Don't be angry,' I do not try to suppress myself,"

Energetic and Synergetics:

"Energetical is in contradistinction to synergetical.

Energetics employs isolation of special classes of our total experience from our total experience, the better to discern unique behaviors of parts undiscernible and uneasable in total experience."

- Cite RBF footnote on "Pi and Synergetics Constant" holograph, Pacific Palisades, 29 Dec'73, as re-edited by RBF, NYC, 10 Jan'gl

"We are all very familiar with the word •energy* because as specialists we have been persuaded . . . to employ the strategy of separating out our experience. Instead of looking at our total experience, man began looking at just what his eye would do and discovered the energy properties called optics. Newton began to pay attention to gravity alone.

There was no word gravity up to this point but he began to pay attention to what makes things go into the center of the Earth first and then he comes to the concept of gravity. He isolates the phenomena out so all the classifications wrfiave of the scientific words are all energetic words. 'They are words differentiating out the total behavior of nature.**

"We talk about energy capital and energy income. If you will think about the concept I gave you about the Earth being a place in the world Universe where energies are being collected ... That's the function here and now: to collect energy, not to get rid of it. Therefore when we are using fossil fuels, it is very questionable whether this seems to fit in with the antientropic function of Earth.

"Some of the geologists that have worked with me very exhaustively, some of the top oil geologists, tell me that the amount of time it takes for the energies inhibited as soology or vegetation--- for that energy to get filtered down on the land, to go down as coal in the sea, getting down finally to more and more depth, finally the 4,000 foot depth there on the verge of becoming petroleum, a little more together. If we take energy as the pressure and the time involved, and do that in kilowatt hours to find it costing somewhere around a billion dollars a gallon to make petroleum, when we say this is for free. It's like saying how we found how to get a pipe in back of the savings account of the kiddies' bank and all you have to do is pump it out."

"In photosynthesis we find the production of fMMi very beautiful, orderly molecular structures— and orderly molecular structures are exactly the opposite of increasing disorder.

"So, we find all the biologicals are antientropic. In fact, we've found that our Earth itself seems to be antientropic: it impounds and puts energy together and the energy being collected, both as energy and as matter, as the dust, and energy as radiation— both kinds of energy are being impounded,

"We find that the vegetation gradually dies and the leaves fall, and there is dust and winds, and it gradually gets buried. It gets buried deeper and deeper and the three- quarters of it in the water gets buried very very deeply. We've found that by the 4,000 foot depth, where the pressures are really very great, it gets to be such a pressure that it gradually turns into petroleum, at just about 4,500 feet of depth, and suddenly we have great salt domes, and petroleum and great fossil fuels. We find our energies then being concentrated and concentrated in the most beautiful orderly"

^RBF DEFINITIONS

Energy Event:

"An energy event is an energy transaction."

- Cite Definitions for SYNERGETICS BY PETER PEARCE. 1967

Energy Event:

"The energy event of an action and a reaction /"and a resultant-/ ie inherently processional because it is against gravity. It is a linear acceleration and an angular acceleration simultaneously, as functions with a prominent resultant and a prominent reaction. Because we have now learned that these are going to be at angles other than 180 , the three-fold affair is obviously not going to occur in a plane. Therefore, we are not surprised to find that our event has a positive and a negative pair of events which then come together to make the tetrahedron, the tetrahedron then being the consequence of a positive and a negative event and it becomes the first subdivision of Universe."

- Cite OREGON Lecture #5 - p. 175> 9 Jul'62

Energy $\mathcal{E}Y_m =$

•When the end of one energy action comes over the middle of another energy vector there is a precessional effect, a tensional effect. One energy event gets angularly precessed and the next energy event goes by the center of another mass and each one of them are interacting together. It is a basketry interweaving where each one precesses the other angularly so that they hold together very much as a cotton ball.

... •

- Citation in context at Matter, p. 62

energy in the form of a vector

"We have an explanation of structural engineering in force diagrams. You hear engineers say you have action and reaction so there really are always sort of two lines. If I get a result like this I get a reaction in the opposite direction. I began to discover that this was an oversimplification. At the top here I have a man standing and he jumps. In the first place I want you to remember that he jumps. He doesn't glide horizontally, he jumps. That is, he goes outwardly from the center of the Earth and that is a vector. That is an energy action in itself. He jumps. He is the action. The action was not just horizontal but also vertical. It was mildly vertical in that he went outwardly. He represents already this kind of a motion and this kind of a motion. As he jumps this boat goes into reaction and shoots off that way and then a moment later he lands and the boat goes this way so he is the action and he is complex in that he is both horizontal and vertical and he jumped. There is a reaction and a result so there really is a four-foldedness going on. Sometimes it looks quite three-folded because he doesn't jump very high. It is all right for us to think of a tetrahedron very low in

Energy Event: SlidyU

(1)

altitude.”

(See Slides #43-46

140-141. Illustration #3.) 6 Jul'62

Energy Event* (Second Slide):

(2)

"Now here is another case and it has a whole lot to do with how those boats were angled in their keels. There are all kinds of fundamentals of shape. Much of the action->reaction kind of talk doesn't pay much attention to those relationships. At any rate, we have him now jumping again from the stern of the boat and so this one starts to whirl that way and the end comes round like this and he jumps in this one and it goes off like this. This one whirls around and starts to follow him so that the reaction is following the resultant. They are not going in opposite directions."

- Cite Oregon Lecture #4, p. 141, 6 Jul'62

Energy Event: (Third Slide)?

(3)

"Now the boats are more or less parallel to one another so he jumps from one to the other and they literally run around and run into each other. The reaction and resultant run into each other. Notice that this begins to look like a triangle and there also, as I said, was a vertical component out towards it so it not only looked like a triangle but more or less our friend tetrahedron."

• Cite Oregon Lecture #4, p. 141 • 6 Jul'62

'ENC/KV ScC?'s/|,2||

"This complex of his action and the reaction, I call an event. This is a picture of an event and it has also a vertical component coming out towards us. I see that the event could look like this. It could look something like a triangle, and so forth. Now then, let me take an event which seems to be in three parts, but which also has a vertical component and can also look like a tripod of a camera--- and the tripod legs want to spread outwardly.

Then I have another event where the thing comes around on itself, like this, and it contains it so here we have the tripod. In one and the other event, I have two events coming together and one of them comes back around to itself and prevents the legs of the tripod from going outwardly. It is like three strings between the three feet of the tripod and they won't let it go any further because our friend tetrahedron begins to show up so suddenly we have a stable structure. Remember yesterday I also showed you a picture with three things falling towards each other and the legs were sliding out and then we finally contained them. Now we are coming back here to where we have two events which can develop a stability."

- Cite urgeon Lecture A, pp. 141-142. 6 Jul*62

KbF JibKIMThuNS

Energy Event: (Synergetics Illustration #2.): (5)

"Here is our friend the 2-form which we were talking about. I spoke about a triangle and a triangle we said could really be opened and look like a Z. Then we must find they are not operating in a plane, there is no such thing as a plane, therefore one of the legs is sticking up a little. Here is our 2-form. I have a positive Z and a negative Z. One cannot nest in the other. Notice if I try to make this vertical leg go to the other one, this one refuses to go. One is a positive and the other a negative helix--- spirals, and they will never be congruent with one another. I put them together like this and they complement

one another and they become the tetrahedron. This way you can really see that each one of those is what we call the triangle. An event is a triangle, A triangle is an event. Two of them together make the tetrahedron."

Involvement of 92 Elegants: (1}

"The physical Universe is an aggregate of frequencies.

"Each chemical element is uniquely identifiable in the eldFo- magnetic ppectrum by its own unique set of separately unique frequencies. None of the chemical-element sets or individual frequencies is the same as those of any iHl of the other chemical elements' frquencies. The different frequencies of one element's set produce unique cyclic-frequency interactions whose resonances are similar to musical chords.

"The electromagnetic spectrum of physical Universe embraces the full spectrum range of as yet discovered and identified radiation frequencies of all the first 92 self-regenerative, as well as the only split-second enduring elements beyond the 92 self-regeneratives thus far discovered by experimental physics. The macro/micro-cosmic electromagnetic spectrum chart discloses a cosmic orchestration that ranges from those of the microcosmic to the very complex macrocosmic-embracing whole celestial Universe nebulae. The human senses are able to tune in no more than one-millionth of the total known frequency range limits of the presently known electromagnetic spectrum."

- Cite SYNERGETICS text at Sec. 515.21, draft of Jul'71

Energy Involvement of 92 Elements: (2)

"Whether expressed in foot-pounds per minute or kilowatt- hours, the total physical work done by all the muscles of all humans in all the two and one-half million years of known presence of humans aboard our Planet Earth, amounts to less than the energy released in one second of time by one hurricane; one hurricane's released energy equals the total energy of the combined atomic bombs thus far produced and stockpiled by the Russians and the U.S.A. In contradistinction to this minuscule energy involvement of all history's human muscle, the invisible, weightless, but cosmically magnificent minds of humans have thus far discovered, quantized, and catalogued the relative abundance of each and all of the 92 regenerative chemical elements occurring on all the visible stars of known Universe. Thus emerges human awareness of the physical-energy-mastering potential of the metaphysical mind's extraordinary information sorting and -analyzing capability."

- Cite SYNERGETICS text at Sec. 515.21; draft of 25 Jul'71

Energy Involvement of 92 Chemical Elements;

"The physical Universe is an aggregate of frequencies. Each chemical element is uniquely identifiable in the electromagnetic spectrum by its frequencies. None of them resemble each other and their interactions bring about other unique cycles of frequencies which act like great musical chords. We have a great orchestration which grows from the micro which are absolutely undetectable by human senses, to the very complex which are in terms of the whole galaxies. In fact the human senses are only able to tune in about a millionth of the total known realm of identities of phenomena. Thus comes the awareness of the physical giving the metaphysical employment--- to apply its extraordinary sorting capability."

Energy Slave:

"In energy slave is an inorganic energy-processing device which is an externalisation of one of the internal functions of nan. It is a composite measure of the level of industrialization; it is found by taking the total amount of energy consumed and converted to effective work by nan, and dividing this by the amount of work one man is able to do in a year, this gives the man-year equivalents of work being done for man by his inanimate slaves.

"In 1970: One energy slave ` ` 37,500,000 foot-pounds One energy slave - 14.1232 kilowatt hours One energy slave - .0017654 tons (metric) of coal equivalent

- Cite World Game Series, Doc. #1, p.99, 1971

Energy Slav: (1)

"May I mention energy? The mrrv slave . . . had its roots

- . . when I was with Fortune Magazine doing its Tenth Anniversary issue of 1940, we calculated what percentage of the energy of the planet each person has,

"Just 1810, a hundred and fifty years ago, the United States Treasury made the first economic census of America. We had one million families in America in 1810. Shocking figures. We also had one million human slaves in the United States; that is, one per family. There were very,very few families who literally owned those slaves. At that time the Treasury valued the homestead, the average homestead at \$350 and the average man slave was worth \$400, or \$50 more than the homestead. The machine could do some work for you. But there were no tractors, and nothing coming over any wires yet, in 1810. When we talk about energy we mean the ability to do work, the ability to lift one pound one foot and then have foot-pounds per minute. You are trying to describe something acting directly against gravity and mass attraction. So we have the armies of the Earth measuring the capabilities of young human beings to carry loads up mountains, or whatever. Foot-pounds of work for a given amount of energy intake."

- Cite World Game, Jun-Jul'69

Energy Slave; (2)

"If you take the work that a young healthy man can do in a year, and once you get the foot-pounds you can get the decimal units or kilowatts, or anything you want from kilowatt hours. We have manpower years. And we can rate those as if we were talking about horsepower years.

"I found that the way we use our energy, either as matter--- the way we design an engine, the relative efficiencies, and use up a whole lot of energies in some kind of engines, or reciprocating ... our automobiles are only 15 percent efficient. They were actually not designed right because you have the explosion on top of the piston, and the piston connecting with the connecting rod and the crankshaft center--- it contradicts you immediately--- 15 percent is all you get out of it. In the turbine you have the explosion on the side to go, with a 90-degree restraint instead of a 180-degree restraint, and you get 30 percent efficiency. In our Jet engine without any connecting rod at all, you get 60 percent efficiency. Increments each time of 15, 30, and 60 percent. It is interesting to understand these things we are doing."

- Cite World Game, Jun-Jul'69

Energy. Slave; (3)

"Now, I found that our overall use of our energy, our design, is very bad. We have in America--- and it's beginning to be that way around the rest of the world--- but at all times in America there are over a million cars standing in front of red lights with their engines going, averaging 100 horsepower, and going nowhere¹. And we try to get the Russians

and Americanstogether with the Arabs and Israelis fighting over Arabia just to do that kind of nonsense.

"So I find that our overall efficiency is only about 4 per cent, therefore, taking the total energy consumed in what they call a network economy. . . If you are on the Eastern seaboard here, and the amount of energy we take in per year, of food and water and power and coal and fossil fuels, and divide that up by 25 you get 4 percent which we are realizing. Then you come out with so many kilowatt hours and you can put that into manpower, and I call that one energy slave."

- Cite RBF to World Game at NT Studio School, 12 Jun-31 Jul*69, from Saturn Film transcript, Sound 1, Take 1, pp.11-14*

Energy Slave;

"It is a very extraordinary kind of a picture, looking at those energy slaves / `` plotted on the Dymaxion Airocean World raap_7. Notice that America then is really quite white, . , When you get out to the West Coast the number of energy slaves per individual is fantastically high. China is beginning to show much more white. When I dUthis in 1940 China, had practically no white. India is till very,very red. And you get all those reds in Africa with just a few little whites scattered around. In South America notice all reds and very little whites. Nothing could give you more quickly the fundamnetals of man's being successful and unsuccesful for a generation of life,"

Energy

"Energy slaves are determined as follows: In an eight-hour day one man can do approximately 1\$0,000 foot-pounds of work (the energy required to lift one pound one foot vertically). Consumption of mineral and water energy in 1950 is estimated at 80-1/6 quintillion foot-pounds. Ilan's efficiency converts only a rough four percent of these into work, or about 3-1/5 quintillion foot-pounds. Dividing this by 250 work days' (one year) energy output of one man (37\$ million foot-pounds), the result is 85\$ billion man-year equivalents of work done by machines and structures. These equivalents are called energy slaves."

Engineering:

"Engineering really started at sea: It had to float--- and you couldn't
do it with stone."

- Cite RBF to Tale students, New Haven, 9 Dec'73

EfKUiEwIJUP

"Until the Introduction of geodesic structures, structural analysis
and engineering design strategies regarding clear-span structural
enclosures in general, and domical structures in particular, were
predicated upon the stress analysis of individual beams, columns,
and cantilevers as separate components and thereafter as a solid
congressional shell with no one local part receiving much, if any, aid

from other parts. Their primarily compressions! totality was aided here and there by tensional sinews but tension was a discontinuous local aid and subordinate. As academically constituted in the middle of this 20th century engineering could in no way predict, let alone rely upon, the synergetic behaviors of geodesics in which any one, several, or many of the components could be interchangeably removed without in any way jeopardizing the structural integrity cohering of the remaining structure. Engineering was therefore, and as yet is, utterly unable to analyze effectively and correctly tensegrity geodesic structural spheres in which none of the compression members ever touch one another and only the tension is continuous."

- Cite "Tensegrity," Portfolio-Art News, p.116, Dec'61 as rewritten by RBF in SYNERGETICS at Sec. 640.02, 3 Oct'72

Engineering;

"Engineering holds that the prime difference between the point of view of laymen and engineers is that the layman does not recognize, anticipate, and pay heed, as do engineers, to the experimentally demonstrable fact that every action always has an equal and opposite reaction. But the engineers have not modernized their concept to accommodate and adjust refiningly to two of the scientists' recent physical discoveries and measurements--- first; of light's speed, as well as the speed of all electromagnetically propagated radiation; and secondly, the phenomenon known as precession. The approximately one billion kilometers per hour speed of all radiation being too fast for human sense apprehendability, the engineers have not yet been constrained to recognize, as must the physicist, that there is no instant Universe, as was misassumed by all pre-twentieth century scientific cosmologies and cosmogonies--- before the knowledge

that light had indeed a speed. Engineering must now acknowledge realistically and accommodate analytically the experimentally demonstrable fact that every action has not only a reaction, but also a nonsimultaneously, but immediately subsequent, resultant."

- Cite NEHRU SPEECH, p.22, 13 Nov'6?

Engineering;

"Unfortunately engineering has connitted itself in the past exclusively to locally infinite and inherently indeterminate systems and have had to rely essentially on the test proven, local behaviors of snail systems wuch as columns, beams, levers, et. al., opinionatedly fortified with 'safely gueslimated' complex predictions.

- Cite RBF Ltr. to Shoji Sadao, 15 Feb. '66, p.5.

RBF DEFINITIONS

"The processes of engineering

up to the moment of my invention of geodesic structures, are predicated upon the stress analysis of individual beam and column behaviors, as separate components

and thereafter upon comprehensively organised beams, columns and cantilevers as a solid compressions! over-all integrity of cohesion, aided here and there by tensionally exaggerated sinews--- tension being suobordinate and local.

The reforest, engineering--- as academically constituted" can" in no way predict the associated behaviors of Geodesics in which any one, several or many of the components could be removed without, in any way, jeopardizing the structural integrity cohesion of the remaining primary structure."

- Cite "Tensegrity," PORTFOLIO + ART NEWS, p. 116, D«c, *<1

Engineering:

"The behavior pattern of engineering indicates that it functions not at the original design level, but as an inverted phase of science. Engineering is the judicial authority that never assumes the initiative but decides and proves the assertions of science and design. Engineering thus establishes reliable data on the failure limits of complex associations and also measures the new synergetic behavior characteristics discovered by design initiative. Thus, engineering rapidly places on inventory comprehensive data pertaining to the known behavior characteristics of complex associations previously undertaken by design. These complex associations may be broadly defined as alloys, structures, mechanics, processes and services. It is a function of engineering to provide society with reliable predictions as to the behavior characteristics of complex designs predicated on competent experience. Engineering, then, consolidates the net gains of science and design in the industrial complex. Gains are design intuited synergies."

Enough to Go Around: (1)

"To speak about the next 30 years of humanity on Earth in only 30
minutes leaves only about a minute per year. But the next 30 years
will be a period of extraordinary challenge in our time.

"There has been no other time in the history of human beings upon our
planet where so any hum ns have had knowledge of the existence of so
many other humans...the vast increase in knowledge has the potential
of liberating mankind from the clutches of poverty, pestilence, and
war....First human beings have to learn to deal with the totality of their
planet and the needs of the rest of their fellow beings.

"Man gradually survived the evolutionary process by learning how to cope with his environment. The vast know-how accumulation that has taken place in our time has given us the ability to take care of everyone on this planet, the world is rapidly becoming integrated, not isolated. Sixty percent of humanity now experiences a higher standard of living than the richest king did when I was a child."

- RBF quoted by Bob Swetnam in Pomona, CA., Progress Bulletin, 17 Apr¹'77

Enough to Go Around: (2)

"We are learning to do more things with less materials.... Twenty-three years from now all humanity could enjoy very high standards of living, if we would stop our outmoded thinking of national, local, and personal survival.

"We should begin to look out for one another. There is enough to go around for everyone. It is just a matter of realising how we can use the total....We can begin to put our highest hope in our young, for they are the ones who are receptive to the new knowledge, the rapidly changing world. The young are ready for the new leadership."

"If I am only going to work on the environment and not on the individual, then I said, Number One: What's the environment? You've got to have a definition of the environment. So I have a definition of the environment which I've made into a little jingle:

Environment to each must be All that is, that isn't me. Universe in turn must be All that isn't me, and me.

"The only difference between Universe and environment is me, the observer, the transforming center where we can really convert information to action.

"The environment is an aggregate of events, not things. Some of the events are of long duration and others are short. And I saw that all the things that could happen to you and me, the events that could affect us, have two origins: the macrocosmic that impinge upon us from outside; or all the events that impinge upon us from inside of us. Whenever I can I always try to make a comprehensive prime definition and then break it into the main parts. So here are the macrocosmic and microcosmic - Cite RBF lecture at Wistar, Inst. EJA transcript p.9, 19 Feb'73

Environment:

"macrocosmic impingements upon us. And I saw that many of the macrocosmic, very large and very infrequent, would not impinge very often."

- Cite HBF lecture at Wistar Inst. EJA transcript p.9, 19 Feb'73
Environment:

"The only real difference between Universe and environment is me. So I find that the environment is not, of course, things; they're events. We find that the environment is really a pattern of events which occur and impinge on the individual from outside and from inside. Some of them occur very frequently--- the infrequent usually in larger magnitude and the frequent of fairly low magnitude. Man is the focus of these impingements and you can't stop any of them. ... And so, comprehensively, geometrically, outwardly and inwardly, at 1 y and

microcosmically, I find that man is really in the middle."

— Cite RBF in Edward Newman TV Interview, Feb'73
Environment:

"It was clear that environment is not a lot of things around us but consists of all the events of the Universe, I have since written a defining jingle:

Environment To each must be All that is That isn't me.

Universe

'In turn must be All that is Including me.

The only difference between Universe and Environment is me--- The experiencing observer."

Environment:

"I figure that when the environment la scientifically conceived and rendered, that the human occupants can then divest themselves of the necessity of onerous and puritanic hardship of conduct and yet accomplish successful and happy living in naturally engendered sanity."

Cite: Statement by RBF to EJA Wichita Kansas, 1946

•Man is nbt unique in having altered hie environment. All living creatures alter the environment in one way or another, and then the altered environment altera then back. Their is a chain reaction that goes on, giving rise to what we call evolution. And not only living creatures but every physical system gives off energies entropically, and thereby alters the environment. The Universe is a very complex environment

altering local processes, but there are creatures that alter their environment in discrete ways, and we find that when they do so, in as much as all creatures are processes, the altered environment, in its discrete way, carries out some function of the success of that creatures process."

"In 1927 I put the physical and economic success of all s*n on the highest priority as a tactical objective, I felt that mn'a control of his dynamic environment involved his recognition that environment is not static and does not consist of things. He must learn to think of environment realistically as the impingement on each individual and his receptor tuning-in of those impingements of a complex program of variously overlapping nonsimultaneous events, occurring in a wide range of frequencies and energy magnitudes both within

the non-sensorially tunable and visually tunable frequencies of the electromagnetic spectrum as well as within the wave and frequency patternings of the crystalline, liquid, and gaseous states of energy know superficially (and misleadingly), as matter,

"Each Individual's environment of the moment is different from the next moment and from that of every other individual, though two or more individuals may think that they are mutually experiencing the same environment. This is because our environment is the consequence of our response to and employment of only a few of the operative factors present,"

- Cite NASA Speech, p.33» Jun'66

- At almost any spot anywhere around the Earth there are always thousands of different radio or TV programs silently and invisibly present. With a wideband radio set we can tune any one of their •twelve* components of the environment, in the same way* the other factors tune in or out.

"It seemed evident to me in 1927 that if these local metaphysical and physical event patterns could be realistically conceived that they then could be brought under control by design science to an ever increasingly satisfactory extent. This would permit the new life growing and developing within a favorably organized environment to do so without having its faculties damaged, its drives frustrated, its information storage system overloaded with false information, and its reflexes and subconscious coordination illogically coupled.

"In 1927 I said to myself: 'What do we know about the metaphysical and physical events that impinge on man?' I saw first that all the things that could happen to humanity came either from outside or from inside themselves and that I must catalogue them all in two main groups--- those of inside origin and those of outside origin, i.e., of microcosmic and macrocosmic origins."

- Cite NASA Speech, pp.3-34, Jun'66

"I decided next to start writing a list of everything I could remember as ever having happened to humanity. It rains on him_ It snows on him. People smile at him and people stick (their/butl tongues at him.

"I listed everything I could think of that could possibly happen to nan. I thought this listiikg might go on for months or years. I therefore was amaxed that in a few days I had written down everything I could recall ever having happened to anyone, either from inside himself or from outside himself. I compiled that list in 1927-28. In 1929 I showed my list to some engineering magazine editors. They were interested in it. They liked the idea of a checklist of all the things a design scientist has to cope with. Over a periomd of two years they made a few additions to my list and made it part of society's knowledge. This gave me perspective upon the list as does the spider gain a perspective view of the webbing it has extruded from itself.

"I said, 'Now that it is published, I see something about this list which is ridiculous. I see "hurricanes" nect to "mosquitoes."' I set about immediately to rearrange the list in the order of relative severity of vital threat to the human individual of the gamut of events that impinge upon man both" - Cite NA1A Speech, pp.34-35, Jun'66

Environmental Events Hierarchy:

<4)

"from outside and from inside himself. I rearranged all my environment items under headings of relative severity starting with »cataclysmic--- which contained novae, that is, exploding stars. Next came 'very dangerous.' Next came 'disturbing.' Next came 'annoting.' I ended with innocuous. When I had all the events distributed under

those headings, I then took the groups of Itemized events within the separate categories and arranged them in order of relative severity. None defied placement within this order of severity magnitude. When I had finished a truly surprising realization occurred.

"What I saw as that the more severe the event, the less frequently did it reccur. Earthquaked were far less frequent than bugs.

"I saw that the *iiole complex of everday reality which compounded to constitute 'the environment' continuity was altogether identifiable as pure quantum mechanics. It could therefore be treated with rigorously as a design science."

"Furthermore, its discovery as constituting quantum mechanics"

Enylrgncientftl EYonta Hierarchy: (6)

"»Mach numbers/ said, 'Physics is experience arranged in most economical order.' To define the special case of science known as physics Mach added only the two words 'most economical' to Eddington's definition of generalised science. Mach made this qualification because physicists have found that nature always behaves most economically.

"Experiments show that there are six positive and six negative degrees of fundamental transformation freedoms, which provide twelve alternate ways in which nature can behave most economically upon each and every energy event occurrence.

"Eddington's generalized science could look with equal validity for less economical orders. Thus was Boolean algebra discovered by deliberate employment of the absurd, i.e., nonexperience, which would mean the deliberately noneconomical. Reductio ad absurdum is often a powerful tool of scientific exploration."

- Cite NASA Speech, pp. J6-J7, Jun'66

Environment Events Hierarchy:

"Just as it may be verified that the larger the magnitude of nature's environment events, the more energy involved, and concomitantly the lesser the type of event, the lesser the magnitude, the more frequent. This is basic to quanta and wave mechanics; and therefore, to teleological design strategy.

"It is a corollary that the more frequent and the more universal the events of environment--- and therefore the more universally adaptive the tool--- the simpler of its solution; for example, the simplicity of the biological cell nucleus which valves universal teleological problems; or the simplicity of the solar system's chemistry and that chemistry's transformation upon the solar system, and its checks and balances including VB its support of life on Earth, all done with the interplay of a few of the simpler atoms, and most universal of all and accounting for 99 per cent of the physical Universe are a few types of parts of the simplest structures of all: the atoms."

• The logistical evolution of human artifacts and their cumulative
 feedback transforming effects on human ecology's total environment
 transition and the latter's reciprocal modification of man's evolutionary
 patterning in Universe. . .

- Citation and context at Computer (A), 10 Dec'64
 Epigenetic Landscape:

All creatures, as with any systems including inanimate systems, give off their energies and thereby alter the environment by doing so. Living creatures alter the environment a little more as they give off more energies; they alter it much more than the inanimates. The altered environment requires alternation of the patterning of the living creatures. There is the

¹ epigenetic landscape.¹ the interplay of living creatures altering an environment and of an environment altering the creatures. This goes on and on and it is what we mean by evolution. It is inexorable and irreversible. Many creatures alter the environment in nondiscrete ways. Other creatures alter it in discrete and preferred patterns; as, for instance, the bird's nest."

- Cite COK.ITKhKT TO HUriAKITY, p.)2 , May'70

Epigenetic Landscape:

"There's continual evolution and change. Man tends to think of the great security of things. He feels that if he's familiar with it, he wants to hold on to it a little. • . just in fear. He's been afraid of change. But change is always there. But what we have unique about human beings in relation to other living species is the following • • •

*1 find when all the phenomena alters the environment, that its due to entropy, just as somebody would call a very inanimate system, as giving off energy. So in giving it off to the environment, it alters the environment. All the living creatures alter the environment a little more rapidly than the altered environment alters the cultures. So there's a feedback regeneration going on here, which brings about evolution."

Epigenetic Landscape:

"Professor Waddington the geneticist of Edinburgh IflBfilflBMHMMU-niversity points out that all biological species--- including humans--are continuum ally altering the environment and the altered environment in turn alters the biological lives. The process is regenerative. As genetics control the initial behaviors of the biological lives so too does the environment modify the regenerative phases of the biological lives. For this reason Professor Waddington speaks of the environment as the epigenetic landscape."

Cite UNESCO TIFLIS 1968, p. 1

RBF DiiFDiTIOTiS

"As no energy may be lost of Universe, and as all parts of Universe act, theoretically, upon all other parts, man may accomplish modification of his particular evolution only by relative modification of the aspects of the Universe. The picture is of Universe as a kaleidoscope Of sum-total symmetry only, the relative aspects of which may be dynamically and infinitely reordered without exemption of, or addition to. the component totality. Every shift (in the energy balance accomplished by man at Earth's crust) affects all Universe. Though fantastic, this is the scientific truth. If man seems frequently frustrated in his attempts at evolutionary modifications, all his failures and success may be truly evaluated in the scientific frame of total dynamic reference. It is an astronomical kaleidoscope--- the little fellow is shaking--- and from within. Even thinking about truth alters truth."

****».Epistemological Accounting consists entirely of rational tetrahedral quantation."**

NOTE: For the past year RBF has used the above term to describe the synthesis of the topological hierarchy and the quantum hierarchy--- or Euler and Gibbs. In the course of reviewing Chapter S, "Omni topology" RBF concluded that the term was not descriptive. Henceforth he will use "Synergetic Hierarchy."

See Synergetic Hierarchy.

tumn 1968, who attributes this quote to * RBF

Epistemology:

"... The weightless process of human thought development is known to scholars as epistemology. ... Such words as epistemology stop most of humanity from pursuing such important considerations as the development of the thought processes."

- Cite HORF LITTLE, p. 2. Oct*66

"I don't know any man who really knows anything about himself. I don't think any man in this room can stand up and tell me what he's doing with his luncheon. And no one can stand up and say that he's consciously pushing each of his hairs out of his head in preferred shapes and colors, and I doubt that anyone even knows why he has hair. In fact, I don't know anybody who really knows anything. But it's very important to recognise what we don't know, and to realize that so far man has been moderately successful in his environment despite his ignorance."

- Cite Calvin Tomkins, *The New Yorker*, 8 Jan, 66, p. 62.

Epistemology;

'Omnidirectional Halo' is "the consequence of my deep and continuing urge to describe our thought processes and thereby to discover the fundamental generalised mathematical principles governing subjective comprehension and objective realisations by man of his conscious participation in evolutionary events of the universe."

"In order to reduce the concept of vector equilibrium to a single name identify, we employ the word equanimity aa identifying the etrnal metaphysical conceptuality model that eternally tolerates and accommodates all the physically regenerative, intertransforming transactions of eternal, inexorable, and irreversible evolution's complex complementations, which are unitarily unthinkable, though finite.

"The equanimity model permits metaphysically conceptual thinking and permits man to employ the package-word 'Universe.* Equanimity, the epistemological model, is the omni-intertransfor- native, differential accomraodator and Identifies the direction toward the absolute, completely exquisite limit of zero- error, zero-time omnicompre- hension toward which our oscillatory, pulsating reduction of tolerated cerebrally reflexed aberrations trend.

"Humanity's physical brains' inherent subjective-to-objective time lag reflexing induces the relatively aberrated observation and asym- metrical articulation tolerated by ever more inclusively and incisively demanding mind's consciousness of the absolute exactitude of the eternally referential centrality"

- Cite SYNERGETICS draft at Secs. 443.01-03, 26 May'72

Equanimity Model:

Equilibrium:

"The Universe just refuses to get caught at equilibrium. I became
suspicious back in 19*7 that nature didn't become infinitely disorderly.
We caught her in sort of a symmetric phase where you called
it a molecule, and another symmetric we may call a cell. Thus we get
what we call atom. And then we get the complexes like human beings,
and they are sort of levels of symmetry. But these levels of symmetry
would never occur in equilibrium; they are always on one side or
the other: the crystal is positive or negative* So she had what I call
asymmetry, and she had what I saw was minimum asymmetry and

maximum asymmetry--- which we call disorderly just because it was more confusing to look at. But she did everything relative to equilibrium. She would go from the negative through the equilibrium to the positive. But she refused to get caught at it. So the concave--- pull the rubber glove off your left hand and now it fits your right hand--- and the concave becomes the convex. You could have the proton and neutron, and they were always known to coexist These are the covariables, which ML is complementarity, as they call it in physics."

Equilibrium:

*. . . Truth is ever approaching evolutionary and constantly inter-transforming . . in ever closer proximity to perfect equilibrium of all transformative forces, but never attaining such equilibrium of Absolute Truth The metaphysical passes through but fails to remain at the xero of equilibriaus truth,"

- Cite Pendulum Model VS Scenario Model. 23 Dec*6fi

Equilibrium:

"Nature abhors an equilibrium as much as she abhors a perfect vacuum or a perfect anything. For instance, when an airplane in flight comes to equilibrium, we call it a stall, and the plane becomes unmanageable and goes swiftly out of equilibrium and into a plunging field of gravity. But I saw that we could approach or employ an almost perfect equilibrium as we employed a crooked line which swiftly approached but never reached the perfect or exact. I saw that a comprehensive structural system would have to involve all the positive and negative tendencies either side of equilibrium. The comprehensive system would have also to involve all the topological pattern components and as a quasi- equilibrial structure would have to be approximately the same length; therefore, all the angulation would have to be in increments of approximately sixty degrees."

Q. "Do you have any feelings or ideas or intuitions about schizophrenia?"

RBF: "I think that whatever my thoughts are, they relate to---coming back to my mathematics---to vector eaulilibrium. Nature refuses to stop at equilibrium. So long as we have time we will always be dis-eauillbrious. It is only when you have eternal nothingness that you can have eaulilibrium. And the equilibrium is not a linear affair. It is an omnidirectional phenomenon of all the motions I have given you.

"And so getting into my synergetics again—and

the isotropic vector matrix which is the central position where everything is at equilibrium in relation to its orbit pulsations, rotations, and so forth occur. I feel that every day you and I become asymmetrically disequilibriumous and that our sleeping is where we come back to the minimum aberration of the disequilibriumous pulsing...

So that I can see how a child might really get disequilibriumous asymmetrically so and not return with the sleep. And to add asymmetry to asymmetry could really get pretty badly hoiked"

- Cite transcript p.20, RDF taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb*77

"away from the relief of the night.. To me, sleep then is becoming more symmetrical---the minimum asymmetry of all of our faculties. Each day we get quite asymmetrical---like anybody's desk, it gets all messed up and then we get it all cleaned up.

"I think of sleep as the greatest cure we have. The kids who don't get cured in sleep are the ones who really get in trouble. They can't get back to the minimum disequilibrium."

JffF DEFINITIONS

Q. What conclusive evidence la there of mind as God?

A. *1 do not know of any single conclusive evidence of God. but there is ample disclosure of the unique capabilities of mind. Brains deal always and only with apprehending, recording, storing, retrieving for reconsideration and re-storing again for further recall, each

special-case experience. Mind and mind alone has the capability of discovering relationships existing between uniquely identifiable entities, which interrelationships are not indicated or predicted by any of the constant characteristics of the entities taken separately. As for instance, the interattraction of masses; as for instance the interattraction of the Earth and the Moon. The relative interattraction force of these is enormous; too, in contradistinction to the interattraction force between a golf ball and a pea. The relative force is determined by intermultiplying the relative mass values of these four bodies or entities, respectively, having arrived at the total relative mass values of the four. The relative force value of any two may be obtained by, let us say, multiplying the Earth mass times Moon mass, which is obviously very great in respect to golf ball M times pea M."

Etern*1 Designing CAPUIVY (2)

"These relative initial force values are seen by experiment to be predictable by the inherent values of the separate entities. However, what is not predictable from their inherent characteristics per se, is that when we halve the distance intervening between any two. e.g. Earth and Moon, then their mutual interattractiveness increases at a rate of the second power of the inverse to the ratio of the relative interdistance change; i.e., halving the distance of the two mass-identified objects increases the interattraction fourfold.

"Mind having learned intuitively and observingly from the experience of successively repeated measuring, finds this accelerating interattraction always occurs under such circumstances. Mind informs brain that this result has been obtained, whereafter discovery of that mathematical formula becomes one of brain's special-case experiences that it had learned from mind, Just as it learned from nose that such and such an experience is occurring and brain thereafter remembers

that that experience occurred. Synergy means *the integrated inter-behaviors of all systems unpredicted by behaviors or characteristics of any of the system's parts when considered only separately.* An atom per se does not predict atomic"

"intercombining as chemical molecules, A molecule per se does not predict unique enzymic proclivities and biological protoplasm's organizational integrities. Protoplasm per se does not predict elephants and palm trees, nor their interregenerative conversion of their respective respiratory gases. Neither elephants nor palm trees per se predict the solar system does not predict galaxies, etcetera. The greater complex is never predicted by any of the lesser subassemblies. Universe is unpredicted by any of its parts or subassemblies. Universe is explored by humans but their exploration is inherently only a meager segment of an eternally regenerative scenario of * a nonsimultaneously aggregating and only partially overlapping experience events of inherently limited local observers. Universe itself is synergetic, ergo the eternal mystery is inherent. Awareness of this greater integrity and mystery has inspired thinkers throughout all known history to acknowledge a greater, a priori intellect to be experimentally manifest in Universe and cosmically greater than that manifest in humans. How else the integrity of design of the regenerative chemical elements, et al? That awareness of an a priori greater designing integrity has, throughout history, occasioned O a human,"

Eternal designing Capability Sequence:

"intuitively sensed, word identification of the greater integrity. In our western world's language the word is mouthed as 'god.' The brains of those who do not have confidence in their own thinking have recorded this 'god' symbol as a special-case concept and have often given it specialcase form and clothing--- most frequently that of a bigger man,

thus missing altogether that it was occasioned only by a thinker's hierarchical sense of awareness of this cosmic integrity being inherently the most comprehensive, scientific generalization-of-generalizations implicit in the thus far discovered complex interaccommodation of all the thus far scientifically discovered cosmic principles, which to rank as principles must be devoid of exceptions, ergo must be eternal."

"However physically minuscule -an may be, the integrity of transformational transactions everywhere governing local Universe regenerations with discrete omni-interactommodative design logic, apparently requires the presence of a little bit of the eternal designing capability available as metaphysical mind, operating through human organisms, to be aboard planet Earth as the complex local problem processor, to offset the gamut of non-thinking conditioned reflexes of all biological systems. . . "

"We have a new norm. The phenomenon lag la simply due to the limited mechanism of the brain; we have to wait for the after-image to realise.

"The norm of Einstein is absolute speed instead of 'at rest' • . . What we called instantaneous in our innocence of yesterday. We get to lesser and lesser lags where we then approach eternal instantaneity: no lag at all. However, we have now learned from our generalisations of the great complexity of the interactions of principles that as we are disembarassed of our local exclusively physical chemistry, our local information-sensing devices, what will be realized is an eternal and

instant awareness of all the potentials that ever existed. All the great metaphysical integrity of the individual which is potential in the complex of interactions of the generalized principles, will always and only coexist eternally. I am saying that intellect, top-speed radiation, is simply the minimum lag before you get to the eternal.

"Intuition derives from the instantaneity of intellect, which is much faster than any physical phenomenon, such as the brain lags. Intuition is the insistence of intellect."

- Cite RBF to EJA, Beverly Hotel, NY, 22 June 1972
 Ettnwl JnotAnmmy: (2)

"Intuition is intellect coming instantly in at highest speed into dominance over lower-speed lagging brain-reflexing.

"Motion is not relative to standing still, but motion is relative to eternity, which is No-Time-At-All because no-time-at-all is inherent in the generalized principles. The beginning of awareness of intellect is otherness, the mass attraction of another with a pull which relates it to all our system.

"Eternity is simply highest speeds: not 'at rest' because it gets there in no-time-at-all: Complete intellection + Otherness + No-time-at-all.

"Differentiation functions in eternity through the nonredundant plurality of generalized principles."

•The physical expands and increases its velocities to cope with the greater and greater distances. There seems to be a constancy of top velocity, however, and

it was this that so impressed Einstein. All the various types of radiation , the ultraviolet, the radio waves, and the x-ray reach about 186,000 miles per second. This is very extraordinary. The metaphysical in contrast tries to define the principles that are discovered; as the definitions can never be perfect, the metaphysical must also modify the definitions from time to time as we learn a little more. But that doesn't change the principle. As observation becomes better, then*is less alteration.

"Thus we find the metaphysical tending to become steadier and to work toward the eternal.

"As a result words accumulate to form the dictionary as men discover shared aspects of their total experience that are unique and require identification. They agree; even though we know how mankind battles not to agree. But this is also part of the metaphysical drive to be sure. It will not be"

Eternal Slowdown:

(2)

"satisfied until it feels that the word is getting fairly close to eternal. So I find that one cannot slow down. The epitome of slowdown would be eternal. Hence there appears to be an absolute of the acceleration toward the speed of light and a slowdown toward eternity.

"The metaphysical orders a particular aspect of the physical; it finds new challenges and brings problems to men. It is continually harnessing the physical and cohering; it coheres and reorders. Therefore, I see man in an oscillation between his physical incarnation, his metaphysical occupation of the physical, and the regeneratively rebuilding phenomena.

"It may be only a complete new baby or the regeneration of the local cells (an organic total birth). This rebirth is continual. We have longer and longer metaphysical occupations in our experience of the physical Sun's cycles.

"The physical Universe is an aggregate of frequencies. Each element is uniquely identifiable in the electromagnetic spectrum by its frequencies. None of them resemble each other and their interactions bring about other unique cycles of frequencies"

"that act like great musical chords. We have a great orchestration that grows from the micro which are absolutely nondetectable by the human senses, to the very complex which are in terms of whole galaxies. In fact the human senses are only able to tune into about a millionth of the total now known realm of identities of phenomena. Thus comes the awareness of the physical giving the metaphysical employment---to apply its extraordinary sorting capability. I find then that the more metaphysical and sensitive the man, the more his real significance; since there is no weight lost as life goes. Man is metaphysical; he is born into the physical to experience Universe and to continually re-order and master it. . .

"The metaphysical works toward the eternal slowdown and becomes steadier; the physical alone accelerates and is fast. It is really only the destructive or negative things that accelerate. Popular music is getting more and more noisy, raising more and more of a row: it is purely physical. Metaphysical is in exactly the opposite direction."

Eternity: (i)

"The focal manifest of entropic dispersal la increasingly disorderly and syntropic association is increasingly orderly. . . . Between the two they work very much like the rubber glove. There really is an annihilation into eternity with no time and dimensioning--- these are only in our temporal relativity. Time is within our lags and our gestation rates and in the frequencies of the electromagnetic spectrum.

But every time we have annihilation into eternity, it is not lost in principle; it Is only lost in the' relative inaccuracy which we must have to differentiate and have awareness.

"Every time you enter eternity, everything called shape is cancelled and therefore there can be no static frame of reference. Our scenario Universe does not have shape nor is there relation to any static frame. There is an ideal which is eternal and inherently complex, which complexity is accompanied by the ideal transformability which synergetics elucidates.

"The episodes have shape, but the shape is always mildly asymmetrical and continually transforming. There is"

- Cite RBF to BO*R, Kent, Ohio, 23 May*72

Eternity; (2)

"conceptual shape in the ideal, i.e., the ideal tetrahedron, but no size, no time. We have here what the Greek mathematicians were trying to say, but more accurately. Time gives specific size and symmetry due to inevitable lags: the lags of realization!

"Synergetics is the central symmetry through which the asymmetry pulsates. There are several kinds of positive and negative. The eternal temple of positive and negative, the North and South Poles; concave and convex; inside and outside. There is a fourfold twoness: one the exterior cosmic tetrahedron and the interior cosmic tetrahedron; the other is the circumference around the pole. The additive twoness is the poles; the multiplicative twoness is the concave-convex; these are the eternity."

buler:

"There are no surfaces. Therefore there are no areas.

So Luler*s topological aspects have to be altered to read : "lines" • trajectories; "vertexes" " crossings: and "areas" □ openings, i.e., where there are no trajectories or crossings. This relates to systems."

- Citation at Sm.a. 22 ipr'71

Euler:

"For Euler (covered tarily in the nineteenth century That all patterns of universe Can be resolved into three Conceptual differentiations Lines, crossings. and areas--- Systems immediately divide tniverse Into an outsideness And an insideness And a little bit of the universe <'/hich is the dividing system itself--- Xhlch always consists Of a constant relative abundance Of the lines, crossings, and areas In which .

$C + A - L + 2$."

,HI. WrilTTIOH, P. l?t

- Citation t context at Constant BelatlTa Abundance. Feb>71

Euler:

'"Topology is the science of fundamental pattern and structural relationships of eventw constellations. It wae discovered and developed by the mathematician Euler. He discovered that all patterns can be reduced to three prime conceptual characteristics: to lines, points where two lines cross or the same line crosses itself; and areas. bound by lines. He found that their is a constant relative abundance of these three fundamentally unique and no furhter reducible aspects of all patterning

$P \square A - L + 2$

This reads: the number of points plus the number of areas always equals the number of lines plus the number constant two. There are times when one area happens to coincide with others, . 'hen the faces of polyhedra coincide illusionarily the congruently hidden faces must be accounted arithmetically in formula.**

Eulr;

"I see things soetimes in terns of vectors, sometimes in terms of the faces, and sometimes in terms of the vertexes, which would be spheres. These are the three main aspects of all patterns known by Euler. Euler founded these incontrovertible minimum aspects of pattern. When Euler introduced topology, he, for the first time, initiated the return to conceptuality out of seemingly complete abstract mathematics, where we could come to completely empty sets, we thought; where we could have complete substitution of symbols for numbers and we could play the game of symbols.

"Euler said: 'We are dealing in pattern. Mathematics is pattern.' And he said, 'There are irreducible aspects of pattern. That is the patterns do represent some kinds of events. And there are the lines: a line is a unique kind of pattern. If i have two lines, where the two lines cross is distinctly different from where the two lines don't croos: it is the vertex, the convergence. This is absolute pattern uniqueness. Now I might have a third line crossing, and where the three of them cross, they will leave an interior area. An area is something completely differentiable from a line or a vertex and these make irredlOible qualities of pattern? *"' - Cite Oregon Lecture #7, pp.245-246. 11 Jul*62

RBF DEFINITIONS

"He was finally able to say that on a plane pattern the number of the vertexes plus the number of the areas will always equal the number of the edges plus the number one. Looking at a polyhedron and thinking about it as a flat picture, we can count these up. The number of vertexes is 18, and the number of faces is 19, so $18 + 19 = 37$, but the number of edges is 16 and the plus one makes 37. Euler found that he could do this for structures which were not in the plane. And then the accounting becomes the edges plus two instead of the edges plus one.

"If the pattern has a hole through it, like a doughnut, then we don't have plus anything. We leave out the two from the solid. When we leave out the two from the solid it is really a doughnut, and we are cutting out the axis which is to say that the axis is two.

"In other words when I say frequency to the second power times ten plus two, I assign two in every layer for the axis. We must pay attention to the fact that the 'plus Two' that Luler found has to be added to the vertexes plus faces equals edges plus two, when it is a structure in the round; but whehrw we"

- Cite Oregon Lecture #7, pp.245-246, 11 Oct'62

Euler;

"put a hole through it, we find we drop off the two; and then it ia vertexes plus faces equals edges. The plus two comes from coring, like coring an apple, which is to take out the axis.

"My identification of plus twoness is verified as it has shown up in the number of balls in any layer. In the round affair the two related to the axis of spin is inherent for any system, so we now allow the energy to account for the spinning."

- Cite Oregon Lecture #7, pp.245-246, 11 Jul'62

Euler: Leonhard Euler:(1707-1783.)

"Any system ia spinnable, a condition Euler began to discover in his great topology. Not only did Euler develoo the basic laws of tocology. . . but he also gave the world of engineering the concept of axes, that every system ia subject to its spin. Therefore there were neutral axes to every system."

Everybody's Business:

(D

"I think this town nesting of the air, the audiences here, those of us at the table, really are all of one mind. Humanity is deeply concerned about humanity. But I¹¹ Just point out as an engineer and as one who has operated in the research and advance activities for many, many years that the total community does not invent the telephone, nor the airplane; this is the work of the individual. The individual who finds technically better ways for society finds that what he has is usually not employed until society gets in a very great emergency,

"What we're really talking about today are human beings themselves, Not weaponry. We're really talking about human beings; that is our concern... and how will we serve them properly. It's coming out in the public domain in such an important way. There's much literacy. Society will in due course find itself in a very emergency.

"I talked to you about the government having underwritten a completely obsolete way of carrying on. If all those buildings were any good they would pay for themselves and we would not need those 20- to 30-year mortgages. The whole New York City"

Everybody's Business: (2)

"problem is that long, long indebtedness where you can't even meet the debt service; where we have been continually underwriting the old rather than tackling the new.

"I really am hopeful that this meeting will be paying considerable attention to what are the kinds of technical team of builders that we will find available as emergencies increase.

"I've just been at a meeting in Albuquerque. I was asked by M.I.T. if I would come to an intercollegiate meeting

of solutions of energy-harvesting problems. Engineering students from 30 universities were granted \$5,000 each to grant their producing technically-equivalent, new windmills, new methane gas, sun-energy converters, and so forth. Scientists and engineers went over the work of each of the different student groups. They had to have the apparatus run for 24 hours to prove that, it really works. They were all rated for BTUs and KWH tpt they could turn out. And what was really important was that I could see the whole academic world the engineering world returning to doing what just the individuals had been doing, the individual windmills, and so forth."

KBF DiFinition

Evolution:

The tension in evolution, and to a large extent in mankind of the twentieth century, lies in the 'attempt by man to convert his evolution from a subjective to an objective process. **

- Cite context and RBF quotation from William Kuhns in "Poet- Industrial Prophets" (Harper-Colophon), p.2J7. 1971

Evolution:

What I mean by evolution relates strictly to both the metaphysically and physically evolving frontiers wherein the basic informational assumptions are being progressively altered, simply or complexedly, energetically or synergetically. Evolution is the net irreversible inexorability of change. All else is what men call status quo. . . . Change involves time and total experience change is complex. Evolution is scenario and not single-frame. It is the scenario of eternally regenerative Universe at its regenerative-ly most exquisite eventing."

- Cite A Definition of Evolution, p. 3. 15 Sep»71

Evolution;

"To the few who are disciplined to deal with invisibly integrating trends, it is increasingly apparent that man is about to become almost 100 percent successful as an occupant of the universe."

□ Cite RBF quoted by Hal Aigner in "Belax...", Rolling Stone, 10 June 1971

Evolution:

"Evolution is the scenario of happenings which are always permitted by nature's precise eternal laws governing angular degrees and frequencies of event freedoms, which are realised as happenings."

- iwH 22-April-1971

- Citation & context at Happening. 22

Evolution:

The principle of irreversibility states that the evolutionary process is irreversible locally in physical time-space --- i.e., in frequency and angle definitioning because the antientropic metaphysical is not a mirror- & imaged reversal of the entropic physical world's disorderly expansiveness."

- Citation at Irreversibility: Principle Of Apr'71

Evolution:

"It becomes retrospectively visible that the universe is a dynamic continually evolving process within which man himself is continually evolving. Dr. Waddington, the famous animal geneticist of the University of Edinburgh, points this out when he sneaks of what he calls the 'epigenetic landscape.' in which we have all of the biologicals continually altering the environment and the altered environment continually realtering the biologicals. There is manifest a chain reaction of extraordinary pattern interactions whose consequently progressive intertransforming we recognize as evolution, evolution is both you and I and the comprehensively dynamic macro-micro environment--- that is, universe. Due to entropy, the physical evolution of universe is Irreversible. There are cyclic patterns which are repeated but not reversed. Only the metaphysical abstract thoughts can review and reconsider the evolutionary transformations, individually or collectively, but cannot 'turn the clock back.' "

"It is well within my lifetime that we have gone from less than one percent of humanity having any economic advantage whatsoever up to almost 44 percent enjoying standards undreamed of by J.P. Morgan. I am convinced that this unexpected transformation is a manifestation of a much larger evolutionary pattern in operation around the Earth and in the Universe than any as yet recognized and apprehended by political man.

Life have an extraordinarily vain concept regarding the brilliantly managed responsibilities of man on Earth. Each man in his turn assumes that everything up to his birth is natural order. Thereafter each man assumes that he is supposed to be responsible for making the Universe work.

"To such an extent does man believe in man's importance that he doesn't realize that he is himself almost completely automated, that he is subconsciously coordinated and motivated, and also part of an immensely evolving, totally new, era gestation process to be realized in magnitude beyond man's conception.®

"Nobody knows how his breakfast is being processed into gland-stored energies. He cuts his hand and it heals. He does not"

"know how. His hair grows--- or doesn't grow--- and he knows not how or why. We go from seven pounds to 170 so relatively slowly that we don't think of this as evolutionary. Between World Wars I and II American men unexpectedly increased their height by three inches.

"Up to and including my father's life the average distance covered by man in his lifetime locomotion was 30,000 miles. In my lifetime thus far I have covered three million miles, a 100-fold increase. Astronauts knock off that distance in three days flight. I don't think we tend to accredit at all the fact that we might go on to have some other form of living in the Universe.

"I find man tending to ignore, however, what seems to be any kind of mass development. He is tremendously apprehensive of losing individuality. He shouldn't be. When he cooperates and coordinates he is not losing individuality. In fact, at that point he is beginning to demonstrate individuality to the only degree to which it is important: his very ability to dedicate himself to a cause is manifest of his individual freedom to do so."

Evolution: Man as Evolution Modifier:

"Man accomplishes the progressive modification of his evolution through the coupling and articulation of his subjectively and objectively imagined synthesis of the factors of experience. This modification of his own evolutionary relationships by man involves a continuity of the thought processes. Superficially challenged by the seeming discontinuity of death, man has become successful in his distinguishable degrees as evolution modifier by virtue of his ability to further the refinement of thought toward the evolution of truth, by communication of the truth refinements to the new life--- the new life being spontaneously persistent, overlapping and only modifyingly nurtured by the synchronous continuity of old life."

Expanding Physical Universe:

"In the most comprehensive picture of Universe, we find physical Universe consisting entirely of energy. As the Second Law of Thermodynamics shows, every local physical system continually loses energy to surrounding systems in physical Universe. This loss of energy is called entropy. Because all the

local systems of Universe are in constant motion and transformation. the energies are given off nonsimultaneously in multidirections and with Increasing diffusion. The scientists call this the law of the increase of the random element. This Increasing random element brings about physical Universe enlargement. These nonsimultaneous enlargements bring about expanding physical Universe. The expansion is verified by the astronomer's discovery of the red shifts in remote galaxies."

Externalleation of Man's Own Functions;

"Ian has learned how to externalise his own functions.

and to leave them behind. . . There are no tools that man has developed that are not extensions of the original integral functions. ... I don't find anything that has been done by man, that we call mechanics, that isn't part of his internal organism. He was apparently designed with this capability to externalize his internal metabolic regenerating organisms. . . "

- Cite COMMITMENT TO HUMANITY, p. 31, May'70

"Such is the acceleration of the great new industrially implemented life pattern. Its ecological-pattern- transforming networks of tools have been invented by men only as a result of progressively externalising and amplifying their integral bodily functions and innate faculties. Granted the intellectual discovery of physical principles and inventive initiative of man it is nonetheless clear that the network of industrialization has been realized only through the a priori existence of the physical resources."

errs gtrfrrl. Hwang:

"AU of man's gains cose at times when he's being orderly. Every once in a while he gets scared and gets very disorderly and makes an awful mess and thousands of years of gains are lost. He may not make good on this planet. Inasmuch as Universe needs him she isn't depending on this little team on this planet. There are probably quadrillion times a quadrillion planets with humans on board them. And this little team may not make good just in the way that some of the seeds coming off the trees don't make good. So we're in a touch- and-go position right now: whether we make sense in Universe or not. The poker game is over. We've been given a lot of time to learn what our function is and now we can really begin to see it. We can see it consciously; we've been getting along subconsciously up to now. We were born helpless; so it's all right to start helpless. But we were born with equipment to find out and discover the information; and we better start using it or we don't stay here. If we make good here, we're going to suddenly discover that we are aboard a mother ship and there are other things to do elsewhere in Universe."

Eyes:

*'I lift up nine eyes unto the hills from whence cometh my help'-- possibly because of all our faculties, it is only our eyes that can apprehend the distant presence of the high hills---a presence of which we are informed by radiation from the Sun reflected from the hills to our eyes at 186,000 miles per second, all of which seems so instantaneous that we mistakenly say that we 'lift our eyes.' And we know that no man---no mere human being invented that velocity, nor its reliable regularity throughout the full spectrum range of all electromagnetic wave phenomena, nor the regularity of its ultra-high-frequency inter-trafficking."

- Citation in context at New York City (11); 1964

Eve-Beamed Thoughts:

(I)

"Recognizing that it is possible To conserve energies by reflection, As well as to reach

Great distance by beaming,

We can point out that it is also possible That our human eyes are just such

Very high-frequency electromagnetic waves Propagating and receiving reflector relays, As with the original propagation Occurring in the brain And the transceiving Relayed by our eyes.

"I have had extraordinary experiences With audience after audience Around the world.

I find that eyes tell me so much That I am able to go into a room Wherein some verdict has been adopted, And I find that

I know what the verdict is Before anyone has spoken Audible words.' '

****The parabolic reflector beamed, ultra-ultra high frequency electro-
magnetic waves--- such as can be coped with by transceivers with
the infra-diameter of the human eye- are such that they would be
completely interfered with by walls or other to-us-seemingly opaque**

objects. However, when they are beamed outwardly to the sky in a cloudless atmosphere, no interference occurs. Ultra short wave radio and radar beams which are interfered with by mountains and trees can be beamed into a clear sky and bounced off the moon, to be received back on Earth in approximately one and three-fourth seconds. In a like manner it is possible that human eyes, operating as transceivers, all unbeknownst to us, may be beaming our thoughts out into the great night-sky void, not even having the sun's radiation to interfere mildly with them. Such eye-beamed thoughts sent off through the intercelestial voids might bounce off various objects at varying time periods, being reflectively re-angled to a new direction in Universe without important energy loss. A sufficient number of \square bouncings-off of a sufficient number of asteroids and cosmic dust could convert the beams into wide-angle which diffuse their energy signals in so

many angular directions as to reduce them below receptor-

Eve-Beamed Thoughts:

(2)

"detection level. Eye-beamed thoughts might bounce off objects so remote as to delay their 700 million miles per hour travel back to Earth for a thousand years, ten thousand years, a hundred thousand years. It is quite possible that thoughts may be eye-beamed outwardly not only from Earth to back \square to Earth at some later

period from some celestially-mirroring object, but also that thoughts might be beamed--- through noninterfering space to be accidentally received from Earth--- from other planets elsewhere in Universe. There is nothing in the data to suggest that the phenomenon we speak of as intuitive thought may not be just such remote cosmic transmissions.

Intuitions come to us often with surprising lucidity and abruptness. Suchta intuitions often spotlight sigiflicant coincidences in a myriad of special case experiences which lead to discovery of generalized scientific principles heretofore eluding humanity's thought. These intuitions could be messages to the Earthian brain receiving it to 'Look into so-and-so and so-and-so and you will find something significant.' Intuitions could be thoughts dispatched from unbeleivably long ago and from unbeleivably far away."

Fail-Safe:

"The people getting together in Bali in July were able to demonstrate that there is another way of carrying on---neither the capitalist way nor the communist way---where everyone is in on the information.

"That's why all the great corporate executives should have their fail-safe projects where all the information comes in and they don't have to wait for correction of their erroneous atomic energy programs to be frustrated by society or accidents--that's too slow a way to get improvement.

"Getting everyone in on the information---as in Bali---is what the design science and fail-safe strategies are all about."

- Cite RBF to EJA, from Philadelphia, PA; 13 Sep'77

Fail-Safe:

"Only the whole big system works. Like all well designed, complexly intercomplementary, evolutionary systems, the selfregenerating terrestrial ecology has a plurality of alternate circuits, i.e., of fail-safe mechanisms with a plurality of newly developing alternates and an equal number of progressively phasing-out components. Of all the biologicals, only humans are able consciously to discover this omni-generative pattern in pure principle."

- Citation and context at Ecology Sequence (E), 5 Jun'73

False Property Illusion:

"Plagiarism is an ethical offshoot label of the false property Illusion..."

__ Citation and context at Plaaiairm. 1938

"Inevitably, the phantom captain's habitual association of his infinite self with his subconsciously subservient mechanisms has inclined him to a dual presumption: (1) that this mechanism is an actual (by extension) part of his phantom self, whereas it is purely an electrochemical combination of inanimate energy molecules that are intrinsically the ship the phantom captain commands. and (2) an attitude of ownership: the mechanism of ordination for his will is 'his' permanent •possession,' whereas in reality it is only temporarily in his custody. This illusion of 'possession' of the mechanism has been further extended, through accustomed relationship, to include 'possession' of one's clothes, pencils, house in general, land, friends,

wife, and children, business, state, nation, world, and finally 'god'---
the last named quite naturally being 'pictured' in the exclusively
original form of his 'own' egotistically important, special mechanistic
and chemical process arrangement.

"As the 'possessor' of all his extensions, the phantom captain au-
tomatically evolves a myriad of illusory necessities for which he
assumes a vain egotistical responsibility. This false- possession and
always innocuous myth (which is consumptive of"

Fear:

"Fear makes people linear."

- RBF quoted by Mercedes Matter in her letter to hia received by RBF
23 Feb'73

ilBF DxJllUTluNS

Ffiar:

"Fear is not innate, 'rhe fear reaction of the new born infant is brought about MBonly by extraordinary noise or falling, if falling does not occur early, fear does not develop as dominant. It is fostered, however, by the exquisite stupidity and cruelty of singing 'Hockabye, baby baby will fall, cradle and all,' and for the child who has experienced falling this is by way of being an ultimate lullaby into lunacy....

' 'Fear is instilled through the repetition of traditionally honored falsehoods, or by the invention of a lie, a moral, a code, or statute to suit the circumstance."

(blightly rearranged)

VHHB Fear and Longing:

"I think every human being is born an artist, scientist, inventor, or explorer, but his innate capabilities do get so frustrated, discouraged and paralyzed. Einstein found two fundamental forces operative in human beings. These are fear and longing. Fear is almost always present. Unfamiliarity may be compounded with the built-in drives of hunger, thirst and procreative urges together with an urge to understand and be understood. Those are very, very powerful. And when the circumstances seem so daotic there is fear--- a congealing fear. Fear has been very powerful in humanity. But I find that there are times when one out from under it and cheers up again and longing begins to carry on, I began to try co weign the fear versus longing of humanity and I began to feel that longing was more powerful and would win in the end."

« Cite RBF Address at National Conference for Philosophy of Creativity at SIU, Carbondale, Ill, 16 Oct. *69 - p.22.

MUM fSr and Lffnjdfy;:

"Assuming Einstein's postulate of fear and longing as the prime motivators to be correct, let us analyze the implication further, and utilize fear and longing as yardsticks in a general tracery of the history of creative design and the latter's effect on economics and social movements.

"While neither fear nor longing is experienced in pure form, nevertheless one or the other is always dominant for every specific moment. A person may be at one instant 90 percent dominated by longing and 10 percent by fear, at the next vice versa, and tomorrow 50-50. When, however, the person's life span has terminated, he may be analyzed

sumtotally as having demonstrated for instance a 60 percent fear motivation and 40 percent longing. So, in terms of indicated sumtotal of a personality, one may say that a person is dominantly to date a fear or a longing type. The genius and the talented person are specific members of the longing dominated group, although manifesting greatly diversified performance characteristics."

- Cite NINE CHAINS TO THE MOON, p.96, 1938

Fear & Longing:

"... In consideration of the contribution to the study of radiation and the degrees of its scientific authority by the currently most eminent mathematician, Mr. Einstein, and his thoughtful nomination of longing and fear as the two primary motivating forces of human activity in the bi-polar world; and in consideration of our tracery of the effects of longing and fear, the longing into a general inspiring of the creative and talented types of artistw. the abstractionists, the scientists, and teleologic philosophers in general, and fear into the contracting and 'conserving' of the materially minded, either driver or driven;..."

RBF DEFINITIONS

Feedback;

"Norbert Wiener next invented the word 'feedback' to identify discovery of biased error and its spontaneously-coped-with over-correction. Governed by automatic-angular-error-maintaining devices, such as gyroscopes governed by delicate hydro or electrically actuated servomechanism connected to the powerful rudder-steering mechanisms, these devices greatly reduce the magnitude of rightward and leftward steering errors. In gyroscopes governed by servomechanisms, steering is accomplished only by minimizing angular variance errors, and not by eliminating them or pretending they do not exist. Gyro-steering produces a net wavelike course, but always with errors of much higher frequency and much shorter wavelength than those made by the human handling of the rudder and the latter's inevitable veerings left and right.

"All designing of Universe is accomplished only through angle and frequency modulation. The DNA-RNA codes found within the protein shells of the viruses governing the designing of all the species of all biological organisms in Universe consist only of angle-and-frequency-modulated instructions."

- Cite RBF Ltr, to Bro. Jos. Chq\al, P.4; 7 Nov*75

Feedback: Self-Accelerating Feedback:

"As the irreversible succession of self-regenerative human events---experiences, intuitions, experiments, discoveries and productions---

Successively increases both the comprehensions and capability

options

The commonwealth of intercommunicated comprehensions

Produces and ever-evolving, subconsciously changing common sense.

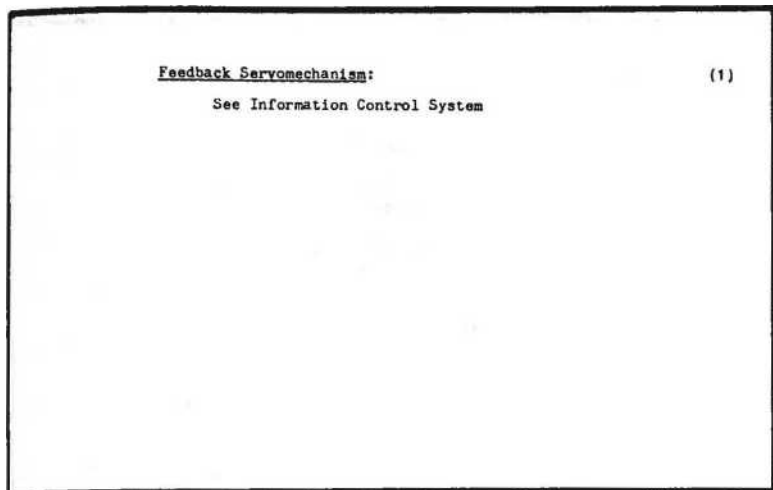

Where syntropy is gaining over entropy, life prevails;
Where entropy is gaining over syntropy, death prevails.
Their exponentially regenerative birth-death interplay
Is describable in information theory
As 'self-accelerating feedback',*
And in nuclear physics it is manifest as 'chain reaction'
And in an even more comprehensive way
It is manifest pulaatingly, resonantly and propagatively,
As the irreversible regeneration of universal evolution."

Field:

"Einstein was up against trying to communicate with the mathematicians in terms of mathematical models all of which were— and still are— straight line. XYZ models on a linear frame and with linear coordinates going outward from the model to infinity. So 'field* was always a little set. of local perpendicular crossings of straight lines each onward bound to an infinity of infinities. "

"All the experimentally harvested information says that the * 'field' must now be recognized as a complex of never-straight lines which, at their simplest, always will be very great circular orbits. And thaorbits are all elliptical due to the fact that unity is plural and at minimum two. There will always be at least one other critical proximity aberration with both of its diametric alterations of orbit."

RUF bdUMTIGNS

"... I find that even in peacetime when man was homesteading, going out to open up their land. And he came under tenting and very temporary form of shelter until he got to a site where they were going to commit themselves. The thing that really counted was getting the seeds in the ground, something to grow so they could eat next winter. The high priority is seed and growing things. You keep living under wraps as best you can. And on the way there you've been hunting and have a lot of food. But now you're so busy clearing the fields of rocks and getting the seed in the ground, your wife says, 'Darling the meat is beginning to spoil now ' and so we've got to build a fire and at least cauterize it-- it lasts a little longer. This meant then that people in the fields began to build fires; and making fire took an awful long time--- you didn't have time for that you were so busy with the field. So you keep that fire going, and I'm clearing wood out of the fields here; so you've got plenty of wood. Just keep burning that wood. Well, that M makes smoke in the sky and that gathered often

hostile strangers here. It brought animals at night. So they built kind of a chimney around it so it was easier to keep that fire going. It got a lot of rock out of the fields; there was a lot of rock around and they used that to make a temporary chimney.

- Cite Univ, of Alaska Address , p.10, 20 Apr '72

Fire: (B)

"And then you began to make a stockade around so that the wild animals couldn't get at you, naturally, or strangers. So you got a stockade and you got a chimney in the middle. Then when you first had a little time you took some more trees around, and ran some logs from the stockade to the chimney. You got a roof on this. The wind is going to be coming now. But the building was always on the antipriority. How do you get nature to keep you going. You don't know why the little thing grows into big things, but it does, and you've just got to take advantage of that fact. You realize that even in the peacetime building was an antipriority--- something you did only in off moments.' "

RBF DEFINITIONS

"No surface is conceivable without its inherent sphere as ,a flat Universe is contradictory to experience."

- Cite Noah's Ark, p. 3. 1950

Flat:

"No sphere is large enough to be flat."

- Citation and context at Dynamic. 1950

Flat:

"Flat is a confined triangle phenomenon.

- Citation and context at Dynamic. 1950

"Th® transformational projection model coupled with the spheric experience data prove that a finite minima and a finite maxima do exist because a flat is exclusively unique to the area confined within a triangle's three points. The almost flat occurs at the inflection points between spheric systems' inside-outing and vice versa, as has already been seen at the sphere's minima size--- and that at its maxima the moment of flatness goes beyond approximate flatness as, at the minima phase to satisfy the four triangle minimum momentum of transformation, thus inherently eliminating the paradox of static equilibrium concept of all the Universe subdivided into two parts: that inside of a sphere and that outside of it, the first being finite and the latter infinite. The continual!/ transforming from inside-out to outside-in, finitely, is consistent with dynamic experience."

REF DEFINITIONS

"When a fleet of one-of-a-kind racing sailboats is performing they usually are beautiful to watch unless one is being incompetently sailed. The winner often appears the most beautiful because it is most inspiredly and capably sailed. The winning boat of yesterday's race may be sailed today by an incompetent careless helmsman and appear ugly though it is the same boat which yesterday appeared to be so beautiful.

So too will the architecture of the new era be the inadvertent qualities and attitudes manifest directly or indirectly by its occupants. While one of two identically designed dwellings may appear beautiful because of its dweller's competence and consideration for others, the identical dwelling may appear ugly because selfishly and incompetently occupied."

- Citation and context at Invisible Architecture.

(F), Aug'72

RBF DEFINITIONS

"Then... complexities are viewed in reverse, from the advantage of even the most mathematically supersuper- interference, the whole regains the acceptable sublimity of aspect such as a fleet of little ocean racers 100 miles off Bermuda struggling with the waves of interference of the Atlantic turning the perversely interfering winds to advantage by virtue of the relative inertia of the relative waves of water eventually to pass Bermuda as the whole picture is observed from the airplane and its infinitude of subcomplexities."

Float City:

"In due course there would be my floating cities. Strange as it may be, they are impractical to build on Earth due to the gravitational effects and the winds. As a consultant to the advanced structures team at NASA we developed a geodesic sphere two miles in diameter. But this is really a delicate networkball to ball--- and they would be centrifuged in space, weight- lessly; and in that form they are going to be crystallized. They will be locally loaded.

"If you have sphers a mile in diameter then you can fortify them to any extent you want, but when you let it down into the atmosphere, it would be like a ping-pong ball landing in Niagara Falls. Because of its structure we would have it reflecting, so it would reflect its heat out and the structure would weigh so little that it would be lighter than the atmosphere around it. It is simply a cloud--- just the way clouds float in the sky because they dismiss the heat outwardly But they are a practical thought: Housing in Space."

Foldability:

"The foldability of the great circles and their Identification with wave phenomena is one of the unique discoveries of synergetics

- Cite SYNERGETICS Sec. 250.10 1971

Foldability of Great Circles:

"Wave phenomena always being cyclic ... I began to take whole circles. I could take four complete circles and fold them in such a manner as to make bow ties, and they fasten together and make the great circles. Everyone of the 25 and 31--- making a total of 56--- can be made by folding. You simply do your spherical trigonometry, your central angles. . . sometimes a four-part bow tie and sometimes a two-part bow tie. They go together and you can re-establish them, the bow ties together, corner-to-corner, and they make a whole sphere again and you can see the 15 great circles, you can see the 10 great circles, and so forth. . . They turn out to be only great circles. There's no other way I can take a great circle and fold it, because everyone of the fundamental symmetries of both the icosahedron and the vector equilibrium are foldable into great circles where the energy instead of going cyclic around the whole system, can go around in a figure eight, for instance-- or it can go around in 15 great circles. In the 15 great circles you find they again disconnect and they go around very locally on the surface of the icosahedron. 'When you make up the icosahedron you find them in strange little curlicues and they're very asymmetrical.'"

RHF DEFINITIONS

Foldability of Great Circles:

"This may be pure accident but I could say something to you now categorically that is really very fascinating, that is, I found that you could fold and make all the

25 and 31 great circles. There are no other circles though that I know how to fold and make any other kind of great circle patterns on spheres. They and they alone seem to be foldable into these conditions. This seems to be a very strange kind of control because if they did they all relate they are the ways of the grand central station and all the shortest, most economical railroad tracks between all the points in Universe--- flying either concave or convex."

- Cite Oregon Lecture //7, p. 271. 11 Jul*62

RBF DEFINITIONS

Foldability of Great Circles: Spherical Vector Equilibrium:

"Here I am taking a great circle and folding it on its 60-degree angle, and we fold down, up, up, and down, up, up, and it comes together and makes this bow tie. You bring these corners together and join those edges. And you take four sets of these and they make the vector equilibrium.

So, the fewest great circles can be folded up and made into bow ties and reassociated and then, even though you made them into a local bow tie, it seems to re-establish to all the great circles. You can play the game either by going around this way or by going around in a local figure eight. Either one is legitimate. These are very typical characteristics of fundamental wave phenomena.¹

Food Production:

"What we have now in these vital statistics is a look at what we've got on Earth right now. What we've found in our research is that the materials of the Earth are there; we don't have to create the materials of the Earth. What we have to do is to increase the efficiency with which the materials are used. It just comes home every time that it's the metaphysical that has to be altered; not the physical. The physical is always there. . .

"There is enough land if we work the land in the same way Japan works it, in which they're feed six-and-a-half people per acre; whereas in the United States we feed about one per acre. If we could duplicate that efficiency factor all over the Earth, we actually would feed the people; but the problem is always the electrical power; it's always the necessity of processing the food and getting the food to the people. It's fine to grow it in this area, but if you can't store it, you can't feed the people who are living in the other area. . . •»^a

"One of the concepts of plane geometry goes along with something we are told quite early, when getting into physics, and that was that when we get the lines of force, when we get into the parallelogram of forces. We get Galileo's concept of two ships running into each other. One ship: we will take what its weight is-- it is ten tons and it is making ten knots, so we will multiply ten tons times ten knots and it is going east so we have 10×10 , which is 100. So we have a line 100 units long going east on the pattern on the map on the table here. Then we have another ship going 20 knots and weighing 20 tons so we multiply 20×20 and get 400. So we have a line 400 units long, instead of 100, and it is going north. We have these two ships run into each other, and by Galileo's diagram of forces, we have two lines, one going east and one north. And we make two lines parallel to them of equal length. Then we make a diagonal from the point of running into each other to the opposite corner of the parallelogram, and we take that same line and extend it outwardly from the point and we said that that was the resultant of forces. This is MMV a game we played on a plane. One thing that interested me very much when I"

Ung: Qn>njdirational Pig?? gf Force: (2)

"got into the Naval Academy, particularly when I went to sea, is that when two ships ran into each other, they didn't waltz off north-northeast 12 miles together. One of them usually went into the center of the Earth. And that wasn't in the diagram. So I felt that to give me that kind of elementary education was not a kindly form of

simplification. It was absurd. I felt there was a place where Universe just started operating and that was where she always operated. Je were operating omnidimensionally, and we might as well find out, if we could, what the minimum set of forces operating were--- and where, and how, and why, and whatever was interference did what it did."

- Cite Oregon Lecture #3, p. 106, 5 July '62

Force Lines: Pmnidirectxonul Lines of Forco: (A)

"I was told in school about Galileo's parallelogram of forces. It was drawn on a plane where you saw one body running at a certain velocity in a given direction. I on multiplied its weight times its velocity and that made the length of the line; we called such a force line a vector. Then we had another body which was on collision course with the first moving body which we had vectored. And you took the second moving body's weight times its velocity and that was the length of the second line or vector. And the second body also was going in a unique and discretely identified compass direction. You had these two moving bodies come together and then you made two other lines parallel to the first set of two vectorial lines and they made a parallelogram with the first two vectors.

"Next you made a long diagonal in that parallelogram from the point of collision to its diagonally opposite corner. Then you extended the long diagonal outwardly from the parallelogram from the point of collision, extending this line to a length equal to the diagonal"

- Cite UTOPIA UR OULIVIOI., liu.lc of the hew Life, p. 53, '0 Oec'61, ,
force I4n?B • Omnidirectional Lines of Force: (B)

'already constructed inside the parallelogram and that external equidistant extension of the diagonal of the parallelogram was called the resultant of forces. In the Kavy 1 had also been taught Galileo's parallelogram of forces. . . For some reason that I don't know of it was never considered at the U.S. Naval Academy that whrn two ships ran into each other, Galileo's force diagram told us that following the collision as indicated by the 'resultant of forces' the two ships were supposed to waltz north-northeast for 12 miles together. I saw as indeed most all sane men see that such behavior was Just what the ships didn't display after collision. One of them went in toward the center of the Earth and that wasn't in the diagram. I dccidied that this criticism was typical of my general suspicion that we were not starting with the right set of axioms or simplest concepts. . .

"So one of the two ships colliding on the wavy surface of spherical Earth goes towards Earth's center. One of them does go a few hundred feet in the direction of Galileo's resultant of forces, but not 12 miles. E'c find that in reality four forces are operating. Two accelerate conically together, rising from Earth, plus gravity, plus the resultant." - Cite UTOPla OR GJLIVIoii, i-.usic of the Eew Life,p. 54-54, 10 Doc

DEFIHtIOIJS

Force Lines: Omnidirectional Lines of Force: (C)

M`.ilhen the ships first ran into each other, they actually rose outwardly from Earth's center because in acceleration both ships were 'trying' to leave the Earth. If they could accelerate faster--- like rockets--- they could leave the Earth. So when two ships collide they usually rise outwardly, against gravity, before they subside, and then one or both go into the bottom of the sea, or go a few yards in the direction of the resultant of forces. The pattern of real force

lines looks very much like a music stand--- three vectorial legs spread out with a fourth vertical vector. And so I began to discover and study what we may call fundamental angular degrees of the vectorial interactions of universal freedoms."

RBF DEFINITIONS

Forces Ljntt: Omnidirectional Lines, of Force: (I)

"Vectors had first been developed to important extent in electrical engineering (though Galileo used them tentatively and erroneously in developing his parallelogram of forces). According to Galileo we could make a vectorial pattern of a ship A of such and such a weight, going in such and such a direction at such and such a velocity. You multiplied the velocity times the weight, and that gave you a vector \vec{E} . You then made a vectorial line AC on your diagram that was x units long, that was shown going $\vec{}$ in the compass direction that the ship was going--- let us say, 'due east.' Ship A collided with another ship B at point C. Ship B weighed such and such an amount. You multiplied ship B's weight by its speed (velocity) and it gave you the length, E , of a vector line BC. BC had a compass direction, too--- let us say, 'northeast,' reading from B to C. Galileo then constructed a parallelogram ACBD with BD parallel to AC, running $\vec{}$ west from B to D, then DA constructed parallel to BC, running northeast from D to A. Galileo then drew a vectorial line diagonally from D to C. the point of collision of ships A and B, and then Galileo extended the line DC outward of the parallelogram to E with $CE \parallel DC$. and with the angle $DCE = 160^\circ$, i.e., a 'straight' line. Galileo called"

Fgrgg lpea: Omnidirectional Lines of Force:

"I spoke about Galileo's parallelogram of forces where, you may remember, you had two moving bodies and you had their discrete angles and you have them running into each other. One weighs so much and has such and such a velocity multiplying both and making vectors, you drew two lines parallel to them with respect to where they intervened, i'hen you made the parallelogram and the diagonal of the parallelogram from the points of interception, extended it outwardly of the parallelogram, and call it equidistant, and call it the resultant of forces. I thought this was very strange because I was in the Navy, while this diagram tells me that when two ships run into each other at sea, they waltzed off 12 miles northwest with each other and that isn't what they did at all. One seemed to go to th» bottom and that wasn't in the diagram. So I felt that it was really invalid to make models that really didn't have to do with our physical Universe,'*

Form Cannot Follow Function: (1)

"Louis Sullivan employed the phrase 'form follows function' and it became seemingly most apt to Europeans developing this kind of simplified building. So form follows function is the phrase that most characterizes our cultural experience in the arts since the mid-twenties. . . More than a generation has been preoccupied at the cultural level with the idea that you do things in a very direct honest right way and that it should be visible how you do it. . /hen you learn how to do that in a becoming manner then form is following function. . •

"So the Germans said why can't we take this good logical kind of building. All it needs is a little refining. Give it a little cleanliness and we could give up all the orders of architecture and turn out something very pleasing in its own right, "on this began the Bauhaus kind of viewpoint and the development of architecture which is today called the international style."

- 'Cite OREGON UNIVERSITY Lecture '1, 19-20 - 1 July 1962

IBB OBBBHHMMIMHO Form cannot Follow Function: (2)

"One of the many characteristics of tensile strength is that you can't see it. . /hen we say form follows function and if a form is stronger then we ought to be able to see it. But alloys make it possible to do things with less. Therefore form is not following function at all. In the advanced technology form is not following function All the form is where you can see it. ible functions are invisible. There are not forms

following the functions at all. There is a great computer, it is just a black box. ..'hat does it do? You don't know what it does. There is no disclosure of the function whatsoever by the really advanced technology.

"In our cultural life we have been preoccupied with being very modern, conaoling ourselves, in fact boasting, that form follows function. »'e are being very frank, Je are not putting a lot of orders and decorations on here at all. But we are not being modern at all, -ie are being just the opposite and fooling ourselves because form cannot follow function. This is what we mean by the trend to invisibility,"

KBF DEFINITIONS

 Four:

"One of the most typical tricks I hav found in humanity is to see the little small one /~triangle_7 and miss the big one and the big one is the one that counts. Then Itold him he drew four triangles. And he said, how did that happen? Well, they are spherical triangles and there is a concave little and a concave big as viewed from inside and a convex little and a convex big as viewed from outisde.

Convex and concave are not the same; so there are inherently four. In fact, you will always find that there are four there. Four is the minimum and when we get t oany kind of system there is always four there. You will get used to that fourness and get used to not allowing yourslef to become overconfined and looking at the little ones."

Fourteen:

"Two pairs of seven-ball, triangular sets of closest packed spheres precess to associate as the cube. . . .

This cube consists of 14 spheres whose number corresponds to the » 14 tetrahedral facets, the 14 faces of the vector equilibrium, and the 14 faces of Lord Kelvin's tetrakaidecahedron, the all-space-filling, 14-faceted symmetrical polyhedron of eight hexagons and six squares. The cube shown is the minimum cube which may be stably produced by closest packed spheres. Eight spheres will not close pack as a cube and are utterly unstable."

- Cite CONCEPTUALITY OF STRUCTURAL SYSTEMS, Ed. Kepes
1965, p. 84, Figure 7e, Caption. *

Fourteen:

"...All life cell structures, no matter how complex the total association may be, and all bubble complexes, are characterized by 14-faceted, webbed chambers, the *4 facets being an infinite variety of asymmetrical polygon sizings, but always of 14 facets. These 14 facets are then to be identified with the tetrahedron's four faces plus six edges plus four vertexes which prime aspects total fourteen. Tetrahedrons of very high frequency composition which result from piling up a triangular pyramid of ping pong balls, or of any spheres of the same size, can be truncated on each of their edges or each of their four vertexes by off balls--- which adds six facets and four facets, respectively, to the four original faces. By simply increasing the frequency of the basic layers of the spheres, the truncation of the edges or vertexes may be so patterned with the faces in such a manner as to result in 'any' polygonal shapes of a total of 14 faces."

Fourteen Axes of Truncated Tetrahedron:

(2)

"--- the 14 Facets boundingly interbonding all bubblea in the bubble complexes; and

--- the 25 and 31 unique planes generated by the seven sets of foldable great circles, that are the only such foldably unbroken sets (i.e., the 3, 4, 6, and 12 sets of the vector equilibrium and the 6, 10, and 15 sets of the icosahedron).

"Various high frequencies of modular subdividings of the tetrahedron produce a wide variety of asymmetrical truncatabilities of the tetrahedron. The dynamics of symmetry may employ seven sets of the 56 foldable-great-circle variations of planar orientation. Thus it follows that both the biological cell arrays and the bubble arrays display vast varieties of asymmetries in their 14 enclosing planes, so much so that this set of interidentifiability with the 14 topological characteristics of tetrahedron, the prime structural system of Universe, have gone unnoticed until now."

See. 7J4.0?!

"Science had thought that it was impossible to be conceptual because it had felt that fourth dimensionality, which had been showing up time and again as an arithmetical behavior of the physics, could not be accommodated by the XYZ coordinate system and it can be coordinated by synergetic geometry. Why can it be? Because the vector equilibrium has a volume of 20. You can get eight cubes around one point and so the third power of two, which is eight, has used up all the space. But using the tetrahedra I can get a volume of 20 around one point as I do in the vector equilibrium. Mmattp Twenty is two to the fourth power plus two to the second power and it makes it quite possible to use models of fourth powering by using tetrahedroning.

"In fact, we find the vector equilibrium is unity because its edge module is one as is the cube the module of one. It is when it is one, when it is unity, that its volume is 20. When its edge module is two, it is two to the third power times 20, which is 160. and the volume is 160 where the edge module is two. It will accommodate very high powering, the sixth powering and so forth. It makes possible the actual modelling of the multi-powers. . « "

Clt. OHECONJ.ecture *tfb*, p. 233. ,0 Jul'62

FourthDimension:

"In the 1890's a fourth power relationships were beginning to show up in the physics and in relation to electromagnetic phenomena, but you couldn't make a model of it. . . . By using imaginary numbers, complex numbers, where the square root of minus one is going into yesterday one quadrant. they found they could accommodate the fourth power mathematically though they couldn't make a model of it."

Cite OREGON Lecture - p. 131 , 6 Jul '62

"Since every symmetric system contains a neutral axis, with polar points, it follows that Fuller identifies 'third powering' specifically with a symmetric swarm of points around and in addition to a neutral axial line of points. To find the total number of points collectively in all a system's layers, it is necessary to multiply the third power of the frequency by one of the first four prime numbers (times 2). Consequently these collections disclose a fourth power characteristic of the number of points in the symmetric swarm--- four dimensionality of total point population with reference to the frequency of the system."

"This freed the scientist then without any need to explain to the writer what was going on. The scientists had been getting along very beautifully in our calculation about fourth power, fourth dimension, because we borrowed a little from tomorrow's clock. We do our problem, then we pay tomorrow back. You can't do that in the physical model, but you can do that on the paper mathematically. We can use the imaginary numbers, the square root of minus one, and so forth. So we get into no trouble at all just handling this with figures and algebra, so we can make a model. . . "

"Since the middle of the 19-th century it had been the confusion brought about by the succession of visible thermodynamics by invisible electrodynamics. The crisis was dramatized by the discovery that black bodies were demonstrated to have fourth-power rates of change. The trouble was that the world was accustomed to an eight-place omnidirectional clock (eight cubes around one point) instead of a 20-place omnidirectional clock (with 20 tetrahedra around one point. With the number 20 you can bring the the fourth dimension into modelability with no trouble at "It's been several years now since I made this point in a conversation with C.P. Snow in London and he was kind enough later to acknowledge in an article that 'an American architect had indeed shown him that the fourth dimension could be modelable.

Fourth Dimension: Regular Tetrahedron as Fourth Dimension Model:

"Since the outset of humanity's preoccupation exclusively with the XYZ coordinate system mathematicians have been accustomed to figuring the altitude of a triangle as a product of the base times one-third of its perpendicular altitude. And the volume of tetrahedra are arrived at by multiplying one-quarter of the height of the perpendicular to the base times the area of the base. But the tetrahedron has four uniquely symmetrical enclosing planes and its dimensions may be arrived at by the use of perpendicular heights above its four possible bases. That's what the fourth dimension system is: it is produced by the angular and size data arrived at by measuring the four perpendicular distances in respect to the centers of area of the four faces of a tetrahedron. As with the triangle, the perpendicular from the center of the tetrahedron's base triangle goes right through the tetrahedron's apex. The central angles converge at 109° 28'.

"The area of a triangle is arrived at by multiplying the length of the base line times one-third of the triangle's apex altitude. This is four dimensionality. A tetrahedron of a"

Fourth-dimensional Synergetics F>athematicg;

"Our synergetics mathematics is prospering.... We are challenging academia at its heart. We are saying that science requires experimental evidence and experimental proof---yet at the outset adopted mathematical tools that are not experimentally demonstrable.

"Science starts the children off by saying experience in the round is too complicated , 'so we will start off with plane geometry that is two-dimensional.* There is no Isolatable, demonstrable two-dimensionality. There are no solids, no continuums--- only discrete energy packages. Physics has found no straight lines, only waves. Universe operates four-dimensionally.

Physics employs only three-dimensional coordinates. Plane geometry employs rectilinearity and parallelism, when Universe has no parallels. Universe operates only convergently-divergently; that is, gravitationally and radiationally. Universe is always omnl dimensional and always intertransforming spontaneously

"The young world seems/prone to take on my □□□□ synergetics which is, fortunately, conceptual and sensorially testable, ergo experimentally evidenceable. There is no question in my mind any more that it is the coordinate system employed by Universe. Fortunately some great scientists now support me. This means a great revolution, really the greatest."

Frequency;

"The word frequency would never relate to the word one, incidentally, because frequency involves some plurality of events. Therefore, frequency would begin at two. ... we have to have frequencies for size. Therefore vector equilibrium is really subsiie. • • • Looking at vector equilibrium as unity--- all the domain of a point ... we find that it has a volume of 480."

* Cite OREGON Lecture #8, p. 286. 12 Jul'62

Frequency:

In closest packing of spheres "we discover that the number of balls in any one layer, we could call it frequency or radius, because we have found that they are the same words.

"Though the diameter of Betelguesm in Orion's Belt is greater than the diameter of the Planet Earth's orbit around the Sun, Betelguese appears to Earthians only as a fine point of light. As in the rate of information recall by the mind from brain storage, there is also an inherent lag in the rate of human optical apprehending of newly perceived phenomena. The pulsa- tive frequency of alternating current

electric light at 60 cycles per second is designedly frequenced to coincide with the frequency corresponding to humans' 'second look' stroboscopic rate of apprehending. In a like manner the frequency rate of cinema's picture-frame running is synchronized to coincide with the rate of mental-mouthful digestability of new information receptivity which must check the new information with the old to permit recognition or new cognition. The static frames themselves---as in benday screen printing---are frequency-subdivided into local increments whose wavelength-spacing is infra- tunable by the human-brain-apprehending set. The human brain apprehending at 200 info-bits per inch appears as omnicontinuous despite the separate frequency islands of their different color light points, each of which is an island of different electromag netic frequencies. All of the spots are frequency islands like events and novents."

- Citation at Covariables. 20 Jun'66

"By designedly synchronized frequency of reoccurrence of their constituent event patterning a machine gun's bullets may be projected through a given point in the rotational patterning of an airplane's propeller blades. Such purposeful synchronization of alternate occupation at a point by first a bullet and then a propeller blade, and repeat, is called frequency modulation, which avoids interference since all physical phenomena from largest to the smallest consist of frequencies of reoccurrence of otherwise discontinuous events. All physical phenomena are subject to frequency modulating avoidance or use of interference patterns.'*

Fuller. R.B: Crisis of 1927:

"...I realized how facile at popping off things that others had given me; so for ten years I didn't use words to see if I could really understand what I was WHHHi thinking."

- RBF quote recorded by Neva Kaiser as shown on screen at Harvard Commencement & reunions, June'75

"Dear Ked:

"I thank you very much for letting me know about the college endowment program which is an excellent one.

**i want you to know a little bit about my own case. I do not have any securities or interest-bearing business investments, m 1927 I committed myself for the rest of my life to undertaking the solution of problems which were not being attended to by others which experience taught me would, if effectively solved, greatly advantage society and if left unattended, would bring about comprehensive disadvantage for all.

"There was no one to pay me for these tasks. No direct bargaining could be undertaken. I saw that the Universe operated regeneratively on an indirect, complex circuitry of intersupport.

"All biological life on Earth is sustained exclusively by star (bun) radiation. The radiation is vegetation-imposed by photosynthetic chemistry, which proliferates hydrocarbon molecules.*

- Cite KBF Ltr. to Robt. H. Davison, Boston, 12 Jun'73
RB; Crisis of 1927: (c)

"of inadvertently to the cyclically regenerative functioning, I would find myself surviving without direct accountability and only by surprise income sources. This 46-year-old assumption seems to have proven valid as the sums of money which have come to me annually have just about matched my ever-increased funding of original research and development. For the last 20 years the income has averaged greater than \$150,000 a year, all of which I have reinvested in further research, ergo, no savings,

"I have not attended directly to developing any income for my heirs. I have, however, inadvertently developed income for them because of the 12 books I have written and published, royalties from which will accrue to them for some time. This means that I do not have any of the guaranteed income-producing capabilities of many amongst our classmates who I am confident will be able to participate in the new endowment program. As I have done throughout all the last 56 years, I will keep on giving annually to Harvard until I die, and will try to increase the giving.

I hope that whatever benefit I may be to Harvard accrues to the work I have done. I know that some of my books are already used by Harvard classes."

- Cite RBF Ltr. to Robt. H. Davison, Boston, 12 Jun'73
Fuller. R«B: Crisis of 1927?

"To avoid dehydration by Sun exposure the vegetation puts down roots through which, by osmosis, it draws water through its whole system, launching that water into the atmosphere to return some day as rain.

"The vegetation gives off gases that keep the animals going. The mammals give off the gases that keep the vegetation going. Honey bees going after their honey only inadvertently cross-pollinate the vegetation, which vegetation being rooted, could not reach other vegetation to procreate its Kind, in the same way the money-bee (sic), humans, going after their profit inadvertently cross-proliferated general production tooling but only for warmaking, which all inadvertently in due course provided swiftly amplifying, world-around life support not foreseen by the money bee when underwriting the development of arms production.

"I saw that all living organisms were given genetically incisive drives which, in their accomplishment, inadvertently fed into the complex regenerative pattern of life on planet Earth which has now come to be known integratedly as ecology.

"I decided 11 1927 to assume that if I attended directly, instead*

*When I was 22 a major change came about in my life. Up to then I had been conditioned, both lovingly and harshly, to live in accord with inspirations, biases, values, concepts, resolves, laws, loyalties, and credos evolved by others.

"In 1927, I resolved to do my own thinking, and see what the individual starting without any money or credit-- in fact, with considerable discredit, but with a whole lot of experience--- to see what the individual, with a wife and new-born child, could produce on behalf of his fellow men, I have been in this second stage of my life for approximately half a century now."
