Fuller, R.B.: Crisis of 1927: (1)

"I felt I was a low-average man. It occurred to me that the world was largely made up of people precisely like that. So I resolved to determine if there was something the little Individual could do to help his fellow man, to see if there was something the individual could do that all the vast corporations couldn't. . .

"There is nothing in the system of checks and balances of giant corporations that produces a breakthrough. We keep the system going by deliberately introducing inefficiency. • •

"Humanity has been doing the right things but for the wrong reasons. We're told that the Golden Rule is beautiful and all that, but the hard economic fact is that there's not enough to go around. It's you or the other guy. I tried very hard to play that game until I was 32. But I discovered then that I wasn't doing my own thinking, according to the rules of the game, I was told I was impractical. So I tried to open up again the valves of sensitivity. I resolved to discipline myself not to talk to anyone else unless they asked me. . . and then to give them my very best insights."

(2)

"You see, we spend so much time trying to persuade others to see things as we do that we don't really listen to each other. And we must be economical with our time. . . It's so short. . . I try to overcome my own reflex. . . the way we act in moments of stress. . . to see things not as I was convinced they were yesterday, but as I found them, even if they are different--- today."

- Cite RBF to Wm. C. Lyon, Philadelphia Enquirer, 1 Nov*72

"Thia / the birth of Allegra 7 precipitated my absolute determination to peel off. I had really been through a great deal. But I had gone into Harvard with high honors in physics. I had very rich boyhood experience with boats. In my Navy, I had looked into electronics, the chemistries, and navigation. I had papers to command unlimited tonnage on the ocean. I could fly. But I had kept pushing things, trying them out. And it always seemed to come to a dead end, I decided I'd better call myself to account, with this new child to care for. Or get myself out of the way, because I was a mess.

"This is really where I started. I was not called an architect. I was not called anything. I was simply faced with the problem of organizing myself and really starting to use me* I had to educate myself in a great many ways to pursue such a course. But I found it's actually possible for an individual to make first moves, and that these will incite various others."

- Cite RBF to William Farlin, Architectural Forum, Feb*72

"So I said to myself, 'If this gets anywhere it's going to take 50 years and unless you're willing to spend 50 years, don't touch it. Because it's too important. It's too big and right. Don't flub this one, or you'll discourage a lot of others coming along.'

"I said to myself, 'What can I do to help my fellow man without trespassing on him?'"

"Let's say you're looking at me. But I can see behind you. And a rock is tumbling downhill and it's going to hit you in the head. Let's say I divert it. You'd have been killed if I hadn't. You didn't even know you were going to be killed. You might say 'Why did you do that? I wanted to die.' Well, I would say, 'Then jump out that window over there. There are many ways for you to die if that's what you really want.' But I want you to have the option of saying whether you want

"I resolved to apply the rest of my life to converting my pattern sense, through teleological principle into design and prototyping developments governing the pertinent, but as yet unattended essential industrial network functions, necessary to removal of such housing chaos by physically effective and lasting technology. As a corollary I resolved to eschew further acceptance of conventional recourse to political or moral reforms which, lacking physical energy effectiveness, must in the face of physical inadequacy adopt peaceful or forceful palliation through political action... I sought only to allow myself to articulate my own innate motivational integrity instead of trying to accommodate everybody else's prefabricated credos, educational theories, romances and mores as had occurred in my first life!"

— RBF interview in "Friends," (London) 14 Apr'70 "In 1927 I gave up forever what I thought was a fallacy of most of my contemporaries-- in fact, it seemed to me all of my contemporaries. They all said: 'I have to earn a living.' And that had the highest priority in what they were studying at school. The phrase 'earning a living' I thought was wrong. The words really meant you had to prove your right to live; you had to prove that you were worth living; in the face of Darwin and Malthus, there was nowtr near enough to go round and survival only of the fittest. And I felt that all this was wrong, so I said in 1927: I'm going to give up forever this concept of proving my right to live. I'm going to find out what it is that I've experienced, that I see needs to be done, that nobody else is attending to and that my experience tells me I know how to solve. Most people were attending to very narrow things; therefore it forced me to concentrate on big things, and employ the biggest pattern-comprehending capability with which we are all born."

Q. "la it true that you used to drink? Why did you

do it?"

RBF: "In the 1910s when I had that great resnonsiblility

of exploring our highest scientific capabilities.., when I had the burden
of proving that politics just might be invalid.

I had to regard myself as the custodian---but not the proprietor of the
rules of Universe, and not JUst our little local rules called politics.

"I did not want to be a leader, playing the political game. But this was in the depths of the depression when I sometimes got a decent meal only every two or three days and when some of them in the street didn't get that much. And I found that people listening to my ideas started treating me as a messiah, as some kind of guru---and I didn't want that so I deliberately took to drink and when the people saw me stumbling out of bars or coming out of a brothel and things like that, well I can tell you that it shook off all those disciples all right."

"Both Hugh Kenner and thia professor at Stanford have pointed out my mistake In dating the publication and recognition of i-althus's work. I will write them both and thank them. But I have already made the first amende of public admission of my error at a great university— when I opened my tai* yesterday at Harvard, at the Faculty Club, toiling them that I have beenwrong about the dates.

First of all I welcome corrections, but at Fortune I got into the habit of being casual about dates because we always had researchers to check everything. I talked to the head of the East India Company studies about this. Even though palthus didn't get his degree till later, he had access to all the facts and figures. And the

people around him recognised that his first surmise— about population— was so valid that he really had earned his professorship, long before it was actually awarded. As far as that date goes. ... It is a part of my personal discipline to make a public acknowledgement of my errors, it's not a question of excusing myself. There's no vacuum in Universe about this: your face is what it is. The welcoming of attention to error is of the greatest 'importance.'¹

Fuller. R.B.: Meeting with Fernandez-Moran: (1)

Bill Lear had arranged for RBF to meet (fnu) Fernandex-Moran. Director of the Fermi Laboratory, University of Chicago. Thia was also the site of RBF's one-day meeting with Cyril Stanley Smith in 1950. RBF also recalled that Fernandez-Moran was at MIT at the same time RBF was--- 1955* At the invitation of Fernandez-Moran RBF met with him and hia top people in the Chicago Laboratory, from 8.30 - 10.30 a.m., 5 Apr'73.

"They showed me everything they had--- the largest superconductor in the world, their laser diamond cutter, absolute zero conditions with no energy loss at all. There was a man named Wolf who had won the Scott Medal in Philadelphia and was the head of the electron microscope work in the laboratory. Wolf was the top mathematician at

Cambridge. Fernandez-Moran and Wolf said that RBF's mathematical discoveries were really confirmed by the latest developments in nuclear physics. They said that Fuller ranked with Einstein and Dirac as the only other two men whom they knew in their lifetime to make original mathematical discoveries of such significance. (They said Dirac was as mean as was Einstein modest and generous.) They ranked me with Einstein and Dirac as most important personal"

"It was the head of the Soviet Academy of Scientists who first made the comparison of RBF with Edison and Franklin.

"He gave the summary address to the 100 guests of the final formal dinner of the 1961 10-day 'Dartmouth Conference' held that year in Leningrad, between what the Russians called the leading representatives of across-the-board fields of the USA and USSR economied with 30 Russians and 25 USA's partici

pating. Amongst the USA team of 25 were Arthur Larsen, Norman Cousins. Dr. Paul Dudley White (cardiologist), James Michener (author), John Galbraith, Norton Simon, David Rockefeller and B. Fuller. The Russian team had five of its science academicians—

also their leading philosophers, writers, economists, sociologists, the head of the moving picture institute, and the editor of Pravda. Both sides had the representatives of their air sefvices and the professional disarmament negotiators.

"It was decided by both teams and mutually agreed between them not to have a final summary of the proceedings. Instead, on the last day's morning a Russian team member would to make a comprehensive forecast of world affairs, and in the afternoon"

- Cite RBF to EJA, 200 Locust, Phila., 22 Jan'73, as rewritten by ' * BRU'

"Che USA member would make his comprehensive forecast which, to some extent, would disclose what hope the meetings might have engendered or not discouraged. The head Russian meteorologist gave the Russian prognostication and B.F. the USA,

"Referring to B, Fuller's prognostication which had received applause from both sides, the President of the USSR Academy of Sciences made the statement that, as a consequence of my prognostication and my domes and map that henceforth I would be ranked in the USSR with Edison and Franklin.

Franklin was very much an operational man, first a baker and then a printer. Being involved with production in your early life is a very important kind of experience. And then he became interested in economics and homely philosophy. Anyone who is really involved in discovering principles which help other people determine how they should behave, whether Franklin or Mao, is seeking to find those generalized principles governing sociology, which even to this day has failed to discover any such laws ranking with those of science."

RBF. - Cite RBF to EJA, 200 Locust, Phila., 22 Jan'73, as rewritten by

"If MFranklin had been a large landowner, I'm sure he would never have had the creativity. I'm sure he counseled himself to be as simple as possible and to concern himself with just the truth.

"It's like what Jasper Moore once said to me about why I would never be a success. He said you are always trying to make things simple, when the first rule of success is to try to make things complicated."

: Oft GallX Pf.Mfg:

"I met with Bruce Carrick today from lac mi Ilan and I told him that Thornton Wilder (who was a mathematician though many people didn't know it) said that my mathematics book--- if it is right--- would be more important than Newton's.-"Principle." ... Now we know that

it is right and 8® tactically it is more important than the "Principle"---
the Greatest Book. I talked Navy to him as a young man and told him
I was rather miffed at being stood up for lunch Monday. I told him
about our requirements for color plates and he agreed,

"I explained to him in some detail about wr method of composition.
How a thing is clearly whenl write it down on paper, *nd how much
clearer it is again when it comes back after you (txJA) have typed it
up. But you really can see vastly more only after it has come back to
you as galley proofs. That's when the real writing can begin. This is
not a question of being careless. 1 explained about meeting Winston
Chnnchill's secretary at the N.Y. World's Fair and how we both had to
go through seven drafts. Chutchill had his speeches and other draft-
sxet up as galleys. With me, my use of galleys is not facetious: it is
part of the process of being adequate and thorough,"

Fuller: Indexing RBF Ideas: p)

"I gave Constance Abernethy a job that has really been a very difficult kind of job. I knew she knew me so well, my philosophy, and was so astute in managing and organizing things. ... And incidentally at this time I was being beset with requests for writing. And I hoped that she might be able to make transcriptions of my talks-- which usually take about seven rewritings; and I thought she might be able to put them together in articles.

"It turned out she couldn't do that. But I said, Constance, I'd like you to take everything I've ever written and have any number of xeroxes you need of anything and take it apart in actual idea increments, maybe there's a paragraph--- maybe three paragraphs long--- and begin to collate those ideas. Time and again I've found myself having to talk about those same ideas, but they actually get progressively treated and they get a little better. So if we had a file where you kept cutting things out and were able some way to identify that idea and were able to catalog it so you finally have seven statements of the same idea and pick out the best one or going over them find out what I've left out in several."

- Cite tape transcript //6, Side A, p.10; RBF to Barry Farrell. Bear Island, 16 Aug'7u

Fuller's Indexing RBF Ideas: {2}

"There might be a composite where all the parameters, all the variables, are in there. Make one composite. She did this job for several years and she found it mentally very tiring. And I think it would be awful to try to remember that you've seen this there and here and put all those together. She was very devoted. And she'd gotten to the point of identifying different idea increments with different kinds of names and tried to get up some kind of proper indexing. A really expert indexer would be able to cross reference them so they could be called up very importantly.

"I hoped she would be able--- when she had a tape recording of a talk I'd given some place and they wanted it transcribed to be printed someplace-- that she'd be able to say that's paragraph number seven and this is paragraph so-and-so, and she'd be able to pull out those paragraphs and put a composite together. I thought that could be done. She never has been able to literally do that. I still think it's

actually possible. But the point is she has worked very hard and has a very large collection of work, very large and very valuable. She's now going to stop working for me and Dale's going to pick that up in New York.'*

"The space is a priori mystery that the space vehicle goes in. And you don't think that it's a mysterious thing that he had the capability to get there? It's all part of the same mystery.

'•People who listen to me say, 'Here's a man who's selling screw-drivers... they don't realise how mysterious screwing is. ... I've been identified only with the physical so far. I went through 25, 30 years of people saying: this is the bathroom man, or the automobile man---that's all they thought about me. It's only in the last couple of years that they discover I'm a thinker. And I started off as a thinker.

I didn't start with bathrooms. I started off with God and my charge was to work with the physical. That's where I had the capability; that's why we're here. I accepted this. And to find myself identified, then, with just being a fishing-pole salesman! I find this thing echoed when you say that about my analogy, 'cause I use a very good tool there. I have helped to shock man into realizing he's on board a space vehicle. He's a passenger on it and he's intimately related to it."

- Citation and context at Spaceship (F), Feb'73

Fuller, R.B.: Modus Operandi

"... You don't go to Bucky and ask him a specific question. He gives you a huge view so you can then go back and find the answer. You have to get into a different state of consciousness, really, to hear him. He answers very much according to the way he intuitively you. He'd be different with a molecular biologist, a crystallographer, a mathematician."

- Quoted by Rasa Gustaitis in Wholly Round, p. 152. Holt. Rinehart & Winston, NY, 1973 - Feb'73

"I realise you have this very big love and you want to do some very fine things with it. But I'm afraid you won't be able to do anything beneficial until you really start to think and get inside what's causing this love. You are going to have to think very clearly about basics and about what moves you can make to bring about changes in the things you see wrong. It doesn't do any good to get angry. And it doesn't do any good for you to sit here with me unless you can find in all this something of your own to say,"

- Cite RBF to young student. Pacific Palisades. Christmas. '971. quoted by Wm, Marlin. Architectural Forum, p.74 < Feb'72 ¹

^Fullfir, RxB: Moratorium on Speech: (1)

"The conditioned reflexes, they absolutely astonish me..., because 50 years ago, I went into a speech moratorium so that when I made a sound I would know that I really meant to use that word. I saw that we---like parrots---could make sounds so easily.... How we can learn

patterns and know absolutely the right way for school without really knowing anything. I think many of us got very good marks in school. If we are honest, we admit that we really don't know anything. I think it is very different from reasoning.

"So talking about conditioned reflexes, one person says a cliché and another person pops back with the appropriate other one. This sort of nonsense goes on. This was on my mind and I thought that I must shut off the proclivity in myself for that cliché or countercliché... and I must use words only because I intend to use the words... and obviously at that time I said all the blasphemy, and so forth... but It has actually no meaning. It would be impossible for any human being to be the son of a dog, or whatever It may be. It would be impossible to hold sexual intercourse with a grandmother who was no longer alive---so I said I was forever"

- Cite transcript pp.8-10, RBF taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

Fuller, Moraxorlun on Speech: ¹²

"going to give up those kinds of expressions. I had not grown up with such language, but when I came to have my first job in New York, the second time I was kicked out of Harvard, I found that all the workmen there thought that I was probably a homosexual because I spoke the language I had learned at Milton Academy and Harvard and it sounded so absolutely different from their language which was 50 percent obscene or blasphemous, that I sounded so queer to them that they thought I was a sexual pervert or something. I was sure I wasn't, but the only way I could convince them, I couldn't teach them my language, and I got pretty good at the horrible cursing and blasphemy, so that it was... in there from way back before World War I, so I am talking about 65 years ago.

"So in 192?, 50 years ago, I said I'm never going to use any of that blasphemy ever again.

"I will be driving in my car and suddenly someone will ha come out of a side road very dangerously and I will say ¹ son of a bitch!' and I am so absolutely shocked I will say 'Jesus Christ" that this could come out of me. I want to_n emphasize to you psychiatrists how very deep these things

- Cite transcript_p.11 RBF taped interview with Dr. Michael Bpuwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

'are to somebody who has determined not to use these words, it is always under surprise. It is always because it is a dangerous surprise and you have to alert yourself very fast to avoid an accident. I try very hard not to allow it any more. I was driving with my wife and her young nephews and nieces Quite a few years ago and one of those things happened. One of her nephews was standing next to me and about an hour later someone came out of a side road, and the nephew said, 'Uncle Bucky, aren't you going to call him a son of a bitch?*' And you realize how terrible and unbecoming it was. That's the subconscious we are talking about here—conditioned reflexes in which things we haven't done or thought about for a long, long time and a surprise element will bring them. out.

"You have a very difficult one to cope with there, don't you? thgt these things could be so organized in the subconscious?"

Fuller; R.B; On Social Impositions:

"I was born into an enormous amount of social imposition on me as a child about what is au fait. . . . And the critic says that is absolutely au fait, you get the prizes and they go into the museums, or whatever it may be. And you and I might not exactly, as a kid or a child say : I think that's great. It was part of the way society was operating."

- Cite WHITS TAPE, p. 13, 19 Oct '70

Fuller, R.B., Ag Harbinger of Society:

A# a child he had such a bad eye defect that he thought his sister was telling tall tales when they compared notes about their visual world.

His vision was corrected with spectacles (he now also wears a hearing-aid), but, as an original independent thinker, his mental view of the universe has never quite coincided with that of other people.

At school he fell into the pattern of accepting authority, but "I didn't seem to see things the way other people did," he says.

Today, he describes himself as a harbinger of society--- a citizen of the world with a post office address at Southern Illinois University, a man "living in the frontier of the breaking pattern of humanity.¹" rest of society not long after," he says. "If economics are going badly for me, for instance, I feel very sorry for the rest of the world because it's going to happen to them not long after," (At the moment, he adds, his personal economics are doing well.)

Fuller T. Thinking Me:

"You have done a magnificent job! I find it fascinating. This is good, for in relevant contrast I have been unable to read more than 100 pages of Hugh Kenner's 300-page book about me; not more than 10 pages of Alden Hatch's on the same subject. This is because I soon

found that they were not about the real me, which is the thinking me. Their books are about legendary-type characters that they (and many other writers, too) have spontaneously fabricated from too little data and too narrowly-focussed a viewpoint. Neither of them let me see their manuscripts nor checked any 'facts' with me."

Fuller, R.B: What I Am Trying

To I "But the fact is I really am pure guinea pig to me, . . . Back in 1927 ... I committed myself to as much of a fresh start as a human being can have--- to try to go back to the fundamentals and see what nature was really up to. But I was all alone, and up against the massive corporation and the massive state. 'Can the unsupported individual really get anywhere?' I asked myself. Because I'm not impractical I'm not a blind idealist. How could I work in the system without capital backing? And I came to the following conclusion: In the Universe everything is always in motion, and everything is always moving in the directions of least resistance. That's basic. So I said, 'If that's the case, then it should be possible to modify the shapes of things so that they follow preferred directions of least resistance.' I made up my mind at this point that I would never try to reform man--- that's much too difficult. What I would do was to try to modify the environment in such a way as to get man moving in preferred directions. . . "

"Now, writing about Hucky has its peculiar difficulties, of which the leading one is that it is almost impossible except in his own idiom. There is a very good reason for this--- that his creative thinking does genuinely seem to be done in the grammar and syntax he uses when speaking. Problems are simultaneously bulldozed frontally, undermined terminally, and outflanked by relative clauses lasting up to six weeks. All this is fine while Bucky is telling the tale himself, except possibly for people sitting at the back of large audiences who cannot follow his facial expressions or the subtleties of his hand-actions. Comprehensibility survives into print, if the text is Bucky's own, but if it is written by another hand. ... trouble! In Robert Tarkenton's 1960 book on Bucky, the interference between his own manner of writing and Bucky's manner of thinking, produces a style that falls apart--- ponderous and pedestrian on the facts, which it fails to illuminate, turgid when it turns to narrative, which it fails to animate."

"Synergetics bids fair to being progressively exploratory. There is clearly disclosed the desirability of attaining and commencing scientific exploration with the synergy-of- synergies Universe: metaphysical and physical, while synergetics seems to open new ranges of cosmic comprehension, we assume that the time will come when the inventory of experiences Which have catalyzed both its conceptioning and inception, will have become overwhelmed by vaster experientially based knowledge and nay well taw in its turn become progressively useful but obsolete, Because the generalized principles cannot be principles unless they are eternal, because human experience is inherently limited, there can be no finality of human comprehension,"

"I am . . . thoroughly aware that there is a whole new generation of young people who are becoming preoccupied with this field. I am aware that the return of science to full conceptuality ... is leading to ultimate popular comprehension of the vast ranges of science's nuclear, chemical, and biological explorations wherein, for a century, it had been assumed that nature developed her energy patoriings and transformation without modelability.

"As a result of my energetic-synergetic geometry breakthrough, we are entering a new era in which the transactions and transformations of nature have become so lucidly, rationally, and simply conceptual that children will be playing games of nuclear, chemical, and biological structuring as a fundamental kindergarten preoccupation. The great awkwardness of irrational constants characterising today's and

yesterday's physics will vanish. The awkward irrationalities were the consequence of man's attempts to measure the omnidynamically transforming fourth, fifth, and sixth dimensional Universe with a static three dimensional system."

- Cite RBF Ltr. to Steve Baer, 19 Apr'66

"There is a question-asking-possibility that omniscience may be transcendent in velocity to the definitive physical speed of energy omnipotence. The synergetic anticipatory capabilities of intellect (in respect to conceptual formulations of evolutionary transformations^a ing potentials of universe and the anticipatory stratagems evolved by intellect to test such hypotheses) imply the possibility of a velocity transcendence of omniscient functioning over omnipotence functioning which could mean an intellectually regenerated evolutionary extension of universe in generalized synergetical integrity. Intellect's comprehensive anticipatory objectivities indicates a speed of functioning transcendental to physical events. Intellect may be 'creating' finitely extending and re-fining universe as it asks each next good question."

" I liked what Galileo had been doing with his force diagrams even though they did turn out to be inadequate because he did it on a plane instead of omnidirectionally. But it was good thinking that things did run into each other and there were a resultant of forces. You could prove things on the billiard table showing that Avogadro was right. So there were lengths of vectors that were lengths of vectors that were proportional to the mass times the velocity and there were unique directions in Universe."

Game; Synergetic a as a Game:

(1)

"Energetic Geometry is, as mathematicians say a game; and it is a game of solitaire I started playing in 1917. "it is now no longer a game of solitaire. Certainly. I have many friends like Duncan /Stuart/ who are playing the game with us and we find it very fruitful. When a game becomes fruitful, whereby you can get information from the game itself, one can transfer it to the larger game of life.

"Energetic Geometry started as a game before it had the nice name of Energetic Geometry. It started in 1917 when I was in the Navy and was interested in trying to give myself an additional education which I did not receive in college.

I suppose the education I was trying to give myself would have arrived in very fine order if I would have had the chance of going on in college; and I assumed that what I began to discover in the game was territory that had been well covered by students long ago. In some instances that would seem to be the case. In other instances, it would seem that we have rediscovered arrangements of phenomena that, if they have been known to man, have long since been forgotten. I must say that when you play a game like this you get a strange feeling when you come into view of arrangements of components of your energetic Universe with which you are not at all familiar and" - RBF talk to students at Design School, Raleigh, NC, 1950

Gears:

"The old-fashioned physicist used to put one nail in the wall fasten a rope to it, and stand back and throw a whip into the rope. The whip goes to the nail on the wall and then comes back to his hand and stops. That is the prime characteristic of waves. They always make a complete cycle. That is why, for instance, gears are always whole circles. A gear is a fundamental wave phenomenon. Electromagnetic waves always close back upon themselves."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 522.09, 7 Nov'73

HBF UEFINtriors

Gears:

"Frequencies in waves may be thought of very realistically in the terms of cycles, and you can think then, for instance, of a gear, a mechanical gear which has teeth; they represent waves when they come back to the cycle. And in designing the wave phenomena of the Universe, when the Universe has a lot of energy to invest she®. doesn't do it as often, with a finite amount of physical energy she does big things very infrequently, and little things very frequently. It's exactly like a gear where you have a few big teeth and many little teeth for the same amount of circumference, the same amount of metal."

- Cite KEF at U. i.-ass., AmhqQnt, 22 July '71, Talk 1J, p. 9. v

Gear-locked:

See Frequency k Magnitude, Jun'66 Synergetics, Nov'71

"...A gear is designed to mesh with other gears. But one loose gear put into the machinery will strip all the others. When it is on the right pinion it meshes with the other gears and can bridge a gear-train gap. That's exactly what happens to copper and spinach..."

- Citation and context at Spinach. 11 Feb'73 ' • Having different sized teeth, and rates of revolution, Two such gears cannot mesh, butm associate only tangentially. Consequently, their axial centers must be farther apart Than are those of meshable gears.

Omnidi'pcttonally pulsative systems

Are. in effect, spherical gears.

Their inwardly and outwardly pulsating and rotating 'teeth' Consist of multifrequenced circumferential and radial waves Of fifty-six great-circle subdivisions of spherical unity, Often nonmeshing with other local systems.

The universally infrequent meshing of wavelengths and frequencies Produces an omnicondition

In which the new omnidirectional system's center must, as each is created,

Continually occupy omnidirectionally greater domains of disorder.

- Cite BRAIN & MINO, p.B9 bay'\$2

Gears: Toothed Gears:

"Toothed gears correspond with wave frequency cycles.

waves are cyclic. .Whatever the number of teeth might be we can call the wave frequency. Two gears that do not mesh can only be brought into tangent proximity and take up more room than do meshing gears. Frequencies given off entropically that don't mesh with energies given off by other systems take up more room in Universe."

Cite Museums Keynote Address Denver, p. 12. 2 June '71

Gear Train; Locking and Blocking:

"In three-dimensional, omni-intermeshed, unclutchable, mechanical systems, if any gear is blocked, the whole gear train is locked. In a four-dimensional unclutchable gear system a plurality of local gears may be locked while the remainder of the system interarticulates freely."

- Cite SYNERGETICS draft at Sec. 966.08, 18 Nov'72

"...Now along comes a third sphere and it nests in the valley. This makes a train of gears with each one geared to the next one. Even numbers of gears will always reciprocate and the odd numbers will always block. So no longer can those balls roll in a plane on the triangle which they form. If one tries to go one way it will make the next one go the other way; and one can't be moving in two different ways, so odd numbers will always block."

SAC — 5t<- . 2.'XU6⁴+|

"There's no drive we have quite so great as the sense of order and the urge to employ the sense of order. The best I can see of man's function is the one of the mind. The mind has the ability to generalize. We don't have any experimental suggestion that the physical would be able to generalize. The physical is always a special case. Each of the neurons are keeping the special case incident, but in mind we see the ability to run them over and find out that which is generalized among them. For instance, we said the other day that we have the theory of functions where X can stand for tension and Y for compression; where X could stand for photons and Y for neutrons; where X

could stand for concave and Y for convex. These are always normally coexistent. That's the theory of Functions, that is, a generalization of generalizations. And there are generalizations which embrace a plurality of generalizations.

"There are very basic first-degree generalizations, and second-degree, and third-degree, and fourth-degree. We find there are five degrees of generalizations where one embraces the others, and we finally get to a word like 'Universe.'"

- Cite RBF to World Game, Jun-Jul'69

Generalization Sequence: (2)

"We find that 'Universe' itself has to be complementary because there is the conceptual and the nonconceptual automatically.

"We have nothing else to indicate mind present anywhere in other animals, or in mountains, or in the physical. There is nothing in our experience with little dogs, our affection for a little dog, or whatever it might be, to suggest that little dogs could develop the theory of functions. We find that the ability to generalize is absolutely unique to mind and that the little dog has brains, beautiful brains, but not mind.

"We have no experience of the mind except in terms of the human being; the mind of the human being, which is able to apprehend and comprehend generalized principles. All the generalized principles have been discovered by human mind. The people who have discovered them are usually called scientists. Sometimes there's a poet, but really the sort of artist-scientist is the one who discovers them, and every time he discovers them, he's prone to make a record of the fact that he discovered it, and that he didn't invent it."

- Cite RBF to World Game, Jun-Jul'69

"The great scientists and artist-scientists finding these life principles find them all never contradictory one of the other. They are intercomplementary; they are interaccommodative. There can't be a principle that has a 'beginning' and an 'ending'. We cannot suggest that an abstraction could have a beginning and an end. The words 'beginning' and 'end' have to do with the physical,

"So we have, then, this extraordinary a priori set of absolutely weightless, pure metaphysical principles which all interaccommodate and therefore are extraordinarily orderly. And they can only be discovered by intellect or mind. They seem to be quite clearly purely metaphysical, and in their orderliness and metaphysicality, they seem to be intellectual in their own right. There seems to be an a priori greater intellect operative in the Universe.

"Anyone who discovers anything about his physical Universe begins to be overwhelmed by it. Just to start off with, there is mass attraction. You learn how mass attraction operates. But no scientist has the slightest idea of the why or how of mass attraction. The more you discover scientific-

ically - Cite RBF to World Game, Jun-Jul'69

"the more you are overwhelmed by what we don't know.

We're dealing in a fantastic mystery, and yet that mystery does have all this extraordinary orderliness, so that you can't help but realize that it can only be found by intellect. Apparently we learn it subjectively, so apparently there must be an objective intellect. There seems to be an a priori greater intellect than that of man operative.

"I don't have to do anything about it. Nature knows exactly what to do. Nature is never caught off guard. /RBF throws coin into the air I haven't the slightest idea really how to resolve it when I threw that coin in the air. But nature knew how to handle it. Nature is never non-plussed about what to do. But you and I get tremendously nonplussed about what to do."

- Cite RBF to World Game at NY Studio School, 12 Jun-31 Jul*69
Satrun Film transcript #327, pp.13-16. ⁵

Generalization:

"If you try to remember all the special case experiences of which your life is composed, your brain will be very quickly overloaded in the given category of recall. It is going to take too long to get this information back and sorted out to use. Instead of trying to deal in all the special cases, deal exactly with the opposite; work towards the great Generalizations. Mathematics is one of the great generalizations and so I've worked and kept myself at nBthematics, By understanding the fundamentals of mathematics, I can now understand special case behaviors very rapidly. This is one of the major strategies."

- Cite RBF address at Univ, of Rhode Island, 26 Aug. '66. p.195
RBF UaFIHITIw.S

Generalization:

"You begin to be able to do away with thousands and thousands of what we call special cases when you get into generalizations. Generalization gives you great strength so what I had learned in chemistry, physics and mathematics began to be very useful. I readopted mathematics because mathematics contains all the great generalizations and there are not really many generalizations. I discovered that if I could be master of the generalization# that I could develop a very high capability."

fowall.*atloiu Pcgrtge °£-

"The whole process of generalising generalisations fores a pyramid whose base consists of all the special cases of direct physical experiences. But when we said, 'We take a piece of rope and tense it,' we did not in fact have a rope in our hands. We have all had so many rope experiences that we generalised MH the concept. This was a first degree generalisation. The discovery of always and only coexisting tension and compression was a second degree generalisation. Finding a whole family of always and only coexisting phenomena was a third degree generalisation; and conceiving therefrom a relativity was a fifth /sic_7 degree generalisation.

•'In this pyramid of generalisations, the human mind then goes way beyond the biologicals in its development of an Increasing and diminishing conceptual Universe. So we find the metaphysical not only balancing the phydcal-- which should have been expected--- but also encompassing the physical by one tetrahedron, and thereafter reducing its myriadness to unity. The metaphysical, as with the circumferentially united, great-circle chord vectors of the vector equilibrium, coheres the physical.

"...Man is the great antientropy.

"... The total rope experiences is perhaps ten thousand kinds, and
 we've gotten that down to only one piece of rope. Then we took all the
 myriad kinds of experience with concaves and convexes and with pro-
 tons and neutrons; we got that down into the theory of functions, and
 then we embraced that even further, getting just the word 'relativity.'
 And finally we got this word 'Universe.' What we have here is a pyra-
 mid of all the special cases working up to generalizations, and gener-
alizations to one word. That's as orderly as you can get.

"We were looking for a phase of Universe where things are contracting and increasingly orderly. Nothing could be more orderly than those generalizations."

QgMralUed PlghQtORY! Grand Strategy?

"I do not mean to infer any set of special case paired dichotomies.

"I first developed the concept of synergy, the behavior of whole systems unpredicted by the behavior of the parts considered separately, which automatically Identifies the unique behavior of the whole as resulting from the interrelationships existing between but not in any of the parts.

"Next I pointed out that there was nothing in atoms per se that predicted their association as chemical compounds; there was nothing in chemical compounds per se that predicted biological protoplasm; I said there was nothing in biological protoplasm per se that predicted camels and palm trees; nor the respiratory interexchange between those mammals and botanicals.

Quite clearly, the more complex systems were never predicted by the behaviors of the lesser systems.

"I next pointed out that there is what we call synergetic grand strategy. The synergetic strategy is that the known behavior of the whole and the known behavior of some of the"

- Cite RBF Ltr. to Dr, Wm. R. Cline, San Francisco, CA, 26 May'75 *parts may frequently provide the capability to discover unknown parts or all the unknown parts.

"I pointed out that Euler's topology provided mathematical means for dealing with the whole of visual experience reducing it into points, areas, and lines and we found there was a consistent generalization of the relative abundance of those three irreducible aspects of experience.

"I then pointed out that Willard Gibbs, at the beginning of the 20th century had been able to provide a formula for relative abundance of the tactile experiences of liquids, crystallines, and gases; and with the known behavior of the whole and the known behavior of some of the parts quantitatively predicted, the behavior of the unknown parts and energy inputs we could arrive at the factors necessary to establish the equilibrium of a substance.

'Having found, then, that humanity had three successful grand strategies for proceeding from the whole to the particular, I produced my scientific definition of Universe; and I produced the concept of a system; and was able to find an equation for*

Generalized Principle: (A)

"Human mind has discovered a number of generalized principles, each quite different from the others: one, for instance, being mass attraction; another being leverage; another being refraction of radiation; another being precession, etc. in order to qualify as generalizations, these different principles found by science must be devoid of exceptions. Therefore, principles must be both eternal and mutually interaccommodative. Humanity apparently discovered a plurality of a priori, absolute, weightless, abstract principles, each displaying unique mathematical relationships, realization of which generalizations can be employed physically by humans but only in time-limited special cases-- for instance, to produce a lever of such and such a length of wood or other substance.

"Only through a succession of many subjective, special-case physical experiences do we humans gradually come to discover a generalized principle. Later we also discover that we can objectively employ those generalized principles. But then we find they can only be employed in special-case physical ways. Only the human mind can discover and think conceptually in generalized terms. Physical life is always a special-case."

- Cite GbuViEW i, "Ko Title," (Part 1), World lag., p.34, 22 May'73

Generalized Principle: (B)

"Human mind alone has the capability to process and conceptualize in eternal, weightless, timeless metaphysical abstractions. it follows that while all human organisms exemplify and embrace a large number of generalized principles, each human demonstrates the complex interaccommodation of an aggregate of generalized principles.

What we have discovered, then, an eternally regenerative universe consisting of a complex of eternally generalised principles, wherein none of the generalized principles has ever been found to contradict the others, and, indeed, all are found to be interaccommodative at exponential rates of synergetic inter-augmentation, as for instance, the efficiency of an electromagnetic generating and distributing system increases as the square, i.e., as n^2 , of the rate of the system's voltage increase."

General SystAma Theory: (1)

"The 12 universal degrees of freedom govern the external and internal motions of all independent systems in Universe. In order to take synergetic strategy advantage and thereby to think comprehensively and anticipatorily, in terms of total systems, we have to start off with Universe itself as a closed finite system that misses none of the factors. We must also include all the universal degrees of freedom, and the approximately unlimited range of frequencies in the use thereof, which cover all variable interrelationships of Universe.

They become the controlling factors governing general systems and, thereby govern such supercomplex systems design as that of a nation's navy or a fundamental program for comprehensively considerate and efficiently effective use of all world resources.

SYBfHgTheoryj (2)

"The general systems approach starts with the differentiation of Universe, including both metaphysical and physical, and permits progressive subdivisions in cybernetical bits to bring any local pattern of any problem into its identification within the total scheme of generalised system events. Problem solving starts with Universe and thereafter subdivides by progressively discarding irrelevancies thereby to identify the 'critical path*' priorities and order of overlapping developments that will most economically and efficiently and expeditiously realize the problem's solution by special local problem identifications and location within the totality of the problemsolving scenario."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 537.31, 7 Nov'73

"General systems theory treats with phenomena that are holistically comprehensible. The objects of our experience are finite systems. Their superficial outlines close back upon themselves multidirectionally as a systematic continuity of relevantly contiguous events.

"Maximum system complexity consists of a dissimilarly quantified inventory of unique and nonintersubstitutable components. That is, Euler's irreducible-system aspects of vertexes, areas, and edges exhibit the respective dissimilar quantities 4, 4, and 6 in the minimum prime system, the tetrahedron. This demonstrates the inherent synergy of all systems, since their minimum overall Inventory of inherent characteristics is unpredicted and unpredictable by any of the parts taken separately. Systems are unpredicted by oneness, twoness, or threeness. This explains how it happens that general systems theory is a new branch of science.

"General systems theory is another example of evolution by inadvertence. It developed fortuitously to accommodate the unprecedented and vastly complex undertakings of the late twentieth century, such as the 10 million separate and only"

General Syattma Thwry? tB)

"partially overlapping 'critical path' tasks that had to be accomplished and tested to foolproof reliability en route to countdown to eventual blastoff, Koon landing, and safe return to Earth, which found all conventional mathematical theory wanting. It required the development of the computer and star-focused instruments and computer programming arts together with operational research, which guess-improvises the inventory of parameter of variables that must be progressively programmed into the system in order to further reduce the magnitude of tolerated errors consequent to trial 'bird' (rocket vehicle) 'flight' (trajectory) control as the vehicles are progressively zeroed-in to progressive target rendezvous with celestial entities. Neither differential and integral calculus, nor

'probability* statistics, nor any branch of specialized hard science has accredited synergy as an a priori assumption. General systems theory, which recognizes synergy as inherent, was discovered and named by the biologically inspired Ludwig van Bertalanffy,"

"...The computer operational research and general systems sciences and their equipment will help... to progressively dispense with opinion judgments. They, as in the space operations, can cope effectively with all the tactical variables."

"General systems theory 1* central to all the successful prognosticating. This theory has been employed in the logistics and ballistics of world-embracing naval theory for at least a century. It involves all the fundamental variables entering into the problem. Its strategy is to start with the most comprehensive family of variable factors possible, and by progressive elimination of those factors irrelevant to the special case problem, to arrive at logically predictable condition /sic/ at a given time and place. The most desirable results often require invention and development of new tools and instruments. Thus,*the physical novelties of tomorrow are often the consequences of a complex family of variables."

DEFINITIONS

Genius?

"I am grateful for being so generously introduced. But I hasten to
jnnt out that all humans are born geniuses. However they 'are usually
degenlused rapidly by perverse circumstances. Most perverse is the
ignorantly and lovingly lavished don¹t or do that cultivates that which
does not 'come naturally,' and discourages much of what does 'come
naturally,' There is nothing innately exceptional about me. I was just
lucky."

- Cite Museum Keynote address, Denver - p. 1. 2 Jun'71

Genius;

"The genius, as discovered by genetics is characterised by a combination of highly divergent physical life cells that are representative of widely cross-bred parent chains. These cells engage in a ceaseless polar tug-of-war for dominance of the specific human offspring and the result is a dual or multiple personality manifestation. Each progressively revealed momentarily prevailing personality is a summary of the dominants of the whole hereditary line.

"Dual or multiple personality provides, then, two or more viewpoints---equivalent to the two eyes of a range finder, an instrument which mechanically widens the distance between the two human eyes; or to the multiple eyes of the Fairchild aerial camera. Thus genius has the ability to 'fix' events by the convergent angle of two or more 'sight lines,' not only in time (or space) past, but, also, in time (or space) ahead, from the central perspective of self-now. Resultantly it becomes possible for genius first to analyze teleologically such 'fixed' phenomena, and then to objectify them in a precise time-energy composition. Genius's dual or multiple personalities may be said to be representative of a breadth of viewpoint, more-than-average, highly worldly, and having an exquisite

sense of Timeliness

Genius: Children Are Born Geniuses: <¹)

"All children are born geniuses. Out of every 1,000 some 999 are swiftly and inadvertently degeniused by the grown-uns. Because millions of human beings in all the years of their history have always been born naked, helpless, and though superbly equipped cerebrally, utterly lacking in experience, ergo utterly ignorant. Their delicate sensing equipment is as yet untried.

"Born with built-in hunger, thirst, curiosity, and procreative urge, they could only learn what humanity has earned by trial and error---by billions upon billions of errors. Lest humanity be utterly dismayed by these errors, humans were also endowed with easily self-deceiving pride by all those witnessing their errors---nroclaimed to themselves and others that they (the witnesses) knew the answers all the time. Motivated entirely by love, but also by fear for the future of the children they love, parents in their ignorance act as though they know all the answers and curtail the spontaneous exploratory acts of the genius of their children.

"Genius does its own thinking--- has confidence in its own exploratory finding, has confidence in its own intuitions."

“ Cift, R?5)jGg5PrefaCe for i: rS* John S: Lillard » Lake Forest,

Genius: Children Are Born Geniuses: (2)

"Nature has her own gestation rates for all evolutionary development* The behaviors of the parents represent the checks and balances of nature's gestation control. Humanity can evolve healthily only at a given rate. Maria Montessori was fortunately permitted to maintain, sustain, and cultivate her innate genius, Maria's innate genius Involved her awareness of the genius inherent in all other children. The intuition and initiative of genius inspired Maria to discover ways of safeguarding the genius while allaying the ignorant fears of the childrens' parents---but not all parents---far from it. Hers was the difficult frontiering task of genius."

- Cite RBF draft preface for Mrs. John S. Lillard, 28 Aug'75

"By genius I mean those who act spontaneously with imaginative realism--- that is. by subconscious coordination of brain by mind-- as stimulated by intuitive insights regarding the interrelationship significances of fa their successive experiences; such geniuses are to be contrasted to those who respond only to external considerations, self-conscious disciplines and pre-conditioned nerve and muscle reflexing.

"All children are born geniuses but almost all are swiftly degeniused by environmental events. By environment I mean all of the Universe that is not self.

"Great artists and great scientists are the same. They cannot be one without being the other. Both realize their inspirations through intuitions. Both have complete confidence in the validity of their intuitions. Both have the courage to commit themselves to the testing of their intuitions."

Geodesic:

"We have a mathematical phenomenon known as a geodesic.

A geodesic is the most economical relationship between any two events. It is a special case of geodesics which finds that a seemingly straight line is the shortest distance between two points in a plane. Geodesic lines are also the shortest surface distances between two points on the outside of a sphere. Spherical great circles are geodesics.

Geodesic:

"A geodesic line means the most economical relationship between events, but the events are not necessarily simultaneous. So there is a relationship between a rocket that just went off and another rocket that goes off a little later. When for instance, if you are so peculiar in the head that you like to shoot at a duck, if you want to hit the duck the way to shoot is not at the duck. W fou shoot where you hope the duck is going to be, but you don't shoot at the duck or you won't hit it. This is typical of the geodesic relationship between yourself and a nonsimultaneous event. The point of the head would not be simultaneous to any shoot. We have pictures taken during this last world war of night battles between two planes using tracer bullets and the pictures are sometimes taken from the Ml firing plane and sometimes from another plane in company with it. in these pictures of the tracer bullets you will sometimes see a plane fire and hit another plane, but the lines are completely skew lines. These are geodesic lines. They are the most economical relationship between those two events, in a nonsimultaneous Universe all the relationships are geodesic. There are no straight lines."

"Einstein and Reimann had resuscitated from a similar limbo to that of pre-1800 synergy the word 'geodesic' as used in relation to great circles on spheres and then anew to Einstein's curved space mathematics. Stevenson had long used geodetics to embrace the whole art and science of measuring the dimensions of subdivision of approximately spherical Earth. I gave geodesics a new scientific definition as 'constituting the most economical relationships between separate event entities in loci in Universe.

"At any one given moment in time, geodesics were dramatically and visually manifest during World War II in photographs taken by the U.S. Air Force of two fighter planes in a "dogfight" at night with one ship firing its nose-mounted machine gun using luminous tracer bullets and successfully hitting its enemy ship. These two airplanes (unattached to Earth) were two 'celestial bodies' and the geodesic line of most economical interrelationship between them was that of the bullets that 'knocked the other out' and that luminous, chain of bullets' tracers was always an accelerated corkscrew line."

Geodesics: (2}

' ` More geodesics---the top leaves of fast-growing vines reach toward the Sun as the Earth revolves, leaving them reaching westward and outward at evening sunclipse, In the morning, the Sun is to the eastward and the vine circles its top leaves to reach eastward; thus the spiraling vine's leaves are always nearer to the Sun than are the vine's routs.

"But Einstein spoke only of geodesic lines---because the great circles of a sphere provide the shortest distances between any two points on the surface of a sphere, they are called geodesic lines. Superimpose a circle of the radius of 00° north latitude upon the equator of a 12~inch Earth globe, which equator is a geodesic line. The latitude circle which is not a geodesic but a lesser circle, crosses the equator at two points, A and B, and it is quickly manifest that it is a shorter distance between A and B along the equator than it is along the circular distance of the small circle. Because I structured my spherical structures entirely with triangles consisting entirely of chords of those great circles, they were structured in the most economical awareness

for that form, and therefore did not want to transform into any other shape. I called the structures 'geodesics---and th* art and science of dealing with geodesic lines as 'GEODESICS.'" - Cite RBF Ltr. to Art Coulter, Dp. 2-3; 22 Sep'76

Geodesic Dome:

(D

"Quite clearly, I am, to myself, not a dome salesman. In fact I don't want to be a salesman of anything. I don't want to persuade anybody to do anything that is illogical and anti-evolutionary. I'm identified with the dome only because, back in 1927, in trying to seek out how I might be able to affect and help man most. I said: if I could only protect younger life while it still has its comprehensive interest in the total Universe and give it a chance to develop its faculties for comprehending the whole--- it would be a way in which we might most rapidly arrive at a condition where all of humanity might be a success. So, I said, this means a controlled environment, and I kept searching for ways not only of controlling it, but of using the chemistry around us in our environment so effectively that there would be enough to go round to take care of everybody and not just a few. All this brought me into very deep study of all that science was doing and all forms of industrialization, and how we could produce the most with the least. This meant then that I went into a series of experiments in how to control the environment, and it was the geodesic dome that was the practical breakthrough."

- Cite R3F transcript iji "The Listener" interview by John Donat, 26 Sep'68 *

"The geodesic domes were the beginning of the public's realization of what I'm talking about; therefore I became identified as the dome man. But I think I've made it quite clear that this was simply the inadvertent consequence of my concern with young life and protecting that young life."

Geodesic Line:

"Synergetic geometry deals with the most economical relationships
and not with the shortest lines. 'Most economical' and 'shortest' are
not the same.

"The 'straight' line of the Early Greeks is the shortest distance be-
tween two points. Ergo, curved lines are not the 'shortest.' geodesic
lines are the most economical (meaning least time-energy involve-
ment) relationship between any two events. Events are energetic.
The way to shoot a bird is not to aim at where the bird is now flying.¹

. Cite RBF rewrite of EJA query, 9 Sep'74

Geodesic Ling:

"When two great-circle geodesic lines cross they form two sets of similar angles, any one of which paired with the other, will always add to 180°. (This we also learned in plane geometry.) When any one great circle enters into--- or exits from--- a spherical triangle, it will form the two sets of similar angles as it crosses the enclosing great-circle-edge- lines of that triangle.

"As in billiards or in electromagnetics, when a ball or a photon caroms off a wall it bounces off at an angle similar to that at which it impinged."

Gfirtelc Sphere: (1)

"rfhat we do have experimentally as a sphere is an aggregate of energy-event foci approximately equidistant in approximately all directions from one approximate energy-event focus.

^wThis is a system in which the most economical relationships between embracingly adjacent foci are the great-circle chords, and not the arcs. This is why pl (yf) is operationally irrelevant. Physics finds that nature always employs the most economical means. Being shorter, chordal distances are more economically traversed than are detouring arcs. All the chords between external points of systems converge with one another concavely and convexly, i.e., with the angles around each external point always adding to less than 360 degrees. They do not come together, as do radii in a plane, with 360 degrees around each point.

"The chords of an omnidirectional system always come together with concavity on one side and convexity on the other. The angles never add up to 360 degrees, as do those formed on a plane by lines converging radially upon a point. This is why the long-held working assumption of mathematics--- that for"

"an infinitesimal moment a sphere is congruent with the plane to which it is tangent— is invalid. Therefore, spherical trigonometry, with its assumption of 360 degrees around a point, is also invalid. Greek spheres cannot be scientifically demonstrated. Almost-spherical polyhedra are the nearest approximation. It can only be treated with as polyhedral-- as an aggregate of points in which the most economical relationships are chords: ergo, geodesics,

"If you find all the connections between all the points, the system is omnitriangulated. A spherical polyhedron is a high- frequency geodesic polyhedron. Its symmetric base may be tetrahedral, octahedral, or icosahedral; but it may not be hexagonal, i.e. , with angles

adding to 360 degrees around each external point of the system. The sum of all the angles around all the external points of the superficially seeming spherical systems will always add up to 720 degrees less than the number of external vertexes when each is multiplied by 360 degrees.

"In every geodesic sphere, you can always take out 12 pentagons. These 12 pentagons each drop out one triangle from the hexagonal

- Cite SYNERGETICS text at Secs. 1022.13, .14 & .15, Aug'71

"clusters around all other points. Assuming; the dropped-out triangles to be equiangular, i.e., with 60-degree comers, this means that $60 \times 12 = 720^\circ$, which has been eliminated from the total inventory of surface angles. You can always find 12 pentagons on spheric >lly conformed systems such as oranges, which are icosahedrally based; or four triangles with 120- degree corners if the system is tetrahedrally based; or six squares where the system is octahedrally based."

GeojlejlC Spiral Tube:

See Hex-pent Sphere: Transformation into Geodesic Spiral Tube

"In our geodesic structures, the surface of a sphere is interlaced by an omni-three-way grid of great circles which always uniquely intercept one another in such a manner that everywhere the surface areas described by the intersections are triangular. As triangles are nondistortable, this intersecting, if substantially structured, represents a rigid trussing of the spherical surface. If, between

each of the vertexes or intersections of the great circles occurring in the surface of the sphere, we construct chords, or straight lines, these lines must fall below the surface between their surface terminals. The lines converging at any one vertex all leading away below the point on the surface must form a convex intersection or pyramidal point. As we press against any convex vertex, where the other ends of the lines are elastically restrained, the vertex will subside and the lines will tend to form a flat plane."

9 Cite IDEAS & INTEGRITIES, PREVIEWS, P, 216, 1 Apr'49

"As each of the chordal ends between vertexes of our geodesic structure is tensionally restrained by the comprehensive trussing of the sphere, it is seen that when pressure is exerted inwardly against any vertex it will thrust outwardly against each of the chords leading radially from it. It will be seen that, inasmuch as each vertex represents a pyramid of triangular planes, the bases of the planes opposite the vertex constitute a closed tensional ring. Because the linkage is of great circle chords and because sections of the great circle always represent the shortest distance between any two points on a sphere (and the chords of the great circle represent the shortest distance between the two points in space through the sphere), the ring of chords tensionally opposite the compression thrust of the pyramidal lines from any one vertex may not be elongated. The vertexes will not subside.

"Thus it seems that the geodesic structure employs the principle of compound curvature as the stress is radially distributed from a single point. All the vertexes surrounding any one vertex are secondarily actuated, and each in turn thrusts outwardly to adjacent vertexes; rings of triangles of geodesic lines are successively activated from the original thrust'*

- Cite IDEAS & INTEGRITIES, PREVIEWS, p.218, 1 Apr'49

GwlfleaK Syrugfrurt:

"against one vertex until six rings have been activated and the equator is reached. All thrusting outwardly against the equator symmetrically, their outward thrust is compoundingly restrained by the opposite hemisphere.

(3)

"In the case of a geodesic structure representing a portion of a sphere, the functions of the balance of the sphere are rendered by the Earth, which tends to complete the spherical structure by stress extension with the Earth. Thus, in compound curvature structures of nature, emulated in principle by our geodesic structure, working stresses are ultimately translated into omnidirectional outward thrust from the stressed centers, and are ultimately satisfied throughout all the cohesiveness of all the enclosing tension. In contradistinction to simple curvature, which is ultimately satisfied in polar focus upon two compression points, compound curvature invokes ultimate activation of comprehensive tension.

"Men have employed geodesic structure in the form of tetrahedrons, octahedrons, and icosahedrons. While useful in small structures, the relative sizes of spans or chords of these well-known continuities of great-circle triangulation become so great in unsupported length when applied to structures appropriate to"

EJA Query: "Is tensegrity a special case of geodesics?"

RBF Reply: "Geodesics are generalizations. It does not mean
•structure,¹ it means the most economical relationship between any
two events. But tensegrity involves more than two events. All of
Universe is tensegrity. Geodesic is the relation between the Moon
and the Earth. Tensegrity is always a total system.

"Geodesics represent a subgeneralization of tensegrity. All geodesics
are not, as built, tensegrities. Tensegrities are inherently nonredundant."

"Thinking about precession Goldy observes that fish fan their tails sideways to produce forward motion, that snakes wriggle sideways to produce forward motion. She sees that iceboats attain speeds of 60 miles per hour in a direction at right angles to wind blowing at half that speed. Coming back to her triangles and their synergetic surprise behaviors, Goldy flips one simple white triangle over and find the other side is black. She realises that there are two triangles, the obverse and reverse, always and only coexisting congruently.

"Goldy realises that every sphere has a concave inside and a convex outside. She knows that convex and concave are not the same because concave reflectors concentrate energy as radiation and convex mirrors diffuse the radiant energy. Convex and concave are nature's macro-to-micro or macro-to-raacro radiantenergy transformers.

"Goldy realizes that unity is OHH always plural and at minimum two. Unity does not mean the number one. She realises that one does not and cannot exist by itself. In Universe life's existence begins with awareness. No otherness: no awareness. The observed requires an observer. The subjective and objective always and only coexist and therewith demonstrate" - Cite GOLDYLOCKS, p.G3, 16 May'75 "the inherent plurality of unity--- inseparable union. Physics tends to think of 'complementarity' (discovered half a century ago) and the letter's nonmirror-imaged complementation (discovered only twenty years ago) as being the interrelationship characteristics of two separate entities. However, the always-and-only coexistent, non-mirror-imaged complementations also may coexist with inseparable plural-unity.

"Goldy finds she can interconnect the three mid-edge points of a triangle which subdivides the big triangle into four similar smaller triangles and can fold the three corner triangles along their connecting lines to produce two different tetrahedra, because folding the corner triangles under or over produces either a white tetrahedron with a black inside or a black tetrahedron with a white inside. Since the inside of the tetrahedron is concave and the outside is convex, there are two very real and separate tetrahedra in evidence, whose eight (four white, four black) faces have been evolved from only four externally viewable triangles, which four were in turn evolved from one (unity-is-plural) triangle.

"Since both the positive and negative concave tetrahedra have four different black faces and four different white faces, she"

- Cite GOLDYLOCKS, pp.GJ-G4, 16 May'75 "can differentiate them by placing a red, a green, a yellow, and a blue dot in the center of each of their respective four white inside faces; and an orange, a purple, a brown, and a gray dot in the center of each of their outside black triangles successively, Since each M of the two tetrahedra can turn

themselves inside out (as their respective three triangular corners rotate around the central triangle's three edge hinges— thus to open like a three-petalled flowerbud), each tetrahedron can be opened in four such flowerbud ways, with three triangular petals around each of their four respective triangular flowerreceptacle base faces. These four separate cases of insideouting transformability permit the production of four separate and unique positive and four separate and unique negative tetrahedra all generated from the same unity— each of which tetrahedra can rank as nature's simplest structural system. Therefore, each prime structural system in Universe has nine separate and unique states of existence— four positive, four negative, plus one schematic unfolded nothingness state— which Goldy reminds the bears constitutes the same schematic 'game* set up as that of physics* quantum mechanics with four positive and four negative quanta as we go from a central nothingness equilibrium to first one«, then two, then three,”

"I have a very discrete mathematics about how loads are distributed. They couldn't be more vectorially fundamental. Synergetic geometry is vectorial geometry. That's exactly how forces are translated and to what magnitudes.*

"And I always must, do it nonredundantly. Plurality: there must be always two discrete configurations. When you get to two you have wanderability ((vulnerability ?)); when you have three you are absolutely fixed."

- Citation & context at Intuition Sequence (2), 15 Jun*74

"Remember the words vectorial geometry: if you want to look for maximum efficiency, you do things vectorially."

- Citation & context at Most Economical. 15 Jun'74 "Time is in our dimensioning because our geometry is vectorial,"

- Citation and context at Tima, 21 Dec*71

"Assuming an energy Universe of curved paths generated by angular accelerations of varying intertensions, rates, and radii, resulting in orbits of high-frequency continuities, and separating time out of the compound dynamic system there retracts only the relative attractions or repulsions expressed in relative vectorial terms in respect to the radius of any one interattracted couple of the set of all the radii expressed.

"In such a timeless and equilibrated instant the remainder of the system may be discovered as a vector construction of force interrelationships between centers. A geometry composed of a system of interrelated vectors may be discovered which represents the complete family of potential forces, proclivities, and proportional morphosis by octave introversion or extroversion."

"At the Naval Academy we learned about Galileo's parallelogram of forces. I liked the idea of vectors. I was excited by vectors because I felt that vectors did what the geometry teacher couldn't do with her 'purely abstract straight' lines. Vectors had not only unique direction in relation to other experiences, but also were discrete in their relative lengths, which were arrived at by multiplying their object's mass times their object's velocity. We didn't have to worry about the vector's lines going to infinity. There was no such inference in their deliberately developed construction. A vector went just so far and that was the end of it. So a vector constituted an experimentally satisfactory kind of a line.

"Furthermore, I could convert mass and velocity into heat, and I could ascertain the time dimension from the velocity, thus all the qualities and behavioral characteristics plus the environmental conditions of 'existence' which I had been seeking, were satisfactorily expressed as vectors. So I said, 'Might there not be a Geometry of Vectors?' --- and I remembered those equi-length toothpicks of my kindergarten experimental exploration for logical structuring and the complex'*

Geometry of Vectors:

"The only thing you have to watch for in the vectorial geometry is times when things double up."

- Cite Lt.DGEh.ONT Laboratory Address, p. 25, 15 Oct *64

"I found his /` Galileo* s_7 vectorial diagram exciting. It suggested a comprehensive geometry consisting entirely of vectors. A vectorial line was a very nice kind of a line because it had a discrete length--- it didn't go on absurdly forever to the nowhere of two infinities--- in both directions as potential extensibilities of lines. It didn't have the 'tine* to do so. It had a discrete amount of time, which time was a component factor of the vector's velocity,

"I wondered if nature might have a set of omnidirectionally operative vectors that represented all of our experiences. It is experiences that we are dealing with in nature.

Nature and Universe are alike the aggregate of all experience. Couldn't I then find vectors that represented any and every unique experience? Vectors are like spears. I could massage any object into a spear shape, point and thrustthrow it in u discrete direction. I intuitively liked those directional vector 'spears.' I felt that they tended at least to embody all the energetic qualities of represented experiences. That thinking-feeling, however, was only an intuition and not an accomplished, mathes atically coordinate, generalized experience system."

"I felt that it would be possible, for instance, when I could make a model of two ships running in to each other, where I took each of the ships. . . and I simply put it into compression, and I make it into a great long sphere, and it weighed and had the same dJjdt as the other sphere, and it would have a certain length and I saw that I could make a model out of these interesting things.

"I thought vectors were extremely realistic. In fact, I liked! the idea then of a geometry which would be made up entirely of vectors instead of a geometry made up of some hyptothetical kinds of patterns. In other words, they could be made of vectors of actions. They were

our experiences of basic phenomena, so I said wouldn't it be interesting if we had no geometry unless there were vectors, because the vectors are real experiences, and because the vectors had inherent velocity and mass.

Velocity is the complementarity of time and space. Time and space are simply functions of velocity, velocity is really the reality. You can examine the time or space increment, but they are never independent of one another. They were unified as velocity. I said because it had**

Geosocial Revolution: (1)

"A half century of subconsciously developing world revolution is now crossing the threshold into human consciousness and ultimate popular support. The heretofore subconscious world revolution may well become the conscious focus of effort of the International Cooperation Year.

"The I&Y-1965 itself has been indirectly occasioned by the subconsciously occurring techno-scientific revolution and its myriad of separate world- around transformations of human ecology.

"The unheralded human ecology transformations have developed only as inadvertent, unanticipated infractions of individually undertaken uncoordinated inventions.

"The independent physical environment reforming inventions have integrated, figuratively speaking, as streamliningly divided, double-decked, banked, and cloverleafed lifeways of human behaviors. These lifeways permit ever increasing numbers of humans to survive logically and sense-satisfyingly without mutually frustrating interferences. |₂)

- Cite GEOSOCIAL REVOLUTION: SYNOPSIS /'./DSD, Doc /3, p.79, 1965
Geosocial Revolution; C2)

'"There are two main classes of inventions: those which increase and those which decrease the degrees of freedoms. Because men are born immobilized there are few invention opportunities for his immobilization. These are prisons, traps, straightjackets, handcuffs, and caskets. On the other hand there are an infinity of opportunities to invent man's increased mobilization--- all the way up to the speed of light, 136,000 mps., and in all directions. Means-of- increased-freedom inventing is irreversible.

'"Inventions occur when individuals, frustrated by circumstance, eschew negative blaming and undertake positive physical environment reforms rather than abstract human reforms. The latter depend precariously only upon moral, ethical, and legal codes which are enforceable only by negative penalties.

"The silent preoccupations of the artist-scientist, whose inventions subsequently pennit mankind to realize his innate potentials without interference with others are in marked contrast to political behaviorisms. Political theories apparently assume that there is no alternative to the word,"

- Cite GEOSOCIAL REVOLUTION: SYNOPSIS UDSD Doc. #3, J.79, 1965
Geosocial Revolution: (3)

"fist, and bullet battles between opposing ideologies. Each ideology seeks to reform man. They scheme and labor to impose their respective viewpoints by omni-interfering political, moral, psychological persuasions, furtive corruptions, bullyings, or punishments.

"Both professional and amateur spokesmen for society apparently assume that the political battles will persist until man annihilates himself. The only considered alternative, happy or unhappy according to the individual's viewpoint, is that one bias or another will gain sufficient advantage to be able to dictate the terms of mankind's reprieve from total extinction. We don't agree. We think there is a third eventuality wherein the political chaos will fade out in ways entirely unpremeditated by political man as the invention order looms in. Geosocial revolution explores the possibility that the nonpolitical surprise has already occurred and will soon be increasingly visible to all."

Ghostly Greek Geometry; Sphere:

"The Greek sphere is wrong because it is a net too small for the molecules of gas to get out."

- Cite RBF to EJA, 3200 Idaho, Wash DC, 1 Oct.'71.

Ghostly Greek Geometry; Sphere:

'•The definition of a sphere by the Greeks was 'a surface equidistant in all directions from a point,¹ Now if you have a surface equidistant in all directions from a point it couldn't have a hole in it. If it had a hole in it the distance would not be equidistant because the surface would start to turn inwardly and the radius would not be the same. To say then that you have a surface equidistant in all directions from a point is considered some kind of a solid surface. A sphere then would be a subdivision of universe in which part of the universe would be inside and part outside and no communication between the two because there are no holes in it. In other words, the Greek definition of a sphere was the definition of the first perpetual motion machine or

local system that was adequate in itself. It didn't need any of the rest of the universe. All experiments in physics has shown energy losses in systems and energy intakes and so there would have to be some holes in the system for them to pass through. Therefore we discover we have to give up the concept of the sphere as defined by the Greeks and all we can say is that

Gravitational Constant; (1)

"Pondering on Einstein's adopted last problem of the Unified Field Theory, in which he sought to identify and explain the mathematical differentiations between electromagnetics and gravity: the two prime attractive forces of universe. In that connection, recalling my conclusion that gravity operates in spherical embracement--- and not by direct radial vectors--- and recalling that electromagnetism follows the high tension convex surfaces, possibly the great circle trunk system of railroad tracks, I found myself pondering, surpris®(BBedly, over the fact that the vector equilibrium, which identifies the gravitational behaviors, and the icosahedron which identifies the electron behaviors of electromagnetics, discloses 25 great circles for the vector equilibrium in respect to its 24 external vector edges, and the icosahedron discloses 31 great circles in respect to its 30 external vector edges.

"In each case there is an excess of one great circle over the edge vectors. Recalling that the vector edges of the vector equilibrium exactly equal the radial explosive forces, while the icosahedron's 30 external edges are

sec j

I oX2.il I

- Cite RBF dictation, 1 Apr '72 "longer and more powerful than its 30 radial vectors, yet each has an excess of one great circle, which great circles must have two polar axes of spin, we encounter once more the excess two polar vertexes characterizing all topological systems, and witness the excess of embracingly cohering forces in contradistinction to the explosively disintegrative forces of Universe.

"This is the field theory.

"The excess two poles permit omniradially propagated waves of energy to be polarly focused, ergo beamable, or wirable by conductors.

Gravity: U)

"My theory of gravitational behavior is an intuitively evolved operational concept. Since

- (a) Spheres contain the most volume with the least surface; and since,
- (b) Nature always employs only the most economical interrelationships and omniscient interrelatedness behavioral stratagems; and since,
- (c) With each and every event in Universe, no matter how frequently recurrent, there are always twelve unique, equieconomical, omnidirectionally operative, alternative action, options: which twelve occur as four sets of three always interdependent and concurrent actions, reactions, and resultants; and since,
- (d) Galileo discovered the mathematically uniform, second-power, exponential rate of acceleration manifest by free falling bodies; and since,"

- Cite RBF Ltr. to Annie Dillard, 12 Jun '74

Twfwr pKfwj o* ess>oM - 5 Gc

(e) Kepler discovered that hidden within the superficial disorder of individual omnidifferences--- differences of size; differences of distances from the Sun; and differences of Sun-orbiting rates--- there nonetheless existed an elegantly exact, one-to-one mathematical correspondence in the Sun's planets* intercoordinate behaviors manifest by the equi-areas of the radii- and arc-bounded, piece-of-apple-shaped areal sweepouts, within an identical time span,

of all the Sun's planets as they orbited elliptically around the Sun at vast distances from one another, all accomplished without any visible mechanical interlinkage such as gears, yet whose orbiting around the Sun--- rather than flying off tangentially from those orbits by centrifugal force as do the round iron balls released by 'hammer throwing' athletes--- altogether suggests some incredibly powerful interattractiveness to be operative; and since,

(f) Newton correlated (a), (b), (c), (d), and (e) above to discover

Firstly, that the prime interattractiveness magnitude existing between two mutually remote bodies, as compared to the prime interattractiveness existing between any other two mutually remote bodies, is arrived at by multiplying each of the

« Cite RBF Ltr. to Annie Dillard, 12 Jun'74

”respective couples' separate masses by one another; and

Secondly, as a cosmic generalization of the acceleration of Galileo's Earthward falling bodies, Newton discovered the second-power mathematical rate of interattractiveness gain occurring with each half of the intervening distance of any two given celestial bodies; whereby it was shown that there are interrelationship behaviors manifest in physical Universe that; are in no wise indicated to be operative by any or all of IMI the unique geometrical or physical characteristics of any one of the mass-interattracted bodies when considered only separately; and since,

(g) Synergy means behavior of whole systems unpredicted by the integral characteristics of any of the system's separate parts, it has come to pass that it has been synergetically proven that Copernicus was 'right on,' for the ever exponentially increasing interattractiveness of bodies freed of other external restraints to come ever

closer together, must induce their ultimate huddling together in the most economical, volume-to-enclosing-surface manner, which as the number of converging bodies increases is that of the spherical conformation.*

Ci he Rbf Lfrr- to Anpia Dillard 12 Jun¹⁷⁴

Gray: (d)

"This would also occasion the spherically trending series of inter-transforming events that would take place as two independent large spherical masses, such as two asteroids, fell into one another and their multitudinous individual atoms began to sort themselves into most economical interarray. Interestingly enough, this is the opposite of what transpires with biological cell dichotomy.

"Electromagnetic radiant energy is entropic; gravitational energy is syntropic.

"Speaking mathematically, the surface area growth is always at a second-power rate of Increase in respect to the linear $\square\square\square\square$ dimension's rate of increase; wherefore, as Newton's linear distance apart was measured arithmetically, we can understand systematically why the relative interattraction of the bodies varies as the second power, whicra*epresented their relative surface rates of change, but this

does not explain why there is any interattraction. Interattraction is eternally mysterious."

^MI met an old friend yesterday, tyril Stanley Smith. I first knew him in 1950 when he was the director of the Institute for the Study of Metals at the University of Chicago. It was in his institute that the first Enrico Fermi atomic pile was assembled, erected, and operated. Cyril Smith was one of the original Manhattan Project scientists. For a number of subsequent years he has been professor of the History of Science at MIT. He is one of the world's great metallurgists.

"I discussed with him yesterday unique metallurgical techniques I had experienced in connection with producing my automobiles, bath-rooms, and aeronautical structures. In producing these prototypes I always had occasion to take on metal craftsmen called 'hammer men,* The best harm er men have been Polish- Americans. They inherited their craft as the best of the early armor makers of Europe. I said to Cyril, *I don't think any of those sheet metal workers ever think of what they are doing in the way you and I would think about what their work does to the atoms.' Cyrils said. 'You mean "in the ways the atoms accomodate their work.'" I said, 'Yes, that's what I should have said.*

- Cite RBF Ltr. to Annie Dillard, 12 Jun'74

Gravity: (f)

"The hammer men have learned that they can gather the metal together, that is hammer it thicker. Anybody can conceive of haraner-ing metals thinner. Few would think spontaneously of hammering it thicker. The hammer men do, however, hammer it in such a way as to bulk it. They can start with a flat sheet of metal and hammer it thicker as you would knead dough together after it had been rolled out thin with a rolling pin. But you push the dough together horizontally with your hands. You do not punmel it vertically from above. The skilled sheet metal hammerers can do just that with metal, which amateurs would spontaneously assume to be illogical if not impossible.

- (1) We can conceive of heating metal until it becomes liquid and flows together. Thus the blacksmith's heating of his horseshoes to a bright red to a condition just short of melted, makes it easy for us to think of the derry-red metal as being

in a plastic or semimolten condition which permits the smith to smite it into any preferred shapes--- thicker or thinner. But the Polish hammer men hammer cold, hard sheet metal into any shape.

- (2) What the Polish hammer men do intuitively without sensing it realistically is to hit the indestructible atoms"

'Tevtiarj - Jt-c. 6.15, .v. nA

Gravity(g) "tangentially as might a billiard player 'kiss' the object ball with his cue ball* Thus does the hammer inadvertently impel atoms sidewise often to roll atop the next nearest 'spherical* aggregate of atoms--- spherical because of the electrons' orbiting combined with the atoms' spinning at so high a rate as usually to present a dynamically spherical surface.

- (3) I went on to say to Cyril, 'I don't think hammer men think about their work as bounce-impelling the spherical atoms around as if they were a bunch of indestructible ball bearings stuck together magnetically as a consequence of which the accelerated ball bearings would cleave-roll, to relodge themselves progressively in certain most economically travel led-to, closest-packed, intersted rearrangements.
- (4) Dislodged atoms of the outer layer atoms of the omniintermagnetited ball bearings would always roll around on one another to relocate themselves in some closest packing array, any two mass-interattracted atoms being at least in tangency.

When another dynamical spherical domain atom comes into closest-packing tangency with the first two the mutual interattractiveness interrolls the three to form a triangle. Three in a"

"triangle produce a 'planar' pattern of closest packing. When a fourth ball bearing lodges in the nest formed between and atop the first three, each of the four balls now touch three others simultaneously and produce a tetrahedron having a concave-faceted void within it. In this tetrahedral MSB position, with four-dimensional symmetry of association, they are in circumferential closest packing. Having no mutual nuclear sphere they are only inter-circumferentially mass-interattracted and cohered: i.e.» gravity alone coheres them but gravity is hereby seen experimentally to be exclusively in circumferential interbonding.

"With further spherical atom additions to the initial tetrahedral aggregate, the outermost balls tend to roll coherently around into asymmetrical closest packing collections until they are once more synuie trially interstabilized with twelve closest packed around one, and as yet exercising their exclusively intercircumferential interattractiveness, bound circumferentially together by four symmetrically interacting circular bands;

whereby each of the 12 surrounding spheres has four immediately adjacent circumfepetial shell spheres interattracting them circumferentially while there is only one central nuclear ball"

- Cor* ss TOM sig<S'

Gravity: (1)

"inwardly, i.e. radially, attracting each of them. In this configuration they form the vector equilibrium, known to Plato as the cuboctahedron. Here we have clarification of the Copernican 'nostalgia' or synergetic proclivity of the circumferentially arrayed spheres to associate symmetrically around the nucleus sphere or the nucleus void which, as either configuration--- the vector equilibrium or the icosahedron--- rotates dynamically producing a spherical surface. But the modus operandi of four symmetrically intertriangulated gravitational hoops (in the case of the vector equilibrium) and the six (in the icosahedron) are lucidly manifest. If we took out the central ball, or if it shrinks in diameter, we will discover synergetics' jitterbug model (showing that the twelve circumferential spheres will closest pack circumferentially until each of the twelve circumferentially arrayed balls is tangent to five surrounding balls and thus altogether form the Platonic icosahedron.

+X "Cyril agreed with me that the hammer men probably didn't think Ceteris paribus about these properties of atoms. The fact is that the spheres S / don't actually touch each other. They are held together only *LUL 14* / mass-interattractively and their electron paths are, of course.

I at > distances from their atomic nuclei equivalent relatively to" "t 'V I - Cite RBF Ltr. to Annie Dillard, 12 Jun'74

Gravity:

"that of the distance of the Earth from the Sun as proportioned to the respective radii of these vastly different sized spheres. As Cyril said, 'The hammer men can push the atoms only as the physical laws allow them to be moved.'

(J)

"The reason I mention this harnner man inadvertency is that you had spoken in your letter about 'hammering barrel hoops' and I felt that the haimering of barrel hoops introduced the operational concept of what it is that the only-intuitively-exploratory hammerer does not see yet, by virtue of which, nature accommodates his only superficially contrived hammering strategies while all the time all those atoms are intercohered by gravity--- which the hammerer associates only with falling objects.

"Ey book, SYNERGETICS, is comnitted to conceptual elucidation of the intertransformative geometries operative in the nonoptically-tunable ranges of Universe events. Synergetics conceptualities always manifest geometrical integrities of intertransformabilities.

"Up to the twentieth century 'reality' was all that we could see, smell, hear, and touch. The vast range of the thus far

Gravity: (1)

"We now have another impressive kind of second-power relationship, the word 'second-power' having something to do with radials and surfaces. Regarding gravity, Newton discovered a certain relationship of masses, but unfortunately his relationship is stated in a negative way. He talks about an Inverse ratio. The word inverse ratio makes it very difficult conceptually. He talks about not what it is, attraction, i.e. coming towardness, but about something else, i.e., repulsion, or reason d'être of going awayness--- the opposite of what he is attempting to explain.

"It could have been stated that the gravitational relationship is in terms of the second power of the relative distance between the given masses as stated in the terms of the radius of one of the masses. That is the way we would say it today. He could have said, quite simply, 'Every time the distance between the bodies is halved, the attraction is fourfolded.'

"We find that the gravitational law is in terms of the second power of radius, which terms are convertible into Einstein's" mass conversion into radiation in terms of the second power of the radius."

7 Feb*71 □ Cite Oregon Lecture #7, P-241, 11 Jul'62 as rewritten by RBF, "We would then be able to know where relative mass was, how much energy and how much quantum were in it; and we would suddenly see the gravitational state in terms of the second power and this

relative concentration of masses. The gravitational, then, is the contractive quantative of second power of the relative masses status in quantum or photons-- and the other one is the Einsteinian one, which is the rate of omni- expansive surface growth of the radiation.

"We have two main conditions of energy: energy omniradiantly divergent, and energy omniconvergent--- and we find both of them in the second power of the radial dimension. We suddenly find a very neat relationship going on."

- Cite Oregon Lecture #7, p.241, 11 Jul'62 as rewritten by RBF 7 Feb'71.

Gravity: (A)

"Gravity is a principle of synchronous coordination of dynamic complexities. Gravity can break a dish carelessly relinquished to its force. Principles may remain carelessly or ignorantly unheeded, or uncomprehended, and the dynamic effects may thus intrude upon man's unrealistic preoccupations to be misapprehended as 'destruction' or 'chaos.'

"If, however, gravity is recognised as a principle, and its behavior and rates are measured, then its enormous force may be put systematically to work to augment man's as yet meager degree of conscious advantage over evolutionary process and environment.

Thus great hydroelectric dams as complex products of intellectual comprehension of principles converted to physical system, operate under routine guidance of a doten men to valve this principle of cosmic force to provide 20 million inanimate energy slaves to serve an Earth-huddled city of a million humans.

"This is a puny accomplishment in view of the potentials of the principle. The principle of gravity takes a little thing like the minor planet Earth, weighing only 6,000 billion VM*"

Gravity:

"What we wanted to do in making tension members is to get longer and longer and less and less section for a given strength as a reason for increasing the bridges. That curve is going up very,very rapidly as every metallurgist knows. However, I saw we were tending towards infinite length and no section at all, so I said back in 1927 is that a silly question that we are working towards great length with no section at all? Of course, in order to be able to see this, we will have to deal in big patterns of the universe because these are big patterns that I'm talking about. Let's look at just the Earth and the Moon, and quite clearly, they are cohering in tension, beautifully, gravitationally. and yet you can fly an airplane right through the point, the center of gravities with no trouble at all. I saw here in the heavens we were demonstrating over and over again great length with no section at all. . . This always seems to be true in the microscope--- with electrons and protons and all the atomic behavior. . . *man is excluded from thinking the way the universe does-- this very efficient way of doing the big cohering tension, and having only local islands of compression."

"The principle of leverage is employed in shears, nutcrackers, and pliers. The longer the lever arms, the more powerful the pressure applied between the internal central angles of the nutcracker's lever arms. We can make an illuminating model of our planet Earth if we think of it as a spherical bundle of nutcrackers with all their fulcrums at the center of the sphere and all the radii of the sphere acting as the lever arms of the pincers. The whole bunch of pincers have a common universal fulcrum at the common center. The farther out we go on the radial lever arms, the less effort is required to squeeze the ends together to exert nutcracking pressure at the center. If we go around the sphere-embracing circumference progressively tying up the ends of the levers together, we find that it takes very little, local, surface effort tensively between any two surface points to build up excruciatingly powerful, centralcompression conditions. The bigger the model, the easier it is to tie it up; ever more delicate an exterior web will hold it together.

- Cite KBF rewrite of SINEitGETICS galley at Sec. 1051.50, 9 Jan'74

"Look at the relative distance of the atom and its outside electron orbit. The atom's electron field may be equivalent to our magnetic field around this Earth. This elucidates the electromagnetic field of Earth as a world-around, circumferential-embrace field operating ephemerally on the outer ends of 4,000-mile-long levers.

"Identifying the surface-angle chordings with gravity, we comprehend why it is that as we get deeper and deeper, we see that the increasing gravitational-compression effect is due to the circumferential containment. The external containment web is always getting hold of the outermost ends of the centrally pinching levers. With this leverage effect, the farther out you go, the more advantage you have and the more powerful work you can do with that lever. Leverage effectiveness increases toward the center, ergo the increasing pressure that we identify with gravity. But it has this circumferential aspect.

- Cite ».BF rewrite of SYNEHGLTICS galley at Secs. 1051.51 and 1051.52, 9 Jan'74

'•There is a tendency to misinterpret the increasing pressures occurring inwardly of Earth as 'deadweight,' i.e., only as a radiationally-inward force, but it must be realized that the •weight' is omnidirectional compression. The gravitational intermass-attraction is progressively augmented, as we go radially outward, by the circumferential mass-interattraction of the relative abundance of elemental atoms, which increases at the second-power rate of the radial-distance outwardly from the Earth's center; and as the pressures bring about ever closer presence of the atoms to one another, there is also an additional second-power exponential gain which results in r^* varying as $\text{proximity}^2 = P^*$, where ϵ = relative compressive force. The surface chordal angle magnitudes multiplied by radius to the second power produce the relative magnitude of network leverage advantage

resulting in the relative increase in pressure as you go inward toward Earth's center. This is exciting because we now comprehend that gravity is a circumferentially operative force and not a radial force, with precession bringing about the 90-degreeness

- Cite RBF rewrite of SYNERGETICS galley at Sec. 1051.53, 9 Jan'74 **"Remembering Newton's law of gravity, wherein the relative interattractions are directly proportional to the product of the masses increased by the second power of the distances between the respective mass centers, we realize that doubling the size of a sphere brings about an eightfold multiplication of the circumferential mass-interattraction. In effect, we have a network of chordal cables tensively intertriangulating the progressively outmost ends of the spherical nutcracker bundle with circumferential turnbuckles continually tightening the tensional surface-triangulated network. This means that the pressures being exerted internally are proportional to the fourth power of the relative radial depth inward of Earth's surface.**

"The surface-embracement leverage-advantage of the sphere operating at the fourth power can always overmatch the total volumetric gaining rate as only the third power of radial (frequency), linear gain, as the second-power interproximity attractiveness is further multiplied by the second-power, radial-lever-arm, advantage gains."

Gross Conwunication:

See Communications Hierarchy, (1)

"The capital worth in tools and other resources of all the nations of the Earth in 1972 is... estimated to be 75 trillion U.S. dollars, which last year yielded the annual world income of \$3.6 trillion. Heartbeat magnitudes give us an idea of the nonsense characterizing the reflexing of human brains when talking 'dollars'. As the \$75 trillion worth of the world's organized wealth-regenerating capacity is just about the same number as the number of heartbeats ago of the earliest known humans on Earth--- 2.5 million years ago--- it suggest that during each one-second heartbeat of that time huirans were making and 'saving' \$1 net.

"They were, in fact, saving memories of experiences, which ever multiply, from which accumulate metaphysical know-how that has never been entered into the ledgers of world-wealth accounting. Those pages are only preoccupied with sovereignty- guaranteed physical-progty equities of socialist or capitalist governments and the economic enterprises that they respectively foster. GNP stands for gross national product annually. GWP stands for gross world product annually, the GWP of 1972 estimated at \$3.6 trillion. The world's population of 1972 was 3-2/3 billion humans. A trillion is iOCO billion;"

- Cite HEARTBtdVrt AND 1LL1UKS, World I'ag», 13 Ear*73 ' 'therefore, the worldte1972 GWP of \$3.6 trillion meant an average income for each world human of \$1000. However, the production was not evenly distributed, as is well known, and naif the world's people averaged an income of \$2000 each, while the other half averaged \$100 each. In 1810, just before industrialization began in the United States, the annual individual income was less than \$100-annual-income-purchasing capability of the 1972 world's indistrial as-yet-have-nots. The difference is the spread of the new method of survival by industrial rather than by farm and craft means. The curve of this rising number of highly advantaged humans shows less than 1 per cent benefited haves as of 1900, 4 per cent haves as of the entry into World War I, and

20 per cent have as of entry into World War II. In 1972 we went through the fifty percent haveness point. Nineteen hundred and seventy-three opens the new chapter of human history wherein, for the first time, the majority of humanity are haves. For the 2.5 million years of man's known presence on Earth, a majority of 99 percent were have-nots subsisting at or below the living standards of the half of humanity who in 1972 received only \$100 of the gross world product. Nineteen hundred and seventy-two was history's"

KBF DtFlrlTIUKS

"most critical year, when the sudden avalanche of new affluence left the not-as-yet industrialized have-nots dramatically dismayed by the differences in human fortune.

"Up to 1972 the ever-increasing irritation of the majority of human have-nots continually multiplied the probability of world revolution. Up to 1972 this could have brought holocaust so devastating as to preclude the farther existence of of any human beings on our planet at any standard of living. There is now the possibility that the majority of humans who are now have's will realize increasingly that they cannot enjoy their haveness while the dismay and irritability of the have-nots persist. The have's will come to understand that it is now highly feasible for the first time in history to accelerate the realization of 100 per cent haveness--- this realization to be reached at the earliest by 1985, a time when the majority of all present humanity will still be alive and young enough to enjoy the new concept--- by then the established norm--- of human beings as cosmically designed to be successful in the Universe, even as are the chemical elements and the principles of radiation and gravity."

"I knew Gurdjieff quite well. I was anything but a Gurdjieffian disciple, but I knew a great deal of my friends who before they went on to Alcoholics Anonymous went on to Gurdjieff and he made it fairly comfortable for them. He would open up his daily sessions with them by 33 toasts to all the types of idiots, and by this time everybody was pretty well plastered and then they'd go to work writing his life history. He had beautiful expressions. •Shovelling out the manure' and so forth. And very sort of easily appealing, talking about the different centers of man and so on. I think too well of the voodoo people to really call a Gurdjieffian one of them."

Gusset:

"Since cubes make such poor structures, the only way that men are able to stabilize the cubical buildings they do build is by going to the corners where the members come together at 90 degrees and putting in little triangular gusset-plate reinforcements. Sometimes this vertexial triangulation of quadrangular buildings is done with a whole lot of nails, but in a big steel building it is done by putting in triangular patterns by riveting or welding in the gusseting. The triangular steel gussets at the corners of Interstices of steel structures must withstand the prying action of the lever arm of the full length of the beam to which each gusset is attached. The builders are able to make the building 'stand' because of the excessive use of steel and nassive inertia but not because the building is really well designed."

- Cite RBF Conceptuality of Fundamentalstructures, Ed. Kepes,, 1965, p. B2.

Gusset:

(2)

"If we draw a line diagonally from corner to corner on each of the six faces of a cube, we find that these six lines turn out to be the outlines of a tetrahedron. These hidden tetrahedra in 'solid' cubes make the cube stand up. Let us now reconsider the triangular gusset plates in the corners of the cubical .buildings of steel, fighting the long lever beams attached to them. Quite clearly, if we made the triangular gusset plates a little larger they would be more effective m opposing the beam's leverage against them. If we increase the size of the gusset triangles progressively they ultimately become the diagonals of the quadrangular openings of the buildings and correspond to the six edges of the tetrahedra hidden in the cubical or quadrangular building scheme"

"Distribution is part of design science... to free up humanity in optimum large patterns. Halfway-round-the-world inbound and halfway-round-the-world outbound.*

- Cite RBF at Bell studios videotaping. Phila., PA, 26 Jan'75 "We have total industry As a model that deals with metals and not just local vegetation from the agrarian era... but the metals were all around the world and man had to go halfway round the world— on the average— from where he started to find all the metals that he needed; and he took them out of the ground, from their matrix, and then he had to progressively refine them, some of it done locally but mostly moved into a place where there were great energy headquarters with energy available to separate out the ores more. He finally separated out more and more until he got to maximum separation. At this point he might then have pure metal and then he could begin to associate that metal with another metal as an alloy. As he associates more and more the parts get into a larger assembly and finally you get into the total complex of technology.

"In order to justify having gone halfway round the world and doing this enormous patterning, taking a long time doing it, he then has to find the most people in the world who are going to be benefitted by what he has done; and so he deduces that he may have to go halfway round the world again.

"Sum totally industrialization is all the way round: halfway inbound and halfway outbound— it really amounts to one complete - Tape transcript, pp.23-24; RBF to B. Brooks, Phila, Pa. 30 Apr'74

Halfway-round-the-Worlding: "circuit. There is a very beautiful model here of a complete circuit giving you the kinds of energies that are really necessary for a total industry. And then you've got to go halfway round the world and collect the ores again and melt them up again and redistribute them again so that there is always this halfway-round-the-worlding."

Halo Concept;

"Halo conceptioning discloses the minute yet finitely discrete inaccuracy of the fundamental assumption upon which calculus was built; to wit, that for an infinitesimal moment a line is congruent with the circle to which it is tangent and the plane is congruent with the sphere to which it is tangent. Calculus had assumed 360 degrees around every point on a sphere. The sum of a sphere's angles was said to be infinite. The halo concept and its angularly generated topology proves that there are always 720 degrees, or two times unity of 360 degrees, less than the calculus* assumption of 360 degrees times every point in every 'spherical*' system. This 720 degrees equals the sum of the angles of a tetrahedron We can state that the number of vertexes of any

system (including a 'sphere,' which must, geodesically, in universal-energy conservation, by a polyhedron of n vertexes) minus two times 360 degrees equals the sum of the "angles around all the vertexes of the system. Two times 360 degrees, which was the amount subtracted, equals 720 degrees, which is the angular description of the tetrahedron. We have to take angular 'tucks*' in the nonconceptual finity (the cfculus infinity). The 'tucks' add up to 720 degrees, i.e., one tetrahedron. The difference between conceptual de-finity and non-conceptual finity is one nonconceptual, finite tetrahedron.'

Hammering Sheet Metal: (1)

"Comprehending the mass-attracted, intensified integrity of molecules and atoms, witness how the blacksmith can heat his metals in the red-hot condition and hammer the metal into varying shapes, all permitted by the mass-interattraction of the atoms themselves and their geometrical, methodical yielding to rearrangement by forces greater than their local surround-ment interattractions,

"The heating is done to accelerate the atoms' electrons to decrease the relative-proximity interattractiveness and accommodate the geometrical rearranging of the atoms. The cold metals, too, can be hammered, but the energy-as-heat facilitates the rearranging. When metals are reshaped, they do so only as the absolute orderly intertransformative geometry of closest packed atoms permits."

- Cite KBF rewrite of Synergetics galley at Sec. 1024.13, 30 Dec'73

Hammering Sheet Metal: (2)

"Because the atoms and the molecules are subvisible in magnitude to man, he fails to detect the exquisite geometrical orderliness with which they yield to rearrangement while retaining the total interattractiveness occasioned by their initial aggregation within the critical limits of massattraction where the attractive force overcomes the individual orbiting integrity. The relative interattraction increases as the second power of the rate at which the interdistances diminish.

"The atomic proximity within the metals is of such a high order as to give high tensile strength, which is resistance to being pulled or put asunder. Exquisite magnitudes of interattractive proximities have nothing to do with pressure. (The error of reflexing is here comparable to humans' misapprehending the wind's 'blowing' when we know that it cannot blow; it can only be sucked.) Man is always thinking he can push things when they can only be pulled." Men are pushers. Women are attracters."

Hammerthrow:

"While the hammerthrower is swinging the ball around he is acting as gravity: the acceleration is angular. When he lets go of the ball the acceleration is linear."^w

- Cite RBF to EJA, Pepper Tree Inn, Santa Barbara, 11 Feb'73

HBf DtFINITIUrTb

Hammerthrow:

"There are two kinds of acceleration in physics. Of all the physical Universe there are only two basic kinds. One is what is called linear acceleration and the other is angular acceleration. When you take a hold of a steel ball on a rod, we call it a hammerthrow in sports events,

you start spinning it around you. That is an angular acceleration and you measure it in terms of the cycles or fractions of circles as it goes round in a circle. If you have a piece of pie, those are angular accelerations. ...

"When you let go and it goes away from you, it is now linear acceleration. All of our rockets are linear acceleration and all our firings are calculated in terms of the linear. As something goes away from you like a rocket all you can see is a little speck and then it goes away. The only way you know where it is is in terms of knowing at what angle it went off, and how fast it goes, and you can look at the clock and you find it is so many cycles of the clock and the linear accelerations are measured in increments.

- Cite Oregon Lecture A, pp. 146-147. 6 Jul'62

Hanraerthrow: (Peashooter k Deflection - 1):

"I am going to have a picture of a hammer thrower and we are going to give him a hammer and start it spinning. Before we start him spinning I am going to put a very large belt around his waist here. He is able to shove off with his feet all right and keep moving around here but his waist is so tightly held in this belt that he can't lean over and I have a -great many hooks on this belt. And we give him another one. And we gradually give him one hammer after another and he gets them all accelerating and it is finally like a grass skirt with all these balls out here. He can't stop himself. The angular acceleration is very, very great like a fly wheel and the poor man will be very uncomfortable so we put a roller bearing stand under his feet and have * another roller bearing stand above it and we clamp it down on his head and his belt is so stiff that he can't bend.

He can just stand on these two and- he is just whirling around like a merry-go-round. We -gave him so many of these hammers that they are touching one another, they are tangent to each other so in effect he has a kind of solid ring around him. He is spinning so successfully that we can forget about him and now we come to another man who has a Sea shooter. He is not on the Olympic team because we don't have any pea shooting but peas are nice to deal in because you can stop them with your finger and you can't stop bullets with your fingers. He has a mouthful of peas and blows and the peas are coming out. We stand over here and we put out finger in the trajectory of the peas and we come down on it slowly and we find that if we touch the trajectory of the peas that the peas will deflect. That is fairly simple. We find that if we put our finger deeply into the trajectory they will deflect at a sharper angle. We learn that balls in linear acceleration are deflectable.

"Now we come back to this man who is spinning and he has these steel balls and he is spinning around in front of us here. As these balls are going by me, if I touch one of these balls I'm going to learn that it deflects. So I am going to put my finger out and touch the ball as it goes by and the first ball goes by and it deflects. The next ball comes by and it is deflected. They all come around quite rapidly and each get deflected. Because however these balls are not free, they are attached by wire to him, so they go down in the deflection to a circle, down here, and then they come up here and start taking a new pattern. As a result of my touching them here the plane of the wheel turns out Ulf® that. For the moment then I break the wheel by this deflection. It is quite tough on the wheel to be bent there. Half of it is deflecting out like this and the part that hasn't come to

Hammerthrow: (Peashooter & Deflection - 2):

my hand yet is horizontal and so it kind of has a bent Ml waffle form. Finally all of them go on by and now all of them are going like this. Here they were going around like this and the one that came by me here, I turned it down like that so it starts down here so they are all doing this in respect to me. The fact is that if you touch a flywheel, like that, powerfully, you would very often explode them due to the fact that you do change these angles. "I am going to do something to protect this whole situation. The man is still spinning but I am going to get him to start all over again and he is spinning horizontally here and before I touch it I am going to take some mylar tape which is very sticky and I am going to drape it on the balls as they go by. I keep feeding it out and it keeps going around here sticking very hard to the balls. The balls have the mylar tape sticking to the tops of them. This is the ball that I touch with my finger and it stops and deflects and goes down here and because it does there was a nurture of this one here and this will pull this one up. This is simply a see-saw. If I push this one down, this one stays at a nurture and this one goes up and because this one is coming down the tension of this one pulls this one up to here. It can't help it and the same tension will pull all of them upwardly,

"Now I am going to do something else. Instead of using the cellophane tape* I am going to have the series of the balls tangent to one another going around here. We are going to give Mm this hanner thrower a whole lot more balls and there will be one lodge here and another lodge there. They keep building up and I give * him some more. They will be on the top and on the bottom. The wheel gets to be very thick, but this set are horizontal and due to the acceleration the ones on the top and bottom both try to get horizontal so they press very hard on the horizontal layer. They build up so much friction due to the rotation that they are much better than the cellophane tape. You know that when I touch the wheel with this ball going by

here the tension goes back along this way and acts as a fulcrum
the whole wheel will bend downwardly so that the wheel that was
going by me horizontally like this goes in this position. Let's get this
patterned again--- the ball is going by me here and they are all thick
now and when I touch the wheel that is going around me like this it is
deflected so it has to go in to a pattern like that. As it went by me it
Went down into that pattern."

Do you think that the vibrations of music and light can have something to do with healing? And what do you think is the significance of the points under pyramids?

RBF: "Pythagoras discovered that the points are related

to halving--- fractionating the whole: that is quantum strategy. Everything should be neutral until muted. A piano, like a house, or like fog, should be neutral. I found in building that the grays of aluminum were not neutral enough. Brown Earth is what the human eye is most accustomed to; it is the best color for floors and walls. Seek first for the neutral tones, but arrange them so that the human occupant can change things. '

"If my domes were first being developed Wilfred was inventing the color organ. Nature changes colors quite rapidly. We get to feel gray on a gray day. The seasons change slowly; the changes of day and night are more frequent. Colors don't change in seconds; colors tend to change in minutes or hours. But sounds change really quite rapidly as in brooks and bird notes. The frequency of sound change is much more rapid than the frequency of color change. While smells--- like lilly of"

Harmonics: (2)

of the valley-- may last for several weeks. They are slow notes. Too rapid smell changes would not be particularly pleasing.

"Touch: roughness and smoothness, we're very sensitive to it, but it's difficult to say what the periodicity is.

"What we have is quite different scales of harmonics. Humans* attempts to bring light and sound harmonics together/ don't seem to me to be too successful. (abstractly

There might be some such synergetical effects of this but I have no experimental knowledge of your question. But it could be so, particularly if the subject is very musical. In ultrasonics we can use sound to destroy--- even smash a bridge.

"As for your question about pjnts in pyramids, in our SYNERGETICS book we describe the bouncing of energy patterns within triangles and tetrahedra. It goes out at the corners into the next triangle. The B Quanta Module is an energy loser and the A Quanta Module is an energy holder: proton and neutron. Spheres become spaces and spaces become spheres. There are a number of such interchangeabilities. Energy comes out of the B Modules"

- Cite RBF videotaping, Phila. PA., 1 Feb'75

Harmonics: (3)

"which makes pyramids of half-octahedra'3. The B's are the heart of the octahedras. There could be some very interesting energy effects in pyramids and I think the A and B Quanta Modules provide the mathematics for it. We hear of how the safety razor blade under a pyramid becomes sharp-- everyone talks about it--- but it's really up to the young people to check these things. The basons had the pyramid and the star that show up on our dollar bills.

"Energetic-synergetic geometry is the embracing word for it. I know that energy is precessed by geometry very powerfully. The great-circle railroad tracks of energy and the seven axes of symmetry... Note how the equator of the icosahedron never gets near to any of the vertexes and so we see how it really will hold energy. The answer to your question is: I can accredit mathematically high potentials, but I don't know anything about pyramid points or about astrology per se. It may be like the great dipper: seen from another point of view it looks quite different. The astrological patterns would look quite different of course from another planet. But the vectors operating in Universe are quite different for each birth and they might have quite a different effect on each"

Heartbeat Cyclic Experience:

Seo Time Vector, 24 Sep¹73

Heartbeat Magnitude Sequence: (1)

"We need a way for humane to coordinate their senses and thought in terms of their personal life experience, for instance with their respective allotments of life time. Each one is born to some average total lifetime expectancy, as calculated from census statistics by the life insurance company mathematicians. Some Russians live 150 years, but the average in the Western world is now about 70 years, having doubled in the last three-quarters of a century. Let us think, then, about the minutes and seconds you and I really have at our elective disposal out of every 24 hours. We all have to sleep--- about one-third of our time. A lot of our time is \$BML dedicated to Just going from here to there. We don't have very much available to us for elective investment. The one kind of time measurement directly and sensorially available to all of us is our heart beating. We have a built-in clock.

Just close your eyes lying in bed and feel your own pulse or heart-beat. Healthy hearts beat between 60 and 100 times each minute; you're quite normal if you're pulsing 60 to the minute, or once each second of Earth revolution time. So a one-second-of-time heartbeat is a natural time increment that you can really feel."

- Cite HEARTBEATS AND ILLIONS, World, blog., 13 Mar'73
Heartbeat Magnitude Sequence; (2)

"Let us now assess human history and Universe in one-second heartbeats. For instance, two weeks is 1 million heartbeats. One year is only 31 million heartbeats. You enter college at 500 million heartbeats. At the prime of life, i.e., at about 32 years of age, you've had about 999 million heartbeats. So not until you start the second half of your life do you need to get into billions magnitude. Vitally speaking the, millions are large numbers. The money game of 'millions' and those who are millionaires have led us to assume that millions are inferior magnitudes leading swiftly to eccentric billionaires. If you live to full life insurance 'expectancy'--- 70 years--- you will complete only 2 billion heartbeats. If you reach 100 years, you've had only 3 billion heartbeats. Christ and Hohaimed both lived tens of billions of heartbeats ago. The billions magnitude does not exhaust itself rapidly.

"You may begin to realize how preposterous it is that humanity is spending \$200 billion each year on armaments on the erroneous assumption that we cannot afford to support all humanity, when that magnitude of 200 billion, considered in your own heartbeats, takes history back to the dawning of the 8,000-"

- Cite HEARTBEATS AND ILLIONS, World Kag., 13 Mar'73

"years-ago earliest-known Egyptian people. The earliest known artifacts of arctic-cultured people were being fashioned only 500 billion heartbeats ago, i.e. 15,000 years ago in northeast Thailand. We don't exhaust billion magnitudes until we go back historically to 30,000 years ago, about the time of the last ice age. Earlier than that, we must go for the first time into the trillion magnitudes. The earliest known skull of a human being found by the Leakey father-and-son team was in live use 2.5 million years ago, which is only 75 trillion heartbeats ago. The capital worth in tools and other resources of all the nations of the Earth in 1972 is also estimated to be 75 trillion U.S. dollars, which last year yielded the annual world income of \$3.6 trillion. Heartbeat magnitudes give us an idea of the nonsense characterizing the reflexing of human brains when talking 'dollars.' 'When the 75 trillion worth of the world's organized wealth-regenerating capacity is just about the same number as the number of heartbeats ago of the earliest known humans on Earth- 2.5 million years ago--- it suggests that during each one-second heartbeat of that time humans were making and 'saving' \$1 net.**

- Cite HEARTBEATS AND ILLIONS, World Pag., 13 Mar'73

"Next we get into the quadrillion magnitudes to express the probable age of our planet Earth, whose birth was only one hundred quadrillion heartbeats ago. Then we come to the age of the Universe thus far known to have existed, which is only 300 quadrillion heartbeats ago. We don't know of anything older than 300 quadrillion heartbeats ago.'*

Heiiberg-Eliot-Pound Sequence:

"As usual poets anticipated

The scientists' discoveries

Before Heisenberg's 'indeterminism,'

T.S. Eliot said,

'The act of considering history alters history.'

Ezra Pound anticipated then both

For he remarked much earlier

That 'the act of thinking alters thought,'

And all of this

Evolution regenerating altering Is found to be implicit in entropy,

The name given to the

Experimentally disclosed fact

That energy system is always giving off energy.

Thus evolution must forever

Alter the total inventory

Of humanity's nonsimultaneous

And only partially overlapping

Experience

For clearly experience always alters

Previous experience

And the process is both irreversible

And nonidentically repetitive." 28 Jan'69

-Cite GENERALIZED PRINCIPLES, d.8.

Heisenberg: Eliot-Pound Sequence:

"Werner Heisenberg, the physicist, identified as 'indeterminism' the experimentally disclosed fact that the act of measuring bringing light to bear on the observed phenomenon--- automatically excited the specimen's atoms and in one way or another altered the observed phenomenon in such a way that it was not exactly the same phenomenon as before the measuring commenced. Before Heisenberg's 'indeterminism,' T.S. Eliot said 'the act of considering history alters history. Ezra Pound anticipated them both when he remarked much earlier that 'the act of thinking alters thought.' Thus evolution must forever alter the total inventory of humanity's nonsimultaneous and only partially overlapping experience for clearly experience always alters previous experience and the process is both Irreversible and non-identically repetitive."

- Cite Generalized Laws of Design, p. 1. 22 Apr'6u

"Heisenberg said that observation alters the phenomenon observed. T.S. Eliot said that studying history alters history. Ezra Pound said that thinking in general alters what is thought about. Pound's formulation is the most general, and I think it's the earliest.*¹

- Cite Hugh Kenner, "The Rope and the Knot." Kentucky Review, Autumn 1968, who attributes this quote to RBF. .

"We've discovered experimentally and Heisenberg's indeterminism makes it very clear that the act of measuring alters that which is measured. Just to single out this phenomenon enough to begin to try and isolate it would be to alter it by doing that. Just the light that comes to bear as you make a microscopic note, just the light there, changes the

temperature and the behavior. You discover then that the act measurement always alters the measured. You find the poets saying earlier that the act of just consideration of history alters history. It really does say thought itself simply alters that which you think about."

- Cite RBF quoted in San Francisco Oracle. Vol. I, No.11, 196?

Heisenberg: Eliot-Pound Sequence:

"Heisenberg's indeterminism, In which the act of measuring Always alters the measured, Would seem entropic were it not For the experimentally realized knowledge That the successive alterations Of the observed, Diminish

As both our tooling and instrumentation Continually improve;

Ergo intellection's effect

Upon measurement and the measured Is a gap closing,

And the pursuit of more truthful comprehension Is successfully antientropic.

before Heisenberg, T.S. Eliot said, 'examination of history alters history* And Ezra Pound,

And even earlier poets, Reported their discoveries That in one way or another The act of thinking alters thought itself."

- Cite HO.. LITTU I KNOW, Oct *66, Pp. 53-54.

"As Heisenberg shows in his principle of ultimate determinism the physical act of measurement always alters the behavior of the measured phenomenon. In the same way we show here that the thinking process inherently alters the fundamental patterning of universal thought-about interrelationships

Hex-pent Sphere:

"The hex-pent sphere is a three-frequency sphere consisting of 12 pentagons and 20 hexagons. It consists of 60 fat diamonds plus 30 thin diamonds, totalling 90 diamonds in all. There are 180 chordal struts, all of which are the same length.

"The hex-pent sphere is the polyhedron with the largest possible number of identical-length edges whose vertices also lie in a sphere of the same radius: it thus manifests a limit case vector chord system.

"In the hex-pent sphere 20 vertexial hubs convene six chords each; 60 vertices convene three chords each; and 12 vertices convene five chords each, for a total of 92 vertices.

"This unique geodesic sphere represents the limit number of equi-length chords within a sphere of given radius with all the vertices equidistant from the sphere center."

- Cite RBF Ltr. to Sumet Jumsai,
Bangkok; 15 Sep'76

"The hex-pent sphere exhibits an anting property of transformability into a geodesic spiral tube. If any two polar-opposite, chord-connecting vertices are openingly released, the whole spherical structure of fat-thin diamonds will stretch out to a cylinder with those poles at the opposite ends. As it transforms into a geodesic spiral tube, the 180 equilength chord struts approach parallel bundling together. As the cylinder approaches pure parallelism of all its members, it becomes almost a tight rope.

"The sphere consists of 12 pentagons and 20 hexagons: when it transforms into the spiral geodesic tube, it has pents and 20 hexes,

'The most symmetrical tubular array occurs when the released polar pair of vertices are those occurring at the pentagon centers of the sphere.

"This spherical-to-spiral transformable structuring must be intimate to nuclear and atomic arrangement in vinyl and like plastics where the end of a very long rod of the plastic is pierced and air is blown into it between two sets of steel"

- Cite RBF Ltr. to Sumet Jumsai, Bangkok; 15 Sep*76 'rollers, and this bubble of air is continually rolled into the rod, stretching it into a thin transparent monomer film. The last roll through which the material passes folds together the two surfaces in a long tubular sheet. This tube is, after the last roll, slit open and the whole of it is stretched out into a longwise film and gathered into rolls. This is the way the thin plastic film such as Saran manufactured by Dow is made.

"It would seem then that this particular structure would be essential in accommodating going from a cylinder to a sphere and back to a cylinder again, which would account for how this invisible transformation occurs from a thick mass to a uniform thin film."

Hierarchy;

"... The hierarchy of geometrical intertransformings which is the subject of this book..."

- Citation at Synergetic Strategy of Commencing with Totality
28 May¹72
Hierarchies:

"There's nothing in the gravity that we've now learned about--- that mass attraction--- that predicted precession. So we find that precession is synergetic to the mass attraction. Then we find there's nothing about the atoms per se--- an atom--- that tells you it combines to make molecules. There's nothing about molecules per se that predicted they will make biological protoplasm. There's nothing about biological protoplasm per se predicts both pine tree and elephant--- and the exchange of gases between the mammals and the vegetation. In other words I find that Universe is a series of hierarchies--- of hierarchies of synergies where the more complex is not explained by the lesser, if you really want to get any important kind of information you really have to start with the Universe and not with the parts. And that's exactly where a child always starts. A child is always interested in that whole Universe."

- Cite RBF address, transcript p.6, Tel Aviv, 1b Jun'72

Hierarchy of Constellar Configurations:

"Out of cumulative patterning overlays there emerges what seem to be generalized principles apparently governing all associative and disassociative transformings and their resultant regeneratively persistent hierarchy of constellar configurations. These hierarchies of constellar configurations disclose in turn a hierarchy of dynamically symmetrical constellation phases and their respective maxima-minima, asymmetric and complementary, accommodative transformabilities which are apparently permitted within an omnirational, omnidirectional, omniequi-economic, energy-accounting, coordinate system of Universe. This omnirational, arithmetical-geometrical accountability is of such sublime simplicity in contrast

to the awkward 'mathematics' of all known yesterdays as to have occasioned an almost universal incredibility and nonconsideration of its potential significance though it has been in disclosure for one quarter of a century."

Hierarchy of Dynamic Interactions;
See Reciprocity, (1)

"It is implicit . . . that mathematics, logic, science, analysis, and teleologic design discipline must all take origin in an hierarchy of patterns, and that initiations at any lesser level are abortive and futile. This is to say that all such present economic criteria as is generated from the limited facets of generalization which seek 'keys' or 'basic building parts' from which to predict wholes is fallacious and obsolete.

` ` Conversely, the more comprehensive the pattern originally selected and defined, the more effectively may the contained subpattern reciprocities be identified and treated."

High. Pgygr. (D

"You can only introduce power into an area for so long before you have to feed the people and power is no good without eating, . . The most incredible thing is that in the areas where all the people are there is no power or food. . . So everything comes back to electrical power. . . Identifying the kilowatts with the internal metabolics. . . what they* are really doing is getting on to energy networks. That's where the standard of living is. . . We talk about this longer transmission of energy from here to there. To get work done. There is no way that we can get work done in quantity and speed compared to that of electrical transmission. Better than pipelines or tankers, and so forth.

To get it from here to there you have to use relatively high voltage. After World War I the United States was set on a new level of high voltage for transmission and we've been operating on that ... until we have now come to a new era realizing we could step up to a million kilowatts from 138,000. Through the past decades you could only trasnmit about 350 miles, which meant that you couldn't really reach the next time zone. In generating electricity whatever you generate that isn't used, is wasted."

- Cite RBF to World Game, Jun-Jul'69

"If you can't anticipate your peak loads your customers will desert you, because they can't put in their own power generation. So you want to be sure to have as much as they need, so □ you always have to generate a little more than is actually used. That is wasted. But by integrating the living patterns of two cities you can even out the peaks and valleys--- so you always make money, and up go your profits by integrating cities. Say ft 350 miles was the limit. Suddenly we're coming into an entirely new era, and it is now actually being instituted, of being able to use a million volts which means 1500 miles. The 1500 miles means we're going to be able to integrate three time zones right across the country. The net effect is to increase deposits both in the United States government and in the private sector of about 30 percent--- a very big step-up."

Homosexuality:

RBF: . During all those thousands and thousands of

years before our time, nature really gave man the capacity to make many, many babies. Now suddenly she doesn't need them anymore. So I'm not at all surprised to see girls dressing like boys and boys dressing like girls. I'm not at all surprised to see women getting very naked, because the more naked they are, the more they tend to discourage the sex urge. Part of the procreative urge is man's insatiable curiosity. You are covered up with skirts and man is driven by curiosity. Take away the skirts and he says to hell with it. And I find us getting enormous amounts of homosexuality, which I see as nature simply supplying a negative urge which advances our capacity not to make babies."

Playboy: "Then homosexuality would rank as something intended by evolution?"

RBF: Yes, to short circuit. Here the good-and-badding kind of idea has led us completely astray. So many things that are changing or coming to a stop tend to make people feel negative, but it is simply nature winding up certain phases quite rapidly right now."

- Ite B_{ar}y Fa_{rr}ei, Interview, 1972.

Homosexuality:

"...As survival rate and life sustaining capability increase, fewer births are required. This may be related to our developing capacities in interchanging our physical parts, of producing mechanical organs, of having progressively fewer organisms to replenish. The drive in humanity

to reproduce as prodigally as possible decreases considerably. This may be reflected in social behaviors--- when all the girls begin to look like boys and boys like girls, wear the same clothes... This may be part of a discouraging process in the idea of producing more babies.

"We shall have to stop looking askance on trends in relation to sex merely as a reproductive capability, i.e., that it is normal to make babies. Society will have to change in its assessment of what the proclivities of humanity may be. Our viewpoints on homosexuality, for example, may have to be reconsidered and more wisely adjusted."

Horizontal va. Vertical:

"It is in evidence that the horizontal vulnerability of structural components to gravitational effects requires the strongest awering stratagems. Columns are easy; beams are difficult. Ships' masts support their boom, not vice versa. The walls and columns of history's ruins stand the longest. Rarely are the horizontal beams, elevated floorings or roofs to be found intact, if at all, v/ith the exception of domes which combine both horizontal and vertical behaviors progressively translated into mutual synergatical aid and integrated success."

Human Beings :

Q. "What is the minimum system that you can

describe as a human being?"

RBF: "Awareness and the phenomenon love have nothing

to do with the organism they employ---which is just a confluence of 1000 (exhausted) tons of food, water, and fuel. The question tries to make the human being a system.

"Kind thoughts and concepts are systems; the human being is not a system. The thinkable is systemic and relevant, but human beings, the metaphysical capability to tune-in---loving, caring---I have no way to put that into a system. You can call the organism a system if you want to, but the internal systems of organisms are very complex."

- Cite RBF to Question by Dr. Michael Bruwer at "or Id Came Workshop"77; Philadelphia, PA; 22 Jun'77

Human Beings:

"Here are human beings on board of our planet and they do have very extraordinary capabilities.... Now, how and why would human beings have all this extraordinary capability that I found other creatures didn't have. I want to identify the difference between human beings and any other of the biological phenomena that I know. I could say that human beings are not only halfway between the biggest and the littlest; but what differentiates them from all the others is something very interesting.

"All other species than man have integral equipment fitting them for a special advantage in « special environments: the bird has wings. He can fly beautifully with his integral wings.

But when he's not flying--- which is a great deal of the time--- he cannot divest himself of his wings and he's greatly encumbered by his wings in getting along in other environmental conditions. And you'll find this in each of the species. What is really unique about man is that he doesn't have this integral special equipment for special environments and has instead an enormous amount of information-gathering capability.*¹

- Citation at Universe, 2 Jun'71

"I am quite confident that the biogeneticists will not be able to design a better human because we are omnidirectional and you can't improve on the middle and the more symmetrical we are, the nearer we are to the middle. So I am talking about all these aberrations: that's the trouble when you get asymmetric...."

"I will explain it to you omnidirectionally. Human beings are---as far as I can find out---in the really center of things. We have in all other living organisms, having really special equipment built-in, fastened in, that gives them special advantages in special environments. But human beings are unique in that they don't have this built in, that they are in the center of things, that they have this mind which discovers principles and if they employ the principles they can fly better than the bird with his wings; they can dive deeper than the whale which was designed just for that water---who can't get along without it.

"We can go into all the different environments with our mind,"

- Cite transcript p. 21, RBF taped Interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

"but we stay strictly in the middle here. What is unique about us is the middle. If human beings were linear or specialized, the biogeneticists could make him a little better. They could make him jump higher---but because we deal in principles and not in the actual physical equipment and are actually the center, we can't improve on the center ...and the best, most balanced, human beings are really nearest the center. That's all, they are just less asymmetrical, and these things are not built-in, they are purely of the mind."

Human Beings at the Center- (1)

See Jan as Halfway in Range of Size of All Creatures

Overspecialization of Biological Species

See Human Beings in Complex Universe,

Q: "What is your conception of mental health?"

RBF: "I start off with my saying that when I feel great I don't feel anything. I am astonished at how quickly one forgets it when pain is gone. There is a synergetic whole. When we say *1 feel great,' it means you feel nothing and are absolutely wide open receptively.

"As you know, I make a great differentiation between the brain and the mind. I see the brain of all creatures as always coordinating the input from Universe of the physical senses. The brain then makes a special package and remembers these special cases. Brains are always dealing in special cases. Kind is the capability of human creatures---that we don't know any other creatures to have---to make from time to time a discovery of relationships existing between special cases that are not in any one special case considered separately. This is really almost another statement of synergy, which is the behavior of wholes unpredicted by the behavior of parts. Kind can discover what those synergetic relationships are."

Michael Bruwer, Chicago, IL; 16 Feb

- Cite RBF interview with Dr.

• 78

"For instance, Newton discovered the law of the mass interattraction of bodies, where, if you double the distance you reduce the attractiveness to one quarter of what it was. The interattractiveness varies as the second power of the arithmetical distances. Human mind discovers these generalized principles which are related to the fact that Universe is inherently complex. The inherent complexity is now proven in science.

"We have the clearly demonstrated proclivity of human beings throughout all history to want to find the building blocks or the key. They look for one thing as being the clue. That may be because their ego possibly wants to monopolize the one thing.

"./hat we have discovered is that we have fundamental complementarity as recognized by physics only in 1922. Then we get to discovering the proton and the neutron in 1928. By 1950 we have the Nobel prize given to physicists for demonstrating that complementarity is not the mirror image, -/e had assumed up to that time that it was actually a mirror image. It was"

- Cite RBF interview w/Dr. Michael Bruwer; Chicalo, IL; 16 Feb'78
Human beings <x Complex Universe: 43)

'called parity. Then they found that parity is not so. Then we have the proton and the neutron always and only coexisting and their masses are different; they are very close---one is interchangeable with the other, but they are different. So we are now dealing in a Universe where there is inherent complexity. Unity is plural and at minimum two. This has got to be very relevant to our mental health builders.

"If I want one word describing the experience of life, I use the word awareness: no otherness, no awareness. One of the first things a child begins to demonstrate to you is the discovery of his left hand with his right hand, the discovery of its toe, of its tongue. . . the discovery of the otherness within self and the otherness that is the motherness. So I say mental health would have to relate to the fact that there is this fundamental complementarity in Universe.

"Unity is plural and at minimum two. You probably have very bad health when you try to look out for just me---the single building block out there. That is where mental health goes bad, trying somehow to justify this self-survival business. So we have the individual looking out for self and feeling that self is Universe."

- Cite H3F interview w/Dr. Michael Bruwer; Chicago, IL: 16 Feb±78
Hunan Beings *ic* Complex Universe: (4)

"The concept of 'Unity is plural and at minimum two' opened up the field of quantum mechanics. Quantum mechanics really gets down to being a fourfold affair---Just like the tetrahedron. It was a recognition of the complementarity. I say I have a rubber glove on my left hand. I have only one rubber glove. It is red. I turn the Vim of it down and see that it is green inside. I gradually roll it off and no longer do I have a left-hand rubber glove. How it fits my right hand only. The left hand has disappeared. I find there is always the rest of the Universe to complement this. This hapiened to be tuned-in.

"If the rest of Universe is tune-in-ablebut is not at the moment tuned in, we isolate the tuned-in set. . . and it is a very different way of talking about things: not just space, but actually tuning,

"I find myself operating in terms of tuning---tune-in and tune-out. That has a very great deal to do with sanity and mental health. You realize that there is the rest of the untuned-in; and each one of us tunes in little special episode programs of a great Scenario Universe, each one of which is"

- Cite RBF interview w/Dr. Michael Bruwer; Chicago, IL; 16 Feb*78

‘ ’built into the big one but is not the big one. It is just a manifest of the bigger one and so we are tuning in special programs. When we get enough programs we begin to get an idea of what the whole of it is all about. You get this sense of some of that relationship: synergetics.

' 'Well, out of the net of all the things that I have given you, I have given you that unity is plural and at minimum two, and I am talking about relationships. . . it is that interrelationship of the twoness which is what the human mind is able to go after and from time to time to discover relationships---the actual mathematics of it. Every human being has this capability potentially.

"But nature doesn't have too many of these principles to be discovered. What the little child is trying to do---immediately-- is it wants to understand. It is trying to understand the relationship between the stars and the smallest things, between the macro and the micro, and the parents don't help with their continually saying 'never'mind about that, just pay attention to the separate things.' So we immediately take the child away"

- Cite R3F interview w/Dr. Michael Bruwer; Chicago, IL; 16 Feb'78 "from the sane, from the absolute balance of trying to understand the total interrelatedness. . . Whew! the parents say, 'No I'm just going to give you a spot, a special thing to look at.

Q: "What about the emotional aspects of mental health?"

RdF: "That's the side where we have humanity. Humanity is in a Universe which is inherently complex. It does have 92 chemical elements, and not just hydrogen. Darwin came along at the time of Dalton. Dalton was a great physicist. We thought he was going to be able to make all of the chemical elements out of hydrogen, so it was logical for Darwin to think about the building block as a single cell which would get more complicated gradually, and by mathematical probability would gradually get us into something as extraordinary as human beings.

"But I know now and see now that Universe is inherently complex, that is, it does have a plurality of principles like optics, and gravity, and so forth. There is some interrelatedness of them,"

- Cite RBF interview w/Dr. Michael Bruwer; Chicago, IL: 16 Feb'78

RdF DEFINITIONS

but they are really separate principles. There really is a number one, and there is a number two. The prime numbers are unique behaviors. There is a minimum of a fourness of vertices of that insideness and outsideness in order to have a system and to have thinkability. Where there are four points there are six relationships between them. So the number six brings in the prime number three---and the prime number two is in the vertexes. Prime numbers are unique to what I call primitive experience and minimum experience.

"You can't have a system of less than four points that divide the Universe into insideness and outsideness of the system. The number four is the beginning number and not the number one. Unity is plural and at minimum two. There is a minimum of four vertexes, a minimum of six basic relationships that are the tetrahedron: the six degrees of freedom each have a positive and a negative so you have the twelve degrees of freedom right there.

"A little child represents the human being designed by Universe to have the very important function of being a local information gatherer and a local problem-solver, and gathering that information in greater and greater ways from the

“ Cite RBF interview w/Dr. Michael Bruwer; Chicago IL; 16 Feb'78

”microcosm and macrocosm, getting information from an incredible 11i-billion-light-years-around sweepout. . . optically and photographically.

”Hunan beings are here as a function of Universe. We have to find our way and be sure that we develop. We are born naked, helpless, and ignorant with hunger, thirst, and procreative urge—and curiosity to drive us to make mistakes. We learn gradually by trial and error what works and what doesn't work. And we invent words to be able to intercommunicate our experiences about what works and what doesn't work. This is a tremendously important sequence of events taking place. We are at the point Where we have 150,000 words in the Oxford dictionary”, making it clear that human beings have agreed to those 150,000 nuances of experiences that are so unique as to

require their own word. That we have agreed on all that seems to me a great victory of man because it is very hard to agree on fundamentals. Here we have an enormous accomplishment and capability to interact. This enables us to integrate experiences of both those of us alive with those of us of the past who are dead'—through their”

-Cite RUF interview w/Dr. Michael druwer; Chicago IL: 16 Feb'78 "writing. Humanity has gotten to some kind of a point here where there is enough information that we can be bom into better functioning. Our ultimate functioning is to be as a local problem solver.

"I saw that nature, in order to get us through making all those mistakes, must be sure that we continually repeat ourselves so she built in a very powerful sex urge.

"No human being would ever design themselves. I have checked this with kids in school, and have said 'If you had to go to the supernarket and pick out your own liver and your own stomach and your eyeballs, and the whole works, it would look very gooeey to you. You wouldn't think of hanging them up on a skeleton; and you would have no proclivity to have a sex urge with other complexes of similar equipment.* So nature then deliberately put a single skin over this—a most economical skin and made it opaoue so you couldn't see all the machinery, and made it seem like all this oneness. It would be hydraulically structured so that the water wouldn't freeze. Nature was using the by-product heat to keep it at just the right temperature, and keep it warm and smooth so”

-Cite RBF interview w/Dr. Michael Eruwwr; Chicago IL: 16 Feb'78

Hunan beings 6- Complex Universe: (10)

”people get the urge to actually cohabitate. I think it was an enormous design accomplishment of nature to take the complexity of the quadrillion atoms in our brain and get all that much activity and make it all look so simple: really like a China doll.

’Nature gave us proclivity to reproduce—until we were sure we had enough information so that we wouldn't have to produce so many more. She wanted to be sure that we would learn about principles, as we ar*¹ now, so that we can double our life expectancy, and maybe even learn how to replace all the parts—and just have a continuous human being. . . I don't know. . . a continuous human being may be coming into the picture.

“We are discovering that the human is not the organic, but that we are the metaphysical—the mind, looking at relationships which are not in or of the parts but are just relationships between the parts.

”Mind is very, very different from the brain which is part of the physical, with the physical always being temporal, limited”

-Cite RBF interview with M. Bruwer; Chicago, IL; 16 Feb'78

Hunan beings k Complex Univerge: (11)

"case, having beginnings and endings. Brain wants explanations of how the Universe begins and ends. But mind is discovering these eternal principles and deals in eternity instead of temporality and the terminal; it doesn't have to have a beginning and an end of Universe at all. It just has to find relationships existing between. . . whatever is the mind in part of us, the metaphysical, is this relationship existing, but is not in the parts by themselves---that we are something apart from it, like the tuned part. The physical and the brain part are all that blah that is tuned in. You and I are really the non-tuned-in, the totality, the only capability that can tune in all the different ones. We are on the eternal side.

"So I see that humanity really is immortal, but I see us confused about life. We think of life as being physical. We said 'animate and inanimate.' The inanimate was clearly a cold hard stone and the animate was clearly warm soft flesh. . . . the warm soft lily petal, or something like that, if it was animate."

-Cite RBF taping by Dr. Michael Bruwer; Chicago, IL; 16 Feb'78

Hyman Beings, k coinpiex UnlYgrae: U 2)

"We have human beings gradually then, thinking that life is physical; and then gradually getting into chemistry, physics, and biology, and separating these things out, and finally in the biology discovering controls in the design, getting into genetics and the chromosomes, and finding that some of these controls brought about blue eyes. . .and so forth.

"We began to have accelerated generations of other living creatures from which they could make observations to see if by marrying these two---to see what kind of results we could get. Fruit flies work very well; and the tobacco mosaic virus. In that world of viruses and the protein shell where they discovered the DNA/HNA in a world of virology where we have physicists, geneticists, biologists, and mathematicians--and all of them excited by the results they are getting--so excited with the results that none of them are tending to philosophize.

"They are all so specialized; they don't tend to look at the total significance of it. What had always been thought of as a clear threshold between the animate and the inanimate... but at that level of virus you can call the whole show purely atonic: You could call it purely crystal, absolutely inanimate.

-Cite RBF taping by Dr. Michael Bruwer; Chicago, IL: 16 Feb*78

"The point of it is that you came to it from biology. Studying the controls of the design of this equipment, you said life is the equipment. Because you came in from there you are assuming that this is somehow still animate, whereas everything that you have found is inanimate, --that is inanimate has become clearer and clearer; and what is animate has become less and less clear. So we finally get to where you find that we consist completely of atoms—and that atoms are completely inanimate, and so that whatever you are sumtotally is completely inanimate.

"This brings me around to the error man made thinking that life was the equipment used. I have developed an analogy where we have a friend who saVs 'I have this other friend who you would like very much. I would like the two of you to meet.* So our friend introduces you over the telephone.... You get to know each other very well, but you have never met: it is always over the telephone.... This begins to be the oldest friend you have, but you have never seen him.... All you ever know about Joe is over the telephone. We have been misidentifying ourselves. Obviously, the telephone is not Joe."

- Cite RJF taping by Dr. Michael Bruwer; Chicago, IL; 16 Feb'78 "We have been misidentifying the regenerative transcievers as being the equipment; we have been identifying ourselves as being it instead of being the metaphysical.

"I am now getting to the point where I see that life may carry on and not have to reprocreate. As a consequence of much that is going on in our day, like all of the homosexuals, all of the male and female, are simply nature doing this. I think it was very deliberate when you began to see the boys with their long hair, and you couldn't t^{tr}ll whether you were looking at the boy or the girl. Nature is really cutting down on the proclivity for making babies. About the same time she gives human beings the ability to discover the pill, and so forth. It became perfectly clear that nature is now... that much of what may be considered as being off balance and so forth, is that nature is deliberately cutting down on the proclivity to procreate...,"

"What I did like was the idea in relation to health. We don't have the special built-in artifacts that other creatures do.

We learn the principles and then we make the artifacts separate from ourselves. We are not living in a Universe that is linear. We are living in an omnidirectional Universe of"

"convergence and divergence. We are at the center. There is no way we could design improved human beings because you can't improve upon the center. If we were linear, you could make it a little further out or a little higher, but you can't improve upon the center.

"I don't expect anything to happen other than to take people who have been aberrated and get them back into the center.

I think that every day when we wake up we get aberrated into a special set of patterns, What I call sleep is allowing us to retract all the aberrations and get back to center again. I learned it was a pretty good idea when I was going to sleep to try to review all the problems I have because when I wake up, I may have some of those answered. That has happened many times. I say before I go to sleep, I am going to do this kind of thinking about the great integrity of Universe itself and try to understand why we are here and to understand that there is a greater intellect operating than you and I and we don't have anything to do with it at all. I think that may help to get me back to center, even before going to sleep. With that out of the way, I will get back to normal more quickly."

"You are so much liquid. You have to know this to understand human beings. The only difference between ourselves and hard, cold machinery is that we also have these metabolic processes processing energy to be regenerated and these have a byproduct heat of 98.6°. It's as if you put a natural heater into the tree so that its liquid wouldn't freeze, so it wouldn't crystallize and break off. So that when you and I run into each other we don't get too badly hurt... Hydraulics, and pneumatics, and the heating so you're not going to freeze up. That's

what we have here. That's what makes us seem different from the hard machinery, where we're only doing it in pure compression. So nature has simply gone considerably further and doing a much better design by using this load distributing capability.'

Twelve-inch Steel World Globe, (1)

"Goldy points out that the initially regenerative organismic equipment of any biological species, including that of humans, can be inbred to concentrate the programmed probability of dominance of certain behavioral characteristics in the offspring; and that the human design as received on planet Earth starts with optimum inclusion of general adaptability; ergo, humans cannot be fundamentally improved upon physically,

"Humans are not only halfway between the largest and smallest known biological species, but are distinguished from all other biological species in that all other species have predominant 'built-in' equipment, giving them special physical performance advantages in special environments. Humans can only be protected, supported, and accommodated more effectively by human mind's capability to employ abstract principles wherewith to invent and produce various artifacts that will permit humans to cope with evolutionary changes of the environment, within which, the humans are to function.

"Goldy shows that the modification of the biological organisms by the inbreeding through concentration of special-type genes---"

- Cite GOLDYLOCKS, p.K7, 5 Jun'75 "for instance, by the mating of two fast-running horses— increases the mathematical probability of offspring with such specialized fast-running physical behavior excellence. Species, which progressive reduction of general adaptability always lead toward eventual extinction of that species when those bred-out, infrequent, extreme environmental conditions, adaptability to which had been sacrificed with the inbreeding, do occur.

"Goldy also points out that inbreeding experience shows that human organisms could be progressively inbred to attain high probability of retaining only tree-branch-swinging simian characteristics and capabilities in the offspring, while concurrently outbreeding many of the comprehensive range of human faculties and capabilities. This would require the provision of a complex of sghrted-out, ecological environment support devices, or biological species whose operative presence permitted the unique specialization within the generalized cosmic complex of chemistries and frequencies of eternally regenerative Universe.

"Goldy then pints out that, on the other hand, there is no"

- Cite GOLDILOCKS, p. K8, 5 Jun'75

"breeding experience of Earthians which suggests that the limited inventory of different chemical elements constituting amoebas could be progressively amplified and complexed to produce the wide variety of chemical elements constituting the unique information-harvesting organisms employed by metanhy- sical humanity,

"On the other hand, humans have been able to separate out and transplant hearts, kidneys, blood, skin, bones of humans, sometimes substituting mechanical devices for keeping the separated-out human constituents separately alive by remote complementary inter-functioning devices. Originally integrally complex human functions could be multiplyingly deployed into a plurality of intercomplementary functioning devices, organisms, and creatures. It is implicit that amoebas and other simple organisms can be progressively, subdiviasionally isolated out of complex organisms such as those of humans and Introduced into an intercomplementary ecological environment-sustain!ng complex, but not vice versa, Goldy says Darwin's evolutionary sequence, was brilliantly conceived, but its occurrence programming was in inverse of reality,"

A

- Cite GOLDYLOCKS, p. K9, 5 Jun'75

"Humans are as complex as Universe. Each human is one way in which all the potential intertransformabillties, decrees of freedom, and frequency variables could eventuate, provided all the other complementary evolution events of Universe had been concurrently transpiring.

"As partially noted previously,¹ Goldy says, ` the complex physical organisms employed by exclusively metaphysical humans differ from all other species in that all other species have highly specialised, built-in, special functioning equipment integral with their unit organisms which provide special capabilities in special environments, whereas the human organism lacks any such special integral equipment for functioning in special environments.

"Many creatures have brains. Brains always and only coordinat- ingly apprehend, store, and recall, only the special-case input information provided by humans' senses: smelling, tasting, touching, hearing, seeing, and possibly an ultra-high-frequency electromagnetic wave tune-in-ability. Brains of all the brain- equipped creatures always and only apprehend, memory-bank, and reconsider the special case information sense-harvested from"

- Cite GOLDYLOCKS, pp. K9,K10, 5 Jun'75
their succession of special case experiences.

"In addition to their brains* special-information apprehending, storing, and retrieving capability, the metaphysically operative humans have minds which have the (only-intuitively-triggered), exclusively unique capability of discovering the synergetic, weightless,covariant, complex interrelationships always existing only between, but never in, any of the separately-considered, special case phenomena with which the brain is exclusively preoccupied, Human mind not only can discover the weightless, abstract, only-mathematically-statable, generalised scientific principles governing physical behaviors of Universe, but human mind can also use the generalized principles to produce the special case technology with which to cope successfully within any special case environment, and do so more effectively than can those creatures with special-environment-adapted, integral equipment.

"Bernoulli's discovery of the principles governing behaviors of atmospheric pressure differentials, which led to comprehension of the negative-pressure lift produced by motion through the air on top of a wingfoil, which eventually made possible"

- Cite GOLDYLOCKS, p.III, 5 Jun*75 "human wingfoil flight 40 times faster than that of birds. When, however, humans are not using their mind and intuition-discovered equipment, can detach themselves from that equipment, and, unburdened, can make that equipment available to others. Generalisation-informed human minds can deal with any special environment, but in order to do so have developed a myriad of detached-from-self tools and devices with which to operate more successfully, not only in all the known special environments around our planet Earth's surface than can any of the many known creatures especially and integrally equipped for operation in those special environments, but also occurring outside the Earth's biosphere in 'general space' and on the airless, waterless Moon where no other only-integral-species can survive. All of humanity's nonintegral, special environment operations equipment may be employed interchangeably by all humans. Goldy remarks that apparently humans' minds have the potential capability of technically advantaging humans in sufficient degree to permit their eventual, safe, and progressively informing exploration of any and all physical and metaphysical environments in local Universe. "Since 'life' and its comprehending mind are only metaphysical, weightless, sizeless, and immortal, there are no physical environmental conditions within which it cannot cognitively prosper."

- Cite GOLDILOCKS, p.K11, 5 Jun'75

"For these and other reasons, Goldy assumes that the only-from-mind-to-mind communicable, abstract, weightless, synergetic, pattern integrities, with which the minds of exclusively metaphysical human life operate is utterly transcendental to any physical evolution transformability. In confirmation of this, Goldy notes that when human organisms are declared dead, all the physical chemistry misidentified by scientists as constituting the prime ingredients of human life

are as yet present, ergo, those who speak of the 'chemistry of life' are, unwittingly, self-misinforming. Life is not chemistry. Life is not physical. Life is indestructible, immortal, eternal. Life is only weightlessly-and oraniinvisibly present."

"I think anger is a secondary event. I am going to review something that has been going on in Philadelphia where I am the world fellow in residence in four universities and I have a lot to do with the University of Pennsylvania in particular. The head of the University of Pennsylvania Museum-- ex-Senator Clark---asked if I would be in a program they were running for the Bicentennial, called 'War and Peace.' They had a number of seminars inviting very Important people from around the world on the phenomenon aggression and they brought together those of the highest reputation... of any knowledge at all on behaviorism and aggression in the biological species.

"I summarized the last meeting we had in Philadelphia and apparently---to the satisfaction of all those participating--- I point out that as even humans, we have 30 days that we can go without food; we can go without water for only about a week; and we can go without air for not more than two minutes. If it is available to human beings they will consume two pounds of dry food a day, about five pounds of water, and seven pounds of oxygen extracted from 5L noivids"

"of atmosphere. What we use the most of, we go the shortest time without. What we use the least of, we can go the longest time without. And I think nature very deliberately gave us this long tolerance with food and water so that we would have a way to learn something.

*In behavioral science with animals we have what is called punishment and reward--and they are the thrashings and gold cups. Punishment is not getting what we need within nature's allowed tolerance of time--where you don't go panicky. And reward is getting what

you need within the period. Everything sublimely moves along and everything is O.K. and I would say human being have learned, in the behavior games of animals to find out what the animals recognizes in the way of colors and shapes and what fish do and frogs do and so forth--all by doing these experiments within the tolerable limits of which this vital supply can be had by the creature.

"I would think nature---having us all bom naked, helpless, and ignorant, and having to find our way--gave us a long tolerance on food so we would get to know our geography before we starved to death. And the ones we need the most of--the"

"oxygen--she didn't have us maneuver on that at all. The air has always been socialised and food has always been competed for--and the water many times at oases.

"So taking that basic tenet, I point out that the father and the mother with their children have gone to the theater and there is one of those horrible catastrophes, where there is a great fire. And what really happens is that the oxygen gets used up so that they suffocated. The whole theater is not burned down, but they just suffocated. And you would find that the father and the mother who would consciously give their lives spontaneously and lovingly to their children, went mad in less than two minutes tolerance without air and have run over their own children. So here is our own fail-safe secondary mechanism which is absolutely deathly.

"The father and the mother had this first proclivity, which is this very great feeling for the child before any aggressive thing. Aggression is a fail-safe mechanism to finally get life to do something very desperately. It is also very blind. So it is like that anger. That anger then, to me, is the"

"secondary trigger that comes in after we try to resolve things comprehensively in a spontaneous and logical and loving way. In other words, they are not equal and alternate--- one always comes first. If the first one is satisfied the other one doesn't occur. This function I have given you about nature helped human beings learn what they could eat and what they couldn't eat what are the tolerances of the human being, and so forth."

- Cite transcript p.7 R3F taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

"Humans are often spoken of as behaving like animals. Vast experimental study of animal reflexes and proclivities has disclosed reliable benign behaviors to be predictable when the creatures' vital necessities are both habitually and readily available well within critical limits of safe, healthy input periodicities of the chromosomal and DNA-RKA optimum metabolic processing of the subject species creatures.

"Such scientifically conducted zoological behavior studies use the words reward and punishment. By the word reward they do not refer to a gold medal. Their word punishment does not refer to whipping. The animal behavior scientist's word reward means that the creature is acquiring the vital lifesupport chemistries of air, food, and water well within the critical metabolic timing tolerance. Punishment, to them, means that the creature's subconsciously generated hunger, thirst and respiratory instincts are not met within comfortably tolerable time limits, whereafter the creature panics;

its original subconscious, spontaneous, Innate trust that its environment will always provide what it wants and needs'*

- Cite SYNERGETICS, 2nd. Ed. At Secs. 181-182; 17 May '75 "exactly when it is needed, having been violated, the creature panics and forever after its behavior pattern becomes unpredictable.

"It is clear that with the pushing of the panic button a secondary set of subconscious behavior controls has been activated. It is one of comprehensive anticipatory design science's selfdisciplined responsibilities always to include fail-safe, automatically switched-in, alternate circuitry of mechanical functioning whenever a prime function facility is found wanting. When a series of failures has blown out all the alternate circuits' fuses then a sense of lethal frustration sets in which is identified as panic. Once panicked, the individuals--- creatures or humans --- tend to trust nothing and their behavior then becomes utterly unpredictable. They become spontaneously suspicious of their environment in general and prone to be spontaneously hostile and aggressive.

"When they are aggressive, or even worse when they panic, both humans and animals demonstrate a subconscious drive only for self-survival. For Instance, when a great theater fire disaster occurs and the fire quickly exhausts all the oxygen,"

- Cite SYNERGETICS, 2nd. Ed. at Secs. 182-18L, 17 May* 75

"people suffocate within two minutes. When the fire is over and many of the human dead are found Inside unscorched, their death having been caused by suffocation, we discover that the otherwise loving fathers, lost personal consciousness and stampeded over their own children crushing them to death--- the children for whom the conscious fathers would gladly have given their lives a hundred times over.

"This frustratedlv insecure or panicked animal iurvival drive is not a primary human behavior; it is an only secondary and subordinate "fail-safe" behavior that occurs only when the very broad limits of physical tolerance are exceeded. When it is available, humans consume about two dry pounds of food daily as well as five poundd of water and seven pounds of oxygen, which their blood extracts from the 50 pounds of atmosphere that humans inhale daily. Humans can go 30 days without food; seven days without water; but only two minutes without air. With 30 days tolerance humans have plenty of time to decide how to cope with vital food problems; with only a week's waterless tolerance they have to think and act with expedition; with only one-and-a-half minute's oxygenless tolerance they rarely have time to think and cope successfully. Because the"

- Cite SYNERGETICS, 2nd. Ed. at Sec. 184-185, 17 May'75

"substances that humans require the least can be gone without for 30 days, nature has far millions of years used humans' hunger and the fertility potentials to force them to learn by trial and error how most competently to solve problems. But because more than a minute or so absence of oxygen, of which humans use the most, could not be tolerated, nature provided the air everywhere around the world and in effect 'socialited' it.

"As long as the 30-day, seven-day, and two-minute tolerances of food, water, and air are not exceeded, humans* minds tend to remain in ascendance over their brain-reflexive s ensing end people are considerate of their fellow humans. When the human is stressed beyond these tolerable limits, then the procon- ditioned-reflexing brain function takes over from the thoughtful, loving, orderly reasoning of mind and the SfccondarWy utterly thoughtless behavior occurs.

"It is at least scientifically plausible, and possibly even scientifically validated, to say that not only all humans but all creatures are designed to behave spontaneously in a benyij manner and that all creatures have toleration limits"

- Cite SYNERGETICS, 2nd. Ed. at Secs. 185-1*7, 17 Fay'75

"within which they continue to function with subconsciously spontaneous amiability, but that many have been stressed and distressed beyond those limits early in their lives and consequently have developed aggressive, belligerent, or outrightly nad proclivities. This is not to say that this switch by both creatures and humans from dominance by their primary proclivities to dominance by their secondary proclivities is an □ irreparable condition of life on Earth. Though humans as yet know little about complete repair of their innate propensities there are promising signs that such cures are not beyond human minds' successful attainment."

"spring 'moving days' when the average US urban family moved from one house to another house, but only within their same home town--to more or less expensive rentals according to their changing means. With the advent of the automobile

between World Wars I and II, workers could reach their factories or offices many miles away---could hunt and find better pay. Money-making corporations seeking to reduce labor costs by instituting automation, and opposed now by ever- more-effectively-organized labor, moved their factories to faraway out-of-town locations. The workers followed. Human families began to move out of town into new industries. In 1950 the average American family, both farm and urban, was moving out of town every six years. In 1975 the average American family was moving out of town every three years. Humans with legs to move were freeing themselves from the rooted dwelling patterns imposed by the roots of their earlier agrarian era. Human settlements had been inherent to both the agrarian and mill town eras. Now human unsettlement was occurring. Using marine life analogies, human life was graduating from its barnacle and coral era and was entering into its heavily armed, crab and lobster crawling-about stage---but here and there graduating into its free-swimming age."

Human Beings & Complex Universe

Humane City: (1)

"The humane city---what it might be---is a very challenging matter. Number one: we have to realize, in trying to answer that properly, that human beings are probably not on our little planet just to be amused, or to be pleased or displeased. We probably have a very important and unique function in Universe. What is unique about humans in contradistinction to any other phenomenon we know is their minds.

"So I would say that a humane city would have to give the human beings the time and the ease with which really to use their minds and not just their muscles. I don't think you could possibly design a humane city if you designed it on the basis of how are you going to make money out of real estate. You would quite clearly have to try to accommodate human beings on our planet who are all becoming very rapidly world-interested world citizens; and they are going to continually deploy for various experiences around the world; and they are going to converge from time to time---converging as we are here in this city.

"So they are not going to have a city ever again where it is"

- Cite RBF at "Town Meeting of the Air," Kennedy Center, Wash., DC; 10 Sep'75

Humane City: (2)

"designed for people to be put and stay there throughout their whole life. All of us are going to be very transient with a higher and higher frequency of transiency.

"In order then to have the really satisfactory-to-humans city, we'd have to solve many other problems, particularly assessing the methods by which human beings account their energy---account their wealth. I am convinced that humanity is incredibly wealthy today. That is, that it has the know-how to take care of all of humanity at the highest standard of living that anybody has ever known; but it is preoccupied with long, age-held misassumptions that there is no where nearly enough to go around, nowhere nearly enough resources to support all human life. It has to be you or me. World society is spending \$200 billion a year for the last 20 years on the wastefulness of getting ready for war---just to destroy each other; and this increases the scarcity of effective life support.

"I think then, to bring about the ideal city for humans, you would have to bring about a gradual accommodation of what we are here for--or else I think we're not going to stay on this* planet very long anyway. That is, you would have to really"

- Cite RBF on Town Meeting of the Air, Wash., DC, 10 Sep*75

"accommodate this extraordinary intellectual and mental capability of humans. Inasmuch as we're all here for problemsolving with those minds, it will not eliminate problems but the local problems of the Universe or something other than the questions of jdst how we might get on. Such a city would get completely away from the idea of inventing jobs just so people will have life-support buying capability. We will not waste those extraordinary amounts of gasoline just getting to work and away from work. We will not waste a great deal of the resources of the Earth for invented jobs, for invented ways of getting life support distributed.

"So I'll simply say... My statement is that the ideal city can be designed, we know how to do it technically. Whether we realize this... it will be a question of how rapidly humanity gets over its age-old preoccupations and arrives at a proper way of accounting their wealth and know-how, for that is what real wealth is, accrediting the enormous energies we have in a way that can take care of everybody, in a way that we already know how to do. I think that would be the humane city with its high potential of real success for all."

- Cig 1'75 "National Town Meeting of the Air, Wash.,DC;

Humanity:

"Universe is the aggregate of eternal generalised principles whose nonunitarily conceptual scenario is unfoldingly manifest in a variety of special-case, local, time-space transformative, evolutionary events. Humans are each a special-case unfoldment-integrity of the multi-alternated complex aggregate of abstract, weightless, omni-interaccommodative, maximally synergistic, non-sensorial, eternal, timeless principles of Universe. Humanity being a macro---micro Universe unfolding eventuation, is physically irreversible yet eternally integrated with Universe. Humanity cannot shrink and return into the womb and revert to as yet unfertilised ova. Humanity can only evolve toward cosmic totality, which in turn can only be evolvingly regenerated through new-born humanity."

Hydraulics:

"With hydraulics you can get up to any kind of compression strength you want. We have never found any limit because it's noncompressible. And it's always distributing its loads. And hydraulic will burst anything. You can put a hydraulic pump under a great stone church and lift it just like that! No trouble at all. You lift whole highways with hydraulics. So we're going to come nov/ with this beautiful high tensile capability getting up in the millions and we're going to balance that with hydraulics. You're going to see some fantastically delicate substance coming.* I just want to introduce you to some of the strategies and evolutionary things going on when we're going to do more with less."

Hyperbolic Paraboloid: Four-frequency:

"A flat four-sided frame (A) can be folded to define a nonplanar hyperbolic paraboloid (B.C.D.).

"The edges of the four-sided frame are joined with lines parallel to its edges. This forms the basic grid of the

hyperbolic paraboloid. When the frame is in planar position (A) all the grid lines are of equal length. As opposite vertexes of the frame are lifted the grid lines change lengths at unequal rates. Shown here is a four frequency system which, when in closed position (E) reveals that there are two different cross lengths in addition to the length of the frame edge. Although the lengths shorten as the altitude increases there are always only two different cross lengths for a four frequency hyperbolic paraboloid. The moment the four-sided frame is no longer planar the fact of the two different axis lengths is revealed."

Cube: Diagonal of Cube as Wave Propagation Model Deliberately Non-straight Line

"The wholesale exodus of mathematicians from reality with the usual, notable, and relatively few exceptions, such as Euler, occurred simply because the mathematicians' inability to cope epistemologically with the increasing flood of emergent inter-w relatedness of physical reality which imposed many hyphens between the adjacent sciences--- of physics and biology for instance--- as the increasing specializations found themselves inadvertently overlapping on the joint thresholds of the older sciences. Leaving the weddings of

biochemists, physio-chemists, astro-physicists, et al., mathematicians plunged into the ultramorphic abstraction behind a screen of axiomatic inadequacy whose alleged 'obviousness' of unprovable first truths' were, to me, neither true nor obvious. With each advance of the physical sciences the mathematical axioms were ever less apt, even as tentative hypotheses. There was nothing wrong with the mathematicians' play once they had adopted the axiomatic rules of their game."

Ice:

"Children can learn from their remembered observation of the rotational progression of angles that the hour and minute hands of a clock have moved; that the tree and the vine have grown; and that the pond's top has frozen into ice that surprisingly floats---whereas getting colder means getting denser and heavier per given volume, which would suggest that ice should sink to the pond's bottom.

"But the crystallization of water forms a 'space frame' whose members do not fill allspace, and whose vacated space embraces and incorporates oxygen from the atmosphere---which makes ice lighter than water. The crystallization of water takes up more room than does the water in its liquid nonform condition. Crystallization is structurally and vectorially linear; it is not allspace-filling. Crystalline structurings are interspersed by additional atmospheric molecules occupying more volume (ergo having less mass); the process of crystallization cracks open its closed containers. If ice did not float, if ice sank to the bottom, life would have long since disappeared from Planet Earth."

Ice

See Invisible Pneumatics, 27 Dec'73

"The energy conservation of a closed local system improves twofold each time the system's linear dimensions are doubled. This principle is demonstrated in stars and in icebergs. Icebergs can melt only as fast as they can import heat from their surrounding environment of air and ocean through the surface of the iceberg. The larger the iceberg, the lower the ratio of surface area to its volume or mass. However, as icebergs melt, their mass gets smaller at a mathematical velocity of the third power while their surface area decreases only at a velocity of the second power. This is to say the volume decreases much more rapidly than does the surface area so, as icebergs get smaller the amount of surface area for each unit of volume of its interior mass increases at an accelerating rate.

"Therefore, icebergs melt faster and faster and when the final piece of ice dwindles to pea size it can be seen by the human eye to accelerate to extinction. Due to the principle of energy conservation improvement with size, the larger the domed-over city, the more stable its atmospheric conditions become and at ever-decreasing cost per unit of volume.

' • If we take the vector equilibrium with the center ball as the nucleus we can make a model of the 12 balls around one and put rubber bands between their centers. It is very easy to make a necklace of rubber bands of four great circles around together, the four greſt circles being the four great planes of the tetrahedron that went through the common center of vector equilibrium. When we have rubber bands it is possible to strebbh the rubber band and pull the center ball out. We must remember that the vector equilibrium has six square faces and eight triangular faces. When we pull the center ball out these six square faces immediately rotate in such a manner that each of them becomes a diamond. Every one of the souare faces become a diamond and the whole system becomes the icosahedron.

"The balls simply rotate and contract a little. The center ball was keeping them from packing and so there is a little more compactibility when the center ball goes out.

"Now we see omni-triangulation and no more squares. We

Icosahedron: Contraction from ~~thJX4drda-La3-er~~ cf

"There is something to warn you about. If I made the five layers of the vector equilibrium, you could not have the condition I have spoken about of becoming icosahedron. You could not have two adjacent layers of vector equilibria and then have them collapse and become the icosahedron. . . , I could take any single layer of the vector equilibrium and if there is nothing inside to push it outwardly, it will collapse into becoming the icosahedron. But

if there are two layers, one inside the other, the radius contracts when that occurs, and these two layers will not roll on each other. The gears block each other. So you can only have this contraction in the vector equilibrium in a single layer and it has to be the outside layer remote from other layers.

"For this reason we begin to be suspicious about the icosahedron's condition of 18.63 and its relation to the electron--- we begin to be suspicious that we have the electron kind of shells going in the icosahedron, which are remote from the nucleus group and are therefore not frustrated from contracting in that condition."

RdF DEFINITIONS

Ippahedral Disconnect?

``Closures and pulsations disconnected at the icosahedron stage."

- Citation and context at Invisible Circuitry (1), 28 Oct '72

"Here we have the tetrahedron as unity, volumetrically.

The octahedron has a volume of four, the cube has a volume of three, and the vector equilibrium has a volume of 20. But the icosahedron has a strange number: 18.51. This is a very interesting number because the ratio of the mass of an electron to its neutron is 1:18.185.

It's the same fraction. But when you compound that 18.51 with the volume of what we call a vector-edged cube, which has a volume of 8.49, the two together give you a whole number 27, which is a second-power number and seems very interesting. So the whole thing comes out rational by combining two fractions and makes the effect sum totally rational."

- Cite RBF to Verner Smythe, NYC, Reel 2, p.3, 11 Mar'69

"The icosahedral phase of self-structuring is identifiable uniquely with the electron whose mass relationship to the proton is as 1 : 18.36. whereas the icosahedron's volume is to the vector equilibrium's volume as 20 : 18.51. This difference is to be identified with the ratioing of the electromagnetic constant to the gravitational constant."

IHMMM icosahedron as Electron Model;

"The icosahedron is the electron world."

- Cite RBF to EJA, Beverly Hotel, New York, H Sept. 1971

"... To have it become icosahedron it can only be done one M with one layer. It's only the outer layer which can be collapsed into an icosahedron. That is why I am quite confident this is the electron. The electron is always outside the rest of the system and not touching it."

- Cite RBF to Verner Smythe, NYC, Reel 2, pp.2-3, 11 Mar'69

"Then the icosahedron has a volume of 18.51, It is an

odd number, but you find that number complemented--- one of the few that doesn't have a whole number--- complemented by another that comes out 27. An interesting number because its number close, the fraction 18.51, very, very close to the weight ratio of electrons to protons. I think it is close enough to be worth to be looked at sometimes. It may have some of those kinds of behaviors. Its volume is 20, nearer to talk that way, nearer to 18.51, and it has 26 Faces!"

- Cite Ledgemont Lab. Address, pp.21-22, 15 Oct'64 "Where the volume of tetrahedron is one, octahedron is four and the volume of the icosahedron is not quite that of the vector equilibrium. The volume of the vector equilibrium was 26 and the icosahedron is 18.63. It is the only point where we get to a strange number, but 18.63 is a very interesting kind of number because the electron is one-eighteen-hundred-and-sixty-third of a proton. So it is a very interesting kind of a number when you begin to get into atomics."

Icosahedron: Inside-Outing of Icosahedron:

"When you seemingly turned the icosahedron inside-out, it was just the same as if you had adjoined the original icosahedron with a ring of irregular tetrahedrons, which is the same as if we covered the surfaces of an octahedron with 8 tetrahedrons--- and then those tetra's were complemented by octahedrons around them, etc. So that what

happens when a hole is proposed is that we are starting with secondary or tertiary or subsequent layers and are away from our primary and primordial energetic systems. This is to say, you will find the icosahedron will fit inside your first development and we might then say that successive enclosures of primary forms (vector equilibrium, icosahedron, octahedron, tetrahedron) constitute inside-outing waves. Just as the tetrahedron is really the octahedron's inside-obverse wave. And what we have is (that?) when we go to the neutral center of the vector equilibrium (Universe ?) --- turns itself inside-out and it looks just like a vector equilibrium again."

- Cite Ltr. from ROF to Duncan Stuart, 10 Jan'50

Icosahedron As Local Shunting Circuit:

"The icosahedron makes it possible to have individuality in Universe. The vector equilibrium never pauses at equilibrium, but our consciousness is caught in the icosahedron when mind closes the switch. Our mind, always integrating, opens the switch."

"The icosahedron: its function in Universe is to close the switch into a local shunting circuit. It gets itself locked up even more by its six great circles--- which is why electrons are borrowable and Independent of the proton-neutron group.

"The vector equilibrium railroad tracks are trans-world--- like being in an airplane; you can go anywhere. But the icosahedron is stuck locally with no way to get to another continent. The vector equilibrium is how you go from one sphere to another, from Earth to Mars."

- Cite RBF to EJA, Beverly Hotel, NY, 22 Jun'72 Incorporated in SLT; R>k.TICS at fee, 458.10, 11 C`ct'72

"Of the three fundamental structures, the tetrahedron contains the most surface and the most structural quanta per volume; it is therefore the strongest structure per unit of volume. On the other hand, the icosahedron provides the most volume with the least surface and least structural quanta per units of volume and, though least strong, it is structurally stable and gives therefore the most efficient volume per units of invested structural quanta....

"That is the reason for the employment of the triangulated icosahedron as the most efficient fundamental volume-controlling device of nature. This is the way I developed the multifrequency-modulated icosahedron and geodesic structuring. This is probably the same reason that nature used the multifrequency-modulated icosahedron for the protein shells of the viruses to house most efficiently and safely all the DNA-RNA genetic code design control of all the biological species development. I decided also to obtain high local strength on the Icosahedron by subtriangulating its 20 basic Icosa LCD spherical triangles with locally superimposed tetrahedra; i.e., an octahedrontetrahedron truss, which would take highly concentrated local loads or impacts with minimum effort while the surrounding rings of triangles would swiftly distribute and diminishingly

- CIt SYNERGETICS text at Sec.s V .03 ' 9 Nov'73

"Inhibit the outward waves of stress from the point of concentrated loading. I had also discovered the foregoing structural mathematics of structural quanta topology and reduced it to demonstrated geodesic dome practice before the virologists were using geodesic spheres for their protein shell structuring.

Ignorance:

(1)

"... Man's participation in the moderate success of his complex relationship to Universe has of necessity been accomplished by a variety of indirectly-arrived-at advantages, only ignorantly induced, and conversely reciprocal to the original acts of ignorance. He backs into his future.

"Ignorance hither-and-yons impulsively until brought up short at unpredictable periods by unpredictable push-pull limits. It is slowly becoming evidenced that, though man had been ignorant of the factors governing his successful survival as a species, the reciprocal positive functions governing the periodic alternations which net a successfully steered course may be adduced, only, however, by proper documentation and realistic inversion of the negative evaluations and predilections of ignorance.

'Vanity and superstition constitute the plus and minus springs of ignorance, the expansive and contractive 'raison d'etre' of boast and fear. The boasts and fears of ignorance may be maintained spontaneously only when there is no obviously periodic contradiction in physical experience.

- TOTAL THINKING, I&I, p.230, May'49

"Abandoning vain boastw, the competent but fog-shrouded navigator learned by experience to blow his horn to generate echoes from unseen headlands and thus to position himself and dissipate fears of danger. Ignorance is the inherently diminishing negative residue, the obscuring mist of the receding mental wilderness progressively dissipated by intellect, the inherent positive of Universe that may by inference of the record turn every adversity to ultimate advantage. . .

"Ignorance may only be dissipated as intellect traits by physical initiative in design realizations of anticipated periodic functions, designed to disclose coincidence with the periodic contradictions forcefully experienced and thus potentially further revealing in principle. Thus, the designed experiment is resolvable, eventually, into general behavior laws of the energetic Universe, whose interactions in turn become subject to increasingly reliable predictions by man."

- Cite TOTAL THINKING, Itl, pp.230-231, lay'49

Ignorance:

"Ignorant of his own coming 'blessed event,' ignorant of the circumstances of his realization, ignorant of final causes and effects, ignorant of consequences and significance, and ignorant of absolute values, man is clearly a priori ignorant. He is born helpless and nurtured by progenitors but meagerly understanding him, who in turn have experienced the identical involuntary helplessness and meager understanding. Ignorance is indeed a priori."

"There are a great many immaculate conceptions, but they are all metaphysical. Christ would not have had to be physical at all. There was no need for an Earth birth--- just a powerful thought. . . since we are dealing with pure mystery. A composite of all the eternal verities, whatever these mysterious principles are. We have had imperfect man. We have to have the theoretically perfect man as he goes through the vector equilibrium, he no longer needs the physical. . . . Everyone is 3.702 * short of his potential.'¹

frQraJ-jty:

"The word is immoral rather than sinning. A man works hard and gets promoted and suddenly he finds that his new job carries with it the need to really compromise and let something go by. He's turning out goods that will work for a month. It's quite long before he discovers that somebody else has already arranged to make more profit by cutting down the quality. And he's just an executive; and it's months before he discovers all these production tricks. So the immorality part is the compromise, and not resigning or making a fuss. It's getting caught in the circle. It's an elusive kind of thing: that built-in immorality of the corporation."

Plosion-Explosion:

"The vector equilibrium is of the greatest importance to all of us because all the
nuclear tendencies to implosion and explosion are reversible and always in exact
balance.

The radials and the circumferentials are in balance. But the important thing is
that the radials which, if they are outwardly pushing, would tend to explode are
always frustrated by the tensile finiteness of the circumferential vectors which close
together in an orderly manner to cohere the disorderly sundering, • /hen the radial
vectors are tensilely contractive and separately implosive, they are always prevented
from doing so by the finitely closing pushers or compressors of the circumferential set
of vectors."

Q* "Do you think it would be a good idea to set up

an Information Center or some kind of Clearing House on all the work
that has to be done?"

RUF: "I don't know that you need an organization. This

World Game 'Workshop we're having here is such an effort. And we see what
individuals can do, like Hans Meyer who has brought out a bibliography of windmills
and their manufacturers, really all those in the field competing with him. We need
more of this kind of generosity instead of all the corporations' strategy of monopolizing
information for greater profits.

"Thus the design revolution is up against a great deal. Hence we started in
Carbondale the World Resources Inventory of Human Trends and Needs. All the
world-around architecture students wanted to get into that.... But I don't know about
a newsletter- I wouldn't want anything that made me into some kind of a guru. But
we can have people like Tony Gwilliam who is running this inventory of Energy-harvesting
Dwellingmachine Devices.

"Anyone who wants to get into the design revolution has to do really a lot of
work—and he has to be alert and on the"

Impossible: Only the Impossible Happens:

"When Anne and I were living at 6 Burns Street rent controls were still in effect and there was no way the landlord could raise the rent, but there was also no way we could get a new icebox. They always maintained the icebox poorly, hoping we would move away; and if we made any improvements to the Icebox our landlord said he would own them.

"Shoji had started up the icebox because we were expected back soon and he wanted us to have ice ready. When the icebox burnt up it fell into the apartment of our neighbors below.

We never met them but they were always for the most obnoxious political candidates--- according to the posters on their door--- it was unpleasant even though I was apolitical. Sometimes when I was writing I would pace the floor till 4 a.m. I was quiet but they would knock on the ceiling anyway; we clearly didn't like each other and never met.

"I went to Bull ock'-Wil shire to get Allegra a watch because in buying a watch you had to pick ^a good place to get it repaired. When the saleswoman from Forest Hills discovered who we were, she wouldn't approve my check."

".When we were living in Forest Hills, at 6 Jurns Street, once Shoji was staying in the apartment when Anne and I were away. .«'e had disconnected the icebox and put the furniture in the middle of the room for the walls to be painted. The day before Anne and I were due back from Lew Orleans, Shoji plugged the old GE- with the coils on the top- back in, and left. The next day we were stopped by a Louisiana trooper as Bill Parkhurst had culled the police to get word to us that our apartment had had a big fire. The icebojt caught on fire and fell into the apartment below; the rest of the apartment was in fair shape with smoke damage to my papers, but the insurance company granted a total loss. The people down stairs always complained anyway and banged on the ceiling whenever I worked late.

'•Months later I was visiting Allegra in Los Angeles and went to bullock's to get her a nice watch for Christmas. I told the sales clerk-- a very nice little lady--- to call the floor manager to approve my check. She said she could approve the check, but I answered that she didn't

understand; this check was from out of town, from Forest Hills, Long Island. She said why she and her husband lived in Forest Hills for years, but the only reason they left and came to the west coast was the awful people"

In & Out;

^HIn is temporal; out is eternal, ins are knowable; outs are unknowable. In is individually uniquely identifiable; Out, though total, inherently integral and finite, is nonidentifiable. in is individually uniquely directional;

Uut is any, all and no direction. Out is all direction, even when temporarily inward toward center it passes beyond the center to eventual outness."

- Cite KBF to EJA, Beverly Hotel, New York - 19 June 1971.

C«x<ri«Tv»inY- HWOIT-

fIB *ⁿ & Out:

"There is only omnidirectionnonconceptual 'out' and specifically directed conceptual 'in.*

""In¹ is individually unique. 'Xn*' is a direction toward the center of any one system of universe.

"In¹ is always a direction. 'Out' is not a direction."

- Cite SYNERGETICS Jraft - "Conceptuality:Space" - toy, 1971

In and Out;

"There are no specific directions or localities in Universe which may be opposingly designated as UP or DOWN. In their place we must use the words OUT and IN. We move in towards various individual masses or we move out from them. But the words in and out are not mirror-imaged opposites. In is in respect to individual experience foci. Out is common to all. In is discrete. Out is general. The in's are discontinuous. The out's are continuous.

Out is nothingness, i.e, non-experience. Only the nonexperience nothingness implies a continuum. The non- event continuum is the NOVENT."

CoMcer-TVwtfTy - Citation & context at Novent (1), 13 Nov'69

S°esi^li ~ CMar-lttMrtt-SFHKCU, p. 1V <3 Nov'69

In and Out:

"... I think your words 'up*' and 'down' are meaningless. Which direction is up? Which is down? Are people in China upside down? Which star should one's head be pointing at to be identified as 'up'? What you mean is what you say in your next phrase, i.e., in and out. Aviators come in for a landing and go out for altitude. In and out refer to focal centers of systems of local events of Universe only. ' In* is unique to individual systems. One 'out' is common to all systems and is omnidirectional in respect to any one system and Universe, being a plurality of continuities of local dynamical experiences, the direction out of Universe is not integrative as geometrically identifiable as it is permeative and comprehensive of experience. The outness permeates the nuclear event remoteness..."

- Citation and context at Tetrahedral Dynamics (3), 4 May'57

In_t Out k Around:

"...The president congratulated the astronauts for getting safely 'up' to the Moon and back 'down' to Earth again.... Even the astronauts themselves spoke on television from the Moon as "being up here on the Moon."....

"The correct words, of course, are 'in, out and around.*... into the Moon, into Mars, into Earth. 'In' is always one-directionally unique and is individually point-to-able. 'Out' is any direction. You go in to go out because out is not only any direction but is all directions---electro- magnetically speaking it is 'tuned-out.* In is what we are thinking about now. In is the momentary reality into which we are tuned. All the rest is for the moment tuned-out but equally real as progressively tuned-in.

"Physics finds that Universe has no solid things surrounded by and interspersed with space. Life is an inventory of in-and-out tunings. Birth is the first tuning-in; death may not be the last.

- Cite RBF preface to "American Space Photography"; 17 Kay*77

"There'a no up and down in Universe. In, out, and around are all the directions there are."

- Citation and context at Time Vector_r 24 Sep*73

"There 1b a unique and limited set of angle and magnitude consequences of interfering events. These resultants may always be depicted as vectors in the inward-and-outward, omnidirectional, multifrequency-ranging, circumferential- or-radial relativistic system patternings, which altogether constitute the comprehensively combined metaphysical and physical 'reality' that is reported into and is processed by our brain and is reconsidered by our thoughts as referenced conceptually to various optimally selected observational axes and time-module durations."

- Cite SYNERGETICS text at Sec. 517.05; Nov'71

****Ia>** and around are the words that indicate conceptually all our sensing of directional behaviors of physical Universe, 'When these directions are modified by relative angle and frequency changes, they accurately satisfy our needs in respect to all conceptual systems of consciousness--- subjective or objective--- and all systematic considerations of experience, from instrumental probings of the atomic nucleus to celestial nebulae."

- Citation and context at UP and Down Sequence (A)(6), 1968

In, Out & Around Experiences: (j)

"Experience is always special case but always governed by generalized laws. Among the generalized laws governing experience is the law that there are three directional aspects of all experience: in, out, and around; these directions manifest an inward-outward pulsing and a surface-articulated patterning. The pulsing patterning has six consequences:

(1) the change in size wave frequency;

- (2) the plurality of professionally induced surface vertex-vortex rotations of the expansive-contractive pulsations acting as omni-non-polar vertex, alternately winding and unwinding, to alternately and symmetrically take in the slack of the contracting

s system or unwinding locally to permit symmetrical expansion;

- (3) the inherent axial rotation of the whole system;
- (4) the inherent orbitally-occasioned surface changings occasioned by external forces operating precessionally upon the conceptual system considered;*

"The individual can address himself to finding out what nature may be trying to do in relation to the incredibly complex design of eternally regenerative Universe....

"The momentum of the conditioned reflexes of the politics and national sovereignties cannot bring about the changes society needs now. All the great economic and political

institutions are going to have to go. This is the undertaking of the little individual.... And you're up against fear all the way."

- Cite RBF to meeting of Design Science Institute. Aspen, Colorado 13 Jul»74

"I was interested in what the individual could do on behalf of his fellow man . . . even in a very few years.

"Starting without any money, without any credit, what can the little individual do that the great corporations and great organisations and great states can't do? . . . And so I really felt that there were things that the individual could do, he really could take initiatives like that. And he could work on something that would not be needed for 50 years--- and no corporation would do that and no state would do that. And so I saw a great many things that were needed, exactly the ones that would be needed in 50 years and we'd really be in trouble if we didn't do it. And luckily it's almost 50 years ago that I started doing it. The reason that I'm really here with you is that the things I really did undertake nobody else has underbaked to do. I'm really coming into phase now because they were so far out from what were considered logical and practical and worth budgeting.

"So the strategy I was employing, and the tiny little capital you and I have, which is just our experience. Self-experience. Beautiful equipment and how it can be really be turned to the powerful advantage of the many."

"and the problems along with it. And you finally get to the point where you have some problems that are here right now today.

"So it could be that human beings, wherever they occur in Universe may be introduced as how you handle the most complex kind of problems; so that each one of us is really where the problemsolving of Universe is going on. If we think of ourselves as things--- as China dolls, and as China dolls that just get smashed or just get eroded--- then we don't do very good thinking. But if we think of ourselves as absolutely continuous process itself, then you might get some idea of it. We are the most complex problem-solving part of the invention Universe. And in this way each one of us would be a department of the mind of what we might call god.

"There must be an accounting for the a priori principles which we find to be operative and each of us would be a very important part of that totality of integrity. The invention of the game of Universe is really the invention of introducing time; by introducing time, and having lags, and having different frequencies so that events are not simultaneous, there have to" I- Cite RBF to Barry Farrell: Bear Island; Tape #8, Side A, \ transcript. 3; 22 Aug'70

"be some ultimate complexities, and we may be just that.

"And part of the game might be that we just blow ourselves up, but I don't think it could be that. To us that seems like a bad solution; but it might be a very good solution."

Individuality:

"Each life as we know it is definitive, i.e., consists of a plurality of terminable, ergo definite, experiences, beginning with each awakening and terminating with each surrender to sleep (no man can prove upon awakening that he is the man who he thinks went earlier to sleep, or

that ought else which he thinks he recollects is other than a convincing dream). The intermittent beginnings and endings of conscious experience constitute an aggregate of definitive experiences--- and the aggregate is therefore finite."

Individuality;

"Inexhaustible faith of man in the validity of himself as an effective factor in the biological equation of the Universe, to which latter the principle of essential priority of common weal is implicit, i.e., that the individual is a product and servant of a plurality.

"In the principle of mass production industry, the significance of the individual as a producer continually diminishes and his importance as a consumer increases proportionally. The productive ability which displaces the individual as a productive slave is cumulative to the whole history of intellect."

- Cite Part II, Earth, Inc. Fuller Research Foundation yellow transcript, p.14, 1947

Individuality & Degrees of Freedom;
(1)

"We may define the individual as one way the game of Universe could have eventuated to date. Universe is the omnidirectional, omnifrequency game of chess in which with each turn of the play there are 12 vectorial degrees of freedom: six positive and six negative. This is a phenomenon of frequencies and periods- if¹! i¹* ir ---cities.

Each individual is a complete game of Universe from beginning to end. This is why each of us individuals are so much alike and yet completely different, a unique and individual way of playing the game with each of the omnidirectional degrees of freedom. With the six positive and the six negative omnidirectional degrees-of-freedom moves to be made at each turn of the play the individual can move to any cosmic point that is not occupied and he can move back over the same points or move on to new ones.

"Intellect as 'god' can play all these incredibly different games in all these different ways and at all the differential rates at the same time."

- Cite SYNERGETICS, 2nd. Ed. at Sec. 537.41, 1 Jul'75

Individuality &. Degrees of Freedom: (2)

"The individual differentiates position in Universe, The six degrees of freedom operate at every turn of the play. Just think of the frequencies-per-second of each of the chemical elements that make up the individual human body and then think of the periodicities of the those frequencies,

"That each individual is a complete integrity is one of the reasons that I don't have to make any effort in loving my fellow man. (In the first person plural of we-even the I even classifies itself with the other. Each individual integrity is like a steering effect and like all steering effects they go from one aberration to another. Certain individuals may be ViJSE® very wide aberrations form all the corruption that's going on in Universe, acting as just one of those infrequent and very wide aberrations so that Universe can hold its center. At that center sphere is the two, and you turn inside-out; and only the tetrahedron turns inside out. The other side of the Universe is not like the other side of a river, but an inside-outing.)

- Cite SYNERGETICS, 2nd. Ed. at Sec. 537.42-.43; 1? Jun'75

"We regard each individual as the special case, but conscious as the generalisation. Like the bumper sticker, "The Real World is a Special C_ase." Reality is special case. You and I are sitting here and no one else can be sitting right where we are. This is the kind of reality that the newspapers miss: they write about reality as if we were all the same realities, as if we were all the same things. If you and I are sitting here we couldn't possibly be anywhere else,

"There are a lot of different realities. That is the difference between reality and generalization. There is only one generalization, The only reason the radio works is because it has no interference. The game of Universe can be played on any one of the fantastically large number of the quadrillions of quadrillions of frequencies; the game can be played any way just so long as there is no other interference on the frequency you are using, so long as there are no two pieces on the same square."

- Cite SYNERGETICS ,2n.d Ed. at Secs. 537.U-.45; 17 Jun»75

"What is important about the individual and important about Universe is that neither are exempt from any of the rules. The universe is the sum total and the individual is the special case. Universe is the aggregate of all the generalised principles."

Industrial Lag:

"The individual intellect paces the individuals;

the individual scientist paces the science; science paces technology;
technology paces industry;
and each one of these paces are a considerable lag. „

Finally industry paces economics. . . economics paces what we call everyday life and we have all the political adjustments of the extraordinary reorientations of man to his environment."

-Cite OR&GOK Lecture #3 - p. 80, 5 Jul 1962

Industrial Lag:

"I have made many studies of what we call the relative lag, the amount of time occurring between when a scientific discovery is made, or a technical invention is made, and the time when that discovery or invention is introduced into society and put into use in the Industrial equation. There are really some very great lags like that lag of chrome-nickel-steel from 1854 to 1914 in its being used.

"In studying these lags I find that they have a certain orderliness. Since the more remote the function, the more intellectual the perspective we have on it, the greater the speed with which we accelerate its adaptability into our economic life.

"One can see a cart going by and therefore can be critical of the wheel as we see it changing its positions. They are standing still and the cart is going by so they can see what broke up the wheel as it landed on a rock. So they began to invent ways of not letting that happen. That is what we call perspective. At any rate I find that the greatest perspective is really the intellectual one, and in the communications arts, radio, and so forth, there is only a lag of about two years"

- Cite Oregon University Lecture //1, p.18, 1 Jul 1962
Industrial Lag:

'between the invention and the actual incorporation in the circuits that are designed.

"In railroading there is about 15 years--- a very long span, in airplanes there is only about a seven-year MB span. In housing the average lag is 45 years. This will give you an idea of how this low-priority art really lags behind."

- Cite Oregon University Lecture #1, 1 Jul'62
industrial Lag:

'Then I said I see where the Individual scientist makes a great breakthrough it is a long time before the « academy accepts in general. Then a long time after the academy accepts in general that engineering begins

to have this as part of their working data. Even a longer time before inventors have an atmosphere of logic that helps them to invent within the new terms. Then there's a long lag before the invention is taken on by industry. But once the invention starts to producing, then it alters the environment in a major way and there are all kinds of political adjustments. So that's why I said, quite clearly, there's such a lag between an Einstein and Krs. Murphy."

Word as Industrial Tool

Industrialization: (A)

"Industry has been identified with people trying to make money rather than with people trying to make the world work, Humans are in the middle among nature's creatures; they have no integral equipment but can sense principles. Other biological species... various organisms' behaviors... all systems alter other systems: this is the essence of evolution.

"The organics take on more energy than the nonbiologicals; they alter the environment more and in discrete ways like the spider's web. The mine is part of the mole. The nest is part of the bird.

"Man is unique in his ability to alter the design of the artifacts. Tools are part of the human beings. But the human can only produce what nature permits him to produce. The relative crudity (95 percent) is part of the learning.

"It is very misinformative to refer to industrialization in terms of profits. Profit is just taking the input from the many for the advantage of the few.... I shudder when I hear people say we must give up industrialization and go"

Industrialization: (1

"Industrial authority... has recently shifted from major preoccupation with exploiting original resource to preoccupation with keeping the 'wheels' which they manage turning--- now that the original inventory of 'wheels,' that is tools in general, has been realized from our original resource. Though original resource exploiters still have great power, that power will diminish as the mines now existing above grade, in highly concentrated use forms, yet in rapidly obsoleting original design, become the preponderant source of the annual need.

"Severe acceleration in the trend to increase of performance per pound of invested material now characterizes all world industry. With no important increase in the rate of annual receipt of original mines, the full array of mechanics and structure requisite to amplifying the industrial complex from its present service to approximately one-third of the world's population to serve all the world's population, may be accomplished by the scrap 'mined' from the progressively obsoleting structures and mechanics. World industrial management will be progressively dependent upon the comprehensive designer to accelerate the turning of his wheels by design"

Industrialization: Curve Of: (1)

"It is 45 years from 4-0, 1927, to AD, 1972, and that is the 'gestation period' of 45-50 years that I foresaw in 1927 would be involved in the realization of humanity's highest knowledge and productivity converted from a killingry to a livingry focus and abandonment of the history-long assumption of fundamental, eternal scarcity of life-support; ergo, of a norm of human failure and adoption in its stead of a norm of 'human success.'"

I published my curve of industrialization in 1951 in Harry Holtzmann's 'Transformation' magazine which showed that 1972 would be humanity's crisis year because prior to 1900 AD the ratio of havenots to haves had always been more than 99 to 1. This century has seen this historical ratio abruptly and continually altered--- in 1919 it was 94% havenots and 6% haves, in 1951 it was 70%

havenots and 30% haves. My curve showed that after 1972 the majority of Earthian humans will be haves, with havenots disappearing altogether before 2000--- with my second 'most accelerated' curve showing total success could be attained by 1985.

"It is wonderful that you have committed 'AD' to celebrate this at Hew Year's day, 1973."

Industrialization; Successive Halving Time of National Industrialization: (i)

"Three centuries ago industrialization gradually came to Europe, a continent that thought of itself as having a farming economy. It began with windmills and waterwheels, coupled with trains of gears. The inadvertent 'swords into plowshares' industrial trending increased enormously man's ability to control his local environment and to increase the human lifespan. Europe took 200 years to industrialize. The United States, greatly aided by the knowledge already acquired in Europe, industrialized in only 100 years. Russia, after its great revolution of 1917, undertook industrialization with its series of five-year plans. When the great depression occurred in America and Europe, the Russians were able to contract with the great corporations in America to come to Russia and provide the know-how with which to build prototype factories. So Russia started industrialization at the highest level of American development, just as America had

started at Europe's highest level. Russia industrialized in 50 years. Hence we have Europe, 200; the United States, 100; and Russia. 50. This successive halving of time to institute national industrialization made it possible for me to say in 1947 that China would Indus-

- Cite THINKING OUT LOUD (1): DISPROVING THE POPULATION EXPLOSION, World Mag., pp.1b-40, 3 Jul*73

Industrialization: Successive Halving Time of National industrialization: (2)

"industrialize in only 25 years--- which is exactly what China did. And that is why it opened up to the United States and Europe in 1972. Because 99 percent of modern electromagnetic and electrochemical industrialization is invisible to humanity, the world is surprised at how quickly China has become industrialized."

- Cite WINKING OUT LOUD (1): DISPROVING THE POPULATION EXPLOSION, World Mag., p.40, 3 Jul»73

Industrialization: Successive Halving Time of National industrialization: "Industrialization has a very interesting pattern. As a new country begins to industrialize it does not copy what the older country did first. Even after World War II engineers thought that a new industrial country would have to copy every single thing in the United States that we did.

But you will find that is not the way it goes. Japan did not start with the cloth-covered bi-plane of the earlier Americans. They started right in with the aluminum spitfire level. And China comes into industrialization starting right in without even having propeller airplanes. What took England 200 years to do was matched by the United States in 100 years, simply because we started in with the knowledge and the principles and a fresh start, whereas they had to keep adjusting the old machinery to keep it running.

So the new fellow comes in at a great advantage. Russia industrialized in 50 years and it's very probably that China is going to industrialize in the extraordinary period of 25 years. This is what's going to really surprise the whole world. Somewhere around 1975--- as short as that--- China's going to be almost approaching affluence."

RBF DEFINITIONS

Infinity:

"Infinity is local

And occurs within definite systems,
As for instance
Following a great circle
Around a sphere
Which because of the fact
That lines—
Which occur experimentally
Only as energy vectors—
Cannot go through
The same point
At the same time—
Due to interference,
Which means also that lines
As curves,
Cannot re-enter, or
'Join back on themselves.¹
Therefore, the circling lines
Can only wrap around
And over its earlier part— ”
- Cite HOW LITTLE I KNOW,p,59, Oct'66

Jnanlty: (2)

"As the knot making

Sailor says it,

The circle when followed

Around and around

Results in a coil Which is

An asymmetrical spiral,

Which may be followed experimentally

Only as long as intellect follows,”

- Cite HOW LITTLE I KNOW, pp.59-60, Oct'66

Infinity:

"The concept of infinity, with one end closed by a 'beginning* and the other end open to infinity, is nonsense."

- Cite DOXIADIS p. 312, 20 Jun'66

KBF WliUTluhi

'•The only infinity humanity has discovered experimentally is that of the whole fraction subdivisibility of v/holes into parts as for instance by progressive halvings which divide the finitely close circle into ever smaller central

angle expressed arc increments.”

**The difference between infinity and finity is always exactly two, or 720 degrees, or two times 360 degrees, or two times unity."

- Citation & context at Two, 7 Mar'71

"It was always thought that a sphere and a plane to which the sphere was tangent were for an infinitesimal moment congruent at the point of tangency. A sphere as defined by the Greeks, -and as bUmC always accepted by the calculus mathematicians, -had 360 degrees around every point. But we discover that all systems are polyhedra and there is just one tetrahedron less than all the vertexial points times 360 degrees. This is an important difference. The difference between what we will call infinity and coming back to close upon itself locally as a system to subdivide the universe into insideness and outsideness always require "taking out" one tetrahedron, or 720 degrees from somewhere around flU all the vertexes of the system."

'...The difference between the finite physical Universe of energy with which physics deals and the total Universe which also includes all metaphysical phenomena--- which we used to call infinity--- is just one tetrahedron."

- Citation and context at Comprehensive Universe (1), Jun'bb
- MMB infirtty. .& Elnltx: <¹)

"Compressions are always local and they are always tending toward dichotomy, breaking into two radii. We find that whelms in our old way of thinking, Infinity was $N + 1$... We tried to get a static picture of a sphere but we couldn't quite understand one more layer beyond it and what was beyond that--- in order for it to be something. In the nqsimultaneous picture there is no simultaneous 'one frame.' We are not faced with that at all. We find that the very large patterns are quite clearly finite. We get to the finite physical Universe of the physicist; of the finite Universe that I gave you in a description of 'nonsimultaneous' and we get then to the local compressionals and we find that the local is continually subdivisible. We start with a whole which was finite and then begin to subdivide it and the more local it is the more we can subdivide it so there is in a sense an infinity of further dichotomies and subdivisions locally. This is very much like the intellectual pattern goes... so that the only thing you might call infinity here is the further subdivision of finity.

"So it is really never infinite because you are not looking at one part. It is never just Plus One; it is always plus the rest of the Universe when you separate that One out."

XnUIMYg.:

"I was Invited by the government of Cuba to come to the world design congress there as their guest of honor just after Kennedy had come in. I'd gotten to know McGeorge Bundy at Harvard where he'd asked me to take over the Charles Elliot Norton lectureship. So I went to him and said I've got a world initiative here and I want to take it to Cuba.

"And I told him it was my understanding of the philosophical basis of democracy that when the individual takes the initiative the government is supposed to back him, in disttation to the socialist way. where the government takes the initiative and the individual has to follow. And I told him I expected the government to back me and to do so publicly and in a very big way. Bundy was very perplexed and asked me not to do it, and the reason was that the Republicans were planning to use Cuba in the next election...

"And we were told by those who attended that the world architects were very impressed by Castro because he'd said that architects worked transcendently to world politics."

Initiative:

"Initiative springs only from within the individual. Initiative can neither be created nor delegated. It can only be vacated. Initiative can only be taken by the individual on his own self-conviction of the necessity to over come his conditioned reflexing which has accustomed him theretofore always to yf&J-ld authority to the wisdom of Cithers. Initiative is only innate and highly perishable."

Physical Tetrahedron vs. Conceptual Tetrahedron, Dec'?1

Instant Universe: (1)

"Newton said that time was a very specific phenomenon, assuming
that there was a specific and finite time that permeated Universe and
that everything observable in Universe was occur- ing at the same
time. It was Einstein who discerned that time might be relative to the

individual observer. A majority of academic people and the vast majority of nonscientists are still thinking in terms of the classical Newtonian scientific conceptioning of 'instant Universe.* While light's speed of approximately 700 million mileV per hour is very fast in relation to automobiles, it is very slow in relation to the 'no time at all' of society's obsolete Instant-Universe thinking. It was part of the classical scientist's concept of instant Universe that Universe is a system in which all parts affect one another simultaneously in varying degrees.

"Contemporary science as yet assumes that all local systems in physical Universe are instantly and simultaneously affecting one another in widely ranging degrees of influence, (And the degrees of influence are governed by relative proximity.)

'Whereas radiation, i.e., entropy, casts shadows and gravity, syntropy, does not; and whereas tne tensional integrity of"

- Cite RBF rewrite of SYNERGETICS galley at Sec. 529.C3, £ Nov'73

Instant Universe:

"Universe and all its substructurings is continuous and omniembracing--- while compression is islanded and discontinuous it may also be that while light and radiation has a velocity, gravity is timeless and eternally Instant."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 529.03, 8 Nov'73

Inatant Universe:

"The majority of academic people are still thinking in terms of Newtonian (classical) science's 'instant universe.' While light's speed of 700 million miles an hour is very fast in relation to automibiles it is very slow in relation to the 'no time at all' of society's (obsolete) instant universe thinking.

"It was part of the classical scientists' concept of instant universe that universe is a system in which all parts affect one another simultaneously, in varying degrees.

- Citation at Time. Jun'66

"Comprehensively the world is going from a Newtonian static norm to an Einsteinian all-motion norm. That is the biggest thing that is happening at this moment in history. We are becoming 'quick*' and the graveyards of the dead become progressively less logical."

Integration:

"The other--- diametric--- function of the computer is integration
And the probability is that the computer and its subsidiary automa-
tion will not make man obsolete as an integrator for several million
years--- possibly never. We introduce great complexities into integra-
tion, many variables, and the interrelationships of which we wish to
comprehend, and that is what the human mind is doing all the time. I
can tell you quickly why the computer is never, or not for a long time,

going to displace man as the integrator. The total variables that we deal with integratively all deal with a series of original questions that we have asked ourselves, Furthermore those original questions and their discovered answers are relayed from generation to generation by chromosomic instructions which implement our appropriate, survival-accomplishing, subconscious reflexing to myriad variations of environment stimuli. We have at least two million years and possibly vast aeons of cumulative instructions for relaying our various question-askings and constant answer-relation<hips. . . '»

IntegrationOirforent-latlon:

"Differentiation and integration-- those are really the two great di-
metric limit functions. Those who are expert in the development of
the computer point out that it is very clear that the computer is al-
ready making man obsolete as a differentiator, that is as a 'specialist.'
The computer and its very sensitive controlling subsidiary organisms
which we call automation can very clearly pick out the green from the
red and pick it out very much faster than the human can pick it out. It
can do it all night long at 2000 degrees, where the human can't oper-
ate at all. So the machine as computer'--- as automation--- is about
to make man extinct as a specialist,"

- Citation and context at Computer (A), 10 Dec'64

"Differentiation identifies, evaluates, selects, and separates the uniquely develop-
ing patterns. Integration ratiocinates comprehensively the coordination rates and
magnitudes of complex interactions, developments, or transformations."

- __ Citation and context at Computer. Asks an Original Question ⁽¹⁾, 29 Aug'64

"energy relates to differentiating-out the separate functions of nature-- studying objects, isolated out of the whole complex of universe; for instance, studying gravity, without consideration of hydraulics or of plant genetics. But synergy represents the integrated behaviors *£ instead of the differentiated behaviors of nature."

of universe

"Gravity is circumferentially omniembracing and is never partial, but always whole. Radiation is always packaged, gravity is the inside-outness of energy-as-matter: the integrity of Universe. It is the sum of all the no-points embracing all the points; and it compounds at the surface-embracing, second-power rate of the linear proximity gains. All the no-points (novents) are always embracing all the

points. All the quanta are local-system, center-of-event activity, focal points--- fractionations of the whole point: what are minimally ergo most economically packaged, and expanded outwardly and omnidiametrically as three-central-angle-defined tetrahedra."

- Cite SYNERGETICS draft at Sec. 541.10, 23 Sep'73.

"I think you are going to have coming out of science some statements as to the integrity of Universe discovered directly by a great many individuals. There are so many of high capability and integrity making such discoveries that they themselves wouldn't even think of trying to persuade you. These people will avoid proselytizing, but more gradually their ranks will be joined by more and more scientists, and we are going to get to the point where a very large number of individuals will begin to recognize an integrity of Universe and an integrity of the total experience of life that will be of the order apparently experienced by the first great men, such as Christ.

"No one will be asked to believe anything. Everybody will make first-hand discoveries, 'what has been thought of as atheism is really just an evasion. It wasn't a declaration of againstness, not something against religion, but there seemed to be nothing else to take its place."

"By thermodynamic law energy may neither be created nor lost in Universe. By synergetic postulate intellect is irrevocable and irreversibly comprehensive--- both subjectively and objectively--- in respect to energy,

"Intellect mensurates and modulates relative energy events and event interrelationships. The total quantity of energy operative in Universe is a constant, but a dependent, function of intellect. Universe Is the integral of all metaphysical and physical phenomena.

"In respect to individual humans total energy occurs as a complex of local variables of systematically cooperative, convergent-divergent, complementary-reciprocal, transformation patternings of uniauely differentiable local system aspects, accountable by intellect in locally varying magnitudes of concentration. The modulations are selectable, predictable, and governable by intellect to the extent that superficial acceleration permits."

- Cite SYNERGETICS, 2nd. Ed. at Sec.s 1075.21-.23, 17 Jun»75.

"Modulations through local transformations are arranged or valved by intellect through inherent associative-disociative patterning of local energy-complex environments. Thus the aggregate effective energy behavior sumtotilly accountable as a universal constant is engaged in its local behaviors by individual experience (and apprehended and appraised by consciously operative intellect) in widely differentiated sets of patterns in variable magnitudes of regenerative pattern concentrations.

"Wealth is the measurable degree of established operative advantage locally organized by intellect over the locally occurring differentiable behaviors of universal energy. Wealth is an irreversible advantage: it cannot be expended in preferred reorganization of past events; it can only be expended in organizing forward events in preferential patterns.

"As intellect comprehends local behaviors the wealth gains, as intellect acts in complementary regeneration to oroduce patterns advantageous to human processes. With every "

"But of all the biologicals, human beings are the only ones with mind function differentiated from brain. If we took all the different rope experiences this audience has had, I would say each one of you must have experienced at least one hundred kinds of rope, so that the total rope experiences is perhaps ten thousand kinds, and we've gotten that down to only one piece of rope. Then we took all the myriad kinds of experience with concaves and convexes and with protons and neutrons; we got that down into the theory of functions, and then we embraced that even further, getting just the word 'relativity.' And finally we got this word 'Universe.' What we have here is a pyramid of all the special cases working up to generalizations, and generalizations to one word. That's as orderly as you can

"We were looking for a phase of Universe where things are contracting and increasingly orderly. Nothing could be more orderly than those generalizations. We find, then, the metaphysical balancing the physical--- metaphysical apprehending and ordering the physical. We find Einstein's mind taking the*- measure of the physical writing those beautiful, economical equations such as $E = mc^2$, saying that the physical Universe"

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970

"is energy and you have to have one differentiation of energy on one side and another on the other side of the equation in order to understand it. And one is energy as associative matter, and the other is energy as disassociative radiation. And the rate of the radiation is to the second power or the rate of growth of a wave of 186,000 miles a second, to the second power. This tells us how much energy there was in that mass.

"Here we have then intellect taking the measure of energy. We have nothing in our experience to suggest that this is reversible. Nothing suggests that energy will ever write the equation of intellect. I simply say to you that we have the metaphysical apprehending, comprehending, and ordering the physical. The physical tending to be disorderly and the metaphysical apprehending, comprehending, and putting together. Man, therefore, represents the very clearly demonstrated function in the Universe that is essential to the regeneration of Universe. Also we discover that the Universe is a perpetual motion machine because its energy is never lost. So the minimum number of transformations is Universe. It is the minimum and only perpetual motion machine, and perpetual conservation requires this metaphysical functioning of order and"

Equation of Intellect:

`` And we have Einstein, as intellect, metaphysically taking the measure of the physical and writing the most extraordinarily economical equation that has ever been written, making the most economic statement that has ever been made. I think in 100 years Einstein will be

called a great poet of the 20th century. He said the most important things in the most simple way when he wrote his equation $E = mc^2$. • We have here, then, intellect as metaphysical taking the measure and mastering the physical.

We have nothing in any of our experience to suggest that this is reversible--- that energy will ever write the equations of intellect."

- Citation and context at Man as a Function of Universe (D).

26. Sep'68

Equation of Intellect;

"Despite our confession of how little we know... I am confident, .. that there is manifest in all our special case experiences a complex of coherent and omni-interaccommodating generalised principles so elegant, exquisite, magnificent, inclusive, and inherently interminable, as to require the a priori external existence of a metaphysical universal intellection that is as relatively greater and effective in respect to the metaphysical intellect of man as is the physical Universe bigger than the almost negligible physical man: an intellection which alone amongst all phenomena is infinitely perfect and towards which ever-less-imperfect truth omnidirectionally and refiningly leads.

"Metaphysical intellect took the measure of physical Universe: $E = mc^2$ and naught in experience suggests that the physical E can take the measure and write the experimentally validatable formula explicitly defining metaphysical intellect. The metaphysical alone can comprehend the metaphysical as well as comprehend the physical. And only man's intellect can apprehend the intellections of metaphysical Universe."

- Cite BEAR ISLAND STORY, galley p.36, 1968

rtBF DEFINITION

"Intellect wrote $E = mc^2$.

Energy did not inscribe intellect $E = mc^2$.

Intellect may write every equation of physical behavior, But no physical or abstract equation will ever compass intellect or its self-starter secret."

(Slightly rearranged)

- Cite "Historic Attempt by Man to Convert his Evolution from a Subjective to an Objective Process," in NO MORE SECONDHAND GOD, p.51, dec'45

"As gravity, and light, and heat, and spinning, and orbiting, and expansion, and contraction are special characteristics of the comprehensive principle energy, so are democracy, and science, and technology (and their complex assembly into industrialization) and evolution all special characteristics of the comprehensive principle intellect. And the relative position in the hierarchy of energy and intellect, or omnipotence and omniscience, is demonstrated by the fact that intellect discovered and inscribed that energy equals mass times the speed of light squared. Energy did not (and seemingly cannot) write or discover what the comprehensive faculty intellect, is or equals."

Interchangeable Intertransformativeness:

"The spheres and spaces are disequilibrium, i.e., asymmetrical phases of the vector equilibrium's complex of both alternate and coincident transformabilities. They are involutorially-evolutionally, inward-outward, twist-around, fold-up and unfold, multi-frequenced, pulsations of the vector equilibria. By virtue of these transformations, and their accommodating volumetric involvement, the spheres and spaces are interchangeably intertransformative. For instance each one can be either a convex or a concave asymmetry of the vector equilibrium, as the 'Jitterbug' has demonstrated.

The vector equilibrium contracts from its maximum isotropic vector matrix radius in order to become a sphere. That is how it can be accommodated within the total isotropic vector matrix field of reference."

Interference:

"Two different energy events cannot pass through the same point at the same time. When one energy event is passing through a given point and another impinges upon it there is an interference.

"There is a unique and limited set of angle and magnitude consequences of Interfering events. These resultants may always be depicted as vectors.

"When there is an interference of two similar magnitude energy events, there is a co-equal pattern of interference resultants, as when two knitting needles slide tangentially by one another. When one converging body of an interfering pair is much larger than the other, the little one 'seems' to do all the resultant moving as viewed by an observer small enough to see the small converger's motion---as for instance human beings see a tennis ball hit the big ball Earth and see only the tennis ball bounce away, The Earth being too big to be seen as a ball by the viewer and the relative bounce-off deflection of the Earth's orbit from the tennis ball point of impact, being too small for detection."

- Cite NASA. Speech, Pp. 50-51, Jun'66

"As the magnitudes of energy vectors are products of the mass multiplied by the velocity, the velocity may be high and the mass small, or vice versa, and the vector remains the same length or magnitude.

"A little body moving at sufficient velocity could have the same effect upon another body with which it interferes as could a big body moving at a slower rate. With these vectorial variables in mind, we see that there are three fundamental preconditions of the interference vectors where one is either larger, the same, or smaller in energy magnitude than the other.

"There are also four fundamentally unique patterns of the resultants of interferences. The first, which is reflection, results from a relatively direct impact and a rebound at an acute angle. The second, which is refraction, results from a glancing impact and an obtuse angle of deflection. The third is a smash-up which results in several parts of one or the other interfering bodies going away from one another in a plurality of angular directions. The fourth is a critical proximity, an attractive link-up such as that between Earth and moon."

- Cite NASA Speech, pp.50-51, Jun'66

"We discover operationally that we cannot run two lines through the same point at the same time aid you can't have two actions through the same point at the same time. . . It seems this could apply directly to life, that we all have been assuming that everyone is going to interfere with everybody else, that everyone is trying to occupy the same points and the lives are these vectors. We thought of ourselves in opposition to everyone else and we really do discover that it is fundamental. If it is absolutely fundamental mathematically. then we have the basis for developing a very powerful philosophic contentment that we are not going to be in interference .with one another. People must have known that they don't go through the same point. They get into the critical proximities of the individuals and that is fascinating, but you don't go through the same point. You are not interference. There-are larfee numbers of the pragmatists who are convinced that you or me are both trying to monopolize the same point, and so people have been lethal towards one another. . . "

Inurfwgncg: You Really Can't Get There From Here:

"Omnitopology recognizes the experimentally demonstrable fact that two energy-event tracteries (lines) cannot pass through the same point at the same time. It follows that no event vectors of Universe ever pass through any of the same points at the same time. Wherefore, it is also operationally evidenced that the conceptual-system geometries of omnitopology are defined only by the system withinness and withoutness differentiating a plurality of loci occurring approximately midway between the most intimate proximity moments of the respectively convergent-divergent wavilinear vectors, orbits, and spin equators of the system.

'•The best you can do is to get almost there: this is evidenced by physical discontinuity. Zeno's paradox thus loses its paradoxical aspects.

"In omnitopology, a vertex (point) is the only-approximate, amorphous, omnidirectional region occurring mid-spatially between the most intimate proximity attained between two almost-but-never-quite, yet critically intertransformatively, interfering vectors."

. ./hat we call a great circle arc or 'edge' is

indeed an internal angle.¹¹

- Cite Synergetics draft, Sec. 860, August 1971.

See Central Angle "It is also this method of uniformly progressive concentric correction by subsidence from spherical segment to plane geometry which provides the unique characteristic of this method of projection which distinguishes it from all other methods. This unique characteristic referred to is that the projected diagram retains true measurement, shape, direction, and distance throughout all of the enclosing boundaries of the segments with mathematically controlled distortion •massaged' to the center of the projection areas. All other projections are true in measure, shaping, and direction only at an interior point or along one side or along one or several separated lines or arcs crossing the projection with progreee- ive distortion articulated outwards toward one or more of the enclosing edges of the projected diagram. In other words, my new projection is uniformly corrected

by internalization while all other projections are corrected by some systematic externalization of error. This allows of true external association of my projection units, which is impossible in all other methods demonstrated to date."

BBBI Internuclear Vector Modulus

"Every vector (line) leads from one nuclear center to another, and therefore represents the operational effect of a merging of two force centers upon each other. Each vector (line) is composed of two halves, each half belonging respectively to the two nuclear centers and each half of the line representing those unique radii of each tangent spheres which alone are perpendicular to the identical point of tangency and therefore constitute a continuous straight line:--- wherefore it is setetermined that unity (represented by the internuclear vector modulus) is of necessity always of the value of two, i.e., unity is inherently two, for it represents union of a minimum of two energy centers."

Two Kinds of Twoness, (B)

"Consciousness: I really very clearly differentiate today what I call reality and what most people call reality.

Their reality is that you have got to make money and you have got to pay your bills. I consider that really a game. So it is part of my reality that man is hooked with a game, which makes it very inconvenient for me where they are not dealing with reality. The game includes social standings, reputation... that there is a place called Chicago... because in my reality there are probably no names.

"We don't know what the names are. There's a phenomenon... I can see by the way that you smile that you understand me quite clearly, because my consciousness is of an extraordinary Interrelatedness of all phenomena. We are on a tiny little planet of a very limited chemical inventory in our biosphere--- yet it is adequate to cope with and adequately support human organisms on board our planet. My reality is: life is not the organism which employs it. It is part of my reality to say that there is a powerful game being played by human beings using geographical names, human names, all kinds of power structures. I don't know how many people would give"

- Cite transcript p.6 RBF taping of interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 2nd Feb'77

"you that kind of differentiation, but it is very important in trying to understand why these human beings are here on board this planet and I assume that they have an extraordinary function in the great intercomplementarity of Universe so that a priori they must have an Important function."

- Cite transcript p.8 , RBF taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

RBF DEFINITIONS

Intuition:

"Intuition operates in the twilight zone between conscious and sub-conscious. Like the heartbeat vs. What's that man's name? We have so many rhythms we are counting internally anyway.

The line of distinction is not sharp. Intuition is a pulsative, tidal phenomenon.

"The metaphysical may tell me to turn 90 degrees and look over my shoulder. There can be a metaphysical 90-degreeness. All of our charts have their base line at 90 degrees, but now our acceleration factors are becoming so high that the curves are approaching verticality--- the Einsteinian normal of radiation, tying things up in local knots; constant motion and intertransformation; change is normal. Newton said that rest is the norm because they weren't thinking bigger than the world, which was standing still at the time. They were thinking of the world, not the Universe. Death was the norm: standing still. Turn all the charts in a metaphysical 90-degree reorientation and the vertical becomes the norm."

- Cite RdF at dell studios videotaping, Philadelphia Pa.

1 Feb'75

Intuition:

"Intuition is the dawning awareness of the experienced but at first unconsidered, newly occurring, unique, system-defining fourfoldedness apprehending and the epistemological system search for the six-folded system interrelationships.

"Comprehension occurs when the six prehending interattractive relationships of the fourfoldedness are identified."

- Cite SYNERGETICS, 2nd. Ed., at Sec. 1071.27, 26 Dec»74

IqVUiVApn:

"You do not teach Intuition. You let it work. It is an Innate property, an innate faculty. I am sure that my thinking is continually triggered off*intuition, my intuition of what I should be thinking about, intuition is some complex of our senses, a feedback of senses. Intuition is practically physical, the kind of supersensitivity that a child has."

"I look in various directions and big patterns is one reason for my

because I am interested in intuition."

Tape transcript #4, p.5 J HBF to W. Wolf, Phila, PA, 15 Jun'74 p.8

Intuition Sequence: (1)

"Several years ago when I was asked to speak at the Maharishi Maheshi Yogi's big session that they had at Kennerly, I pointed out that I felt that meditation had been somewhat reifenant to me in the 1920's due to the concept that it was being used for personal attainment. I felt that we were given the youngest kind of capability only so that we could be useful to others.

only

"I had taken meditation in/on that basis in 1927. I had not cited anybody but I involved my own disciplines which turned out to be, strangely enough and coincidentally, about what the great Hindus had found, and so forth. But it came to me in a trial-and-error way. Eventually it seemed to be a hierarchy; it identifies why I did what I did. And then I go on and show how you would use this thinking and how you would really go about doing things for others.

"I think it would be useful to you to think a great deal about hierarchies. I always decide what comes first; I always think in terms of critical paths, what overlaps what. There is a very powerful way of my thinking.

- Cite Tape //3, p.1; RBF to rf. Wolf, Phila. PA, 1\$ Jun'74

Intuition Sequence: (2)

•'I'm really involved in very tight mathematics. I will point out to you that in my structures there is discontinuous compression and continuous tension: that's exactly what pneumatics are. But pneumatics has compressibility and I got into noncompressibles such as you have in the liquids and the hydraulics, What I was in effect find I could do was a kind of hollowing out. At any rate, I had a very discrete mathematics about how the loads were distributed. They could be more vectorially fundamental. Synergetic geometry is vectorial geometry. That's exactly how forces are translated and to what magnitudes.

"And I always must do it nonredundantly. Plurality: there must be always two discrete configurations. When you get to two you have wanderability (vulnerability ?); when you have three you are absolutely fixed.

"So, talking about intuition in the first place, I certainly start off by a priori recognition of the utter mystery of our Universe. While we know how gravity behaves, we haven't the slightest idea of what gravity is. Tis has extraordinary mathematical reliability. The whole integrity of Universe is"

- Cite Tape p.2; RBF to W. Wolf, Phila. PA, 1\$ Jun*74

Intuition Sequence: (3)

'that way. Why we are here., we couldn't be more overwhelmed by this mystery, and yet we have this fantastic kind of vanity which seems to me to want to know what it's all about and yet reject the thought of mystery as something for the birds. The attitude is so prevalent that it comes out in your tone of voice in speaking about intuition. I can define intuition for you in a sentence: 'All that I can really give you I must always identify by experience.*

"I get audiences to put two fingers out in front of them and then I ask them to please move your arms sideways, but keep looking at your fingers while looking ahead. I'm looking ahead but I can still see my fingers. We have what I call a twilight zone of operating between our subconscious (99.99 percent) behaviors and our conscious behaviors. You say to yourself: I'm going to wake up at a certain time, and you do. There is then a conscious and a subconscious and there has to be a twilight zone between the two.

"What I call aesthetics and intuition is my cultivated innate sensitivity that everybody has to that twilight zone set of events. There is something going on over here, but most"

- Cite Tape //3, p.3: RBF to W. Wolf, Phila. PA, 15 Jun'74

"people are still looking ahead and missing it. They have a sensitivity, but they're not using it. In other words they have the competence that I began to develop. But there is always a significance when Nature 's trying to tell you something. And I must still find out what she is trying to tell you: is that something clear?

"I also cited in regard to intuition that in the '20's, by 1928, by the time of the great crash, as people were very dubious about things, there was really an elation on the part of the academic scientist and engineer in which he said--- there really is no mystery. He spoke about his very atheism itself; essentially a sort of rationalization of the political viewpoint in Russia where they were trying to get rid of all the religions. Therefore people were quite deliberately taking this negative position and the word intuition was a dirty word. But I kept holding to my intuition despite the fact that it was considered a dirty word. Let's put it this way: I lost quite a lot of people whom we would say were pretty hot people, who just couldn't go along with that kind of thought."

- Cite Tape jp'J, p.j: RBF to VI. Wolf, Phila. PA, 15 Jun*74

Intuition Sequence: (5)

"I was thrilled when two very competent professors-- Northrop at Yale and the other one I mentioned in the book, 'Intuition' both did independent research (one took five cases, the other six) on scientists who had made very great contributions like a Galileo; and they then undertook in a good scientific way to look at the literature, the diaries, the personal letters, written by these men or by their wives to them or their intimate friends, of what happened to these individuals just before and at the time of, and for a little while after, their great discoveries. When did they know they were going to make it? They were looking for something common in all these discoveries. How would they happen to make the discovery? What they found common to every one of them were in their diaries: each one said nothing was quite so important to them in their discoveries as their intuition-- to look in the right direction, this sensitivity that you're looking to try to do something. Time and again they were really doing an important experiment in another direction and the information they really got was relevant to other scientific phenomena and where they were digging was really subordinate. The point was, they then said, the second most important factor in every one of their discoveries, was the"

- Cite Tape #3, p.4; HBF to W. Wolf, Phila., PA, 15 Jun'74

Intuition Sequence: (6)

"second intuition that came very quickly after the first one, about what you ought to do about what you have just discovered. Then, if you light a cigarette and say: I've got to go to lunch now, you'll find you've forgotten it all of a sudden.

What was that all about? In other words, I call it like fishing. You get a little nibble here and what do you do next about how you really bring that fish in? Very few people have those nibbles.

'The documentation of intuition, then, occurred in the early 50's. I was really thrilled when that came along. Since that time, Einstein and many others have made beautiful statements saying that intuition is it.

"I've just said intuition is an innate capability we have, a sensitivity that operates in the twilight zone. We are all born with this sensitivity and all grown-ups used to say to me: Get over that sensitivity, get over that nonsense."

- Cite Tape , p.4; RBF to W. Wolf, Phila.,

Intuition:

"A half a century, even a quarter of a century ago, intuition was almost a naughty word<in the world of academic science, in fact in the whole world of philosophers. Pragmatism of the highest kind came in with the great Depression. Some of the validity of the out-and-out Marxian pqAdfmatism was very convincing to many thinkers in the depths of the Depression. Many of these thinkers thought of intuition as pure romanticism and the antithesis of pragmatism. Therefore the idea that one could get any value out of intuitions was considered as nonsensical as the idea of getting anything of value out of superstitions."

Intuition of the Child (3)

Intuition Sequence (3)(4)*

Intuition of the Child: (1)

"One place the scientists and artists and inventors all come together is certainly in the intuition. And I speak of intuition as the phenomenon that occurs in the twilight zone between the clearly conscious and the clearly subconscious. There is a twilight where there are drives and

capabilities, where the genius that is in us makes us look in a direction intuitively. But it's often being diverted by something else. There is the grownup who says, 'Darling, don't look in that direction, look this way.' And the child misses something extremely important that is there.

` ` The scientist... is really subjective, trying to find order, looking for order; recognizing there is a whole lot of experience--- which is the biggest? which is the hottest?--- putting them in order. Suddenly you understand: some significance may occur.

Then the artist goes on beyond having found out principles and goes on to apply the principles. This is where I find the scientist and the artist really come together and I think that both were spontaneous in the child.

“Then the little child is told, 'Now which do you want to be?

If you want to be able to prosper you're going to have to have”

- Cite HBF in Ed Newman TV Interview, Feb'73

inMUon of xta-Child; (2)

"your specialty. You have to have your little private tollgate that society will have to go through. I remember when I was young, specialization was not quite as prevalent as it is today; but older people kept asking you, 'What do you want to be when you grow up? Do you want to be a policeman or a fireman?' and so forth.... At one time I was asked that and I don't actually recall it very clearly but I was reminded by the family telling it over and over again. 'When I was asked what I wanted to be when I grew up, I said I would like to be a cow. I recall then, the people asking me why I wanted to be a cow. And I said, 'All this beautiful green grass...' the idea of being allowed to be

out in that green grass with the flowers and so forth, and go around eating. I loved the grass. It seemed to me a beautiful preoccupation. However, this is the sort of answer that children give that is so powerful.

"A friend of mine has a nephew--- he's very young--- and the nephew was being taken to his grandmother's, and on the way he kept talking about his grandfather, and they said to him, 'Darling, you forgot your grandfather died.' He said, 'What, again?' And to this little child grandfather* is immortal."

- Cite RBF in Ed Newman TV Interview, Feb'73

Intuition of the Child: (3)

"That dying thing was just a game being played. Grandfather can't die. And I think that the child is right and the grownups are wrong. But this would be part of that genius, of really seeing grandfather as immortal.

Q. —"Where does the inventor come in?"

"The scientist discovers those principles that are operative in Universe; he discovers the principle of the lever. But the inventor is the one who finds ways of employing the lever. • • • You'll find quite a complex of generalized principles. The inventor brings them together, then, and employs them, and reduces to practice. Now there's also quite a lot of difference between a man who just invents an idea, and one who actually reduces to practice. When I talk about the inventor, I am really speaking about reducing to practice. So the artist, scientist, inventor--- the artist is an articulator; he reduces to practice. And I feel that Leonardo was just exactly all three of those. And that is exactly what I think every child is born to be. But he gets very quickly pushed into corners because of his family being interested in this or that, or some friend of the family getting to him and saying, 'Well, I think you ought to be a lawyer,' and"

- Cite RBF in Edward Newman TV Interview, Feb'73

Intuition of the Child:

"so forth. And the child of course was never born a lawyer; he was interested in the whole Universe. All children demonstrate this interest in the total Universe. They ask the most magnificent questions about totality: questions that very often embarrass their parents because they are so comprehensive. But I see, then, the inventor as one who has not lost any of those innate pristine qualities."

Intuition: Second Intuition: (1)

"A little over a decade ago John Howard Northrop /~sic_7 at Yale made a contribution of high order when he studied carefully the writings of a half dozen great scientists. He picked scientists who have made magnificent contributions, and he studied their writings, diaries, personal accounts, and personal letters. He read letters and diaries of families, all the records produced at the time the scientists were about to make their great discoveries but before they made those discoveries or knew they were going to make them. . . • Northrop was interested in finding some commonality about what brought about the great discoveries of those individuals. . . and he found that the number one item leading to their success was their intuition. . w this extraordinary realization of the relationship operating in the universe. . . "

"The second most important item in relation to their discovery and its conversion to the advantage of humanity was their second intuition. The second intuition--- what they ought to do about the discovery--- came within seconds after the first.

Time and time again scientists find retrospectively that they had the □ very same vision and awareness as another scientist who was accredited with the discovery, but they did not do any thing about it. '*

Intuition : Second Intuition: (2)

"They thought they were going to do something about it some time, but instead they just lit their pipes or went off and forgot about it.

"So we have them two important points in the life of the individuals who made the greatest scientific contributions to society-- the first intuition, which was the discovery, and the second intuition, which was what to do about the discovery

- Cite RBF Foreword to Harold Cohen's "A New Learning Environment." 1971

"Seeking some commonality of subjective experiences and -objective initiatives in respect to historically important scientific events, Professor Northrup of Yale University carefully perused the letters and diaries of five geeat scientists as well as the letters and d iaries of those same scientists' families as written just before, during and shortly after they made their epochal discoveries. Commonalities were found. All of them indicated that factor number one in their historical success was their intuition which suddenly disclosed the unique principle of their discovery. Second most important factor in their successful capture of the new knowledge was their second intuition which--- 45 seconds after the first disclosure intuition--- told them what to do about their realization of the discovery. After that any methodical procedure was adequate.'"

intuition aa Hemote Cosmic Transmission'

^wIn lecturing I became very much aware of feedback by eyes; I came to the conclusion that our eyes are transceivers. It's like the second intuition. I have made several hundred mathematical discoveries and each time I get the feeling that my discovery has been known since the distant past, but not necessarily on Earth. It could be that I have received the information from elsewhere. I may have seen it in the sky last night and then it took some time to process. All the knowledge in the Universe may have been known to various people at other times. However distant or remote any information signal is it has to just go on forever unless it is intercepted.

"I look upon myself as an agent. All of us are. I try to be a very responsible agent. I think that things can happen a little more quickly by our being on the alert for what nature is telling us. Nature is really trying very hard to make man a success."

- Cite RdF at Penn Bell videotaping, Philadelphia, 29 Jan'75

Intuition As Remote Cosmic Transmissions:

"There is nothing in the data to suggest that the phenomenon we speak of as intuitive thought may not be such remote cosmic transmissions. Intuitions come to us often with surprising lucidity and abruptness. Such intuitions often spotlight significant coincidences in a myriad of special-case experiences which lead to discovery of generalized scientific principles heretofore eluding humanity's thought. These intuitions could be messages to the Earthian brain receiving it to ¹ Look into so-and-so and so-and-so and you will find something significant.* Intuitions could be thoughts dispatched from unbelievably long ago and from unbelievably far away."

Citation and context at Eye-Beamed Thoughts (2) Oct'70

Intuition; RBF Sailing Yacht "Intuition": (1)

"With my grandson, I have been grooming her for the New York Yacht Club races and have ordered several new sails, including a star-cut reaching spinnaker. I am installing one of the new streamlined rod headstay foils. This entails having all her headsails retailed to eliminate the snap hooks and receive instead the corded lead (luff)edge which feeds into the foil's bottom slot. This makes possible a sail-changing process much swifter than with snap hooks. The boats that have tried the new rotatable foil in the On-ton Internationals in Australia and in last winter's Southern Ocean Racing Circuit found the streamlined foil providing both sharper windward pointing and increased windward speed.

"This year's grooming of 'Intuition' also includes having all halyards rigged inside the mast. I have, as usual, incorporated all newly discovered ways for producing front-rank contender performance.

"I would not sell her to anyone who did not appreciate her. And I would only sell her in the pink of condition. ..."

Intuition RPF S*liiM Taoht "Intuition": (2)

"I came to name her 'Intuition' in the following way. The great yacht designer Starling Burgess was my partner in the early 30's. We frequently thought and spoke to each other about what we called the 'intuitive kinetic sense/ and sometimes 'intuitive dynamic sense/ particularly in relation to developing hull forms. Starling told me that old blind John Herreshoff could feel the lines of a towing tank model with his hands and could sense in advance the tank test performance within five percent accuracy.

"I saw 'Intuition's* hull form when she was being developed in Florida. A lifelong experience with boats--- my intuition--- flashed that she would be not only swift but a fine sea boat--- the finest I had ever seen thus far. This intuition has proven to be correct. She

surfs with the best but has much better rudder control off wind than have those with skeg and spade rudders separated from their keels. She was a stock hull, yet only a few were molded to her class. I have consistently walked away from her sister craft in the annual New York Yacht Club cruise races though these other M-41's had done well in the Southern Racing Circuit."

"defended the would-be slave-eliminating-machine inventor and said, 'I think he has a pretty good idea, and I'm going to dream that we can develop invisible power and send it over solid wire,' again, the committee would have said, 'Throw them both off the committee. Obviously we can't send energy from here to there through a solid wire.'

"Soon after that time, all these inventions, and thousands of others considered equally preposterous in 1810, came to be. All the really fundamental technological changes of our world have happened since that 1810 pre-dawn of world industrialization.

I have lived through the major portion of this historical development and can state incontrovertibly that not one stage of it was ever popularly anticipated until the invention had occurred and was demonstrated."

- Cite THINKING OUT LOUD (3): PHYSICAL TEMPORALITY AND ETERNAL PRINCIPLES, World Mag., 11 Sep'3

Invention: (a)

"In the competitive world of money-making, discoveries are looked upon as exploitable and monopolizable claims to be operated as private properties of big business. As a consequence, the world has come to think of both discoveries and patents as monopolized property.

"This popular viewpoint developed during the last century, when both corporations and government supported by courts have required individuals working for them to assign to them the patent rights on any discoveries or inventions made while in their employ. Employees were to assign these rights during, and for two years after termination of their employment, whether or not the invention had been developed at home or at work.

"The drafting of expert patent claims is an ever more specialized and complex art, involving expensive legal services usually beyond the reach of private individuals. When nations were remote from one another, internal country patents were effective protection. With today's omniproximities of the world's countries, only world-around patents costing hundreds*

"I began the search for what I called energetic geometry in 1917 and
the octet truss, or vector equilibrium, was first assumed as probable
and then glimpse-discovered as possible some time in the 20's and
proven in the 30's, . . .

"My own discovery of the octet truss was synergetic, intuitively avoiding special-case tactics. 'Synergey' is defined as follows: behavior of wholes unpredicted by behavior of parts. I was seeking in the whole of experience and knowledge for a comprehensive mathematical scheme of patterning. The octet truss was incidental to larger discovery.

"Energetic and synergetic geometry prove octet truss to be a coordinate and comprehensive vectorial system rational to all chemical, biological, and electrophysical behaviors of nature. Ergo, energetic and synergetic geometry's isotropic vector matrix is nature's comprehensive coordinate system.

"Any invention within this major coordination of principles must center on demonstration of unique means of gaining advantage through employment of this geometry. The behavior of wholes unpredicted by the behavior of parts is inherently surprising."

- Cite RBF Ltr. to Donald W. Robertson, pp.1~2, 8 Jan'55

Invention Sequence: (B)

"Such surprise advantage can only accrue to some treatment of the following minimum and irreducible system aspects of Euler's topological formula. . . $F + V - E + 2$

"My Ford dome solution was through emphasis of edges, and economical employment of surprise advantages to be derived by use of low-cost aluminum roll sheet and high-speed stampings of same, and surprise {approximately double} strength accruing to micro-tolerance of end fixity riveting specifications, practically obtained by pre-punching of rivet holes, through machine guidance, at tolerances of hole diameters and relative positioning, infra-visible and ergo impossible to previous on-the-job, craftsman-layout techniques.

"I have a large portfolio of photographs of true models demonstrating surprise techniques in joint, edge, and face solutions, and combinations thereof, developed throughout recent years.

All of these were inventions in that I then knew, and still know of no precedent for them. Most of these solutions I reduced to practice in full-scale components employable in man-usable structures.

- Cite RBF Ltr. to Donald W. Robertson, pp.2-3, 8 Jan'55

"As the technical world now accelerates to awareness -of important new degrees of structural advantages accruing to the octet truss, I see published or emerging in the school shops replicas or outcroppings of those technical inventions of component morphation which I had developed at an earlier date. The successive inventions' original disclosures tend inherently to excite a whole new synergetic wave of evolutionary inventions. Some individuals become so stimulated and engrossed by it as to become convinced that it was always obvious in their own a, priori environment and that they are now inventing its existence stimulating evolution rather than running along its already technically biased trails. . . .

"This has made me feel right along that despite the octet truss's metaphysical and unscientific identification--- as conformingly coincident only with generalized principles as earlier mentioned--- my comprehension of its intimate, logical working principles, understood by its occurrence within the total complementarity of energetic and synergetic geometry's permitted displacement, accommodation of all transformative aspect phenomena, and my reduction of it to first practice, and my underwriting of its"

Inventions:

"Aesthetes, educated on antiquity, are notoriously offended by 'inventions,' while pure scientists use the term 'pure invention' as a polite way of identifying what is to them so lacking in scientific elegance and orthodoxy as to be quite possibly 'outright charlatanry.'* They rarely give further thought to inventions.*"

- Cite DISSONANT CHORDS , 9 Feb'64

Invention:

"I myself am legally classified as an inventor. Inventions as legally defined cannot be professed. As legally defined, inventions must be 'surprising.' If they are predictable, they are not surprising. Invention just happens. A device, a structural or mechanical pattern, is not invention if it has precedent."

- CITE DISSONANT CHORDS, 9 Feb»64

Invention:

"In my viewpoint there is no meaning to the word 'artificial.' Man can only do what nature permits him to do. Man does not invent anything. He makes discoveries of principles operative in nature and often finds ways of generalizing those principles and reapplying them in surprising directions. That is called invention. But he does not do anything artificial. Nature has to permit it, and if nature permits it, it is natural. There is naught which is unnatural."

- Citation at Artificial. 1962

Invention:

"One cannot patent geometry per se nor any separate, differentiated-out, pure principle of nature's operative processes. One can patent, however, the surprise complex behaviors of associated principles, where the behavior of the whole is unpredicted by the behavior of the parts, that is, synergetic phenomena. The latter is what is known as an invention, a complex arrangement not found in nature, though sometimes superficially similar to nature.

Synchronous Inverter

Invisibility:

"The ottni-inbound gravity works collectively toward the invisibility of the central zero-six point."

- Citation at Point: Inbound Point 23 Sep'73

Invisibility:

"What holds things together is inherently invisible.

Gravity is inherently invisible. That is why the Universe is so mysterious: the absolute mystery. The integrity of the Universe is Invisible.

"But the behaviors of the integrity are

- apprehendable;
- measurable;
- eternally reliable."

- fl*-* 11| T~Tii 1~wv"*TTrFx_j brL r TL ~u "

- Citation at Integrity, 25 Jan'72

Invisibility:

"Conceptuality is something independent of visibility or invisibility. You can have conceptuality, or understanding of the principles, independent of site, which makes it possible to conceive of events as they occur at magnitudes which would be subdivisible."

- Citation at Conceptuality, 9 Jul'62
- CTEP-Oi geui'i , pp. Uy-lyu

Invisibility:

"We have gone into so much activity outside the sensorial range of frequencies that we really might say as of present times in the total economic generation of increasing capability of man on Earth, that certainly 99.9 per cent of all that is going on now and has any significance is non- sensorial and is in the non-sensorial ranges. We could

say then that my talk about transinvisibility is not a trending a trending of the industrializations already invisible. That is what it is but I am talking about the world society and the way we think. I would say that we all still think almost entirely in the sensorial range so we are impressed with what we can see. In the great scheme of the use of our tools men have employed the theoretical, that is the most recently discovered behaviors of nature that they haven't found any practical use for up to this moment, in the great emergencies such as war they will take the theoretical and try to find ways of applying it to a new trans. enadental cfpbaility that will overcome the enemy. We find that in the great history of technology the materials that can be turned into tools are relatively scarce--- men had to seek them. The number of minds which knew how to deal with them were few."

- Cite Oregon Lecture //1 , p. 14. 1 Jul'62

H0F DEFINITIONS

Invisible:

"As a consequence of its uniquely unopposed diametric vertexing--- ergo permitted--- diametric exit, only the tetrahedron among all the symmetric polyhedra can turn itself inside-out pulsatingly and can do so in eight different ways (see section 624); and in each instance, as it does so, one-half of its combined concave- convex unity 'twoness*' is always inherently invisible."

IH]

- V6-Dee'?3-
- Citation & context at Octahedron as Model of Doubleness

of Unity. (2), 16 Dec'73

Inviaible:

"Invisible does not mean nonconceptual--- though it had come to really mean that. Scientists were saying that you could not model the invisible."

- Cite Oregon Lecture #4, p. 138. 6 Jul'62

"More than 99.9 percent of all the physical and metaphysical events which are evolutionarily scheduled to effect the further regeneration of life aboard our spaceship Earth transpire within the vast non-sensorial reaches of the electromagnetic spectrum. The main difference between all our yesterdays and today is that man is now intellectually apprehending and usefully employing a large number of those 99.9 percent invisible energetic events. Humanity has therefore created for itself a new set of responsibilities requiring a 99.9-fold step-up in its vision and comprehension. This calls for an intuitive revision of humanity's aesthetical criteria, philosophical orientation, conscious action, cooperation, and Initiative in accommodating evolution's Inexorable drive to have mind comprehend and surmount every physical eventuality. Intuition and aesthetics automatically trigger us into consciousness of the existence of opportunities to consider and selectively Initiate alternate acts or position-taking rounding oncoming events, potential realizations or unprecedented breakthroughs in art, technology, and other human productivity.

"Today's epochal aesthetic is concerned almost exclusively

- Cite KBF FUKUOKA to La Jolla Museum Catalog, 10 Apr'70 **"with the invisible intellectual integrity manifest by the explorers and formulators operating within the sensorially unreachable, yet vast, ranges of the electro, chemical, and mathematical realms of the physical and metaphysical realities. Their invisible discoveries and developments will eventuate as sensible instruments, tools, machines, and automation in general."**

- Cite RBF FOREJAORD, La Jolla Museum Catalog, 10 Apr'70

Invisible Aesthetics:

' 'With the return of science to conceptual modelling through vectorial topology and the discovery of nature's 60-degree atomic and crystallographic coordination, there will come about the abandonment of sculptural architecture and the emergence of completely invisible aesthetics in architecture and art as« enjoyed previously almost exclusively by music up to mid-20th century.'

- Cite UNESCO TIFLIS M 1966, p. 5

See Invisible Architecture

Invisible Aesthetics;

(2)

See Tooling of Domes, (3)

"I think that concepts of architecture have gone through and are as yet to go through great transformation. What humans a century hence will identify retrospectively as what they consider to be the architecture of the late twentieth century may not as yet have been so recognized in 1972.

"Architecture in the past often has been spoken of as 'frozen music,' Now the architectural music is being unfrozen and is ultimately to be freed from its embodiment exclusively within the physical structure. The music of the emerging architecture is to be entirely weightless, abstract. It will be the sense of gratification and inspiration of living freedom and potential initiatives of the human occupants disembarassed of their slavery to the production and maintenance of the buildings and emancipated from exploitation of land, buildings, and occupants as money makers. The architectural music will be the metaphysical regeneration of the spirit to be experienced by the buildings' users.

"Commissioned by a powerfully dominant armed land baron, an architect of yesterday designed the master's palace primarily as*

- Cite SET X, pp.1-2, Aug'72

"a fortress. He then designed integral psychological additions to the surface of the fortress in order, for instance, to dismay any potential enemies traveling near the castle. The architect designed emblazements which indicated the master of the castle to be so ferocious a fighter as to be best represented by a red and gold tiger, or a dragon on a black foreboding field. This psychology worked two ways for it also bolstered the master's courage and confidence to act, indeed, as a tiger. This architect had to overwhelm all strangers as well as the overlord's subjects with the power and the glory of his client. Additionally the architect often had to accomplish the impression that the powerful master of the castle was also a man of intellectual and aesthetic distinction. The architect accomplished these psychological effects by skilfull coordination of mass, height, line, and integral symbology. In a like manner architects designed temples, cathedrals, and other buildings as permanent symbolic communication devices. With the advent of the music box, and later the automatic piano playing 'pianola,' and the record and tape players, music was produced which like symbolic architecture could not be altered by the audience. In effect, the form and rendering of the music was as frozen or as 'canned' as architecture has been."

- Cite SET X, p.2, Aug'72

"In contradistinction to 'frozen' we have 'live' music produced by the singing or playing of individual artists where the instruments and the music are separate phenomena and many individuals can play separately or together and thus communicate directly through

the instruments. Even though they play the same notes written by others they have the freedom and controls to reveal their individual depth and sensitivity of conceptioning as well as ability to articulate competently and to do so in infinitely unique ways. When the individual composes his own music and his own instruments and plays the music himself he is a complete artist, but this same complete artists can produce instruments or compositions for others to play. A great artist can also play the instruments or compositions invented entirely by others. Here the music is completely unfrozen and it is the freedom of live conceptioning of the individual who uses the instruments which resonances and regenerates the sensitivity and innate compositional competence of the listener. And the artist whose music is recorded can communicate through the electronic circuitry to inspire audiences remote in time and space. Here the art is that of the live artist. The radio set is not the music."

- Cite SET X, pp.2-3, Aug'72

"Musical instrument and electronic circuitry making are arts themselves but they are not music. Neither the lion's feet on the piano legs of yesterday nor the angels head on the harp have naught to do with music. Any overall sculptural shaping of buildings by self-professed and legally established modern •architects' is 'frozen styling' but it is not architecture.

"I feel that the new architectural era is one in which world society is to be furnished with dwelling, working, and other environment-controlling instruments invented by other artists, produced by tools and processes invented and composed by other anonymous artists and that the 'aesthetics' will no longer be commodities to be purchased, vicariously commanded or lured forth, from captive artists. Ancient Pharaohs, kings or nobles, as patrons of the frozen music's

architectural era, were often ruthless, gross, selfish individuals who with lethal authority could command the artist to design buildings which deceived the public by suggesting that the overlord was what he was not. What inspires the emerging architect

of today is the task of producing invisible-as-Dossible environment-controlling instruments for all humanity, conceived"

- Cite SET X, pp.J-4, Aug'72

'and realized with such integrity and competence as to make possible the unselfconscious enjoyment not only of the environment controlled by the devices but also of all the Earth and all the Universe by all its people in an economically and happily sustainable manner. But just as music is not the musical instrument, the architecture of tomorrow (which can and is now only invisibly emerging) also will not be the architectural instruments or gadgets, but will be the abstract harmony of living which its individual users may articulate.

"When you bite your tongue or cut your finger or get a cinder in your eye you become acutely aware of these otherwise only subconsciously operating organic parts. When people say 'I feel great,' it is because they don't feel anything at all. Life is fully potential and the entfely sublimated human organism coordinates omnisubconsciously. The new era architecture will operate- in the same way making itself ever less obtrusive. Architecture will not only be life itself but that life will be strictly live-it-yourself. It cannot be lived vicariously through others.

"When a fleet of one-of-a-kind racing sailboats is performing"

- Cite ^SCT * pp.4-5, Aug'72

"they usually are beautiful to watch unless one is being incompetently sailed. The winner often appears the most beautiful because it is most inspiredly and capably sailed. The winning boat of yesterday's race may be sailed today by an incompetent, careless helmsman and appear ugly though it is the same boat which yesterday appeared to be so beautiful. So too will the architecture of the new era be the inadvertent qualities and attitudes manifest directly or indirectly by its occupants. While one of two identically designed dwellings may appear beautiful because of its dweller's competence and consideration for others the identical dwelling may appear ugly because selfishly and incompetently occupied. Architecture, like music, will be a verb and not a noun. The new architecture will not be for sale. The aesthetic of architecture henceforth will be integrity."

- Cite SET X. p.5, Aug'72
- This set appeared in World Mag., 21 Nov'72, as

"The New Architecture."

Invisible Architecture;

"Architecture... will be an unobtrusive part of a vastly larger preoccupation of world society with life in Universe, .when successful, tomorrow's architecture will be Approximately invisible, not just figuratively speaking, but literally as well. That will count with world man is how well the architecture serves all humanity while sublimating itself spontaneously. Architecture may be accomplished tomorrow with electric fields and other utterly invisible environment controls."

- Cite FOREWORD TO LA JOLLA MUSEUM CATALOG, 10 Apr'70

"Beginning with World War I, science, technology, and industry began the epochal and ever-accelerating shift from track to trackless, from wire to wireless, from visible to Invisible, and from Newton's norm of changelessness to Einstein's norm of constant, dissynchronous

evolutionary transformation. Man entered into the vast ranges of the electromagnetic spectrum. Within the electromagnetic spectrum visible light is exquisitely minute. At the present moment in history 99.9 percent of humanity's important physical evolution--- scientific, technical, industrial, and biological--- is taking place in that major portion of the Universe of which man has no direct apprehension, but with which he does have exquisite instrumental hook-up.

"This brings us to the historical era of invisible architecture. In invisible architecture the harmonics are apprehensible only by our intuitions and subconscious aesthetics, and operative only in the twilight zone between conscious and subconscious awareness. This is the area of intuitive and aesthetic formulation. Just as we may instruct ourselves to wake up in three hours and 37 minutes, and do so with reasonable accuracy, so also does the subconscious measuring capability of man's eye"

- Cite THE PROSPECT FOR IWI'ANITY, WDSO Doc. 3, p.74, Aug'64 "judge, at considerable distances, to a 64th of an inch accuracy, the diameter of the female leg.

"One of the last trends of humanity that we take up is this ephemeral aesthetic, its intuitive apprehending and conceiving capability, and its now looming major importance in the guidance of human affairs. I will discuss this trend from the viewpoint of my own experience with geodesic domes, which are so relatively ephemeral as to weigh an average of only three percent of the weight of the best alternate clear-span solutions of structural engineering... strong enough to handle nature's fiercest winds, snow loads, and temperature extremes.

"My kind of work deals with how to find the ecological problems involved and how to solve them, hoping thereby to bring about the occupant's satisfaction at the earliest possible moment. That is, I deal with the hows of mathematics and economics, the hows of industrial

production and distribution, assembly, and service. I don't even consider how any structure is going to look until after it is finished. If, when finished, the structure seems beautiful, I know it is all right. To me, 'beautiful* apparently emerges as an ejaculation, spontaneously released by my total set of subconscious control coordinates."

- Cite THE PitOUPECT FOR HUMANITY, V/DSD Doc. 3, p. 75, Aug'64
"Beautiful' is probably ejaculated when my entire chromo- somic neuron bank is momentarily in 'happy' correspondence with my entire experience neurons memory bank. I speak of my brain as if it were a computer. It is.

"The great evolutionary engagement of man with the non-sensori- ally apprehensible yet physical Universe, achieved only through instru- mental hook-up as an extension of man's faculties, is utterly depen- dent on the integrity of the instrumental functioning, and the integrity of functioning of the adult intellect at a level of purity corresponding to that of the four-year-old child's..."

invisible circuitry: (1)

"Disclosure of a new phase of geometry employing the invisible circuitry of nature. The computer based on such a design could be no bigger than the subvisibly dimensioned domain of a pin head's glitter.... Closures and pulsations disconnected at the icosahedron stage... Milky Way-like remoteness."

"As we get into cryogenics--- taking energy-as-heat out of the system--- the geometries become more regular and less asymmetric, thus fortifying the assumptions of synergetics about the vector equilibrium. The isotropic vector matrix can be described as a matrix of lights on a Broadway billboard with powerful little lights at each vertex which could be controlled in intensity and color displaying all the superb concentricity around a nucleus. Your innermost guts could be illustrated and illuminated, I could turn all the right lights on and you could move through space in a multidimensional way, just by moving the lights from one vertex to the next.

"This may be what Universe is doing. This is one way we"

Invisible Hole;

"And 1 just want you to understand what it means--- annihilation. We have a rubber glove. There's only one rubber glove, and it fits my left hand, it's on my left hand, it's red on the outside and it's green on the inside. I strip it off my left hand and now it fits my right hand. And the left hand has been annihilated. I took it off my right hand and now it fits my left hand--- the other one has been annihilated. There's the one that fits, the other one has been annihilated. There's the one that fits: that gives you the local system. The rest of the Universe. In other words you and 1 are matched by the rest of the Universe. There is an invisible hole--- a matrix of you and 1 sitting in the Universe. So it really isn't annihilated, but it is nonlocally identifiable. . . . The annihilation is not going out of Universe, but it is nonlocally, or visually or conceptually .present."

Invisibility of Macro- and Micro- Resolutions; (1)

"The eye of a healthy human can comfortably perceive an interval of 1/50th of an inch and the human's timing sense can recognize the rhythm of identical minimum intervals lying between the black vertical lines of an engineer's white ivory measuring scale, but with

optimum naked eyesight humans can only with great difficulty read a 1/100th-of-an-inch scale. Humans eyesight cannot 'resolve,' i.e., differentially perceive 1/200th-inch intervals between microdots of 1/200th-of-an-inch diameter. For these reasons black-and-white or color plates of printed picture reproductions consisting of subvisible benday screen dots spread 1/200th-of-an-inch apart produce pictures whose surface information appears to humans as being realistically 'continuous' as a progressive color blending, ergo 'naturalistic.'

"The diameter of the spherical activity domain of a single atom including that of the electrons orbiting its nucleus is called one angstrom. And one angstrom is 1/2,500,000th the diameter of the smallest humanly-seeable speck. The diameter of the atomic nucleus is 1/10,000th of one angstrom, and the nucleus has now been found to consist of a plurality of further"

"It is very warm in here but I am going to risk putting you to sleep by putting out the lights again for slides. I think I will take the liberty of removing my own coat which I never did before. I am a very formal person. I think I will tell you why I am formal. In 1927 I started doing the work I am doing and I /njd up my mind to think and to pay attention to what I thought instead of what other people thought. At that time it was such a new experience to be thinking myself and trying to discipline myself to go along with what I thought, that I found it convenient to pay such attention to what I was saying that if I said I was uncomfortable that I would get myself comfortable. You find yourself in strange attire or in no attire at all, and in due course you find you are getting good results. And you are thinking that there are other human beings that are interested in what you are thinking and the thought doesn't belong to you. I found myself being invited out to

dinner at someone's house, and I said I'm sorry but I don't eat that stuff. They had taken a lot of trouble with it and I was wearing something very strange, and they were all neat and so what I was wearing or didn't wear became important and what I didn't

Invisible Man:

"eat became important and what we had to think about became important. I saw I was imposing a lot of nonsense so I decided that what I cared about was understanding one another, being able to think, so I went in exactly the opposite direction.

I decided to be an invisible nan. The way to be an invisible man is to conform; so everything about me physically is as invisible as you can get. This is supposed to make you very [visible--- to wear a Brooks suit--- but it actually makes you very invisible."

invisible Quantum as Tetrahelix Gap Closer-

"As we tense the octahedron It strains until one vector (actually a double, or unity-as-two vector) yields its end bondings and precesses at 90° to transform the system into three double-bonded (face-bonded) tetrahedra in linear arc form. This tetra-arc, embryonic, electromagnetic wave is in neutral phase. The seemingly annihilated-- but in fact only separated-out— quantum is now invisible because vectorless. It now becomes invisibly face-bonded as one invisible tetrahedron.

"The separated-out quantum is face-bonded to one of the furthestmost outward triangular faces occurring at either end of the tetra-arc array of three... with the fourth invisible tetrahedron face-bonded to one or the other of the two alternatively-vacant and alternatively-available of the furthestmost end faces of the tetra-arc group. With this fourth, but invisible, tetrahedral addition the overall triple-bonded tetrahedral array becomes either rightwardly or leftwardly spiraled to produce a four tetrahedron tetrahelix, which is a potential embryo, electromagnetic circuitry gap closer. Transmission may thereafter be activated as a connected chain of the inherently four-membered individual-link continuity. This may explain the dilemma of the wave vs. the particle."

Invisible Tetrahedron: (1)

"Because it consists of two such half-quanta of energy, the vector-edged tetrahedron exactly equals one quantum of energy, and is also one minimal structural system of Universe. The six vector tirahedron is also synergetic in that two vector triangles combined to make the four triangles of the tetrahedron. This is not magic. The two additional

invisible triangles that became visible by associating the visible pair are always secreted in the SXM invisible complementarity reserves of the 99.9 percent invisible Universe of utterly abstract weightless principles.

"Employing vectors, the two convergent sides of any given angle can only be considered as potentially realisable by a third and invisible vector which invisibly holds the outer ends of the angle-describing convergent vectors apart. This is metaphysics and not magic. The physicist says that all the physical Universe is energy--- energy associative as matter and energy disassociative as radiation, both interconvertible to the other. The physicist says that the physical will always move a levered needle--- either by gravity or electromagnetism.

"Metaphysics embraces all experiences, such as the phenomenon"

Islanded Radiation for Tensional Constancy:

"Radiation is special case, systematically centered, and discontinuously islanded. Gravity is continuous tension omni-inter-between all systems. Because gravitational intertensional intensivity varies as the second power of the arithmetical interdistancing variations, whose unique variations are locally periodic, it manifests periodic intensities of tidal pulls, but the overall tensional integrity is constant independent of local intensity variabilities.

'•Electromagnetic radiation is distributive and entropic; its frequency magnitudes represent multiplication by division. Gravity is nondivisive and syntropic; its conservation is accomplished by holistic embracement of variable intensities. Gravity is integral. Holistic gravity has no frequency.

'Earth's biospheric inventory of water is radially dispersed outwardly by vaporization and omnilocally condensed as inwardly 'falling' drops of rain, which are gravitationally and convergently collected as ocean."

KBF DEFINITIONS

ipptropis Vfactor-tairls:

"In an isotropic vector matrix it will be discovered that there are only two omnisymmetrical polyhedra universally described by the configuration of the interSBMBacting vector lines: these two polyhedra are the regular tetrahedron and the regular octahedron.

' ` Each vector is composed of two halves, each half belonging respectively to the unique radius of one of the tangent spheres that is perpendicular to the point of tangency. The half-vector radii of the isotropic vector matrix are always perpendicular to the points of tangency; therefore they operate as one continuous vector."

"...The carrier waves and their internal-external zero intervaling are congruent with the omnitriangulated, tetra-planed, four-dimensional vector equilibria and the omniregenerative isotropic matrix whose uni-vectorings accommodate any wavelength or frequency multiplying in respect to any convergently-divergently nuclear system loci of Universe."

- Cite SYNERGETICS draft at Sec. 122J.14, 9 Mar'73

"Isotropic means everywhere the same, which also means omnidirectionally the same. The isotropic vector matrix provides the actual and only systematic scheme of reference which agrees with all the experimentally disclosed behaviors of nature, while also disclosing only whole number incrementations of nature's and individual's special-case objectifications of the often only subjectively apprehended information regarding the generalised principles being employed by nature. All the isotropic vector matrix identifications of experience are

expressible in terms of angle and frequency. The angles are independent of size and absolutely generalized. The frequencies are all special-case, time-space-limited specifics and identify relative sizes and magnitudes of eternally conceptual generalizations."

- Cite SYNERGETICS draft at Sec 100J.11, 16 Feb'73

Isotropic Vector matrix:

"All the relative volumetric intervaluations of all the symmetric polyhedra and of all uniradius closest packed spheres are inherently regenerated in omnirational respect to isotropic vector matrixes, whether the matrixes are inadvertently, i.e., subjectively activated by the size- selective metaphysical consideration initiatives, or whether they are objectively and physically articulated in consciously tuned electromagnetic transmission, or whether they are selectively tuned to receive on that isotropic-vector-matrix- defined- 'wavelength » "

- Cite SYNERGETICS draft at Sec. 426.47, 30 Nov'72 **"An isotropic vector matrix can be only radiantly generated at a 'selectable' (tunable) propagation frequency and vector size (length) modular spacing and broadcast omnidirectionally or focally beamed outward from any vector-center-fixed- origin such that one of its symmetrically regenerated vector- convergent fixes will be congruent with any other identical wavelength and frequency atuned and radiantly reachable vector center fixes in Universe."**

- Cite SYNERGETICS draft at Sec. 426.02, 30 Nov*72

"An isotropic vector matrix can be only omnisymmetrically, radiantly, and 'broadcastingly¹ generated, that is, propagated and resonantly regenerated, from only one vector equilibrium origin although it may be tuned-in to or received at any point in Universe congruent with any of its radiantly alternate vertexes."

- Cite SYNERGETICS draft at Sec. 426.01, 30 Nov'72

"All dimensions are definitively and intercoordinatably manifest in the isotropic vector matrix."

- Citation at Dimension. 29 Nov'72

Isotropic Vector MatrIx:

"Thus the Isotropic vector matrix of synergetics convergence and divergence accommodates elegantly and exactly both Einstein's and Newton's radiation and gravitation formulations both of which are adequately accounted only in second- powered terms."

- Cite SYNERGETICS draft at Sec. 960.10, 16 Nov'72

•'The limit number of experimentally demonstrable powering involves an Isotropic vector matrix whose omnisymmetrically interparalleled planes and electable omni-uniform frequency occurrences accommodate everywhere and anywhere regenerative rebirth of a unit angle and line structural system of convergent gravtiation and divergent radiation resonatability, whose frequencies are the dimensions.'`

- Citation at Dimension. 16 Nov'72

"Humanity's escape from the irrational awkwardness of the axiomatic hypothesis trap of eternal askewness which snagged him, involves all young humanity's discovery of the isotropic vector matrix synergetics' elegant rational simplicity and its omni-accommodation of all experimentally founded research. Popular understanding and spontaneous employment of synergetics' isotropic vector matrix coordination involves young, popular, experience-induced, spontaneous abandonment of exclusively rectilinear XYZ coordination, but without loss of the XYZ's uneconomically askew identity within the system--- all occurring 'naturally' because of youth's spontaneous espousal of the

most exquisitely economical comprehension of the most exquisitely economical freedoms of opportunity of individual realizations always regeneratively inspired by the inherent a priori otherness considerations."

- Cite RBF marginalis, b Nov'72, incorporated in SYNERGETICS draft at Sec. 216.02, y Nov'72

"` Nature always starts over again with the isotropic vector matrix. Energy is not lost; Just not available. At the heart of the vector equilibrium is the ball in the center of the rhombic dodecahedron at the core--- the one sphere all by itself. You put 12 rhombic dodecahedra around one central rhombic dodecahedron and you get the vector equilibrium. This is why synergetics can investigate nuclear symmetries: it all comes out absolutely discretely. And it does have both the A and B Quanta Modules in it. Look at the picture /"MARKS, p. 167 Pl. L.S7 which shows the one-half of the rhombic dodecahedron. Of all the polyhedra nothing really falls into a group so easily as the rhombic dodecahedron, the most common polyhedron in nature."

- Cite RBF to EJA, 3200 Idaho, Wash. DC, 24 Feb/'72

"Metaphysically the isotropic vector matrix is conceptually permitted. The difference between the physical and metaphysical is the omnipulsative asymmetry of all the physical oscillation in respect to the equilibrium. Metaphysical is equilibrious and physical is disequilibrious."

- Citation at Metaphysical vs Physical, Oct'71
R0F DuFIMITIOHb

"./hen energy-as-heat is progressively extracted from systems by cryogenics the geometries visibly approach equilibrium. Which is to say that removing energy-as-heat reduces the asymmetric pulsativeness in respect to equilibrium. As the asymmetric kinetics

of energy-as-heat are removed, the whole field of vectors approach identical length and identical angular interaction. That is to say that they approach the model of closest packed spherical energy fields. The lines interconnecting the adjacent spheres' centers constitute a vectorial matrix in which all the lines and angles are identical, which is spoken of by the mathematical physicists as the isotropic vector matrix, i.e., where all the energy centers are identical, i.e., in equilibrium."

(For later context see Vector Equilibrium: Elfeld of Energy. (B))

Isotropic Vector matrix:

"Identically dimensioned nuclear systems and layer growths occur alike, relative to each and every absolutely compacted sphere of the isotropic vector matrix conglomerate, wherefore the integrity of the individual energy center is mathematically demonstrated to be universal both potentially and kinetically."

- Cite SYNERGETICS, "Corollaries," Sec. 240.50. 1971

Istrafie VEcroK MTKIX - SEC.

"An Isotropic Vector Matrix is one in which all the forces are interacting everywhere equally in respect to both their (velocity x mass), linear magnitudes and to their relative angular direction interactions; wherefor all the lines must be of equal length and all their terminal inter-anglings must be the same.

"In an Isotropic vector matrix it will be discovered that there are only two clear-space polyhedra described internally by the configuration of interacting lines-- these two clear space polyhedra are the regular tetrahedron and the regular octahedron. But all other regular

symmetrical polyhedra known are described repetitiously by compounding rational fraction elements of the tetrahedron and octahedron. These elements are known as the A and B particles. They each have a volume of one-twenty-fourth of a tetrahedron. (ILLUSTRAT5) It will be discovered also that all the polygons formed by the interacting vectors consist entirely of equilateral triangles and squares,-- the latter occurring as the

cross sections of the octahedra and the triangles as the

uTcro/?] - Cite NEHRU Speech, 13 Nov'69

Isotropic Vector Matrix: (2)

"external facets of both the tetrahedra and the octahedra.

"Because all the vectors of this multidimensional matrix are 'everywhere the same' the vertexes of the system are equidistant from each other. Each vertex can be the center of an identical diameter sphere whose diameter is equal to the uniform vectorrig length. Each sphere will be tangent to the sphere? surrounding it. The points of tangency are always at the mid-vectors.

Because of the omniequiangular intertriangulating the omnitangential triangulating of identical size spheres constitutes WBB what the physicist terms closest packing of spheres and this closest packing characterizes all crystalline assemblages of atoms. All the crystals coincide with the set of all the polyhedra permitted by the complex configurations of the isotropic matrix."

- Cite NEHRU Speech, pp.23-24, 13 Nov'69

Jet Engine:

"World War II saw the coming in of chrome-nickel-steel, non- rust- ing with very high tensile strength--- 3JO.000 p.s.i.--- seven times as strong as the steel of 1851 ana seven times high in tensile than in compression strength. With this sudden increase in tensile strength you could have enormous releases of energy with terrific thrusts in all our engines, if needed when they're on high heat. Nickel steel suddenly made possible great strength at very high heat. And that brought about the jet engine.

"The reciprocating engine is only 15 percent efficient; the turbine gets up to 30 percent... Then we could have fantastic thrust, but the engine would break up. And the principle of the jet had been invented by the squid long ago. Ran was not able to use it for his engine, or thrust, until he got chrome-nickel-steel, and it has such high strength and such high heat that made absolutely possible the jet engine. So the jet engine was something made possible by the metallurgical gains in chemistry. The principle of the jet had been invented long ago by the squid."

Jitterbug:

"The vector equilibrium's jitterbugging conceptually manifests that any action (and its inherent reaction force) applied to any system always articulates a complex of vector equilibria macro-micro jitterbugging involving all the vector equilibria's ever cosmically replete complementations by their always cooccurring internal and external octahedra--- all of which respond to the action by intertransforming in concert from 'space nothingnesses' into closest-packed spherical 'somethings,' and vice versa in a complex three-way shuttle while propagating a total omniradiant wave pulsation operating in unique frequencies which in no-wise interfere with the always omni-co-occurring cosmic gamut of otherly frequenced cosmic vector-equilibria accommodations,"

- Cite SYNERGETICS, "Jitterbug as Energetic Model, Sec, 464.07.

4 Oct'72

Jitterbug:

"The jitterbug is more properly termed the articulation

of the vector equilibrium. . . or the propagative transformations of the vector equilibrium, both radiationally and gravitationally."

- Citation and context at Size, 31 May'71

"In the jitterbug we just use the external vectors of the vector equilibrium— no internal radii. In order to collapse it— to permit the pumping business— the squares accommodate the jitterbug, the triangles do not change," « • . "The cuboctahedron is a truncated cube made by bisecting the edges and truncating the eight corners to make the four axes of the four planes of the vector equilibrium."

- Cite RBF to EJA, Blackstone Hotel, Chicago, May!9?1,
Jtt-bug:

"Now I can't have six equilateral triangles around each corner because it would add up to 360° and the system would not come back on itself. So I have limitations. I can't have any less than three triangles to get this inside and outside. There are only three possible structural

systems in the Universe: tetrahedron, octahedron, and icosahedron. As I pumped this closest-packed set of 12-around-one, it went down like that--- it went down through the icosahedron phase--- that's exactly what happened when you took one ball out--- it goes through that, and then it becomes the octahedron So this vector equilibrium pumps between the three possible cases of all structural systems. So you begin to see how it is the frangfork of how things happen in nature."

- Cite RBF to Verner Smythe, NYC, Reel 2, p.1, 25 Feb'69

Jitterbug:

"You may remember my manipulation of the flexibly jointed vector equilibrium of 24 external vector memebbers. You may remember that thia device, which I call the ¹ jitterbug.¹ had the unique property whereby each of the diametrically opposed eight triangles moves towards its polarly opposed triangle in such a manner that the vertexes of the opposed triangles always remain in fixed positions opposite the midedges of their respectively opposed triangles; i.e.. there are symmetrically reciprocal axes of co-rotation. You may recall that the jitterbug, when so manipulated, contracts in a comprehensively symmetrical manner as the

system's 12 vertexes approach their common system's center at the same rates--- as the system transformed from the vector equilibrium, through its icosahedrmal stage, to its octahedronal stage, and finally, with polar torque introduced as a consequence of thesgj-gggg® momentum of the contraction, the whole systemjcontracted into the tetra- hedronal phase."

(angular

KBF DEFINITIONS

Johansen Gauges;

"in mass production, Henry Ford, in order to have interchangeable parts had to be able to make very fine measurements. And he became very interested in guages for reducing the tolerance of error. Johanses developed fantastic guages. These were block guages with the surfaces so superbly machined that the distances between the surfaces was less than a molecule of the atmosphere. Therefore once you had them together you couldn't lift them apart--- like this--- because the gas couldn't get in. You could only slide them apart. But if you, with Johansen i guages, if you don't slide them apart pretty quickly, you'll never get them apart again because they are in such critical proximity that the atoms literally fall inward and coalesce as solid metal. I just wanted to give you another sort of prominent kind of experience that we do have, at least can have, at our Earth level."

Jones, John.. Pauj:

See Detente, 20 Sep*76 "The brush and chisel artists who, despite the literary man's frustrations, tried to follow the scientists into 'nonconceptuality' with their 'nonrepresentational*' quasi-abstractions are now proven to have been intuitively sound in their conviction that they could really follow or even lead science in the game of intuitive probing, in a sense science behaved more ignorantly than the artists, but the artists' pursuit of science with its various phases of abstraction forsook the conceptually reasonable requirements of the literary man who has been held by society to be the public's interpreter of the significance of the total inventory of evolving realities. James Joyce to a mild extent and Gertrude Stein to a considerable extent attempted to go along with the brush and chisel abstractionists in following the scientists into nonconceptual validity of reasoning, but by and large the world public was left incommunicado by both science and modern art. Both the scientists and the artists themselves became defensively bewildered by the overall and unexpected emergences of major crises of man with none of which emergencies 2.sic/ either blind-flying science or blind-man's-bluffing art could cope, either positively or negatively."

Key-Keyhole Sequence:

(1)

"We deal in a Universe in which unity is plural and at minimum two. We find that this is what we really mean by fundamental complementarity— what the physicists are trying to get society to realize. I've seen a newspaper man ask scientists, 'Is this the building block of the Universe?

Is this the key?' We find that the Universe cannot be explained by a single key; that there has to be a keyhole as well as a key. It is typical of our oversimplification just to think of the keys. We find that our geometries and our whole education just looks on one side of the line.

"So we find that complementarity is even more complex; that there had to be not only the keyhole, but that the keyhole had to be in something. The keyhole that was in something had to be related to the rest of the Universe. So then we had a rubber glove which was stripped off of this hand, which we called the left hand, fairly ignorantly, and now it fits the other hand. So where has the other one gone? Then I strip it off here and there goes the other hand."

- Cite RBF to World Game, Jun-Jul'69

RBF DEFINITIONS

Key-Keyhole Sequence:

(2)

"Quite clearly, both were there all the time, but only one of them could we detect. So there is not only the glove, which could have a keyhole, and we could put the key in that, but it would have to be in something of the rest of the Universe as well as the system we can see by. There's always a conceptual system, and there's the rest of the Universe which is nonconceptual because it's a scenario Universe and not a single frame Universe."

Labor: American Labor:

"American labor fought a great and worthy battle to win the working man's share of the synergetic productivity of industry. Labor's battle proved doubly worthwhile because it inadvertently brought about mass consumption. Without mass consumption you cannot maintain mass production. You cannot have the mass production of industrialization without qn original investment of vast capital effort of work and that original capital came first and long ago from serfdom or outright slavery. In order to bring industrialization to benefit comprehensively emancipated man, you must have mass purchasing power, which in due course will underwrite automation, which in turn will eventually produce so much wealth as to be able to free man's time for further educa-tion and research to increase the wealth long generated by unimpeded automation. American labor will not yield that unimpedement until it is clearly demonstrated that all men will prosper* directly by doing so. American labor did bring about the vast purchasing power in Industry, but in so doing it established all kinds of rules which inadvertently protected the obsolete inefficiencies of building."

inherently the center.

- Citation *6c* context at Center, 21 Jan*75

Lags:

"There is a lag when you actually capture it plus when you really understand,... Lags have to do with the fact that human beings have very limited motion spectrums so that they can't see the hour hand move; they don't see the minute hand; they only see the second hand. They don't see the flower growing. They don't see the child growing. And they don't see that the roots of that tree are going to break the sidewalk up three years from today.

"If they don't see something in motion that's going to run into them, they don't get out of the way. And many things are happening in society where something is coming their way and their not getting out of the way.!" "I saw that we do have this beautiful capability in movie pictures to accelerate the rate of the frames. We can have slow motion and really analyze what things are like... or accelerated motion. And we can take all the speculative or actual data about world population over 2,000 to 10,000 years, where we run every minute as 100 years, or every second is a year, and then"

- Cite tape transcript, pp.16-17; RBF to W. Wolf, 28 Apr'74

Lars: (2)

` ` you can suddenly see the population. We made a movie like that so you can really see it flowing around and it gets you terribly excited when you realize--- like a bonfire--- that it's really coming at you.

" I saw that we can step up and step down; we run backwards and forwards to tend to familiarize yourself with what we really have been through, and really feel some of the momentums of enormous evolutionary events."

Large Patterns;

"The early humans sensed and revered the greater pattern events of Universe as manifesting an ever and everywhere presence of a knowing, life-giving, supporting, and terminating competence vastly greater than that of humans. They saw themselves and all that

they could see, including the Sun, Moon, and stars, as having only minuscule local parts in an organic whole whose shape and size transcended both the ranges of their vision and the scope of their imagining."

- Citation & context at Naga. (3), 30 May*75
large Pattoraa- d)

"In February 1943 when LIFE brought out the dymaxion map, they were suspicious that I had perhaps 'Just rediscovered' an earlier cartographic projection process. They brought in a Dr. Borgs from the State Department Map Division--- he was the head of the American geographers--- and he assured them that my map was Just 'pure invention', which is to say that I just sort of 'fudged' it; anyway, he meant the term as a very derogatory appraisal and he concluded that I must be totally ignorant of the mathematics of cartography.

''(Ironically, his dismissal of my work served me in good stead as my patent attorney cited him as an authority for the map's originality when I applied for, and was granted, a patent for my dymaxion map.)

''LIFE's issue with the map was their first press run to go over two million and it was completely exhausted immediately. at the time there were two Australians passing through New York on some secret mission connected with the war: they were on the way to see Churchill and Luce wanted them to take home a copy of my map. .*1)60 I took the man over to their hotel - showed them how to assemble it. I put it together''

large—Patterns • (2)

"with Australia in the middle and at the top. They were astonished because that's where Australia really is and they said that none of the other maps showed the world the way it really was. They said that's the way the world really looks, but I told them to assemble it for Churchill with England at the center....

"At about that time Henry Luce asked me out to dinner in Greenwich where he wanted me to show my map and talk about it to the guests. In the middle of my explanation he said that for the first time in his life he had found a man (me) who was his exact opposite. So I told him that was a compliment. Luce was certain that all big patterns were introduced by man. He correctly recognized--- but disassociated himself from-- my own view that large patterns are introduced by nature and only discovered by man.

"Just before the war Henry Luce once told me that the U.K.

was sending its archives to Ottawa for safe-keeping. He told me this in great confidence because he said I didn't know the war was coming. I said of course I knew the war was coming;"

- Cite RBF videotaping session, Philadelphia, PA., 26 Jan'75

Larne Patterns:

"I Just didn't know what was going to trigger it off but that didn't really matter.

"Another time I had given a lecture in Haverford and I had a model of the Dymaxion map in nice big picture puzzle pieces. One of the professors took me home after the talk and asked me to show the map to his young children. They spontaneously started putting it together on the rug when the professor looked over their shoulders and said, 'No, no that's wrong you've got the world upside-down, dear.'.... Can you believe it?"

Law:

"I think the antientropic ordering principles are both subconsciously and consciously developed by humans as conventions of understanding of, for instance, how we can prosper without getting into trouble. 'The Law and the Citizen'¹ relates to this consciousness.

"Laws are conventions, working agreements, often different from the experimentally discovered principles governing physical Universe behaviors. There is usually a deal of difference SKS9Q9B between yesterday's erroneous assumption and today's scientific findings.^{1'}

- Cite RBF in panel transcript, AAUW Journal, p.175» May'6\$

Law:

"We must learn what we each bring to the other, collectively and singly. Man has had enough experience with his angers and his disconnects, and his invented national hates and their subsequently contrived reversals, to know how illogical he must often be, at any one given moment, because of the going mode of bias propaganda. He realizes that he has not been very happy when he has been excessive and destructive. Laws come entirely out of experience, but only those endure which are taken with the powerful intent to guarantee our mutually favorable evolution. Each individual has rights all of which must be coordinately protected and realized without cost or inconvenience to others."

"Mankind will demand that political forces yield to the understanding
that either we all make good together or none of us stays. Nobody
will have to yield to another man's policies--- he'll be yielding to a
computer, so he won't lose face. All sides can win."

- Cite RBF quoted by Tina Jeffrey in the Newport News Daily Press, 1
Apr'73

RBF DEPUUTIUNS

"A new, physically uncompromised, metaphysical initiative of unbi-
ased integrity could unify the world. It could and probably will be
provided by the utterly impersonal problem solutions of the comput-
ers. Only to their superhuman range of calculative possibilities can
and may all political, scientific, and religious leaders acquiesce."

- Cite RBF quoted by William Kuhns in POST-IN DUSTRIAL PRuPHETS
(Harper-Colophon) p. 243. 1971

"No opposed politicians may ever yield to their adversary without a
trial of relative strength. To yield prior to such a trial of strength is to
be either a traitor or a funk.

Trial of ultimate political power, in international Malthusian- Darwinian terms, always lead to war. For this reason political leaders avoid arbitration by third parties as subject to subtle corruptibility. But gradually society in general and its political leaders are beginning to yield mutually to computerized solutions of lethally vital disputes where the computer has been given the problem in the terms of the question: in which way do most sides profit the most?"

- Cite SENATE HEARINGS, p.6, 4 Mar'69

KBF DEFINITIONS

"You may very appropriately want to ask me how we are going to resolve the ever-acceleratingly dangerous impasse of world- opposed politicians and ideological dogmas. I answer, it will be resolved by the computer. Fan has ever-increasing competence in the computer; witness his unconcerned landings as airtransport passengers come in for a landing in the combined invisibility of fog and night. While no politician or political system can ever afford to yield undeiijjtandably and enthusiastically to their adversaries and oppressors, all politicians can and will yield enthusiastically to \square MLUUUSMaBnKOH* SOn the computer's safe flight-controlling capabilities in bringing all of humanity in for a happy landing.

"So, planners, architects, and engineers take the initiative. Go to work, and above all co-operate and don't hold back on one another or try to gain at the expense of another. Any success in such lopsidedness will be increasingly short-lived. These are the synergetic rules that evolution is employing and trying to make clear to us. They are not man-made laws. They are the infinitely accommodative laws of the intellectual integrity governing Universe."

- Cite 0 Ph HATING MANUAL FOR SPACESHIP EARTH, pp.132-133, 1969
- U1UB Leaders Can Yield to the Computer:

"Since man's fear conditioned reflexes prevent him from voluntarily freeing his spherical space ship from its success paralyzing sovereignties, we must look to the computers to clarify the ways in which success for all may be found. No politician can yield to another politician but all politicians can--- and eventually will--- yield to the complex problem solutions of the computers. First of those steps to be taken through complex computer analysis will be to stop humanity from trying futilely to compete with the machines as real wealth producers, and instead granting each unemployed human being lucrative fellowship to re-enter the educational processes and, where logical, to engagement in research and development of the doing more with less technologies."

Politics: Accessory After the Fact, 12 Aug'70 Politicians, 31 Jul'69; Ear*70 World Game, Mar*70; (I)---(III)

"Keep all the world's political systems in force and all the world's politicians and political workers at work, and at the same time take all the machinery of industrialisation, all the tracks, pipes, and wires and dump them in the oceans away from all the countries of the Earth, and in six months two billion people, half of humanity, will die of starvation.

"Lacking the industrial tooling, no political system could alter that result.

"But, taking the contrary, leaving all of the machinery, wires, pipes, and tracks in place, and all the humans who now operate them, at their daily tasks, but take away all of the world's politicians of any and all ideologies and send them and their party workers on a trip around

the Sun by a slow speed rocket ship, and all those who are now eating will go on eating, and with all the sovereign nations' barriers unmanned, the foods will begin to cross borders and the resources will be integrated and soon all of humanity will be eating and prospering."

- Cite RBF in interview by George J. Barmann, "Plain Dealer," Cleveland, 4 Jul'72

••Take away the energy-distributing networks and the industrial machinery from America, Russia, and all the world's industrialized countries, and within six months more than two billion swiftly and painfully deteriorating people will starve to death. Take away all the world's politicians, all the ideologies and their professional protagonists from those same countries, and send them off on a rocket trip around the Sun and leave all the countries their present energy networks, industrial machinery, routine production and distribution personnel, and no more humans will starve nor be afflicted in health than at present."

- Cite CITIZEN OF THE 21st CENTURY LOOKS BACK, U. or O Chan. 1
1 Apr'67 *

"At the present moment, we could take all the machinery from all the countries around the world, all the railroad tracks, all the wires, etc., everything we call industrialization--- and we could dump this all in the ocean. Within six months two billion people would die of starvation, having endured great pain. On the other hand, supposing that we take away instead every politician, all the ideologies, all the books on politics- and send them into orbit around the Sun. Everybody would keep on eating as before, down will go all the political barriers and we would begin to find ways in which we could send the goods that were in great surplus in one place to another. So people may even begin to eat a little better--- in a hurry. This could not be said before."

- Cite THE YEAR 2000, reprinted in AD, Feb*6?

"To start with here is an educational bombshell: Take from all of today's industrial nations all their industrial machinery and all their energy-distributing networks and leave them all their ideologies, all their political leaders, and all their political organizations, and I can tell you that within six months two billion people will die, having gone through great pain and deprivation along the way.

'•However, if we leave the industrial machinery and their energy-distribution networks and leave them also the people who have routine jobs operating the industrial machinery and distributing its products, and we take away from all the Industrial countries all their ideologies and all their

politicians and political machine workers, people would keep right on eating. Possibly getting on a little better than before.

'The fact is that now--- for the first time in the history of man for the last ten years, all the political theories and all the concepts of political functions--- in any other than secondary roles as housekeeping organizations--- are completely obsolete. All of them were developed on the you-or-me basis. This whole realization that mankind can and may be comprehensively successful is startling." » Cite WORLD GJKg (2), "Take the technological tools of industrialization away from U.S.A, Russia, France, China, England, West Germany, Japan, and Italy, and leave them all their respective ideologies, and within six months two billion world humans will die of starvation. Contrariwise, take away from those eight sovereign states all their political ideologies and political leaders, and leave them their industrial tools and human operators and their habitual daily production and distribution system network tasks, and no more will starve, than are starving now. New gap-filling pro tempore leaders would spring up everywhere, overnight, with emergency-gained authority who would make things work as well and probably better."

"Don't try to make me consistent: I'm learning all the time."

- UJA, f.Lai.iLY-TTT

Citation at Consistency, 22 Feb'72

Learpn_f;

"It's really a very great world task to get life the information it needs in order to develop humanity's highest potentials; how to get the information it needs in the simplest, almost unself-consciously effective manner. Life with the information will do its own learning. It's not something you can give with a needle. But people have to learn. So how do you provide life with the information it needs to fulfill successfully humanity's function in Universe? I would not like to get up a system and say, 'I have a system,* and try to sell the system to people, but really to see everything we know we can do to help life get the information it needs.

"You don't necessarily have to go through all the grades of school that we usually do before you can start creating wealth. These things are fairly evident. Once human beings really begin to find out how powerful information really can be, they are suddenly able to master spherical trigonometry and make beautiful geodesic structures, and they are eager to make them, ... If you get the right information to people when people want something. You can't get it to them if they don't want it. I never talk to people unless they ask me to talk to them."

- Cite RBF address at Minnesota Experimental City Learning Center

Learning: "I think that anything we want to do to help people has got to be something they ask for when they want it. The appetites of humanity for information are very closely linked up with other chromosomal initiatives. . . . Children ask extraordinarily beautiful questions. They're famous for it. There's no family that doesn't have experience with a child really asking startlingly good questions, that the family can't answer. And the fact that the family can't answer it, this is the time that they really want to know. The kids are asking about the Sun and the Stars, and they want to understand the atoms and the grown-ups can't tell them. The point is that they want to be able to learn for themselves: what they need to know; where to find it. And if you can answer them, they'll develop very rapidly. I don't think humanity understands this self-teaching process.

"Every child is a laboratory." ... I wouldn't start with getting rid of schools. I would start with how to accommodate what needs to be accommodated. I am convinced that life, as born, has many more faculties than has ever been recognised and will grow very, very rapidly if given the chance." - Cite RBF address to I-IXC, Dubuque, Iowa, 15 Dec. »71

"I've learned many years ago that it is quite possible to think out loud and I find that it is quite an extraordinary habit--- about how live meetings are. People will be at meetings at which I am present and will take a piece of paper out of their pockets and start to read me a speech, and I'll say, "Let me have the paper, I can read it myself.* What I think really counts is the fact that we don't have the slightest idea what happens in our lives. This is something very mysterious and I'd rather look in everybody else's eyes--- I'm not interested just in hearing myself, and unloading some ideas. I'm interested in the many meetings in my life, in how we mutually may be able to find out why we're here, and what we ought to be doing about it, if possible."

Left & Right:

"I think your words 'right*' and 'left' should be replaced by the nonequal and opposite words 'positive*' and 'negative*'. The present dilemma of science in respect to 'parity' of right and left image amuses me because I had rejected right and left concepts in energetic-synergetic geometry. Right and left implied a two-dimensional reality, of infinite thinness. I had long ago discovered that systems had inherent convexity and concavity and required irreversible turbinizing of their omnigearred Universe event relationships. Inasmuch as all systems could be turned inside-out, having inherent insideness and outsideness, I discovered that mirror reversal of the rubber glove from one hand to the other could be accomplished without reversal of the finger-wrist axis...**

P. 7.

"Leonardo da Vinci was apprised of the natural principle of mechanically functioning structures, but he had neither the precise materials to be highly use-effective teleologically nor the possibility of evolving them out of anything at hand to correspond with their efficiency as observed in nature."

- Cite NINE CHAINS, p. 176, 1938

Leonardo Type:

"Central to the intuiting of those who in history have proved themselves to be creative scientist-artists of the Leonardo type has been the spontaneous teleologic translation of past experiences into their objective designing. They all manifest in their work and record in their letters and diaries a prime intuitive regard for their potential and kinetic energy- coordinative experiences and for the full family of motion freedoms.

"Attaining and maintaining intellectually informed creative competence involves the antithesis of specialization. ..."

- Cite HYPER, World Mag., 10 Apr'73

"Now all this time the Leonardo, or artist, type was making one thing at a time for his patrons, 'When I was young the Victorian era was absolutely rampant and downtown there were beautiful cabinetmakers making beautiful cabinets for the rich middle class or the nobles. In other words, the artist made the end product with his own hands. They were good at developing more and more artists, digging art into almost everybody. It was being very greatly cultivated. Now in the new era the artist-Leonardo said: 'There are not enough artists to make end product for everybody by hand.' So what has to go on from now on is the artist-scientist-Leonardo type who makes designs for tools and the tools make the end product. And the tools require a lot of power; and we now have the relaying of power. We have the waterwheel. We can generate electricity, and so forth. Then all of our machinery you will find is all leverage... Various forms of levers. For the gears are just a series of levers— all tied up to an enormous entity much more than the muscle of man. So that we really is the beginning of what we might call the mass production era."

- Cite Univ. of Alaska Address, p.7 20 Apr '72 • 'There have been men in our history who have become well-known to us by virtue of their tool-inventing and tool-using capabilities; and their conceptualizing of tasks they could do— tasks they have done on behalf of their fellow men. I will simply call this kind of man the Leonardo-type. He was a very comprehensive toolmaker, tool-conceiver, tool-user, and a large problem addresser and solver."

"In the middle of the 20th century Henry Ford may be identified as the great Leonardo-type, even though he would be absolutely astonished. He thought of his work as utterly prosaic, but he might then be thought of as having Leonardo-type conceptualization. And the idea was that from this point on the artist makes tools and the tools make the end-product, and this is mass production."

- Cite COI-KITKIT TO HUMANITY, p. J2. May'70
Leonardo Type:

"Leonardo types seem to have avoided attempting to reform the metaphysical environment. They are documented only for their employment of the metaphysically generalized principles to reorganize the physical constituents of the scenery, apparently assuming intuitively that a more man-favoring rearrangement of the environment would be conducive to humanity's spontaneous self-realization of its higher potentials."

Lever:

"The principle of leverage ie a scientific generalisation. It makes no difference of what material either the fulcrum or the lever consists--- wood, steel, or reinforced concrete. Nor do the special case sixes of the lever and fulcrum, nor of the load pried at one end, or the work applied at the lever's other end, in any way alter either the principle or the mathematical regularity of the ratios of physical work advantage which are provided at progressive fulcrum-to-load increments of distance outward from the fulcrum in the opposite direction along the lever's arm at which the operating effort is applied."

~ Cite SYNERGETICS draft. Chronicle, pp. 4-5, from NehrusSpeech as rwwritten by RBF j Jun'72

"The lever work# whether it ie wood, steel, aluminum, fiber glass, or even reinforced concrete. Reinforced concrete can make a lever. The principle of the lever: that is, balancing the arms from the fulcrum over to the load and then on to the lifting arm on the opposite side of the fulcrum to go out one increment of distance between load and fulcrum and you have an even advantage: to go out with ten such lengths, you can lift ten times as much weight, and so it goes. If the distance is one foot from the l&ad to the fulcrum, and you go out on the lever arm ten feet, and you weigh 200 pounds, you will be able to lift ten times 200 pounds, or exactly one ton on the other end of the lever.

"So little you could lift one tom. I should say 'little 200- pound you' could lift one ton. That would be ten times your own weight; that is my main point. And the main point about the lever is that it doesn't have to be wood. It can be any kind of material and it can work anywhere in the Universe, Whereas your experience with the lever is always one specialcase lever--- a wooden one, or a steel one-- and any that you"

"You might think about the total of all our mechanic# as being eome-thing done in terms of levers. Men ware learning how to develop higher advantage gainable out of the use of the hands with a lever and then learning how to capture free energy patterns, bring them into focus, and bring them on to the ends of the lever. For instance, a waterwheel is really a series of levers, first one lever and then another lever--- get out on the end of the lever where you can do the most work, move from the center of the hub, the radius of the waterwheel being the length of the lever. You present a series of levers and you learn then to take the great energy pattern of nature: atomizing the waters and making them into clouds and then coming down as rain and landing on the top of hills and coming down the hills as rivers. We learn to take the energy pattern of the waterm rushing to the lowest level; and they exploited gravity then by canalizing that water into reservoirs and then being able to let it out of the reservoirs at the time they wanted to do the work. So they had it coming out specifically, landing on the blade of the waterwheel.^{1'}

"Man suddenly developed a way in which he organized the energy*

MBF uaFinniuho

"For instance, we have the principle of the lever. The lever is nothing by itself, . /e have a bar, a fulcrum, and a load and then the application of effort on the other end of the lever arm with a minimum of the levering function, Using the distance from the fulcrum to the load as a

basic increment, we discover that going one unit on the lever arm outwardly produces an even balance. Going two units outwardly makes it possible to lift twice that amount, in this way little man has been able to lift large tonnages with his little tiny weight, where only maybe a 200-pound man can lift a ton with his lever. I'm sure the first lever discovered by man was a fallen tree, where one fallen tree would lie across another fallen tree. When by accident he stepped on the tree that was lying across the other one--- he saw that his standing on the other end made the big tree lift. He discovered the lever. . . The lever can be of wood; it can be of steel; it could be of aluminum; or it could be of reinforced concrete. It could be many, many substances and we discover that the human mind is able to discover a principle and the mathematics of it. It learns that subjectively. But then it can also employ the principle

- Cite RBF at SIF.S Seminar, U. Mass., Amherst, 22 July '71, D.7.

"objectively. But in employing the principle

objectively, man cannot design a generalized lever. It must be a specific lever, a special case lever, again either wood or steel, six feet long or ten feet long, whatever it might be. So the human mind has the ability to recognize generalized principles which, in order to be principles, must be eternal, we have then the human mind demonstrating a contact with the great eternity and able then to modify within our present life various physical ways."

- Cite RBF at Students International Meditation Seminar, U. Mass., Amherst, 22 July '71, pp. 7-8

"Out of industrialisation came the ability to do very large things in very big ways. But I'd like to get down to something rather more fundamental. What man then has to discover is generalised principles. In literature, the word 'generalisation' means trying to cover too much territory too thinly. In science the word refers to the discovery of a principle that holds true in every case; if you find even a single exception, then it is no longer a generalized principle in science.

"Consider, in ancient times, a man like any of us going through the woods from time to time, woods where men have not gone very often. Trees, fallen in great storms, are strewn across one another, and he tries to reach his destination as directly as he can by climbing over them. As he climbs over one of the trees, it begins to sink with him slowly and he moves back for a moment and then comes up again to the same place. As he walks on the tree and it sinks lower and lower, he wonders what's going on. He looks at the tree and sees that it's lying across another one, the other end of which is under a very big tree--- and as he moves out farther that enormous tree is being lifted, and he says: 'I never lifted a tree like that.' He goes over and tries to lift it with his muscle and finds that he can't"

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970

LAIfTx: Fallen Tree as a Lever; <^b>

"budge it* But standing back on the fallen tree, sure enough he can lift it. Now I suspect this myth must have gone to his family with talk of a magic tree, a very special tree that would be brought home and kept around for a number of generations. But then one day someone must have found that any tree would do. Now, as a generalisation, that is the beginning of the lever.

"With that lever, man was able to move things he couldn't move with his own muscle. He began to move large rocks around and develop monumental defenses. Then the great pirates began to use levers in big ways. They set their slaves to rowing ships, which now could go windward with the rowing ship (something the wind alone would not let them do). They then began to have very much bigger ships, and they had to find a way to anchor them. The anchor, which of course had to be recovered when not in use, was made of metal and was very heavy. So they developed those same levers into a capstan around a shaft that the slaves® pushed around horizontally--- and up came the anchor. Later, man found that he could turn the shaft around vertically and from this came water wheels. Man had time and again felt the potential force of falling water (under water falls and so forth)

- Cite RBF in Franklin Lecture, Auburn, Ala., 1970

"Now men mounted a wheel on a shaft and bearings, and they put pulleys and then belts up into buildings to do all kinds of work. This was the beginning of man's discovering generalized principles and using them to channel energies from the atmosphere. In this case, the Sun is elevating water out of the sea into the sky until it returns down the hills to be channeled to the ends of levers to do man's work. From this point on, the big task of man was to use his mind to find ways of doing work very much greater than his muscles could possibly do, by mastering and channeling energies of the Universe onto the ends of levers,"

RBF DEFINITIONS

Hilts

"Life is the difference between temporality and eternity. Our individual life is a special case. Death reverts to the whole. It may not seem satisfactory, but the individuals survive in awareness because they are potential to the whole--- like an average of plus (+) and minus (-) weights.

"So what we call life is escalation between various degrees of asymmetry, or lags in conceptioning, which brings about what seems to be the temporal. The plurality of lags is the apparent explanation of the awareness we speak of as life itself. Lag is the same as interval. Instantaneity would eliminate otherness, time, self-and-other awareness. Instantaneity and eternal are both timeless: they are the same."

Ufa. & DMUU ID

"Within economics we may be able to demonstrate the existence of a metabolic process generalization which is akin to, if not indeed implicitly inherent in. a composite of Boltzmann's, Einstein's, and others' concept or a cosmically regenerative omnintercomplementation of a diversity of energetic exportimport centers that nonsimultaneously ebb and flow to accommodate entropically and syntropically, omniversally, omniregenerative intertransformings. How can economics demonstrate a generalization from the utterly uninhibited viewpoint of the individual human?

` `It is said that stones do not have hunger. But stones are hygroscopic and do successively import and export both water and energy as heat or radiation. New stones progressively aggregate and disintegrate. We may say stones have both syntropically importing "appetites" and self-scavenging or self-purging entropic export proclivities.

"When a person dies all the chemistry retracts and we see that the human organism's same aggregate quantity of the same chemistries persists from the 'live' to the 'dead' state, which"

Life is a Sumtotal of Mistakes:

(1)

"Man--- bom naked, helpless, and ignorant--- but with innate drives to insure procreating and refueling... He Just makes mistakes all the time, learning only by making mistakes. The billions of humans who have lived must have made septillions of mistakes. Since these mistakes must have given humans such an inferiority complex, nature had to offset this tendency by a chromosomically-induced pride, ego, and self-deceiving capability.

"When people are surprised by some new development, they tend to say, 'I knew it all the timet' in a self-congratulatory way. So parents have brought up their children with the idea that they should make no mistakes, they should be frozen into their customs. It is this Emperor's-clothes-like tradition which universally assumes that only fools make mistakes; it is this kind of tradition that requires such a revolutionary breakthrough.

"Mistakes have a servomechanism you acknowledge mistakes you do function in life. Clearly when recover from them. It is like

- Cite RBF to EJA, 3200 Idaho, Wash. DC., rewrite of 10 Bep'75

"walking: left foot, right foot; or steering starboard or port,..., in between the succession of alternative shifts we inadvertently describe a directional course. As we gain practice we make more delicate alternating corrections at a higher and higher frequency as in a mechanical servomechanism, which devices greatly reduce the magnitude of error eliminate the process of

"Life is a surtotal of mistakes, a balancing of mistakes. This is cybernetics, steering gyro controls. This is how Universe works: this is why physicists have found only waves and

Liff IB Not Physical: (3)

Q. "Spirit and soul: do you have definitions for those?"

RBF: "I don't have any definitions for either. What I have said is that I am sure that life is not the organism which it employs. Our organisms consist physically entirely of atoms--and atoms are completely Inanimate. Whatever you and I are is metaphysical, has understanding, and has nothing to do with the physical. The relationship is between but not of, there is something between us but not of---I speak about mind as operating there, but mind discovers the relationships existing between.

"Brains are always and only coordinating the input of the senses. This one smells this way, this one sounds that way--- so they are always dealing in special case compositions of experience and they can recall the special case compositions. Mind is not the special

cases, but it finds these relations- ships---a good thing--between the special cases. This is as close as I can really come to explaining the phenomena of life and mind. It employs this organism to get its information."

- Cite transcript p.12, RBF taped interview with Dr. Michael Bruwer, Ritz Carlton Hotel, Chicago; 20 Feb'77

Life is Not Physical <2)

Q. "Do you equate spirit and soul with mind then?"

RBF: "I don't ever use the word spirit or soul. I can see that they were probably what people were intuitively identifying as best they could. In other words, they had the spirit leaving the body as though it was weightless. And I say whatever life is, I would use the word life rather than spirit... because I don't use words of which I don't have some kind of knowledge. I think man was making a mistake all this time saying that life was physical whereas it was always metaphysical. The chemistries are right there. I find biochemists saying very improperly that this is the chemistry of life. The chemistry of life is still there when there is no life left."

Life is Not Physical;

"The scientists seemed to have given up the idea of significance ; they seemed to have lost their gift for philosophical thinking. So the focus on physical things was kept kicking along by the church, trying to treat the physical as life, which it isn't. The Catholic Church is built on the

notion that life is physical--the bits of hair of the Savior, the communion with the physical wine, the bread is my flesh, this is my body. In the mass or holy communion the wine is the blood: drink this: piece of bread: the purely physical contacts of life. If life were physical we really could make synthetic men, laboratory animals, and artificial intelligence; we never will."

- Cite SYNERGETICS, 2nd. Ed. at Sec. 531.05; 12 Dec'75

Ig Rgt Physicals

"A foetus is just physical life, a bundle of reflexes like a chicken running around with its head cut off.

"'Consciousness and identity begin not with conception but with birth. Awareness, that's the thingl... that's what begins with birth."

- Cite RBF to EJA, Aspen, Colorado, 13 Jul*74

Life Is Not Physical:

"I an 78--- and at my age I find that I have now taken in more than 1000 tons of water, food, and air, the chemistry of which is temporarily employed for different lengths of time as hair, skin, flesh, bone, blood, etc., then progressively discarded.

I weighed in at seven pounds . and I went on to 70, then 170, and even 207 pounds. Then I lost 70 pounds, and I said, 'Who was that 70 pounds?--- because here I am.' The 70 pounds I got rid of was ten times the flesh-and-bone inventory at which I had weighed in, in 1895.

"I am certain that I am not the avoirdupois of the most recent meals I have eaten, some of which will become my hair, only to be cut off twice a month. This lost 70 pounds of organic chemistry obviously wasn't 'me,' nor are any of the remaining presently associated atoms 'me,' We have been making a great error in identifying 'me' and 'you' as these truly transient and, ergo, sensorially detectable chemistries."

RBF DEFINITIONS

Light on Scratched Metal;

"When a bright light ahinea on a complex of surface scratches on metal, we find the reflection of that bright light upon the scratched metal producing a complex of concentric scratch-chorded circles. In a multiplicity of omnidirectional actions in the close proximity of the viewable depth of the surfaces, structurally stable triangles are everywhere resultant to the similarly random events. That triangles are everywhere is implicit in the fact that wherever we move or view the concentric circles, they occur#, and that there is always one triangle at the center of the circle. We would add the word approx-
imately everywhere to make the everywhere-ness coincide with the modular-frequency characteristics of any set of random multiplicity. Because the triangles are structurally stable, each one imposes its structural rigidity upon its neighboring and otherwise unstable random events. With energy operative in the system, the dominant strength of the triangles will inherently average to equilateralness.

Light: ppg?d Qf LUhV

"The 186,000-mile-per-second speed of light is so fast that it was only just recently measured, and it doesn't really have much meaning to us. You don't have a sense of 700 million miles per hour. If you did get to 'see' that way, you would be spontaneously conscious of seeing the Sun eight minutes after the horizon had obscured it; ergo, consciously seeing an arc around the Earth's curvature. We are not seeing that way as yet."

- Cite RBF rewrite of SYNERGETICS galley at Sec. 801.14, 22 Nov'73

Lixhy; Speed of Light:

"Einstein was much purer than Planck in just taking the speed of light, which was a constant figure. It was demonstrated in a vacuum tube, linearly. Therefore, light--- as all candle power does--- goes in all directions, not just ⁱⁿ *

line. Therefore we know that the surface always grows as the second power of the linear. So the speed of light is c --- use small c for any radiation, the speed of any radiation omnidirectionally.... because a wave of light is going in all directions. Therefore it is c^2 to the second power."

Paint:

` ` Let us consider a tetrahedron which also always has an externality and an internality. At its internal center is its terminal turn-around and come outward again condition. This is exactly why in physics there is a limit point at which you turn yourself inside-out. You get the the outside and you turn yourself inside-out and come the other way. This is why radiation does not go off into a higher velocity. Radiation gets to a maximum and then turns itself inwardly again--- it becomes gravity. Then gravity comes to its maximim concentration and turns itself around and goes outwardly--- becomes radiation."

VECT.CF *sec.* 511. z.<]

Line;

. .As Einstein pointed out, when the speed of light was finally ascertained and measured, there could no longer exist anything that was instantaneous. The mathematician's concept of a straight line was instantaneous: in that way he did not have to say that his straight line was generated. It takes energy and action to get from here to there. Then what is a line? Lines are directional energy events: they are vectors.'*

- Cite HBF, Univ, of Rhode Island, 26 Aug. '66.

Line;

"The pure mathematicians straight line must be instantly Infinite in two directions. All its parts must be absolutely uniform and simultaneously sub-existent. It must avoid being progressively generated as an experimentally produced action-trajectory of one system modifying another. Microscopic inspections of any action-trajectory's impressed, graven or deposited trail must disclose gross irregularities. Progressively closer inspections of experimentally attempted demonstrations by the mathematicians of their allegedly 'straight' lines increasingly disclose volumetric aberrations and angular digressions from straightness. They are axiomatically selfcontradictory."

Literacy: "Literacy ie absolutely Number One priority. Tou have to know what your problem is. Rusela was able to go from under 10 percent literacy up to I think y2 percent in a little over a decade. That came from a ddep understanding that literacy was absolutely essential.

"Historically, men weren't literate. It's an absolutely extraordinary thing to have a world where people are literate and where people can read and communicate and information gets passed around the way it does today. It's a very new matter. But I don't expect miracles. As you become literate, more and more literal, you realize that we do start with a mind and that in the end it's going to be mind over matter. Pan has been operating with matter over mind right up to now.

"The guy who was strongest and toughest could get hold of a gold mine and say: Listen, you, you understand, that's mine. Pure right makes roeight. We're Just breaking out from that. Everybody had just accepted the idea of property. But there's nothing from God in those deeds. Nothing from Universe. It's simply from the strong man. So there's nothing in there about* logic or how to make the world work. It's simply an illiterate man who's very hungry and tough and big and how does he act." - Cite RBF to B. Local vs. Comprehensive; (1)

"I guess as a consequence of trends that I observe that we will always have a limited function, that we are meant to be ^a local function and not the comprehensive function. This is the nearest thing we've come to what we probably mean by the word 'god'; it's a great comprehensive integrity, the all-knowing integrity of the Universe.

"I discuss this in The Game of Life, Chapter 43 of NINE CHAINS TO THE MOON. (I took it out just before it got published because I was afraid it would be much too esoteric for people in the 1930's; I thought it might hurt the credibility of the rest of the book at that time.) In it I have god deciding to test his own infallibility, the real integrity of the Universe, himself; and we have a totality of the time which is for the moment expressed as a sphere, which looks like a circle; and we have then a dropout, an ego dropout, that's a tiny little section of arc of the enormous circle, so short that it looks like a straight line; and it thinks it's straight and breaks out and starts falling away.

"So at first there's a great big circle with this tiny little line dropping away from it; and as it gets further and further"

- Cite tape transcript, pp. 15—16; RBF to B. Brocks, 30 Apr'74

"away, it becomes more and more concerned with itself; and the big circle gets smaller and smaller, and finally gets to be a little dot above a little eye--- i--- and then it gets to be a big eye-- I--- and throws away the dot altogether. And from then on it's really in trouble.

"The god then takes all the cards and all the rules and the laws and everything and tears them all up in little bits and tries to throw them to smithereens-- and you've got to put the Universe together again and find out whether the integrity is really there.

"So we start in in World Game in trying to put it all together again. And this more or less matches the kind of evidence we have as a trial balance of Universe: How much of a mess can you really introduce and still come out of it? And the kind of mess that's going on right now on our planet is typical: So how do you pull out of this mess?

"The god would periodically, then, reject himself so that we might become part of the great all-knowingness again instead of being separated out as ego."

Locality:

Mechanically and chemically, a steerable rocket embraces a complex of internal and external events* Both airplanes and steerable rockets are complexes of internal and external energy event transactions and omni-interacting resultant motions in Universe transcendental to Earth motions, where the observerarticulator is extraterrestrially positioned. Since the Earth is moving as a dependent motion-complex in respect to the Sun's and other planets' motions; and since the Sun is engaged in a plurality of internal and external motions in respect to the galactic system; and since the galactic system is a complex of motions in respect to other galaxies and supergalaxies, and so on; and since the whole set of motion events are nonsimultaneous and of uniquely variant durations; and since the intereffects of the events vary vastly in respect to aeons of time, it is obvious that any thinkably meaningful conceptual coordination of event interrelationships by the meager lifetime limits of humans is inherently limited to a relatively local set within Universe and within a time sense, and the relationships may only be measured in respect to the angle and frequency magnitude characteristics of any one subsystem of the totality."

"I said we like monology and the one reason you seem to like cubes is that you can fill a lot of space with them, so these are the propensities of men. He got into quite a little trouble in a sense with his cube and square because he couldn't square the Earth. I drive across the country quite frequently, and I just drove across coming here, and you come into any one town and there is squareness locally, but the surveyors don't meet up with with the square in the other

town because it is a sphere and not a cube that we are on, so you are always having these lot lines that come to an end of the line at the road turns at a right angle and goes here

and accommodates and comes into the web of the next town. We really pay very little attention to this kind of inadequacy of our working assumptions."

- Citation and context at Science Opened the Wrong Door. 30 Dec'73

HBf DEFINITIONS

Local Systems:

"The phenomenon of entropy, in which all local systems lose energy, means that every local system in

giving off its energy gave it off to the environment and therefore ordered the environment. All local systems are continually generating change and have periodicity. Local systems all have patterns that do not correspond with other systems, and they are unique. While each is regular and orderly as it gives off its energies, these do not necessarily mesh, and they seem to be disorderly with regard to the rest of the system."

-Cite COFKITktNT TO HUMAN ITY, p. 29 f May-June'70

LgCaj Sy\$m:

"Each local system has its own orbiting and its own frequencies, and so forth, . . ."

- Citation and context at Relative Asymmetry Sequence (1), Jun'69

Local System:

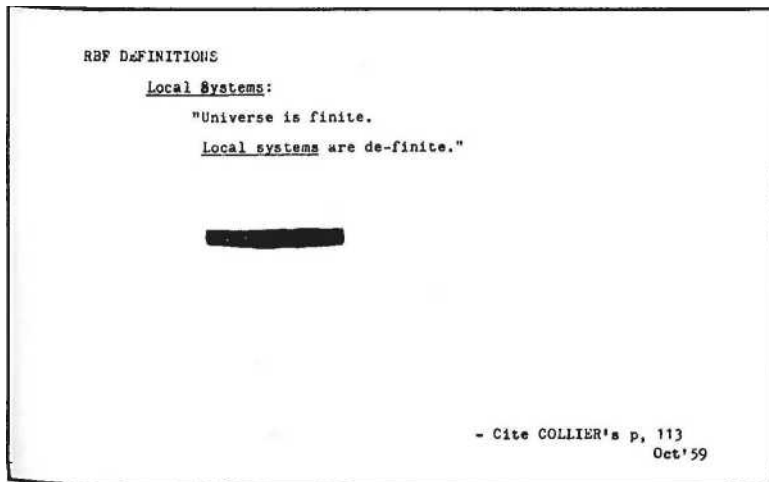

"So I find that you and I and the lamppost and its lamp are basic subdivisions of Universe* You and I and complex it are either all of the Universe that is inside, all of the Universe that is outside, or all the remaining Universe, which comprises a given recognisable system or set. The residual constellation to be reconsidered constitutes a local conceptual system.*'

« Cite NASA Speech, p.41. Jun • 66

Local Systems:

"The locally definable entity is not complete, for it does not exist by itself. All experiments show that local entities are inherently both entropic and anti-entropic, that is, all local systems are always intimately linked with the rest of universe by measurable import and export pattern transactions. Definable entities are uniquely functioning components of Universe."

tagflgMon s RadJ._U3_pf Man's Locomotion: < 1)

"As man has become knowledgeable, ha haa tranalated the principles discovered in Universe into abetting hie quickness and mobility. The physical effect of this translation has been demonstrated in important degree only within this past half century. Born with legs and not with roots, man is in principle mobile. Prior to World War I man's locomotion was primarily accomplished by his legs. He rode in vehicles only about 300 miles per year. Oft-repeated Army surveys show that man has always walked an average of 1300 miles per year, and probably always will.

"In 1919, it was evidenced that the species 'man*' had changed. Man had become an invention which moved about primarily by mechanical means. In the United States he to and fro-ed, in 1919 about 1600 miles mechanically. He continued walking 1300 miles per year, but instead of sitting in rocking chairs, he was sitting in moving automobiles. Thus he totalled 2900 miles in 1919. At the beginning of World War II, the average man was moving mechanically 6000 miles per annum; however, he continued walking an additional 1300 miles per annum, for a total of 7300 miles per year. The U.S. behavior curve in this respect is a pilot or 'tendrill*' curve of the 'world curve' to accomplishment"

Lard-Va. Pr^ayer:

"I came out of a world where the Lord's Prayer was being very generally used. I simply said I thought it has come to us through so many translations from so many languages, and we don't even know who.., it probably was a composite of thousands of mens' thinking. It no longer possibly meant what those who did the thinking meant to say.

"For instance, I said that I don't think it's logical for... to ask God to make a bargain; that you're going to forgive somebody over here—and therefore God's got to forgive you.

I said, I don't think you have to ask God anything, certainly don't have to have any proselytizers for God. God is God. God doesn't need any advocates. God is God and there is really nothing that little human beings can tell God that God doesn't already know,

"So I came to a completely different kind of feeling... I felt that the Lord's Prayer was a catalyst to make me think."

"Retrospective awareness of losses can bring overpreoccupation with self which blinds self to recognition of the synergetic gains potentially accruing to the •separation* or 'cancellation' events which, by virtue of the second-power law, have brought group advantage gains in which the individual has attained fourth-power continuance potential often way offsetting individual freedom losses, particularly in view of the group's discovery that, as a group, it can enjoy all the original freedoms Individually lost, but never realised by the Individual to exist; ergo unemployable consciously by the individual who was more a 'viatlm' or burdened carrier of the unknown freedoms than an enjoyer of them.

"Only as spontaneous group structuring loomingly occurs, do the discovered cosmic freedoms become consciously employable as they are employable effectively only for all and not for self. When, however, this exclusively retrospective discovering of potentially advantageous freedoms is made by the grouped-In Individual, and he selfishly persists in trying to employ the freedoms exclu-

sively for self, or only for an exclusive subdivision of the group, then his attempts become inherently unfulfillable and scheduled for ultimate defeat. failure."

RBF DEFINITIONS

Loyalty:

"The Greeks' concept of the geometrical, bound-area of their triangle--- or their circle--- lay demonstrable on only one bound-area side of the line. As a consequence of such fundamental schooling world society became historically biased about everything. Continually facing survival strategy choices society assumed that it must always choose between two or more political or religious •sides.' Thus developed the seeming nobility of loyalties.

Society has been educated to look for logic and reliability only on one side of a line hoping the side chosen, on one hand or the other of indeterminately largelines, may be on the inside of the line. This logic is at the head of our reflexively conditioned biases."

"The Madison Avenue of the Gay 90's meant the area between Madison Square and 42nd Street, dominated by the J.P. Morgan residence at 38th and Madison, Madison Avenue of the first half of the 20th century referred to the shopping section from 12nd Street to 22nd Street, dominated at its base by Brooks Brothers, the Biltmore Hotel, and the Roosevelt Hotel. So attractive did the Madison Avenue vantage appear to so many corporate newcomers that they, in effect, have pulled down all the old buildings and thus terminated all the old enterprises that constituted Madison Avenue. They have built a new canyon in the Universe whose preoccupation with the abstract function of shaping men's conditioned reflexes, through advertising, has caused the words 'Madison Avenue' to hold an entirely new meaning---having nothing to do with a physical avenue itself, but with their 'corporate image'--- the collective archpropagandist, proselytiser, inducer, and seducer.**

RBF DEFINITIONS

Magic Numbers:

"In the structure of atomic nuclei there are certain numbers of neutrons and protons which correspond to states of increased stability. These numbers are known as the magic numbers and have the following values: 2, 8, 20, 50, 82, and 126. A vector model is proposed

to account for these numbers based on combinations of the three fundamental omni-triangulated structures: the tetrahedron, octahedron and icosahedron. In this system all vectors have a value of one third. The magic numbers are accounted for by summing the total number of vectors in each set and multiplying the total by 1/3."

Magnetic. Field:

"The becoming one of both the finity inward with the finity outward indicates a sensibility of experience preoccupying man as a superficial reality which only occurs at middling dimensions of Universe and appears schematically as a magnetic field. Its flux patterns, like two tangent balls, include every size of particle, as their hour-glass-like tangentially linked inwardness, displays both inwardly and outwardly mingled sets of fountain and reverse fountain flows--- concurrently at both ends--- and through the middle. Periodically, the whole double-bulbed dynamic flux contracts axially, as the two bulbs of dynamic

flow merge progressively and then merge completely, and again separate axially. It is obvious that inasmuch as the whole system was always in flow, that the new bulbs of flux are of necessity new and are therefore only identifiable in principle with the previous comprehensive duality of shapes. The system has inherent yet empty twoness.'

Mln* ths world ^ork: (i)

"The university student, having attained his first freedom of initiative, his optimum level of metabolic efficiency, bodily coordination, and general outlook, finds that his idealism is concurrently exposed to an awareness of powerful intellectual and technical disciplines. At

the same time he is the recipient of fluent science-technology breakthrough news, such as the under-the-pole ice passages of atomic submarines and new achievements in rocketry and electronics. He also receives an overabundance of news concerning world wars and political stresses that break into ever more frequent crises.

"Logically, the student becomes exasperated and says, 'Why can't we make the world work? All the negative nonsense is the consequence of outworn, ignorant biases of the old-timers. Let's join forces and set things to rights.* Parading in multitudes, students demand that their political leaders take steps to bring about peace and plenty. The fallacy of this lies in their mistaken, age-old assumption that the problem is one of political reform. The fact is that the politicians are faced with a vacuum and you can't reform a vacuum. The vacuum is the apparent world condition of not enough to go around--- not enough for even a majority of mankind to survive more than half

Humanity is "taking its final examination. According to my calculations, we have about eight years in which to make it on this planet. . . . We do have the option.

"I do want you to understand that I do know what I'm talking about. This is a very critical period. Nature is trying very hard to make us succeed, but nature does not depend on us. We are not the only experiment.

"Within 10 years, using only proven techniques, and using only metals already mined and in circulation, we could have all of humanity living at a standard never known. We could phase out all fossil fuels and all nuclear fuels and live on our energy income. ... We have come to an extraordinary moment when it doesn't have to be 'you or me' anymore. There is enough for all. We need not operate competitively any longer.

"Human beings have enough knowledge now to succeed. And just possibly there are enough of the right kind of people around to see that they do. Nature is raising a new crop. I go to the schools and each year I see the young people getting to be more and more clear in their thinking: less exploitable.... or it could be curtains; if we make it, it will be because of youth and truth and love,"

Man As A Function of Universe: (1)

"To really commit yourself to your subject, find out the functioning of man in Universe--- which I`m sure is to be a metaphysical problem solver. In order for the Universe to be eternal--- rather than finite as the physicist finds it--- it is continually transforming. Therefore, it is a minimum perpetual motion machine. It is a minimum self-regenerative system: no energy created and no energy lost. In a regenerative Universe where man learns more, we have the intellectual factor--- the metaphysical part of the Universe coming into awareness of the complexity of a system which has 92 regenerative chemical elements and has all the mass attraction and all the different principles operating.

"We have to be local problem solvers where Universe needs man's intellectual capability which knows about some of the eternal laws operating in total Universe; and to be able to apply them locally, to local situations. The regeneration of Universe requires the presence of a literally total design capability of Universe, locally available, to handle some very complicated problems .MMMt What we all are familiar with, everything common to anybody everywhere, is problems. And for every problem that you solve you know

` ` I've come to my own working conclusion that the human does have a function; and that he is to be the most effective metaphysical orderer, comprehender, employer of information to be employed in different ways to nake the world even more orderly--- and to do so without undue wasting of energy.

Energy is supposed to be collected here. Therefore man can learn how to employ the energy patterns of Universe to do work. His job as metaphysical orderer has antientropic force or capability. His job is to rearrange the scenery continually to rearrange the somewhat random receipts of the stardust, and so forth, and to keep rearranging them in more effective ways and certainly for the regeneration of life itself.

' 'Part of this great orderliness is to try to understand that there is this function of understanding in the Universe. Man seems to be the prime, the only, manifestation we have of it; other than the a priori Greater Understanding, and I would think that our functioning is in every way to make that functioning successful aboard this spaceship Earth."

Man as a Function of Universe (*)

"I've been asking some large questions-- when you are a generalist you learn to look towards big patterns--- and I ask myself the question,'Does man have a function in the Universe?' and I am now confident that we can discover that man does have a function in the Universe. And we discover his function in the Universe in the following manner.

"Our nuclear physicists have now disclosed to us that every fundamental patterning in relation to the atom and its nucleus, every energy behavior, has its opposite. The electron has its positron, the neutron its proton, and so forth. But having discovered in our physical experiments several centuries ago regarding energy, that every local system loses energy, we have the scientists in our own era discovering that the energies are always accountable.

"The energies do not get out of Universe. Energy is finite. Je have, however, all the local systems that are continually giving off energies: as they give them off all in continual transformation and all in great motions, the giving off is in a very diffuse way, so that it's considered disorderly, and"

- Cite RBF 'The Listener' transcript by John Donat, 26 Sep'68

"it's called by the mathematicians' law of the increase of the random element. So we have a physical Universe which is locally everywhere becoming more and more disorderly. There must, by my inference of what scientists have found out about fundamental structure, be some kind of complementarity to this coming apart in a disorderly way. Because, by coming apart in this disorderly way. it of course takes up more room. Therefore it's an expanding Universe and it becomes inferred that there must be some phase of the Universe where the phenomena are contracting and becoming increasingly orderly. And if we look for that, we shall see that all the stars which are observable are light objects, and therefore they represent that energy

being given off in a diffuse and disorderly way. And we look for some black body where energy may be collected. We only find one that we know anything about and that's our spaceship, Earth. Our spaceship Earth we discovered in the Geophysical Year is receiving approximately 100,000 tons of stardust daily. We're very much increasing our avoirdupois: the Universe is collecting here. And we find, then, life being regenerated on our Earth.

°In order to have life regenerated, more energy must be taken on

- Cite RBF 'The Listener' transcript by John Donat, 26 Sep'68 **"than is given off. And the energies are impounded by the green vegetation on the dry land, which is a quarter of the Earth, and by the algae in the sea— this is done by photosynthesis, and photosynthesis is an extraordinary process where beautiful molecules are built; and these beautiful molecules become orderly structures. This is the first transition from this increasing disorderliness, where the disorderliness has been picked up as random radiation and suddenly put into orderly form. In fact all the biologicals are developing beautiful orderly structures. And amongst all the biologicals we find by far the most interesting to us is the human being, with this drive to apprehend and comprehend and order and sort out and rearrange in more favorable ways, the same fundamental drive toward what we call antientropy. And we find the human being to have this capability of the mind over the brain, and find that the brain then is physical and it's weighable, and it dies with the man. But what is unique to each of those lives is its weightless mind, then, metaphysical, and the metaphysical's function apparently is to apprehend, comprehend, the physical disorder and to bring it back towards order."**

"We have it manifested at this little tiny point in our space travel in the great heavens. And we have Einstein, as intellect, metaphysically taking the measure of the physical and writing the most extraordinarily economical equation that has ever been written, making the most economic statement that has ever been made. I think in 100

years Einstein will be called a great poet of the 20th century. He said the most important things in the most simple way when he wrote his equation $E = mc^2$. We have here, then, intellect as metaphysical taking the measure and mastering the physical. We have nothing in any of our experience to suggest that this is reversible--- that energy will ever write equations of intellect. I am very confident that human beings have this very extraordinary metaphysical function in the Universe, and we find that if this is their function, then they are absolutely essential to the Universe."

"Goldy's account differed fundamentally from the prime evolutionary concepts fostered by humanity's scholars at the beginning of the last quarter of what Earthians speak of as the 20th century. For an instance, Goldy explained, that the design sequence and assemblage of humanity's complex- edly associated atomic elements assembled into molecules going into cells, all complexedly assembled and behaviorally programmed by chromosomic proclivities as a functioning organism, as well as the designs for progressively assembling all the other members of the Earthian ecology team, were radio-beam, program-transmitted from elsewhere in Universe to exact locations on Planet Earth. These specific species and individual design control program beamings scheduled the relative quantities of the requisite elemental atoms and the sequence of their sub-associations and general organic assemblies. These cosmically-originated, electromagnetic, photosynthetic programmings are exactly the same morphological WK control codings as those of the complexedly and uniquely intervariable sequences of the guanine-cytosine, thymine-adenine of the DNA-RNA tetrahelix assemblage programming codes and of their subsequent operational proclivities which structural and behavioral programmings (as Goldy explained"

- Cite GOLDDLOCKS, p.K5, Q Jun'75

"earlier) were recently discovered to be governing the unique design not only of all the biological species, but of all individuals within the species--- all the requisite chemical constituents for exactly complying with the coded design instruction are or were present on planet Earth at the time of the original electromagnetic wave reception at the terrestrial loci of species' inceptions, which are predetermined by the unique electromagnetic environment's complex tunability existing only at those loci. Many of the requisite chemical elements

for tunably satisfying those cosmically originated species programs had arrived on Earth at earlier times, coming as stardust or as comet plume fallouts. Goldy explained that the chemical atoms are all physical; whereas the phenomenon life is utterly metaphysical. Life is the fourth, now-you- see-it-now-you-don't, quantum. The metaphysical mind employs these organically regenerative, subjectively interacting, sensing, storing, and intuiting devices as well as all the organism's unique, objectively articulate facilities to harvest critically relevant information.

"Goldy points out to the bears that what has not been understood thus far by human scientists regarding the transmittal of energy"

Man: Interstellar Transmission af _Nan:

"Universe is inherently complex and inherently interaccommodative. But man is no more complex than his Universe. So it's no more unreasonable to assume man a priori as a complex of principles than it is to assume Universe. Therefore, I would assume man arriving on board the planet in some way, and the more we study the fact that we are galaxies of frequencies and patterns of behaviors, and not things... it would be perfectly possible to pick up any of these frequencies and radio broadcast them. I could beam Hans from here to there. We'll do such things in due course.

"This planet is a low pressure area for gathering the Universe together again. And I can see man arriving here as part of that function. So we're a gathering point; and every time a gathering point gets to the place where it needs the mental capability of man on board, man arrives. I see him as something complete.

Man an l/QCfrl Problem Solver: (1)

"The one comon experience of all humanity ie the challenge of problems. Problems are metaphysical entropy. Humans are here to function syntropically as solvers of problems as guided by mind-discovered cosmic principles. No other known creature of Universe has this recourse to the eternal weightless verities than which there ie nadught more powerful in problem solving. Eternally regenerative complex Universe with its vast variety of locally unique phenomena Involves complex local problems which can only be solved metaphysically by the principles discoverable only by the human mind. Here is humanity's function in Universe.

"None of the inventory of generalized cosmic principles is contradictory to one another. They are all interaccommodative. Some of them interaccommodate others synergetically with exponential rates of relative vantage gain. Altogether the known inventory of generalized principles discloses a priori, abstract, eternal Integrity of cosmic design. The cosmic integrity inadvertently discovered through my 1927 commitment to comprehensive responsibility of the designer, thus led to design integrities which conserve and abet the regeneration*

Kanifeata:

"As the prime energy impounder,

The vegetation on the land has to have roots in order to get enough
cooling water So that it will not be dehydrated

While it photosynthesises the radiant energy of the Sun into the beautiful
molecular structures

That provide the metabolic energy exchange means of terrestrial life
support.

The algae floating in the sea Are automatically watercooled.

All this is relevant to our search for an understanding of humanity's
functioning in Universe

For sumtotally Earth manifests what we first sought, A moving locus
in Universe where syntropy reigns.

Thus we intuit excitedly that

The photosynthesis process of orderly molecule production constitutes elegant scientific disclosure That our planet Earth indeed may be One such moving locus in Universe 'There energy is accumulating syntropically Being thereby conserved in a variety"

- Cite BiMih & i-irn), paper, pp. 123-124, 1y73

S71

rtuf ever more compactly and orderly patterned

Biological crystalline,

Liquid, and gaseous substances —

As cosmic complementation of the entropic disorder Ever more mysteriously manifest

By the omniexporting star centers of Universe."

Manifests :

"Inasmuch as We set out to discover Whether man had a function in Universe And inasmuch as We only know of Man As a passenger aboard Planet Earth We sought first to discover Whether Earth had a function in Universe And if this could be found

Then we might find what constituent functions Of Earth Planet's Universal function ton might, uniquely, be performing.

Within the teal complementary scheme Of Universal'regeneration."

-cite HBF Draft BRAIN & MIND, 1.0B (19)

1970 1.8C (20)

KBF uLFihuIUfto

manifest: One:

"As already noted, manifest number one That our planet Earth is just such a syntropic locus is the constant terrestrial acquisition of energies Around Earth's spherical surface As provided by both stardust and cosmic radiation. Note that the cosmic radiation, including the sun's is not reflectively redistributed back outward to Universe, As does a mirrored ball reflectively reject radiation, instead, earth is measurably impounding the radiation By progressive angular refractions which separate The originally lethal radiation dosages into nonlethal fractions And progressively shunt those frequency differentialized radiations From perpendicular to circumferential terrestrial travel Within the biosphere's concentric mantles."

Manifests: One and Two:

"First manifest, is the constant agglomeration of surface matter Provided by the star dust and cosmic radiation Which latter including the sun's

Is not reflectively re-distributed to Universe
By an absolutely reflective
Mirrored ball, but
But is instead inundated by
The progressive refractions
Of the biosphere's concentric mantles.
This mathematically orderly refraction
Of the Sun's radiation into separately discrete frequencies
As it is witnessed in a rainbow
Constitutes manifest number two
Of our sought-for anti-entropic energy concentrating
Mobile local of Universe."

- Cite RBF Draft Brain i Mind 1970

manifest: Two:

"This xarthian biosphere's refraction of radiation .anifests matnematically orderly,
angular sorting uf the bun's radiation
into separately discrete frequencies.

mis is witnessable, for instance in a rainbow, ur m the twilight sky's
Ked, orange, yellow, green, blue, and violet Horizontal stratifications.
This relay system of angle and frequency modulating ana biosphere
refractioning Constitutes Manifest iiumber iWo uf our sought-for func-
tional identity of tARTH As a syntropic, orderly, energy concentrating,
mobile locus m universe."

rtBF DbFIKITIOhS

manifest: Three:

"i-iamfest Three that our Earth is a traveling locus of syntropic en-
ergy concentration in Universe is the demonstrable fact already noted
That all the biologicals are continually multiplying Their orderly cellu-
lar, molecular, and atomic, structurings which metabolic conservation
functioning completes l` he comprehensive pattern integrity equation
Governing orderly cosmic energy export-import balancing."

- Cite BKAIN & I'liifd, paper, p.127, 1973

'Manifest number three

Of our Earth being a local

'//here energies are being collected

And as radiation C

All the biologicals are continually increasing

Their beautiful cellular, molecular and atonic Orderliness of aggrega-
tion. On-board Earth is

A fantastically large activity of

Increasing order

Of the biologicals— the third manifest of anti-entropy.

-1.BA £1.8B

Nature has invented

The green vegetation on the dry lands-- rfhich is only a nuarter of earth's surface-- And the algae around the three quarters of the Earth rfhich is water enclosed.

These two impond the sun radiation

By photosynthesis

Aftiich provide our prime energy intake.

The vegetation on the land has to have roots

Manifests: Three: (2)

"In order to get enough water to cool itself While it transforms the dehydrating energy Into beautiful molecular structures.

The algae floating in the sea

Is automatically watercooled.

The photosynthesis process

Is the third manifest

Of orderly molecule structuring

ff the kind of patterning

We are seeking in Universe—

A pattern of agglomeration, sorting, concentration,

And orderly structural conservation.”

KBF DEFINITIONS

Manifest: Five:

"Fifth J-'anifest is the spherical enmantling of biological residues
As hydrocarbons are pressure transformed into coal and petroleum
Which as fossil fuels stably store the cosmic energy harvest."

Manifests: Five:

"Manifest Number Five

Is that of the geological burying

Of the hydrocarbon (energy ?) concentrates Ever more deeply

And at increasing pressures

To produce and store

Rigid, liquid or gaseous fossil fuels."

1

- Cite RBF Draft BRAIN & MIND, 1.8D (21) † 1970

Manifest: Five:

See Fossil Fuels, 1973

"Having set out to discover evolutionary experience clues As to whether humans have an essential cosmic function--- Despite mis-assumption of exclusively self-eminent roles Only as audiences or actors in the Earthian drama 'Life' --- rfe sought first to learn whether the Earth planet itself Had its essential function in the Universe. Saying to ourselves that if Earth's cosmic system function could be found Then we might differentiate out its subsystem functions Thereby to unc&rer which of Earth's universal functionings Humans might be uniquely performing.

We have thus far found a hierarchy of Five Manifest aZ" Clearly confirmatory of planet Earth's functioning As the only Known traveling focus of syntropic reconcentrations Uf the physical energies of eternally regenerative Universe.

"This powerfully reinforces our initial assumption That we had first to find such a syntropic traveling locus Within the total complementary scheme Uf universal Eegeneratiofl."

- Cite BRAIN & I.I.U, paper, pp. 128-129, 1973

Manifests: First Five:

(1)

"All five manifests are anti-entropic.

They combine to demonstrate

That Planet Earth

Is indeed one of the energy collecting, concentrating and conserving,

Mobile and reliably interorbiting

Locals of Universe

For which we were seeking

as a celestially invisible complementary to the Optically obvious energy distributing Radiant stars.

"Thus it is evidenced

That Earth's energy concentrating

Will culminate /sic?

Millions of years hence

In Earth's becoming a star.

Thus we witness a celestial confirmation

Of Boltzmann's Law

Which states in modernized effect

That within a closed system

There are oscillations, evolutions Between high and low energy Concentrations and diffusions

yanUma- First FAW

(2)

"New lows concentrate and become highs

By exhausting yesterday's highs

As yesterday's exhausted highs
 Become today's lows.
 Boltzmann made his finding
 While checking Avogadro's discovery
 That under identical conditions of energy--
 As heat or pressure—
 All gases will disclose the same number of molecules
 Per given volume.
 Boltzmann's law has been found to hold true
 Outside the gaseous microcosmic
 In which he found it.
 It explains, for instance, the weather—
 The highs and lows of our biosphere;
 And now we find it explaining
 Earth's function in the Macrocosm.”
 - Cite RBF BRAIN & MIND draft, 1.8 D&E, 22, 23, 1970

Manifest: Six:

”A Sixth Manifest of Earth's

Unique celestial functioning in this syntropic manner ./as the
 'Geophysical-fear' scientists' discovery of the impoundment of star-
 energy radiation in both the Earth's atmosphere and hydrosphere,
 which power, temperature, and pressure the weather and ocean
 currents

And maintain the critical local microenvironments

Within which the biological proliferation of photosynthesis And sub-
 sequent organic transformations occur As metabolically fed-back
 chemical exchanges,"

- Cite BRAIN 4. MIND, paper, p.129, 1971

****We now come to man's unique function Aboard the energy storing planet Earth As distinctly differentiated From the first five manifests.**

Man's mind-over-mattering
Is distinguishable as Manifest Number Six.”

- Cite RBF Draft BRAIN & MIND, 1.8F (23) 1970

Manifest: Seven:

See Fossil Fuels, 1973

”Thus we come to man’s own unique functioning
Aboard the energy-st on ng planet Earth,
As distinctly differentiated out
And contrasted to the first seven lanifests

Of Earth's cosmic syntropic concentration function Within this moving planetary locus of Universe.

Thus man's mind-over-mattering distinguishes itself As cosmic function i-.anifest Number Eight.

Over and above its syntropic
Physical sorting and rearranging
Cerebrally reflexed planetary capabilities
We find humanity's metaphysical problem-solving capability
To be uniquely and exclusively referenced
To the complex of eternal principles.”

KBF DEFINITIONS

Marx. Karl:

'•Karl Marx assumed the scientific validity of both Malthus and Darwin with their combined `fundamental inadequacy of popular life support' and 'survival only of the fittest.' He assumed that the working masses were the fittest because, though dumb, they Instinctively understood how to cultivate agriculture, husband animals, and work the craft tools.

Wherefore the great pirates, the nobility, and the bourgeoisie who serviced the nobility, were parasites and must perish. Marx also assumed that the genetic difference between the nobility and the masses was valid; ergo his fundamental class warfare inherent in the economic

inadequacy to support both. He also assumed the necessity of downgrading standards in order to stretch support systems to serve all; and he assumed minority-party rule by dogmatic adherence to nonindividualistic code, and annihilation of the treacherous 'other class.*"

- Cite Fragment on RACE, 7 Aug'70 'Marx, as a philosopher-scientist (in the first place a scientist is a man of very great integrity) did his thinking at the time when the leading physicist was Dalton. Dalton was then at the mental stage of the interpretation of the experimental phenomena where he thought they really had found the smallest thing, the atom. ^xhere was no nucleus, just atoms. They were not broken up into protons or anything else. It was just atoms and they thought they actually had found what Democritus had talked about. It was invisible, below sight, but there it was. . . Marx then as a philosopher of the highest integrity dealing with the latest information of the physicists, was convinced that there really was a hard core thing. He was convinced that the strong armed man was always going to get ahold of the hard things and that the people were going to suffer. There was no question about his conviction. I am convinced that if Marx were alive today he would be excited about the discovery that there is no smallest thing. There is nothing that the tough man can get ahold of."

- Cite Oregon Lecture #4, p. 123. Jul'62

"If Marx were examining the present data he would form an entirely new kind of philosophic interpretation and he would see that everybody was really protected by the fact that the only way you could get on here would be to learn about principles and that they are completely abstract and that society was about to emerge into an entirely new era. It was really being emancipated.

He would not have developed his dialectical materialism. That would not have been in his conclusions."

RBF DEFINITIONS

Mass:

Vectors, being the product of physical energy constituents, are 'real,' having velocity multiplied by mass operating in a specific direction; velocity being a product of time and site modules; and mass being a volume-weight relationship. On impact, mass at velocity transforms into heat and work..."

Kass :

"Lj,n stein said any phenomenon which seems to be a mass is some kind of energy self-entanglement wheee the energy is running into interference with itself and the energy operation will be at 186,000 miles per second, but it is running into something so it is getting shunted inwardly, so it is going around in circles, by running into itself from other patterns. . . . all you and I see is this ball rolling along, and it doesn't seem to be rolling very fast but within the ball everything is going around at 186,600 miles per second. . . einstein said the amount of weight, how tight you package this thing up, will give you a clue to how much energy there is in it."

- Cite Oregon Lecture #3, pp.78-79, 5 Jul* '62

. M (mass) means: all the universe's selfinterfering complexes having concentrically selfprecessing, local-focal-holding patterns resulting in locally regenerative constellar associabilities as positive-outside-in structures."

Cite INTRODUCTION TO OMNIDIRECTIONAL HALO, p. 126, 1959

Ma 88:

"In Einstein's formula mass constitutes all the patterns of precessionally self-interfered and concentrically shunted, ergo locally articulated and locally and periodically regenerative holding patterns of energy. This is also to say that M equals all the locally complex, concentric, self-associative, unique holding patterns of aHJenergy. . . ."

Cite INTRODUCTION TO OMNIDIRECTIONAL HALO, p. 124, 1959

Mass:

"Mass is a word of inherently synergetic connotation. It is a behaviorist word popularly mistaken and used as a static word. Mass recognizes and inherent plurality of unique consequences resultant upon any infra- or ultra-sensorial recognizable, i.e., timable, collection of regenerative systems of precessionally self-associative energy-vector events. All the atoms and stars, as well as all the macro-remote astronomical cluster nebulas and remote micro-molecules, are such unique synergetically regenerative, infra-ultra-sensorial, unique multi-atomic mass clusters."

Pass Attraction:

"Pass attraction is to precession

As a single note is to music.

Precession is angularly accelerating fgeneratively progressive

Pass attraction."

- Cite IK'HJITI?:. Vaft Hee 70, p. 7a

"Nothing could be more fundamental to all of science than the phenomenon 'mass attraction,' which Newton was able to formalize. For instance we hang two masses or spheres from the ceiling and measure the distance between the centers of gravity of them spheres. • We find that they are closer together not only from the points where they were hung, which could be accounted for just by the fact that we are on a sphere and the radii of a sphere are divergent, but they are closer than □ that. If you move one of them halfway toward the other and measure the distance between the centers of gravity, you will find that it has moved in much closer. If you keep moving in progressively, halving the distances, you discover as Newton did, that the

relative attraction is in terms of the second power of the relative proximity. When you halve the distance between the two spheres you do not double the attraction; you forfold it. So as you get in very close, as atoms are close to one another, you begin to have things with very extraordinary kinds of coherences."

l<-ast in the Eartp

"I find that man has thought structurally in what I would call inefficient compressional logic whereby he piled stone on stone to make a building. He could also dig a hole and have planted the base of a pole and have rigged tension stays from its top to three or more anchors in the ground. This is the way he put a rigid, solid mast in a rigid, solidly framed and planed ship. In traditional land building tension is only a secondary helper and compression the employed primary structural logic. This is to say that I find most of the world's peoples thinking spontaneously only in compressional structural might-makes-right logic.*'

- Cite Tel Aviv Address, Dec '6?

"Man has tended to think of structure as being built solid in the Earth. He made a hole in the solid Earth and put a solid mast in it. In order to keep the wind from getting hold of the top of the mast and breaking it, he then put a tension member in the direction of the various winds, acting at the end of the lever to keep it from being pulled over.

In this way tension became the helper. We found that he built what he thought was a solid boat, and then put in a solid mast, and then added on tension helpers as shrouds. Tension has been secondary in all man's building and compression has been primary for he has always thought of the compression as solid, Man must now break out of that habit and learn to play at nature's game where tension is primary and where tension explains the coherence of the whole. Compression is convenient, yes, very convenient, but always secondary and discontinuous."

tost in the r-arth: mHfSHMBHRESHB

'•If I wanted to have a mast on the face of the Earth it would take me a minimum of three legs and a tension member to hold those legs down so it takes four members. I can have one compression member and three tension members or three compression members and one tension.

It always comes out four. I can put the hole in the ground and we will find that it still comes out four. We might have the mast bending over and it would take two tension members to hold it up, that is called a gin pole, and then it takes a fourth member of gravity to pull the other end down so there are four members operating. You could do that with two compression legs-- sometimes called a Jack in the Navy, and one tension member, and gravity-- four members every time. So there are four degrees of freedom and the local twist you will remember which gives us twelve. I began to see then that we would always have these kinds of fournesses operative."

Mathematics:

"Mathematics is metaphysical.

"My definition of Universe embraces both the physical and the metaphysical, the latter being all the weightless experiences of thought which include all the mathematics and the organization of tfee data regarding all physical experiments, science, both first and last, being metaphysical, *

- Citation t context at HataBtaaical 1. Physical, 20 Jun'66

Mathematical

"Mathematics. • • embraces MHMBO the fundamental communications systems of all the sciences. . □ It is also the most generalized of all the scienmmtific disciplines. It is both the most comprehensive and abstract of the sciences and tends to evolve less rapidly than physics or chemistry. Mathematics generalizes all sciences and all other sciences must use it."

"Mathematics • • • is, in fact, the science of structure and pattern in general."

- Citation and context at MIT Sequence (2) (3), 1965

Mathematica;

"I was fortunately not as consumed with negativism in respect to professional mathematics as with a positive urge to explore the possibility that nature might employ a comprehensive coordinate system governing all her associative and disassociative nonsimultaneous, usually dissynchronous but sometimes synchronous transformative transactions. I felt certain that nature did not have separate departments of physics, chemistry, biology, cryogenics, crystallography, Mathematics et al., between whose department heads' compromises were-mass concluded in order to expedite nature's awkward and ever urgent demands.

"I conjectured that we could think conceptually in generalized principles in contradistinction to special case empirics and that we might logically hypothesize either (a) that mathematics was entirely physical or (b) that the physical was in reality" pure abstract principle; that you could play the game either way--- both were valid, but not simultaneously--- that there certainly were not two absolutely separate and independently operating Universes the abstract Universe of the mathematician and the energetic Universe of the physio-chemist."

- RBF inaugural address, pp.5/2-5/3: First International Congress for Stereology. Proceedings. Vienna. 18 Apr'63

Mathematics:

' ` When Euler introduced topology he for the first time made the beginning of the return to conceptuality out of seemingly complete abstract mathematics , where you would come into completely empty sets you thought, where you could have complete substitution of symbols for numbers and you could just play the game of symbols. Euler said, we are dealing in pattern. Mathematics is pattern, he said and there are irreducible aspects of pattern. . . "

- Citation & context at Euler (1), 11 Jul*62

Mathematics:

"Mathematics, which most people think of as dealing solely with number, is in fact the science of structure and pattern in general."

(Also Third Lecture

"Mathematicians . . . erroneously thought that they had attained utter abstraction, or utter nonconceptuality--- ergo, 'pure* non-sensoriality--- by employing a series of algebraic symbols substituted for by calculus symbols and substituted for again by 'empty set' symbols. They overlooked that even their symbols themselves were conceptual patterns and only recognisable that way and that all pattern?, for instance numbers, or phonetic letters consist of physical ingredients and physical experience recalls. The physical ingredients consist inherently of event-paired quanta and the latter's six-vectored, positive and negative actions, reactions and resultants, else they would not have become employable by the deluding, experience-immersed •purists."

Matter:

"Sconce states that the entire physical Universe is energy. $E = mc^2$. Some of the energy is operative in associative patterns--- as matter. The associative energy as matter is organised in leverage systems to do work."

Cite HOW TO MAINTAIN MAN AS
A SUCCESS, 18 Mar*65 P. 229

Matter:

"When the end of one energy action comes over the middle of another energy vector there is a processional effect, a tensional effect. One energy event gets angularly precessed and the next energy event goes by the center of another mass and each one of them are interaffecting the other. It is a basketry interweaving where each one precesses the other angularly so that they hold together very much as a cotton ball. This is just what Einstein was working on in his $E = MC^2$ trying to explain a given mass and the way it interfered with itself to give itself this local uniqueness of relative concentration, because these precessions can give you angular changes and it gets tighter and tighter which will give you unique frequencies and every one of our chemical elements has these unique frequencies and you can actually pick them out on the electromagnetic spectrum by a plurality of MH usually four unique frequencies characterizing each of the elements."

McLuhan, Marshall:

"Marshall McLuhan told me the first day he met me--- on one of the early Doxldis cruises--- 'I am your disciple.* Ha held up copies of 'No More Secondhand God' and 'Nine Chains to the Moon' and said to me: 'I've joined your conspiracy!'"*

*McLuhan has never made any bones about his indebtedness to me as the original source of most of his ideas. The 'Global Village' indeed was my concept. I don't think he has an original idea. Not one. McLuhan says so himself. He's really a very great enthusiast, a marvelous populariser and teacher. He has an irrepressible sense of the histrionic, like no one I've known other than Frank Lloyd Wright.

"My idea of 'Man backing up into his future,' appears in his books as 'Rear-Mirrorism.'

"My concept of the 'Mechanical extensions of man' is the basis for his talk of the 'Electrical Extensions' of man.

"What McLuhan is is most of that breed, phenomenal memories a Professor of English literature and, like a very fast reader. He has one of the most I've ever run into. McLuhan felt that there"

McLuhan. Marshall;

(2)

"were many things being written of great cogency but which society was missing altogether. This is the source of his missionary zeal and fervor.

After dinner on the Doxiadis ship we used to dance and Marshall would dance with his wife all over the place, so much so that he took up the whole dance floor. He thought we had all stopped to marvel at his and his wife's performance, but that wasn't it; the way he was dancing there wasn't room for the rest of us and we had to leave the floor.

"And I remember one time on a live television panel at a P.E.N. meeting in Canada when McLuhan's critics were really giving McLuhan a pretty rough time. He relished in it and would infuriate the critics by completely ignoring their most telling attacks. I started taking up for him and coming to his support, but I abandoned this as soon as I realised that it was Just all a big game to him.

"McLuhan has always been the first to say 'Bucky is my master. I am only his disciple.'" - Cite RBF to EJA, 31B, 200 Locust, Phila., 10 Jul'73

"In a sense, my glasses--- I'm very farsighted and have been wearing glasses since I was four years old--- have become a part of me. I recall being invited in 1930 to speak at Dartmouth College, in what they call Dartmouth Hall. Seventeen years later, in 1947, I was asked to speak at Dartmouth again--- and again spoke in Dartmouth Hall. After being introduced as having been there 17 years before. I stood up

and said that while I didn't like to be contradictory, actually I hadn't been there before. My host looked a little surprised, and I pointed out that in the interim Dartmouth Hall had burned down and they had rebuilt it. Moreover, in that 17 years, all my flesh had completely changed--- there was none of the 1930 flesh left. In fact, the only important physical evidence that *I' had been there 17 years before were my eyeglasses: they were the same ones as before. But nothing else about me was the same. Quite interesting to discover that part of the function 'me' was really more permanent than, yet not of, my integral flesh."

RBF DEFINITIONS

Measurement:

"Definition of Intellect: The metaphysical measures the physical, but not the reverse, i.e., local irreversibility."

- .in

- Cite Intellect: Equation of Intellect. 22 *pr'71

Measurement;

"Because primitive sensing is tactile man measures his distances horizontally in feet, vertically in hands..."

- Citation and context at Brains TV Studio (1), 6 Jun¹69

Measurement: (1)

"Heisenberg's principle of indeterminism prohibits any exact measurement or absolutely exact physical agreement of mechanical or structural fitting. As a consequence, engineering and mechanics can only reduce the degree of error to be tolerated. Scientists must be content with relatively elegant agreements. 'All the truth and nothing but the truth,' as pledged under imposed oath giving in courts of justice in many countries, is vainly pledged, for, contrary to

indeterminism, absolute 'truth' is assumed to be legally demonstrable in the eyes of the administrators of humanly invented law. Detection of any natural aberration, witting or unwitting, may bring prosecution and conviction for false testimony. For a long time mechanics have known what Heisenberg--- and science through him--- so recently discovered to be true: that Universe forbids realization of exactitude. The Heisenberg indeterminism implies eternity to be persistent within the physical and metaphysical everevolving continuity-finiteness of scenario Universe, in which the myriads of nonsimultaneously shaken kaleidoscopes are never either simultaneous or identically repetitious.

Having both the finiteness discovered by modern physics”

- VEKTIChL IS TO LIVE— HORIZONTAL lb TO DIis, pp.40-41, Dec '69

Measurement:

"as well as eternity imposes a limitless change, ergo, a never repeating an irreversible omnievolution. Although he had never heard of Heisenberg, the skilled machinist could see long ago that the best he could do was to reduce the amount of error he might tolerate and with very surprisingly desirable results."

- Cite VERTtyAL IS TO LIVE** HORIZONTAL IS TO DIE,p.41 , Dec '69

"Heisenberg's principle of 'indeterminism' which recognised the experimental discovery that the act of measuring always alters that which was being measured, turns experience into a continuous and never-repeatable evolutionary scenario.... The question. 'I wonder what is outside of the outside of the Universe*' is a request for a single-picture description of a scenario of transfer nations and is an inherently invalid question."

- Cite **OPERATING MANUAL FOR SPACESHIP EARTH**, p.65, 1969

Measurement:

(*)

"... All magnitudes of length, area or volume are ascertainable, or conceptually processible, only in terms of arbitrary selected experience modules, employed as regularly repeated increments of measuring use, which measuring act always involves time increments of our totally available time of life and may be conceived of only in respect to local events, in non-simultaneous universe, there being no overall largest size to be referred to.

Furthermore, Heisenberg's experimentally demonstrated 'Indeterminism' shows that the act of measuring always alters the measured phenomenon wherefore all measuring is inherently inexact. For all the foregoing experimentally demonstrated reasons Einstein was able to show that every individual's every time employed yardstick of time, i.e., the cyclic increment of imaginary reference, is always unique and different from others, a difference which amplifies greatly as we enter into astronomical 'observing' by individual instruments whose progressively designed *•

Measurement:

"A steerable rocket is a complex of internal and external activities both mechanically and chemically. Since either an airplane or a steerable rocket are complexes of internal and external motions in universe independent of earth and since the earth is in independent motion

complex in respect to the sun, and other planets, and since the sun is engaged in a plurality of internal and external motions in respect to the galactic system and since the galactic system is a complex of motions in respect to other galaxies and super-galaxies and so on, and since the whole set of motion events are non-simultaneous, and since the inter-effects of the events vary vastly in respect to aeons of time, it is obvious that any meaningful, conceptual coordination of event interrelationships is inherently limited to a relatively local set, in a time sense, and that the relationships may only be measured in respect to the angle and frequency magnitude characteristics of any one subsystem of the totality."

"The meek have inherited the Earth but the lawyers have not probated the will."

- Cite RBF to EJA recapitulation of common theme in hie writings, published and unpublished. 13 Feb ¹ ?2

"The Scriptures were right: the meek have inherited the Earth. But they do not know it. Though irrevocable, the will has not yet been finally probated in the court of public comprehension. The will says, 'The prospects for humanity are metabolically excellent, intensely interesting, culturally fabulous, and of ever greater intellectual challenge.

•'But the will, it must be noted, makes all of humanity its beneficiary. It does not favor or promise unique prosperity to any exclusive blocs of humanity. For the professional secretariat of the Daughters of the Punic Wars; for political spoils systems; for national sovereignties; for annual trade balancing with gold and its concomitant exchange

depressions and resultant human wage-and-purchasing-power inequities; for any social, economic, or psychological differentiations of human originis or color; for might makes right; for purchasable accoutrements, architecture, equipment, and gadgets of distinction; and for the plethora of behavioral obnoxica

imposed or induced by the supposed inexorability of the Malthus-Darwin theorem of survival only for the slick fittest, it is curtains."

- Cite THE PROSPECT FOR HUMANITY, WDSO Doc. 3, p.65, Aug'64

"The will of history reads 'for everybody or for nobody,' and since we balk at 'for nobody' it has to be 'for everybody.' And that's the way it's going, lickety-split and the world around."¹

RBF DEFINITIONS

Memory:

'•By World War II we had come to almost two million chemical compoundNow the human mind can only retain a ctrtain number of items within a given pattern. At least that is my conclusion. I would say I can remember approximately 5,000 namesof people but these are all special cases and there is nothing logical about it. There are limited sizes of vocabularies, for instance, I can remdbber the name of almost every man of the first ship I was on. I don't see any of these men ever any more and I don't really need to remember the names as they are of no use to me. But I meet many people every day and I can't remember their names because the cubby holes are all filled up with those earler names. They don't come around to get their mail and I can't

put anyone else in their rooms. So if you were to just try to remember all the chemical compounds, you couldn't remember them all and you would be in desperate trouble when you are not able to remember more than 5,000. . . . The kinds of questions I used to hear asked a few years ago on the radio quizzes seemed to me to be the kinds of questions you could not afford to be bothered with, ./hat I saw that you could do was go in the direction of what we call generalization."

"Two gears that do not mesh can only be brought into tangent proximity and take up more room than do meshing gears. Frequencies given off entropically that don't mesh with energies given off by other systems take up more room in Universe, Therefore we have a physically entropic

Universe that is everywhere locally taking more room, ergo expanding, and increasingly disorderly from the short time-span local viewpoint."

- Cite Museums Keynote Address, p. 12. 2 Jun'71

- J 0 52.52)

Meshjnh & Nonmeshing:

"As the energy comes off it may not fit the energies of the other system, every chemical element having its frequencies So the frequencies don't happen to mesh . . . and frequently can be thought of like a gear: it has very many little teeth and a relatively few big teeth to each cycle. So if the gears don't mesh, then they take up more room than when they do mesh. So if the energies being given off are continually

taking up more room, because the gears are not in a plane.

They're omnidirectional. This brings about an observable relative increase of disorder."

SV*r/<4rr+- fl/TfePY S-EC. *uszzi*

Cite WATTS TAPE,

pp. 46-47, 19 Oct'70

"All physical systems are always losing energy, iian has called this entropy; though the individual system itself may be very orderly,⁴ the timings of different energies leaving different systems may not necessarily mesh with the timings of energies leaving other systems which may also be orderly in themselves. The reason that they don't mesh is that they are coming from different complexes of chemical elements. Since every element has its unique frequencies, we have gears that cannot interlock and must consequently remain tangent to one another. Hence they take up more room than they would if they had meshed. However, if we were able to observe for long enough, we would find that some of those ears would eventually fit together. But it might be a 'thousand years or twentyeight and a half years or seventeen seconds. The important thing to note is that there is a great period of nonmeshing and that makes the physical appear to take up more room."

"We are at the point of completely unexpected events of humanity. We have human beings being born absolutely helpless physically. And they are not self-sufficient for physical life support until the umbilical cord is severed. But metaphysically they are still dependent on the parents for survival. The mind has to develop all its experience of generalized principles like the lever to achieve the independence of mind over muscle. When the child in the womb leaves off the umbilical cord it means the completion of the development of his physical independence. But as long as the parents did the metaphysical life support for the infant they were the news. They were the metabolic.

"The same kind of thing has happened now on a world-around basis. The radio and the television are presenting a new kind of voice program in everybody's language. And the young world— all of humanity— is changing from its dependence on the parents, the old world of muscle-over-mind. And what is changing is that the authority is changing. The authority used to be the parents and the notion of might-over-right and now the new authority is this universal radio-televens voice programs which herald a sort of metaphysical cord comparable to the umbilical cord. It is what I call the metabilical cord: and

Metal:

"The great new tool of this age is metal from which has been born mechanics or directed mechanical motion, which is governed fourth dimensional design. It is metal that has made possible centralized production, transportation and distribution through multitudinous channels. Metal has made possible the automobile, the railroad, the airplane, telephone, telegraph, wireless, the clothes on our back and all our food, and our city skyscraper. Generally and structurally speaking, we use it in our houses in the form of nails only. Structurally the characteristic of the new tool, metal different from any of the tools of other ages, is its fibre or tensile strength, tremendously in excess of any other tensile unit ever created. For example a small wire rope may be seen lifting a great locomotive. In compression metal does not exceed stone to any marked degree. That is why heavy metal leg tables are inharmonious to our sensors."

?Wlg: Recirculation of Mgtalff: (a)

"Now suddenly we learn that there are other kinds of resources in this vegetation impoundment. There was some metal; and we learn that through the weapons and through the tools. And then there got to be something made of tools, which was the production, which is a very different thing that we call industry today. And then came realization that there was tin in the Malay States. And tin can be flowed very, very thinly on to sheet steel. And you can use sheet steel very, very thinly,

and yet quite adequately; so tinning of the steel brought about the tin can; hermetic sealing. For the first time--- you had to be where the food was or you died because it would rot; and you did learn grains, and you get into wheats and mealies that could last some longer and be transported, but all of that's rotted. So there is something in that can; for the first time you could send it away. So you didn't really have to be at a place any more.

"The metals and the new tools brought about an entirely new relationship-- but these were not planted around the world the way the vegetation was. There was a very different world pattern, in fact, as you began to get into them. Just like your telephone*

- Cite RBF to Arthur Anderson & Co. (p.4), New York, 13 Mar'74

"instrument; you cannot have that instrument without getting metals from three continents of our Earth. So the complexity of this new technology involved the resources of around the Earth and not the local. This had been so strong on the guarding— the conditioned reflexes— there were enough changes by World War I for the simple reason that it was due to the metals rather than the vegetation....

"This is really what has been going on in the last 100 years. So we have then this new picture of man dealing in total world resources. World War I then was the first time when we went over from man-as-muscle-on-the-farm and this hunting, and so forth, and fishing--- to man empowered by tools. Because the essence of World War I was: Who is ready to produce the tools that made tools? Production is the word for World War I and it was, then, the first great energy war."

"We must redesign the use of the world's total resources in such a manner as to make those now engaged exclusively in the service of only 44 percent of humanity adequate to the effective service of 100 percent of humanity at higher standards of living despite a continually decreasing inventory.

"For instance, all our metals are constantly being melted up and re-circulated. Out of all the copper mined in all history, only 14 percent is not at present in an averagely recirculating 22-year cycle of use; and the 14 percent which is not in present recycling use is now in munitions ships at the bottom of the ocean. Sixty-five percent of all our steel is now made out of scrap. That is roughly the ratio of recirculating metal to new mine production in all of the metals categories. It is perfectly practical to think about taking the metals out of obsolete automobiles, taking all the two-ton automobiles off the road, melting them up and making twice as many higher performance one-ton automobiles from the same metal. You may say that you don't want more automobiles--- that the parking problems are too great. In speaking of automobiles I am speaking of a familiar industrial tool. I am not advocating more autos. I am simply considering the feasibility of the"

Metaphysical Experience

"Because the physical is time, the relative endurances of all special-case physical experiences are proportional to the synchronous periodicity of associability of the complex principles involved. Metaphysical generalisations are timeless, i.e., eternal. Because the metaphysical is abstract, weightless, sizeless, and eternal, metaphysical experiences have no endurance limits and are externally compatible with all other metaphysical experiences. What is a metaphysical experience? It is comprehending the relationships of eternal principles. The means of communication is physical. That which is communicated, i.e., understood, is metaphysical. The symbols with which mathematics are communicatingly described are physical, A mathematical principle is metaphysical and independent of whether X,Y or A,B are symbolically employed

Metaphysics:

"Metaphysics embraces all experiences, such as the phenomenon 'Understanding,' which does not move a pivoted needle. The invisible metaphysical Universe of pure principles complements the physical components to realiae in pure abstract principle the empty yet structurally stabiliaing invisible triangles."

- Citation t context dt Invisible Tetrahedron. (1)(2), 27 May'75

Metaphysics;

"But in developing their now rigorously accountable discipline for dealing with all ponderables the physicists said, 'there are also a great many earnest men who are engaged in scholarly exploration but are not dealing in ponderables (weighables)' The mathematician

himself is dealing in unweighable phenomena. So also do psychologists and other have weightless information to explore. These men cannot belong to our Physics Club. They must remain outside our club in the metaphysics world.'

"The word metaphysics was, at that historical moment, somewhat of an affront for it seemed to imply magic and questionable concepts. Metaphysics had been connected by literary men with inexplicables: nonexperimentally demonstrable phenomena. So there was a great deal of resentment on the part of the no-hard science scholars who were excluded from the Physics Club and were relegated to the Metaphysics Club. However the economists and most of the other metaphysicists failed to understand the full significance of the new physics and went on thinking in classic concepts of instant Universe and its seemingly inherent self-annihilation. They as-yet abhor 'spending' because ignorant of the new physics."

- Cite NASA Speech, p.30, Jun'66

Metaphysics:

"We have no experimental proof of magic, ergo, there is no connotation of magic in the word metaphysics as I use it."

Cite NASA Speech, p. 32 » Jun*66

Metaphysics: (1)

"The physicists . . . had deliberately excluded what we call metaphysics. They only included pfindables--- those things they could weigh. They had great success, but at the expense of many human occupations. My definition /of Universe/ became important because I included the dreaming, and not just the other good disciplines but some of the nondisciplinable, Now inasmuch as all our experiences begin and end, they are all finite. It is very important for us to

realize that our experiences are a set of discontinuous finite packages of our awakenings and our going to sleeps and we get very finite increments. Because our experiences consist of finite packages, the aggregate of finites is finite, so my definition of Universe is finite. Now this gives me the same kind of advantage that accrued to the physicist regarding just what we call the energy universe. At least I seem theoretically to be in that position. I am used to generalization and to my mathematics, so once I have accomplished what seems to be a finite definition of Universe I wonder if this cannot be turned to advantage because one of the corollaries of synergy was that the known behavior of

- Cite Oregon® Lecture #2, pp.58-59, 2 Jul'62

"the whole, plus the known behaviors of some of the parts may lead to the discovery of other parts. I now have a definition of the whole and I know some of the parts so it may be that we have a very powerful way of discovering other parts. I have a synergetic advantage of the highest order. I have got the universe itself; not Just the physical Universe."

Middle;

"Comprehensively, geometrically, outwardly and inwardly, macrocosmically and microcosmically, I find that man is really in the middle. He's in the middle between a macrocosmos and microcosmos geometrically. Now to be in the middle— you really can't improve on the middle. So when they begin to talk about improving man, I realize they can't improve on the middle. They could get us to be just a little bit more what we're designed to be, which means that what you do is to reduce the imperfections, the inaccuracy of the observation,

"And that's exactly what Heisenberg discovered: the act of measuring alters that which is measured. So we will never be able to be completely exact. But the mechanic has what he calls a tolerance— a tolerance for error. As we reduce the tolerance for error, we begin to get near the eternal, which is what we'll call the truth. But we'll never quite get there... man being pretty much in the middle, as is the truth itself in a kind of twilight zone on either side of the truth— both microcosmos and macrocosmos, kind of closing in on it. No chemist is going to improve that situation." - Cite RBF in transcript of Edward Newman TV Interview, Feb'73

Millay: Edna St.Vincent Millay: (1892-1950)

"How now, my insulated friend What calm composure can defend
Your rock; when tides you've never seen Wash out the scans of what
has been And from your island's tallest tree You watch advance what
is to be. The tidal wave devoijs the shore There are no Islands any
more.*

- Frequently quoted by RBF as at the end of his Address THc HABIT-
ABLE CITY, 14 Oct. '69.

hUIAX. MM St. Vincent: <i)

"Edna St. Vincent Millay was born In Rockland and roared In Camden at the foot Mt, Meguntlcock in the years before World War I. Looking out on the islands of the bay, she frequently wrote poems about that inspiring scene. In the early twenties, haying moved inland, she wrote the poem 'Mist in the Valley' which laid bare her love for the Penobscot Bay scene.

"These hills to hurt me more,
Than am hurt already enough,

Having left the sea behind, Having turned suddenly and left the shore
That I loved beyond all words, Even a song's words, to convey.

"And built me a house on upland acres, Sweet with the pinxter, bright
and rough With rusty blackbird long before winter's done But smelling
never of bayberry hot in the sun, Nor ever loud with the pounding of
the long white breakers---

"These hills, beneath the October moon,"
- Cite BEAR ISLAND STORY, galley p.30, 168

Millay, Edna St. Vincent: (2)

"Sit in the valley white with mist
Like islands in a quiet bay
Jut out from the shore into the mist
Wooded with poplar dark as pine
Like points of land into a quiet bay.
(Just in that way
The harbor met the bay.)

"Stricken too sore for tears. Inland, remembering the islands and the
seas lost sound □ □ * » *

Life at its best no longer than the sand peep's cry, Tilling an upland ground!

"A quarter of a century later Edna Millay was living in England as World War II approached. She wrote and published an extraordinary book of poems called 'Brighten the Arrows,' an expression used by the English yeoman centuries earlier when war preparations occurred. In this book she disclosed her poet's vision of the future, in which the ages-old strategic significance of the natural physical isolation of the British Isles--- lying as unsinkable ships commanding all"

- Cite BEAR ISLAND STORY, galley pp.30-31, 1968

Millay, Edna St. Vincent: (3)

"the great Atlantic porta of Europe--- would be forever terminated. Her writing fortifies the historic fact that poets are the earliest to foresee and express almost all of the important concept changes in the evolution of humanity's development around the surface of the spherical Space ship Earth.

"How now my insulated friend,
What calm composure can defend
Your rock when tides you've never seen

Wash out the sands of what has been, And from your island's tallest tree
You watch advance what is to be?

The tidal wave devours the shore.
There are no islands any more.

"Thus Edna St. Vincent Millay foresaw the inexorable development of a one-town world and its progressively crossbreeding world citizenship lying around the spherical bottom of the sky ocean. Modern technology in general has terminated the fundamental isolation of any part of the Spaceship Earth's surface from another part. It is effectively integrating humanity as its individuals live ever more dynamically around our spaceship's spherical deck."

- Cite BEAK ISLAND STuHY, galley pjl, 1968

"Because poets too conceive in very abstract and very real patterns too, we quote an appropriate pattern citation also appropriate to accelerating history paced by science and technology and its extra-corporeal transformations."

• ' 'This little life

From here to there—

Who lives it safely anywhere?

Not you my insulated friend What calm composure will defend You
rock, when tides you've never seen Assault the sands of what has
been And from your island's tallest tree You watch advance ' /hat is
to be.

The tidal wave devours the shore There are no islands any more."

Minimum Awareness: "Awareness seems to be the one minimal word best expressing the experience of life.... A philosopher may question that statement saying, 'No you are wrong because awareness can be exclusively of self.' But we reply by recapitulating the inherent minimum topology of awareness:

- minimum self and minimum otherness are both systems; each having both insideness and outsideness;
- one part of a system cannot exist without the other;
- an experienceable point is substantial;
- all substance has insideness and outsideness;
- all substances are divisible into minimum substances;
- each minimum substance is always a whole system; and
- each system always has insideness and outsideness and four minimum-system-defining events, all of which events are inherently nonsimultaneous and overlapping- ly co-occurring.

"Ergo, the minimum cognition employs the information sensing, remembering, and recognising circuitry of the organic-substance'a minimum self-sensing awareness, which could only be at a minimum one as a system of four minimum-event components, being aware"

- Cite SYNERGETICS. 2nd. Ed. At S_c.s 505.71-.72 from RBF typescript of 9 Jun'75

Minimum Awareness: '

"of its own integral system's otherness-defining components. Ergo, experientially, no otherness: no awareness. O.E.D.

"All minimum otherness or all minimum-observer self are both plural unity with mutual interawareness. Interawareness means one system aware of another system or the outsideness of a system aware of MB its system's insideness."

- Cite SYNERGETICS. 2nd. Ed. At. Secs. 505.72-.73; from RBF typescript of 9 Jun!75

"From Euler we know that the number of locally identified minimum entities called points plus the number of separate areas equals the number of lines plus the number two. In minimum awareness we have two identified entities which, being local points, must have directional fixedness against the background of nothingness. Ergo, in minimum awareness two points plus one area of nothingness have one inherent line of most economical interrelationship between the two points, which two points plus one area equal the number of lines, "The Euler 'plus one' abstractly accommodates two in the minimum awareness model:

point + area lines + 2

$$2 + 1 = 1 + 2$$

$$3 = 3$$

Three of two kinds » three of two other kinds - six of four kinds `` the six vector edgem relationships existing between the four different event-point fixes. Points are subdifferentiable systems; i.e. microsystems of event points too far apart to resolve. Areas are supradifferentiable systems; i.e., macrosystems of event points too far apart to resolve. The nothingness area is one MBB unbounded by any visible closed"

- Cite SYNERGETICS, 2nd. Ed. at Secs, 505.S2-.83 from RBF typescript, 9 Jun*75 n|ine. Nothingness is the part of the system unencompassed by the observer."

Minimum Sphery:

"The transcendently Irrational constant π) is irrelevant to spherical geodesic polyhedral array calculations because the minimum sphere is a tetrahedron. We have learned that a sphere as defined by the Greeks is not experimentally demonstrable because it would divide all Universe into outside and inside and have no traffic between the two. The Greek sphere as defined by them constituted the first and nondemon- strabe perpetual motion machine. Because there could be no holes in it, the Greek sphere would defy entropy, A sphere with no holes would be a continuum or a solid, which are physical conditions science has not found. We could dispense with all Universe outside the Greek sphere because Universe inside would be utterly conserved and eternally adeauate to itself, independent of the rest of Universe outside."

"une quantum ... turns out to be also the minimum structural system in the universe."

- Cite RBF at SihS, U.ss., Anherst, 22 July *71, p. 22

"Now I have what I call a system and it is a triangle of equal structure, a structure being a selfregenerative, interpositional stabilization of energetic events. Now a system divides all the Universe outside the system and all the Universe inside the system. In my thoughts I can have a macrocosm and a microcosm, within this and without this--- and a little bit if the Universe goes into the system itself. 80 the minimum subdivision of Universe where we can say this is inside and that is outside: I can't get it at one point and I can't get it at two points, or at three. I can't get it until I get four points. With four points I then get insideness and outsideness--- the minimum system is a tetrahedron. There are four triangles. This is a minimum system. This is not only a minimum structure, it is the structure: there are no other structures. This is what I call a structural system because it subdivides the Universe into this entire triangle--- regular or irregular."

Mistake:

"I'm quite content that evolution is full of great wisdom. Human beings have always been---always will be--- born naked, absolutely helpless and, as that beautiful cerebral equipment comes with no experience, therefore ignorant. They've also been given hunger, thirst, the procreative urge, curiosity. These have forced them to make trial and error, trial and error. So the only way humanity has ever got anywhere is by making mistakes, by learning what is a mistake. The mistake is the very essence.

"Fathers and mothers have enormous love for their children but, in fear that their children are not going to be able to make it, continually say to the child, 'You must not make any mistakes.' We've got to the point where the whole society thinks that to make mistakes is a sign of great weakness. The greatest mistake that humanity makes is not recognizing that the only way we get anywhere is by making mistakes. We're given a left foot and a right foot so that while we make little mistakes in each stride, between the two we get where we want to go. This is the way the Universe operates."

- Cite KBF to Kathryn Elliott, Washington Star; 9 Nov'75

Mistake:

"...Humanity has developed a comprehensive, mutual selfdeception and has made a total mistake in not realizing that the realistic thinking potentially accruing only after mistakemaking was the cosmic wisdom's way of teaching each of us how to carry on. It is only at the moment of humans' admission to selves of having made a mistake that they are closest to the mysterious integrity governing Universe. It is only when human beings, listening to their awareness of truth, confront themselves with self-admission of their mistakes that they are

able to free themselves of the misconceptions that brought about that mistake, and in those special moments of selfadmission of mistake, with the mistaken conception out of the way, they often have their most important insights into what the truth is that had been hidden from them by their persistent retention of the misconception as fostered only by their pride and vanity, or by unthinking popular accord."

MIT Sequence: (1)

"It is interesting in considering the meaning of structure, to think of the redefinitions emerging annually at the Massachusetts Institute of Technology in respect to fundamental phenomena. Every February the Institute exhibits in the main entry hall on Massachusetts Avenue a collection of selfdefinitions by the various academic departments. This is done so that the prospective students for the coming year (it is enrollment time at mid-years) may consider what the Institute has to offer. The Physics Department, the Chemistry Department, the Mathematics Department, and so on, all make statements about their particular concerns. They must say what they have to offer to the prospective students in a way that is both comprehensible and of high integrity of scientific meaning. Casual suggestions of the nature of the work will not suffice. Thus annually each department has found it necessary to reexamine its inexorably evolving disciplines and where appropriate to redefine its subject. Since each year both man's art and science of communication have improved, I have found it interesting to note how, for instance, the Physics Department at the Massachusetts Institute of Technology redefines itself as the years go on."

- Cite Conceptuality of Fundamental Structures (Kepes), p.66, 1965

MIT Sequence: (2)

"There has been such a rapid evolution in the sciences that what for instance the Physics Department said it was concerned with in 1912 was not what it professed in 1922. In 1912 (before MIT moved to the Charles River in Cambridge) it was concerned with mechanics in general, optics, and so forth, and a phenomenon called electricity was newly included as an appendix. By 1922 science was overwhelmed

with the newly discovered world of electron behaviors and the Physics Department said publicly that physics was primarily concerned with electronics. Physics in 1950 at the same Institute was described as being concerned almost entirely with the nucleus of the atom.

"The Department of Mathematics at MIT which embraces the fundamental communications systems of all the sciences, is also the most generalized of scientific disciplines. The last time I wrote down its annual statement of self-definition was in 1953. This definition hasn't altered much since then. Mathematics, which is both the most comprehensive and abstract of the sciences, tends to evolve less rapidly than physics or chemistry. Mathematics generalizes all sciences and all other sciences must use it."

- Cite Conceptuality of Fundamental Structures (Kepes), p.6B, 1965

MIT Sequence: (3)

"MIT's Department of Mathematics' self-definition of 1953 said: 'Mathematics, which most people think of as the science of number, is, in fact, the science of structure and pattern in general. It went on, for another hundred words or so, but that was the opening sentence. This definition of mathematics as 'the science of structure and pattern in general' agrees comfortably with my definition of the word 'structure'--- structure is not a 'thing'--- it is not 'solid'."

KBF DEFINITluKS

MITE: (Minimum TEtrahedron):

"We find this tetrahedron to be the smallest, simplest, geometrically possible (volume, field, or charge) allspace-filling module of the isotropic vector matrix of Universe."

oea SYNERGETICS Draft, 29 Feb '72

KITE: (Minimum TEtrahedron): Positive and Negative Functions: (1)

"MITE" can fill all space. They can be either positive (+) or negative (-), affording a beautiful confirmation of negative Universe. If there were only positive Universe there would be only fE's. But MITE's can function either as plus or as minus space-fillers; they accommodate both Universes, the positive and the negative as manifestations of fundamental complementarity. They are true rights and lefts and are not mirror images; they are inside-out and asymmetrical.

"There is a noncongruent, ergo mutually exclusive tripartiteness, (i.e., two A's and one B in a wedge sandwich) respectively unique to either the positive or the negative world. The positive model provides for the interchange between the spheres and the spaces. But the KITE'per-

mits the same kind of interchange in negative Universe. But MITE's are all-space-filling within their own world. The cube as an all-space-filler requires only a positive world. The inside-out cube is congruent with the outside-out cube. Whereas the inside-out and outside-out MITEs are not congruent and refuse congruency."

"Neither the tetrahedron nor the octahedron can be put together with mites."

- Cite RBF to EJA, 3200 Idaho, DC, 25 Feb'72

Mite & Coupler:

"The unique asymmetrical octahedron is always uniformly composed of exactly eight asymmetrical allspace-filling, double-isosceles tetrahedra, the Mites, which in turn consist of AAB three-quanta modules each. Though outwardly conformed identically with one another, the Mites are always either positively or negatively biased internally in respect to their energy valving (amplifying, choking, cutting off, and holding) proclivities, which are only 'potential' when

separately considered, but operationally effective when interassociated within the allspace-filling, uniquely asymmetrical octahedron, and even then muted (i.e. with action suspended as in a holding pattern) until complexes of such allspace-filling and regeneratively circuited energy transactions are initiated.'*

- Cite SYNERGETICS draft at Sec. 954.43, 13 May'73

"Geometrical Combinations: All of the well-known Platonic, Archimedean, Keplerian, and Coseter types of radially symmetric polyhedra may be directly produced or indirectly transformed from the whole unitary combining of Mites without any fractionation and in whole, rational number increments of the A or B Quanta Module volumes. This prospect may bring us within sight of a plenitudinous complex of conceptually discrete, energy-importing, -retaining, and -exporting capabilities of nuclear assemblage components, which has great significance as a specific closed-system complex with unique energy-behavior-elucidating phenomena. In due course, its unique behaviors may be identified with, and explain discretely, the inventory of high-energy physics* present prolific production of an equal variety of strange small-energy 'particles,' which are being brought into split-second existence and observation by the ultrahigh-voltage accelerator's bombardments."

Kites & Quark* as basic Notes: (1)

"The reason physics continually comes to quarks is that in the total systemic hierarchy of structuring and multipolyhedra-intertransformings there is the phenomenon of allspacefilling. There are several well-known allspace-fillers such as the cube, the rhombic dodecahedron, and the tetrakaidecahedron. However, the mites consisting of three basic modules--the two A Quanta modules and one B Quanta Module--- have their counterpart negatives; as the quarks do represent the minimum allspace-filler of Universe and the A's and B's do produce in all-rational numbers all of the nucleated geometries.

"They also have their volumetric counterpart in the nonnucleated icosahedron in the form of the S Quanta Modules--each of which is 1/120th tetrahedron of which the triacontahedron is composed. This makes the S Quanta Modules probable electron complements of the nucleated system--halvings fractionated 459 times, i.e., 4×459 "

"The quarks are the minimum allspace-fillers of kinetically self-structuring systems. The mites may fill allspace by either edge-bonding or face bonding. That is, by either

- Cite RDF Ltr. to EJA; 4 Jun'77

HBF DEFINITIONS

"omni-edge-interbonding of singular sets of all positive (or negative) mites, or by omni-face-interbonding plural sets of both positive and negative mites. Edge-interbonded singular sets of all-positive or all-negative mites fill allspace alternatively with 'yes' or 'no' mites.

"I use the following metaphor to identify systemically the quarks and the A and b modules as the minimum constituents of systems. Pythagoras demonstrated the system when he stretched and fastened a string between two walls--taut enough to twang. Pythagoras showed that when you firmly clasp (stop) the string at midpoint either half will twang at one octave higher than does the full string. He then showed that if you put firm stops at the two-thirds-way points, the string in between will twang one fifth of an octave higher and also that fifths represent increase of the key note of string twang to its corresponding sharp---or its decrease to its flat octave scale.

Pythagoras then tried various tightenings of the string and the same halving always resulted in the 'flattening' or 'sharpening' fifths. These subdivisions and their results are"

- Cite RHP Ltr. to EJA; 4 Jun'77

Mjtea.jL_Quark8 as basic Notes: (1)

"inherent to any string or to any material of any length and any tautness. The tension string is the aberrationally vibrant system. The same relative mathematical subdivisions are constituents of any system,

"Three quark constants or the three mites are alike the minimum allspace-filling, all-structures-producing, minimum constituents of all kinetic (resonant) structural systems of Universe, all of which systems have their unique electromagnetic wavelength-and-frequency characteristics. Twenty-four modules comprise a tetrahedron, With tetrahedron as structural unity we have each module as 1/24th of unity.

"A three-module mite is then one-eighth of structural system unity, and as with music one eighth of the octave is one note---both mites and quarks are also the single basic notes of all systems."

ModalabiH ty: (a)

"The way in which elementary particles are structured... is clear... and simple." You could say "too simple or... elegantly simple. Inasmuch as simple is minimum case it cannot be simpler; ergo, it is congruent with nature which always does things in tht simplest way—the simplest always being the most economical.

"I would not be at all concerned nor surprised by the academic sciences' rejection' of models. "Physics has been getting along very nicely by flying blindly on instruments and is greatly aided by the computer, else awkward and complex accounting could not be practically employed. Only one percent of humans are scientists. The 99-percent nonscientists have been kept from understanding science by the roundabout, nonconceptual, imaginary-number irrationalities inherent in the XYZ-cgs-three-dimensional accounting.

"When. in the middle of the 19th century, practical application of electromagnetics occurred, scientists were asked by the humanist authors for a conceptual explanation of what electrical generation production and use consisted. They said,"

- Cite RBF Ltr. tp Tell Andersson, Luvika, Sweden, 6 Jun'75

MndiUahi 11 tv:

"Society is asking us as the authors to clarify this extraordinary invisible power which has come into all human affairs.' The scientists said that unlike steam or water in pipes going through turbine wheels, the phenomenon electricity could not be conceptually explained. They said that electromagnetics automatically moved a needle with great regularity, therefore quantitative results could be instrumentally read in respect to any variability introduced into the electromagnetic gen-

eration and use of electricity. Changes in the number of coils or cross section of copper, etc., immediately read out on the dials and rates of change for all variables could be plotted; ergo, results could be predicted.

"Using the instrumental readouts, the scientists discovered that black body radiation introduced a fourth-power exponential rate of change. This gave the scientists great satisfaction because they said quite clearly that nature is employing fourth dimensionality and that all models are only three dimensional, being utterly wedded to perpendicular and parallel concepts of agglomeration.

- Cite RBF Ltr. to Tell Andersson, Ludviga, Sweden, 6 Jun'75

Modelability : (c)

"The scientists convinced themselves that nature was not, then, using models, which justified them in turning humanists away without communicable comprehension of the electromagnetic age's behavior.

"The parallelism permitted them no convergence or divergence. As SYNERGETICS makes clear, nature does converge and diverge, else there would be no radiation nor gravity nor propagation.

"Whether our society is wise enough to foster further comprehension of the great technology of Universe or whether humans are to make the mistake of ignorantly casting aside their salvation, depends on humanity understanding the phenomena with which to date only science has been concerned. A new generation,, employing SYNERGETICS will be able to make clear to the rest of humanity that all nature's behavior and transformations are indeed to be conceptually understood.

You generation of scientist-humanists will go on to deal far more intimately with nature than have the prior blind-flying scientists of yesterday and particularly those so committed to formulas as to have lost the capability not only to think but to apprehend and comprehend the elegant simplicities by which nature from time to time reveals herself to humans." - Cite RBF Ltr. to Tell Andersson, Ludvika, Sweden, 6 Jun'75

"I found myself intrigued and progressively committed to discovery of nature's comprehensive and omnirational coordinate system. One more important consideration regarding nature's omnirational coordinate system emerged and persisted in my school days. When inventors developed the steam engine--- this form of energy could be seen by the eye and steam could be lead through a visibly hollow pipe to a visibly hollow cylinder to drive a visible piston in a powerful engine and control it to do work.

"Then about a century ago man discovered and developed the uses of electricity by which vastly larger quantities of energy per pound of generating and distributing equipment could be conveyed invisibly through a seemingly solid wire in seemingly no time at all to impel an engine. When the literary men asked the scientists for a conceptual model of what was going on in electromagnetics so the writers could explain the mystery to the everyday man in everyday visualizable experiences what was transpiring, the scientists said,"

Modelability: (2)

We cannot give you any model. What goes on is--- to the best of our experimental knowledge--- utterly invisible and nonconceptual and is only expressable in mathematical terms.' Since that time science has been flying blindly on mathematically operated instruments. For a century scientists have not sensed their responsibilities because they have been dealing only in abstract, ergo senseless, mathematics."

"What caught my attention was that in the ensuing century better and more powerful microscopes and telescopes had come into use and nature was disclosed as continually employing models. She did not pay any attention to the scientists' concept of a lowest level threshold below which only mathematical equations had their existence. So I surmised that in searching for nature's comprehensive omnirational coordinate system that it would be best to be on the lookout for conceptual modelability, albeit a dynamic transformative modelling.

"It is impossible to identify the way in which we first follow our intuitively-explored curiosities, nor why we intuitively retrace in our thoughts certain special experiences" - Cite RBF holograph at Chap 2 "Synergy" 1.12, 18 Mar'69

"and thus to explain just why we become especially interested in this or that which later proves to be an Important factor in determining our further, experiments, speculations, and complex relationship discoveries,

"Since I was suspicious that nature was, unbeknownst to the scientists, always using dynamic models of conceptual process transformations--- how to conceptualize nothing, or absolute emptiness, as symbolized quantitatively by zero, very greatly intrigued me. This lead far back into the history of science and mathematics, which overlapped many times into necromancy, numerology, astrology, superstitions, and the symbolism of religious legend and scripture.

"I found myself powerfully prone not to discard from serious consideration any ideas which the academicians frowned upon simply because those ideas had been of interest to, or had been exploited by, non-scientists, tricksters, and carelessly loose pundits. For instance, I have pondered a great deal on why the Babylonians chose to attempt to marry the angles of the circle and time with cyclic unity of the circle, chosen as 360° divisible into 60 minutes per degree and 60 seconds"

- Cite RBF holograph at old Chap 2, "Synergy" 1.12, 18 Mar'69
 ModeXabj,],/:

"per minute while their daily cyclic unit was only 24 hours, which were each divided like the degrees into 60 minutes and divided again into 60 seconds. This meant that each hour was 15 degrees. This meant that there are 15 circular geometry or azimuth minutes per each minute of time; and likewise 15 seconds of arc for each second of time. . .

 JMslablllty: (A)

"Cubing does not permit the making of models of or $N \setminus ..$

******In the fundamental accounting of energy behaviors fourth- and fifth-power relationships occur. The scientists found that they could accommodate the fourth and fifth powering by use of nonmodelable, complex number calculations by involving the square root of minus one. In effect, this calculation of 'imaginary number******' is accomplished by borrowing an hour from tomorrow's clock to solve the problem--- after which we repay tomorrow.

"When the fourth- and fifth-power energy relationships showed up back in the mid-19th century, as in the energy output of 'black bodies,' the electromagnetic scientists said: 'We can't make a model of it because models must always be three-dimensional that is, they must be defined by their XYZ-axes and be coordinated with 90-degree angles. Because we cannot find a fourth perpendicular to the XYZ system that will produce a fourth-dimensional model.'

"Thus the generalised case for models seemed to fail and models went out as a tool of science in the mid-19th century."

- Cite NASA Speech, pp.78-79, Jun'66
Mod.elabj.liyy: (B)

"Scientists did continue to employ schematic models, but as a scaffolding for working assumptions that they said bore no resemblance in reality to the actual events taking place entirely invisibly and formlessly in nature's fundamental energy transactions. We thus have had scientists working on instruments for a little over a century;...

"It is easy to understand how scientific thinking became independent of models. Scientists have gotten along very nicely without them. The great social and epistemological dichotomies opened between the sciences and the humanities... because there were no conceptual models to be comprehended by the humanities. When the authors and reporters for the humanities came to the scientists for conceptual

explanation of science's invisible discoveries, they said, 'What is it you are doing here? I see no model. I have to have a model to describe to people.' The scientists shook their heads and said, 'There are no models. Science speaks only in abstract mathematical equations.'

"Tetrahedral accounting or quantation removes the dilemma."

"So then I went on to say that, if all the energy conditions were everywhere the same, then all the vectors would be the same length and all of them would interact at the same angle. I then explored experimentally to discover whether thia "isotropic vector marix," as so employed in matrix calculus, played with empty sets of symbols on flat sheets of paper, could be realized in actual modeling. Employing equilength toothpicks and semi-dried peas, as I had been encouraged to to in kindergarten at the age of four (before receiving powerful eye-glasses and when I was unfamiliar with right- angled structuring of buildings as were the children with normal vision), I fumbled tactilely with the toothpicks and peas until I could feel a stable structure, and thus assembled an omnitriangulated complex and so surprised the

teachers that their exclamations made me remember the event in detail. I thus rediscovered the octet truss whose vertexes, or convergent foci, were all sixty-degree-angle interconnections, ergo omniequilateral, omniequiangled, and omniintertriangulated; ergo , omnistructured. Being omnidirectionally equally interspaced from one another, this omniintertriangulation produced the isotropic matrix of foci for omni-closest-packed*

"This is the 15 great circles of the icosahedron and there are the basic angles, the $37^\circ 25'$; $20^\circ 54'$; and $11^\circ 45'$ - These turn out to be extraordinary angles because they are the same angles as we found on the A Module, which was this very peculiar thing that was an asymmetrical triangle and was the only one that ever folded up to become a package and yet it could prop down into those spaces,"

- Cite Oregon Lecture #7, p. 270. 11 Jul'62

"There are very few tetrahedra that can be folded out of one whole triangle... This is an extremely rare strange one; and this one particular asymmetrical tetrahedron can be folded out of one asymmetrical triangle. I haven't found any other asymmetrical triangle that can be folded into any kind of tetrahedron: the vertexes refuse to come together on a piece of paper. This is a very special case and the only other one is the whole equilateral triangle that makes the regular tetrahedron.

"They are very interesting_f because the bounce lines— we know we have reflections into mirrors, and so forth, and lines bounce off at the same angle as they come in— so when we are bisecting the edges of an equilateral triangle and interconnecting those points with lines, we get the lines on which light would bounce around on the inside of an equilateral triangle if its edges were mirrors. We also get the same thing going

on inside this one; but light will bounce out where it comes in at 90 degrees. However, light bouncing around any given triangle (always remember that any triangle, if you bisect its edges and interconnect the points you get similar triangles and they will give you similar angles) and energy lines getting inside a triangle,”

- Cite Oregon Lecture #6, pp.219-220, 10 Jul'62

”will bounce around inside that triangle. A tetrahedron that can be folded out of a single foldable single triangle has this strange property of holding energy. If energy gets inside it, it will bounce around inside that tetrahedron and not try to get out. It is perfectly content to go around and round. It would do so within a regular tetrahedron and this one tetrahedron which I showed you here... I don't know any other cases where it would do it.

- Cite Oregon Lecture #6, pp.219-220, 10 Jul'62

”Take a one-quarter tetrahedron and make a line which is a perpendicular bisector from any given vertex to the opposite edge. Those three perpendicular bisectors cut the one-quarter tetrahedron into six pieces of pie. This quarter-tetrahedron divided into six symmetrical components; each one of them must be one-sixth of a quarter—and this is one-twentyfourth of a tetrahedron, this is a very interesting piece of geometry because we find that it can be unfolded — you can make it out of paper if you like. These are the angles you actually have in your paper: 30 degrees; 35 degrees and 16 minutes; and 19 degrees and 24 minutes. Those do not add up to 90°. This is not a 90° angle. This is an asymmetrical triangle with three different size edges, it is not 90° and not 60°» It has these folded edges and you can fold it up, but as it lays out it becomes a whole triangle, even though it is not 90° angles.

”If you take a regular tetrahedron and take its three slanting faces and open them up as if they were hinged on the base, you will have for the base an equilateral triangle. In other words, the regular equilateral triangle: bisect its edges and fold up the three corners and you have a tetrahedron. A tetrahedron

- Cite Oregon Lecture #6, p.219, 10 Jul'62

”can be folded out of one whole triangle, A Quarter Tetrahedron cannot be folded out of one whole triangle. In fact there are very few tetrahedra that can be folded out of one whole triangle, whether they are asymmetrical or symmetrical.”

- Cite Oregon Lecture #6, p.219, 10 Jul*62

"We can take a one-quarter tetrahedron and make a perpendicular bisector from any given vertex to the opposite edge. The three perpendicular bisectors cut the one-quarter tetrahedron into six pieces of pie. . . The quarter tetrahedron divides into six symmetrical components, each of which is one-sixth of a quarter tetrahedron, or one 24th of a tetrahedron. I call these units "A" Particles which are increments of "A" tetrahedra.

"This is a very interesting piece of geometry because we find that if made of paper it can be unfolded to become a triangle and at one corner the angles appear on the paper as 30 degrees, 35 degrees and 16 minutes, and 19 degrees and 28 minutes. This is an ayametrical triangle of three different size edges and not 90 degrees and not 60."

Module: A Quanta Module: Introduction Of:

"Rational numerical and geometrical values derive from

(a) parallel and (b) perpendicular halving. The thirding and physical isolation of the prime number three and its multiples, is an only inadvertent consequence of the three-way, symmetry-imposed, perpendicular bisecting of each of the tetrahedron's four triangular faces:

(a) the parallel method of tet@rahedral bisecting

has three axes of spin, ergo, three equators of halving;

(b) the perpendicular method of tetrahedral bisecting

has six axes of spin,ergo, six equators of halving.

Halving and its inadvertent thirding introduces the 24 A Quanta Modules.

(a) parallel equatorial halving is both statically

and dynamically symmetric;

(b) perpendicular equatorial halving is only dynamically

symmetric."

'An "A" particle is $1/6$ of a one-eighth tetrahedron.'

• Both 'A' and M_B particles have equal volume but different shapes and in combination can make all polyhedra.'

(See ILLUSTRATION H 25)

- Cite RBF Glossary of Terms bound with "The Live Book foud"

1967

"The one-quarter tetrahedron and the one-eighth octahedron each have an equilateral triangular base and each of the (base ?) edges are identical in length. We can superimpose the one-eighth octahedron over the one-quarter tetrahedron because the volume of the one-eighth octahedron is one half and the volume of the one-quarter tetrahedron is one quarter so the volume of the one-eighth octahedron is twice that of the one-quarter tetrahedron. Therefore, they will have the same base and the one-eighth octahedron must have twice the altitude because it has the same base and its volume is twice as great.

"In figure # 16' they are superimposed and there is a space between the surface of the one-eighth octahedron and the surface of the one-quarter tetrahedron because the one- eightha octahedron has a volume twice that of the one-quarter tetrahedron, the space between the two must be the same as the one-quarter tetrahedron so this space in here is a unit of one and the one-quarter tetrahedron is a volume of one. That is, the space between is superimposed as a concave lid and it has a volume of one. If you would actually make that a solid and weigh them, they would have the same weight.

(Over)

<4-t d n 00V t- C 5 - SE-C.

"I can take that one-eighth octahedron which is sitting on top of the one-quarter tetrahedron and I can slice it along its three vertexal edges towards the opposite mid-edge, slice it with a knife and break it up into six parts. Then I can fold it back disclosing the one-quarter tetrahedrons so that each of these B Particles is one-sixth of a volume which is the same as that of the one-quarter tetrahedron. It is a space between the outer surface and the one-quarter tetrahedron.

"Th® A and B particles are a way of quantizing our total experience. .
. They are two tetrahedra. one of which is foldable out of one triangle
and if folded out of one triangle you would find that energy patterns
within it would simply ricochet around in it, not trying to get out. The B
particle was not folded out of one triangle and energy introduced into
it would tend to get out of it automatically. We have two very inter-
esting pieces of geometry, both of them asymmetrical, both of them
having the same volume. They would have the same amounts of en-
ergy. I will talk about it when we get to vector equilibrium. We get a
condition where everything in universe is in equilibrium. At that point
I can talk about volume, energy, quantum, field, and so forth--- as all
interchangeable conditions. ... In the A's the energy tends to lock up
and in the B's it tends to release the energy, even though they both
have the same weight. We find that all the geometries can be made
with them. All of the family of the important symmetrical transforma-
tions were completely accounted by the A's and B's. We at last have
found something: that while they are two different shapes, they are
the same quantity. We found there were 24 A's in a tetrahedron and
there will be four times as many in the octahedron--- so you

RBF DaFIKlThhb

"I find it a very phenomenal matter suddenly to discover units of geometry which are reorientable within the same space, with the same volume, in fact the same pieces, --- and yet they d give different kinds of fundamental coherence of the system and so I begin to find this kind of geometry being dynamic in explaining fundamental structure."

- Cite UtttGuN Lecture rfb_t p. 223. 10 Jul'62

"We find octahedra are made out of A's and B's. We can composite A's and B's and make octahedra or tetrahedra . . . We have two things that have the same volume though they have different shapes. . . . Not only d® they make octahedra and tetrahedra but we find that they will make practically all the other geometries, . .

"A and B Particles are reorientable in the same space. They are composite and can fill the same space and yet they take different positions. The cenmters of gravity of the particles can be oriented either transversally or radially. In one case the center of gravity is outwardly deployed and in the other case the center of gravity is inwardly deployed. When we get into X-ray diffraction you will find certain things you can do to metal. You can Hit the piece of raetal and you will find an array of centers of gravity where they deploy. You can take the temper out of the metal and they will change their positions. No longer does it cohere as well when the centers of gravity are reoriented. When the centers of gravity are arranged so they get closer to each other, then they pull each other harder and it is a much tighter metal, when we heat treat metals ar.d alloy they transform just as the A and B particles rearrange themselves. . . "

- Cite UKECuN Lecture //6, pp. 222-223 } 9 Jul«62 "These are little corners on the cube superimposed on the vector equilibrium and it gets chopped into these little small components. I calculated the volume of each one of these components and found that each one of them came out in whole numbers in respect to tetrahedra. They were fractions, it is true, but if I used the A or B Modules as unity, one-twentyfourth of a tetrahedron, these have very interesting numbers like seven and thirteen— but all whole numbers.

We are now getting to a very interesting kind of fractionation of nature. Everything is coming out in beautiful whole numbers, in simple integers up to 20, and it is coming about in very much the same kinds of numbers we get in the chemistry,"

"I made many other subdivisions of octahedra and so forth, and found the components always coming apart, as long as there is any cutting on the axes of symmetry, any of the ways in which nature could chop herself up with various extensions of planes, and they always come about in whole rational numbers." - Cite Oregon Lecture i!6, p. 228. 9 Jul»62

Modules: A and 8 Modules: (As Equated to Meson): "That's what I think the A and B Modules may work out to be--- the meson. That works out to about 1/24th of a quantum."

RBf DEFINllluNS Modules: A and B Modules: Rhombic Dodecahedron:

A and BPsi; ueule u: Rhombic Dodecahedron:

"We find you can take one-quarter tetrahedra out of A particles and you can superimpose them on the octahedron which has eight faces. (The octahedron we found was made of A's and B's.) So we can add a little pyramid to each of the eight faces of the octahedron. Because there are twelve edges on the octahedron there are twelve diamond faces and this is called the rhombic dodecahedron. It can be made up entirely of A's and B's; we find its volume coming out in whole units of A's and B's and we find that its total volume is six. The tetrahedron has a volume of one, the cube three, the octahedron four and the rhombic dodecahedron six. The rhombic dodecahedron is an all-space filler like the cube. I have seen quite a few of them being made around the architectural schools and you will find nature using them a great deal. If you go out into Colorado and Arizona you will often find in rocky fields the rhombic dodecahedra crystals which nature uses to fill space. This is one of the most common naturally occurring crystals."

Modules:

A and B? BivwAimST Constant Volume.

"Now we come to an interesting consideration of the tetrahedron. This problem I pm going to show you, I was told by Dr. Einstein's mathematical assistant from Princeton in about 1947 that this was his mathematical Ph.D. problem that got him his job with Dr. Einstein. Here is an aluminum tube and another aluminum tube /See Figure

D, of SYNHCETICS Illustration #26.J . They are the opposite edges of a tetrahedron. Notice that the opposite edges of the tetrahedra are at 90 degrees to each other. They have been precessed to each other. There are six edges of a tetrahedron and each of them precess to the opposite at 90 degrees to it." The two discreted edges of the tetrahedron represented by the two aluminum tubes can move anywhere along their respective axes. "They will oscillate on these lines and they will produce all kinds of asymmetrical tetrahedra, but □ we find that their volume always remains unit" by virtue of their constant base area and identical altitudes.

"You can see why this is so. The A particle and the B particle start with the unit base and add unit altitude, so 1 have another unit of altitude and it has the same base, it is just superimposed on it, and it has the same volume, a volume of one.

A AwP & fwni es qjS.O I -p \

We find these things getting longer and thinner, but their volumes are always the same: one. Supposing we think about something like an electric wire and we start with this base, and we divide this base into three 120 degree angles with a circular base. 1 can superimpose these almost iconic sections and every time there is a unit of frequency on the line, the vilume will always come out the same as the base fruju volume. Finally the last ones get to look like theyw are just as long as the wire itself, so there is an outside charge on the wire like fluorescence of a wire is coming off in un<H charge and we begin to see the wqy an electric ascillation impulse put into an electric line always seems to come in relative to the plane to the base and begins to precess of and finally comes off in unit volumes."

Mpnfay wrench;

"There is a minimum set of patterns, which is a consequence of one set of patterns reacting with another set of patterns.

In order to have a monkey wrench, you also have to make one or buy one at a store, you have to have other things, and these procurements in turn have antecedent event requirements. Each event of Universe leads back to all the great complex of events, and we get then to a minimum set of complementary events whereby the system regenerates itself, and we thus come to Universe. This tends to be a clearly

defined inventory of known principles and relative abundance of the various chemical element patterns in Universe which needs a large amount of the pattern hydrogen while apparently not as much of the pattern uranium.'* t For earlier version see Universe, 9 Jul'62) - Cite RBF rewrite of SYNERECTICS galley at Sec. 333., 30 Oct»73

RBF DEFINITIONS

Montessori System:

"There will come the time when the proper education of children, by a glorified system of spontaneous education of choice, similar to the Montessori System, will be made possible. Children, as well as grown-ups, in their individual, glorified, drudgery-proof homes in Labrador, the tropics, the Orient or where you will, to which they can pass with pleasure and expedition by means of everimproving transportation, will be able to tune in their television and radio to the moving picture lecture of, let us say, President Loweil of Harvard; the professor of mathematics of Oxford; of the doctor of Indian antiquities at Delhi, etc. Education by choice, with its marvelous motivating psychology of desire for truth, will make life ever cleaner and happier, more rhythmical and artistic."

Montreal EXPO*67 Dome: tA)

"On the day the Vancouver Habitat opened, front-page center photographs appeared in newspapers around the world— not of the UN Habitat meeting, but of the acrylic skin of my USA 275-foot diameter, geodesic dome of Montreal's Expo¹67 (now belonging to the city of Montreal) being burnt out. At first the news reports said the dome had burned to the ground. This was untrue: the steel structure was undamaged. Since the invisible acrylic skin had been mounted inside the spherical structure, the structural appearance had not changed. No one wasknside and no one was physically hurt. Within 10 days (before Habitat closed) a committee from the city of Montreal came to see me in Vancouver and it was publicly announced in Montreal that it intends to rehabilitate the dome....

"It almost seemed as though the nonstructural skin of the great unharmed geodesic dome had been set afire by some mystical evolutionary wisdom to remind the world of geodesics' very high structural performance as accomplished with only three percent of the weight of any given material necessary to produce equivalent structural and functional capabilities by any other known alternative engineering systems."

- Cite ACCOM. ODA TING HUI-AN UIISETTLU-.ENT, p.3; 20 Sep'76

Ri»F UtFli.ITIONE

"Apparently, the 100,000 geodesic domes built around the world in the last 30 years had proven their economic value, reliability, and economy to such an extant that this frontpaged fire news brought no charges of inadequacy of geodesic dome principles,

"The Expo*67 dome event and the progressively increasing magnitude of human numbers voluntarily listening to me--- as the protagonist of a design science revolution (vs, global political revolution) with which to physically accommodate the now evident evolutionary insistence on world-around unsettlement of humanity from yesterday's remotely deployed agricultural, mining, manufacturing, seaport or mountain-pass tie-downs and evolution's insistence

upon omni-integration of an ever more dynamic nations-homogenizing world society--all of which evolutionary reality seemed in marked contrast to related aspects of Habitat and its technological focus almost exclusively upon nationalistically-emphasized, local, immobile, an 1 'one-off' tailoring of human settlements."

Montreal Expo'67? Dome Sequence: (1)

"On May 28, 1967--- three month's before Allegra's birthday--- a set of swift unpredicted event* intimate to all this chronicling took place.

"Anne and Bucky went on May 28, via Carbondale, to the official opening of the World's Fair, Expo'67, at Montreal. Both of them were overjoyed at the reception of Bucky's geodesic dome installed at the U.S.A.'s pavillion. The millions who have already viewed and entered it seemed inspired. They said so quite freely. Anne and Bucky could hear the public's words as they walked around in the crowds, it represented a very extraordinary moment for Anne and Bucky--- this being the year of their 50th wedding anniversary.

"To Anne the Expo dome seemed to give sublime validation to the extraordinary backing she has given Bucky.

"When he was a little boy his mother used to tell Bucky about the Taj Mahal and showed him pictures of it. His mother felt it to be the most beautiful building in all the world and sensed that its beauty went beyond its structural and material exquils-"

- Cite BEAR ISLafIJ STMuKY, galley >.33, 1968 "iteness. She deemed it* beauty to be emanating mystically from the love of its conceiver for his wife.

"Both Anne and Allegra know that in 1927 Bucky had put aside entirely the idea of trying to use his capabilities to develop special economic and physical advantage for them and instead connitted himself to the proposition that if those whom he loved were indeed the kind of

human beings he thought them to be that they would not enjoy finding themselves in a position of special economic and physical advantage won at the cost of deprivation of others, and likewise that their true happiness could only develop through an awareness that their efforts were always in the direction of progressively increasing advantage for all humans without any biases whatsoever.

"Because every action has its reaction and resultant; and because no event in Universe can be independent of the rest of Universe, Ducky's 1y2y commitment in the direction of all Humanity and its present symbolic embodiment in the Expo'67 dome which, though dedicated by Bucky*s thought to all humanity, must have its inadvertently complementary involvement of Anne and Allegra as well."

KBl Montreal EXPO*67 Dome Sequence: (3)

"Bucky said to Anne at Montreal, 'In addition to the geodesic dome which 1 have designed here to demonstrate the doing-so- much-more-with-less for humanity that world man will realize intuitively that his salvation and physical success on the Spaceship Earth is to be gained primarily by such a design revolution and not by political revolution, 1 have inadvertently brought about the production and installation of our own Taj as pure fallout of my love for you.' Anne knew that it was so. The Expo Taj is powerful and the beauty goes far beyond the subs of its physi-cal parts.

"Anne and Bucky left the dome and flew from Montreal to New York City. Bucky was to leave her with her family on their old home on Long island. Un the way from Kennedy Airport to New York City, the taxi in which they were riding skidded at high speed m the rain and

crashed against a bridge abutment and bounced across the highway. Neither the taxicab driver nor Bucky were hurt, but Anne was very greatly damaged. She had two hemorrhages in the brain. After a magnificently successful operation she recovered completely."

KBF DEFINITIONS

"'Extracted from Gene Fowler's letter to B. Fuller, dated June 13. 1967, San Francisco, California:

""Dear Bucky:

'Anne is a woman of considerable strength: she will not leave you to continue alone.

'I have known a long time that Anne's strength, beauty, and grace were in your work. It makes sense that this skybreak bubble should be not a monument, but an embodiment of your love of her. Isn't that love a carrier wave that brought her form and substance, her nature and patterning into and through you and into your visions and work? Isn't a human being a thin, sparkling, transparent membrane reaching out and containing for a time some part of the Universe?

'Human beings are fragile skybreak bubbles, as vulnerable and quickly gone as a child's soap bubbles in a bath. Yet, without vulnerability, there is no courage. Without mortality, there is no beauty or love, no reason to reach out and touch.

RBF DsFINITIOLO

"Next thing; So that's why I said call it World War I because it involved the newest... and was on a world accounting basis instead of local. And the whole world was suddenly gaining. Now since— as a consequence of that we've gone from less, in 1900. One more very important input, for all of you— and this has never been on the books. There's nothing in any book of economics about— not even a sentence. The most highly classified of all the— I was regular MB USN— of all the information— Navy— and you'd learn by design, the same tonnage, this kind of sea, so you get into optimum design* and that was the tonnage of it so the enemy could see exactly what size ship you were building and he had one of the same tonnage. And it was not until you came into contact that you knew who could outfire the... who with the same amount of tonnage could outperform the other, who was getting more out of the same.

"Now this is the very essence of the sea— going back early to the wooden sailing ship. Twashi ps of the same size. You built your ship locally, used the best trees you had for your mast (but they weren't particularly good) and the best fabrics you had for your sails. But you came to a country like— spruce—'

- Cite RBF to Arthur Anderson & Co., (pp.5—o), New York, 13 Mar'74 **"and you careened your ship and put in much stronger, longer fiber masts. No knots. Then you came to a country like what we call the Phillipines today and we find that the fibers were much stronger for your ropes; so you put on a lot of that rope and make some more rope at home. And you get to a place like Egypt and they had much longer fibers for their cotton and you make your sails out of that. And you found that by the time your ship came home— the same ship, weighing exactly the same— could way outperform the other ship that was the same. So when it came to the great battles of the sailing ships, a man who had really been around the world and had got his ship into a very high performance out of the same amount of material— you would close with the other man when it really was blowing hard; the other man was going to have to take off sail or else his sails would blow out, or his ropes would break, or his mast would break, ./however did the most with the**

same, or more with the same, was the one who stayed on top of the ocean. And this was the most highly classified thing, which never showed up. So that when the other nan went to the bottom, he couldn't tell about it; so it was kept as a really great secret. I'm really amazed that it's never gotten into the book of economics—about doing more with less!... And from your own accounting viewpoint, just think what I'm saying.”

More With Less : Sea Technology: (3)

"Now I began to get into doing more with less sir, because back in my i.avy days I had been trained as a line officer. It means that if your seniors are killed, you have to be able to take over--- not only the ship, but the fleet. In those days there was no contact with the central authority and you'd operate without-- therefore, you had to make your own decisions. And you're really dealing in world. And we were trained to be comprehensivists instead of specialists in the Navy. It was the only place where they trained you to be comprehensivists instead of specialists.

"Now I was fascinated with having this man trained scientifically and involved with all these beautiful ships. Enormous power systems. And we could do anything. How did this happen? It was all on the basis of I-althus that there was the working assumption that there'd never be enough to go around, that it had to be Yours or Kine, it could not be both. And this was to take care of the showdown.

"And I said we had refrigeration on this ship--- we had refrigeration on the ship 25 years before it came up on the land. And we really had cream on the oatmeal in the morning--- an amaaing"

- Cite RBF to Arthur Anderson *tc* Co., (p.8), New York, 13 Mar*74

Lore With Less: Sea Technology: (4)

'thing, when we'd been at sea for 20 to 30 days. So I said: What else did Malthus leave out? He assumed that food would rot... I began to go into that. Back in 1917, I said I can see suddenly a little airplane that's now threatening to sink the battleship--- the more-with-lessing is so powerful., this electronic thing, this radio, and the messages. This great big ship--- my messages go right across, like that. So I said there is something going on here, more-with-lessing. So I said that it could be that the whole *raison d'être* of this war that I've been trained to operate in, might be invalid--- if we really looked into doing more with less in relation to all those things that make man a success.... And I said, apparently it's going on inadvertently.

"And after ` World War I, sure enough, the oil burner came off the battleship and into the oil furnaces on land. And all these things that we'd had at sea suddenly came up on the land. In 1927 I committed myself to... where I found nobody paying attention to doing more with less--- and that was in the building world. On the sea and in the sky, yes; and the airplane was a beautiful series of victories of doing more with less, or more with the same. It was fantastic, what you could get out of the same power system in the sky, and you could get even more electronically

- Cite RBF to Arthur Anderson & Co., (pp.8-9), New York, 13 Jan'74
More With Less: Sea Technology 1 (5)

"So I said I find that people don't even know what buildings weigh, let alone what is the performance per pound, 'what is this building really supposed to do? Well, people say 'that it is merely designed to make money. Then I say that this money concept came out of a great complexity of nature regenerating life through the vegetation. Here you are growing corn but you need some shoes on you, so somebody else making shoes--- he made more shoes than he could wear, and you're

growing more corn, and here we began to have some way of exchanging. And we had a very complex way of exchanging all the things you get into in those tools. So we get into money as a central way of accounting; and with the market, set some values--- but we didn't really know how to assess those things properly. In the end there was a way, because every time we held them up they gave more performance.

Eras, Economical • '1

”The most economical is always spontaneous.”

”In my mathematics, synergetic geometry, I am interested in the most
economical relationships between events which is the only way syn-
ergetic geometry says things; it doesn't say the shortest lines.

”Tt would be very easy to integrate the jet streams and all the forces
operating what's the most economical from here to there, I certainly
couldn't help looking at it as a whole. Then I would begin thinking
about a trolley system for the whole Earth. Everything would really go
with the prevailing winds as much as possible. As much as possible
I'd get it West to East: go around one way and not try to go both ways.
You might find it really very quick if we began to get into some of the
advances coming in, getting to the most economical way of handling
affairs. So I'm going to see whether it really pays to buck headwinds,
which maybe you'd never need to. It's very, very important, the big
picture.”*

"Remember the words vectorial geometry: if you want to look for maximum efficiency, you do things vectorially."

RBF DEFINITIONS

Motion;

"Motion is not relative to standing still. Motion is relative to eternity, which is No-time-at-all. No-time-at-all is Inherent in the generalised principles which to be valid must have no exceptions and be eternal, thus eternally true. The beginning of awareness, of intellect, is otherness. The whole complex of different and nonintercontradictory all interaccommodative generalised principles are eternal. Complexity is eternal. The principle of mass interattraction of complex otherness is eternal and relates all this eternal complexity to our eternal system interfunctionings.

"Newton's norm, as disclosed in his first phrase in his first law of motion, was 'at rest.' The stars were 'fixed.* The planets and the moons of planets, as well as comets were in motion because hurled by explosions from fixed stars, etc.

Oito~ "motion¹?

Einstein's philosophy did not hold the speed of radiation unfettered in a unified vacuum to be very fast. It assumed this speed to be normal, and all other lesser speeds manifest in the physical Universe to be occasioned by local interferences, shunting independent phenomena into local circuit reappearings."

3200 Idaho, Wash DC, 27 May*72m as rewritten/RBF

Motion:

"Motion is not relative to standing still. Motion is relative to eternity, which is no-time-at-all. because no-time-at-all is inherent in the generalised principles. The beginning of awareness of intellect--- is otherness, the mass attraction of another which exerts a pull, which relates it all to our system."

- Cite RBF to EJA 3200 Idaho, Wash, DC, 27 May*72

Motion:

"Only the afterimage gives a sense of motion— as in the butterfly"

- Cite RBF to EJA, 1970

Motion;

‘ ‘ The sense of motion is produced by an overlapping continuity of afterimages of a plurality of optically tunable separate and sequentially occurring electromagnetic frequency events just as music is produced for the hearing by a metrically momentumated sequence of both separate and resonantly overlapped sound frequency notes. Motion is visual music made possible by the spontaneous retention in the brain of a series of separate still picture frames of our separate sense experiences scanned and reviewed in the brain at a vastly accelerated sequence rate. Our brain discovers that each successive electromagnetic picture is just a little different from the ones before and our dawning awareness of that increasing difference constitutes our motion sense."

ijjtion: Six. Positive and Negative Motions:

'There are five notions that we are very familiar with and each one of them has a positive and a negative:

- spin (horizontal or vertical)
- orbit (srxnning and orbiting together is dancing)
- turn inside out (that is, anythin? with a hole in it)
- expand iconvergence ar: divergence)

* torque (twist, north pole spins right, other pole left)

'There is a sixth motion which very few pwoole are familiar with called precession,"

cube ≈ 6

§ - 1

"The sum of all relationships, i.e., understanding, is tetrahedral.

"A cumulative tetrahedral matrix of successive relationships of our additional experience interrelationships, the sum of all interrelationships, means understanding of all experience interrelationships."

15,268 Earham, Pacific Palisades,

- Cite RBF holograph scroll CA; 11 Sep'63

RBH DEFINITIONS

"Vectors---as with all real experiences---are inherently terminal. The relative lengths of the vectors are the products of the mass and velocity of the energy events, as expressed in unified scale in relation to other co-occurring energy events. All co-occurring vectors have unique angles of direction as angularly referenced multidimensionally to a given observer's system axis, spin orientation, and system-orbit direction at the time of observation. All angularly referenced relationships inherently involve fourth-dimensional accommodation (and fifth-power accommodation when referenced to the cosmic scenario). These relationships can be conceptually comprehended in synergetics but can be expressed only in complex formula terms in the XYZ-cgs system."

Musical Chairs:

"It's no longer a matter of pulling the top down, or Jailing the heretics.
It's pulling the bottom up, and every body can be brought into the
success we'll all enjoy.... The top can react as it will. To the extent
that it's not thinking, it'll be fierce.... They'll pull every trick they can
just when they don't need to anymore.

"We've always played musical chairs. You start with 100 people
and 99 chairs. Well, you could play it another way. You could start
with one chair and a thousand people. That was the old condition
on Earth. But then you begin manufacturing a few more chairs. The
players increase but the chairs increase faster. Now we know that
the chair manufacturer can make enough for everybody to sit down.
When there was only one chair you felt pretty god damn exclusive
when you sat down."

See Individual Freedom vs. Mutual Emergency

"It is mathematically probable that the unprecedented physical and geographical magnitude of the United Nations' war effort will win a military advantage over the unprecedented military challenge to the as yet adolescent cause of democracy.

"However, the educated individual, thinking responsibly upon the problems that confront personal, family, state, and national fate, if not survival of the human race itself, is well aware that a military advantage gained over the enemy, no matter how tactically incisive, cannot represent a solution to the greater problems in principles governing a workable system of mutual survival.

"The unheeded challenge of these overgrown mutual survival problems themselves precipitated the war. Rather than diminishing in the emergency, they have been heightened in degree of general recognition and of popular language definition. Because the problems are now total in scope and therefore astronomical in dimensions, there is a tendency to assume that the answer must be found in physical plans of unprecedented might.

- Cite Introduction to Motion Economics; May'll

RBF DEFINITIONS

"In contradistinction to the latter assumption, the body of thought here presented holds that solution lies not at all in physically Gargantuan innovation but rather in the direction of exquisite and delicate universal attunement of the individual and ergo of society in general, to truths and principles everywhere at hand.

"While some of these principles have already been theoretically accepted, few have been realistically digested, because they have never been compounded to reveal their integrated dynamic significance.

"It is the second principle of this thesis that no one can 'tell' another something they do not already know. One can report events to others, but beyond that one can only communicate developing awareness of the significance in phenomena also experienced similarly by others. Significance--- itself a relative phenomenon---is developed by correlation. And significance is increased by compound correlations.

"Pursuit of this theme leads to unveiling of a natural panorama, systematic and reassuring in its revelation of"

- Cite Introduction to Motion Economics; May*44

• vival Principle,

(3)

"universal orderliness. Development of such progressive significance must start, however, with reinspection of the seemingly simplest yet most profound phenomena of experience, i.e., the thought communication processes.

"If the reader will take heed of each of the first ingredients of the problem---no matter how seemingly familiar---the whole thesis will soon move to form into subassemblies of significant thought. Ultimate function of the subassemblies of significant thought, if not at

first obvious are soon intuitively recognised. This in turn will develop progressive awareness of a dramatic grand ensemble of principles governing total world economic integration by science-paced industry.

"The third principle of this thesis differs widely from the popular misconception that man has 'built up a body of knowledge' as a synthetic stockpile of mental stuffs accumulated on shelves of brick buildings requiring experts and even colossal mentalities to interpret. This third principle has it that the universal phenomena always exist--- that man out of a chaotic sensorial relationship to his Universe, has" from time to time transcended his confused self-preoccupation¹?

- Cite Introduction to Motion Economics; May'44

"long enough to dimly discern those phenomena of ever present universal and dynamic principles. That learning, instead of 'advancing' as a progressive invention of accessory complications related only to the affairs of 'civilised' man, is instead a process of progressive simplification to universal reality. That the answers are always so simple as usually to be overlooked. For the grownups this means unlearning, or divestment of error.

"In view of this premise of infinite and omnipresent wisdom to be progressively discovered as principles of sublime simplicity, we also discover the initial advantages accruing to the scrupulous humility of creative science."

Myopia: Incaatlng YC. B_{rp}fldcAg£lw

"... There are great varieties of periods of nonmeshing which altogether make the physically observed totality appear to take up ever more room, anywhere within which expansiveness the locally predominant events occurring within short spans of time appear to be omnidisorderly.

"When we compound that realization with the now-known millionfold greater span of electromagnetic reality and the lesser span of direct sense ranging of the human organism, we begin to comprehend how readily humanity fits into the trap of dismay, fear, and negativism in general.

"Impatience engenders further myopically disorderly incrementation of information receipts. Those who are impatient for the receipt of the next news broadcast are only beguiled by negative information. That is what myopia looks for. Chronic shortsightedness spontaneously seeks and tunes in only the broadcasted entropy. Syntropy incases in contradistinction to entropic broadcast. Syntropy can be apprehended only through overall or comprehensive review of the totally recalled information of long-term experience.'*

"Goldy then introduces Naga, the sea serpent: god of the oceanic world of the ancients. Naga is the wave. Naga is a live tetrahelix. At sea the wavelinear profile of Naga's back always rims the horizon.

"Influenced by the language of previous millennia of long distance ocean-traveling sailors coming originally from the atolls of the South Pacific and Indian Oceans into the Arabian Sea to reach Mesopotamia, and by the subsequent tracing of those world-encircling, deep sea routes by the Phoenicians, the ancient Hebraic language of the earliest Biblical scripture came to contain the word nachash. which means 'serpent,' or 'whisper,' or 'divine,' (the ch being a guttural or 'g' sound); i.e., naga and nachashot" (or nagashol) means the sea, and the root verb Nacha (-naga) means to lead, conduct, guide, and Nacha (pronounced naga) is also the name of the ancient seafarer Noah. (O) (A) (CH--- Noah.

"Nachan* (pronounced nagan) is the word for copoer or bronse alloy, the latter being the high-strength form of the nonrustable metal with which all ship fastenings, fittings and instruments have of necessity been fashioned since copper's first discovery,"

- Cite GOLDBLOCKS, pp, 11,12, 30 May'75

Naga: (2)

"and its alloyed production as bronze by humans 5»000 years ago at Ban Chiang in Thailand, where the bronze age first took over from the stone age, in what was once a Venice-like complex of canals leading from the sea into all of the Southeast Asian lowlands on the Indochina coast nearest to all the seafaring activities of the Southwest Pacific in the region where the Naga nation long ago came off the sea and out upon the mainland, and as yet lives, where Hanoi now exists.

"Two thousand years ago there existed a place called NCanna.

"This bronze age birth occurs at the final peak of the Austronesian civilization, of which there are evidences going back 16,000 years or more. These ancient water peoples' world embraced the Central and South Pacific, South Indian Ocean all the way westward to include Madagascar, and all the way eastward to include Easter Island, and all the way northward to include both Japan and the Hawaiian Islands, and southward to include New Zealand. This is the world of Naga, the *na' prefix' being the 'na' of na-vy; na-tivity; na-vi-ga-tion; na-tion. 180 million of these Austronesians as yet are alive and many are as yet living with the same maritime and insular artifacts as those of"

- Cite GOLDBLOCKS, p.12, 30 May'75

Naga: (3)

"their possibly millions-of-years-ago forbears.

"When the god of the sea, Naga, tidally enters the river mouths of the land, as seen from the high mountain, his snake shape is clearly revealed by the river's shape. The Japanese word for river, •Magala,' indicates that the ancient water people looked upon the river's banks and bed as constituting the female organ of the land being sexually intruded by Naga, the god of the sea, as the oceanic tides pulsed inwardly and outwardly for great distances at the lower extremities of the rivers. The early humans sensed and revered the greater pattern events of Universe as manifesting an ever and everywhere presence of a knowing, life-giving, supporting and terminating competence vastly greater than that of humans. They saw themselves and all that they could see, including the Sun, Moon, and stars, as having only minuscule local parts in an organic whole whose shape and site transcended both the ranges of their vision and the scope of their imagining."

RBF DEFINITIONS

Naiveto:

"Naivete means not knowing it all, not being a aucker about everything, not pretending to know about the safety rator in the pyramid. Too many people miss things because they dismiss them when they think they know all about them. De as a child and a child is naive. Adults say young people must get over that sensibility but I say we must open it up again. I feel very much about life as I did as a child. Once I was blase about flowers as something for funerals but now I try to look at a flower as a child seeing it for the first time."*

- Cite RBF in videotaping session, Philadelphia. PA., 1 Feb*75

Naive:

"I often think that the motto on the shield of Milton Academy--- "Dare to be True"--- ought really to have been "Dare to be Naive." In 1927 I tried to recapture what it was to be young, to recapture naivete . . . , which is innate I wanted to recapture the innate.

"Man cannot invent naivete: it is innate.

"Like Chris Morley's poem:

In your unstained, transparent eyes There is no conscience, no surprise
Life's queer conundrums you accept Ypur strange divinity still kept.

So I think that divinity and naivete must be akin."

- Cite RBF to EJA, 3200 Idaho, Washington DC, 23 Jan *72;

RBF DEFINITIONS

NaivetS:

"Much of the most exciting and important part about tomorrow is not the technology or the automation at all, but that man is going to come into entirely new relationships with his fellow men. He will retain much more in his everyday relations of what we term the naivete and idealism of the child. This will be completely justified and not exploited or exploitable in any way. I think then that the way to see what tomorrow is going to look like is just to look at our children."

Naked Universe:

"Pure science events represent openings of windows through the wall of ignorance and fiction to reveal the only- reality--- the behavior of the naked Universe that always was, is, and will be. True it is that the first glimpse may be hazy and imperfect, but the behavior itself is absolute and progressively clarified. Therefore, this comprehensive

curve of the chronological rate of acquisition of knowledge concerning the pure science absolutes, separated out from all other events of history, may be inspected as the basic means of prediction of inherent technical and social events --- immediate or somewhat distant."

Nation:

"All the customs, all the languages, all laws, all accounting systems, viewpoints, cliches, and axioms are of the old, divided, ignorant days. The corollary of 'divide and conquer' is 'to be divided is to be conquered.' To be specialized is to be divided. The specialization which humanity perseveres in was invented by yesterday's armed conqueror illiterates. The separation of humans into more countries made them easy to manage. Nations may unite, as at present, without success. Strife is proliferating. Not until specialization and nations are dispensed with will all humanity have a chance of survival. It is to be all or none."

Nature in a Corner.

"Getting nature in a corner is a way of making a aomething- ness out of a nothingness."

Cite RBF to World Game Workshop'77; Phila., PA; B Jun'77

"Getting nature into a corner---the windows of nothingness and the nuclear sphere---it all comes from getting away from the up-and-down language and bringing in all the in-out-and- aroundness in the language of frequency.^{1*}

- Cite RBF to EJA by telephone from Beverly Hotel, NYC; 17 Nov'75

"Getting nature into a corner is the essence of synergetics. It is the coordination of thought and physical action, the genesis of geometry, system and structure. Physics and metaphysics are resonantly integral: the integrity of their intertransformative mathematics into all the special case, variably enduring associabilities cognized by humans as structural design. The frequency rates are the separate static frame rates of inspection and are recognized by humans' brains as mechanics when the frequency of inspection by humans synchronizes with the cinema frames' running. The difference between structures and machinery is the same as the difference between "moving" and "static" pictures as both relate to human* information comprehending. This is the grand strategy."

- Cite SYNERGETICS, 2nd. Ed. at Sec. 261.01; 13 Nov'75 **"The synergetic coordinate of nature and its hierarchy of ascending or descending components provides human mind with a means of resolving problems by bringing nature into a corner—a four dimensional corner of the four-dimensional planes of the tetrahedron. Only with the four-dimensional convergence and divergence of synergetics can the human mind resolve comprehension by minimum limit corners. The minimum polygon is a triangle; the minimum polyhedron is a tetrahedron: both of their structural behaviors are unique. Because humans think only in terms of parallel and rectilinear coordination, they tend to hold to the parallel conditions of their**

lives, seek to maintain the status quo, and fail despite birth and death and organic and biological manifests, to be able to take advantage of the cornerability and the positional fix provided by the four-dimensional synergetic convergent- divergent coordination.”

Cite SYNERGETICS, 2nd. Ed., at Sec. 260.1.2; 12 Nov'75 "You can never figure out what nature is up to if you are working in parallels and perpendiculars. You have to deal in convergence and divergence. That's the only way you can get nature into a corner. And when you have nature in a corner, then you don't need anybody to mark your paper.”

RBF DEFINITIONS

"And wherever they came from Ththoughts arranged in this book Are discoveries of its author Since he first came in 1913 To think that nature did not have Separate departments of Mathematics, Physics, Chemistry, biology, History and languages, Which would require Department head meetings To decide what to do Whenever a boy threw A stone in the water, With the complex of consequences Crossing all departmental lines. Ergo, I crme to think that nature Has only one department--- And I set to discover its Obviously Omnirational Comprehensive co-ordinate system.

- Cite BRAIN KIND, p.?71 May '72

"When I grew older I was intrigued with the geometry of mathematics and I kept thinking a lot about the alleged ineffability of the so-called fourth dimension. When I left Harvard and went into the Navy I remember saying to myself, "If nature has a department of physics, a department of chemistry, a department of biology, and a department of mathematics it would have to have meetings of all department heads in order to decide what to do when I throw an apple core into the water. The omni-departmentalization seems too awkward a system. I think nature has only one department and I think she has

one comprehensive coordinate system to interaccommodate any and all events, and that system is probably rational as nature's chemical associating and disassociating is all done with whole, low order numbers."

- Cite RBF marginalia in old Chap. 2, "Synergy," 1.11, 18 Mar'6?

"Now. in order to understand universal structure one must consider the fundamental coordinating system employed by nature. It occurred to me half a century ago that nature might have a coordinating system of her own--- which might not be the same system as that which man has arbitrarily invented.

adopted, and applied to his measuring of nature. It also occurred to me that nature probably did not have separate departments of physics, chemistry, biology mathematics, and sociology, etc. In formulating the quadrillions of bubbles per second in the waters of Niagara Falls nature has no time in which to refer her structural formulation decisions to bureaucratic conventions of departments heads of academic categorical states."

Nature Has So many Options:

"I say: if nature permits it, it's natural. If nature doesn't permit it, you can't do it. And you can see that nature has so many options. And we're used to using only a few of the options and we think that the not-frequently used options are unnatural. But they're just as natural. Soleri: "So the typewriter is a natural phenomenon?" hBE: "Absolutely."

- Cite WATTS TAPE, 19 Oct '70, p.23

Nature*8 Subvisible Order: (1)

"Man talks carelessly and ignorantly of such words as 'chaos* ... 'turbulence'... 'turmoil', and (the popular, modern) 'pollution*... where nothing but absolute order is subvisibly maintained by nature and her transformation arrangements unfamiliar to man. Universe does not have any pollution. All the chemistries of Universe are always essential to the integrity of eternal intertransformation and eternal self-regeneration.

Physicists invent nothing Chemists invent nothing.

... They find out what nature does from time to time and learn something of what her laws of rearrangement may be, and fortunate humans employ those rules to cooperate consciously with nature's evolution.

"All humans, endowed at birth with a billion capabilities beyond the knowledge of the parents, evolve in ways that are utter mystery to them. The exquisite, myriadly endowed child employs that mysterious endowment and intuitionally apprehends itself as inventor of ways of using the orderly laws of Universe to produce tools, substances, and service integrities, to communicate and allow humans to participate in Universe's ever-transforming"

Naw Sequence; (1)

"... I look in various directions because I'm interested in big patterns is one reason why my intuition solves some big patterns... And my Navy experience brought me into celestial navigation. Goodness gracious! My navy experience brought me into...logistics, ballistics, controlling the trajectory of missiles. This brought mLnTo the realization of variables where I realized I had never heard anybody say this, they didn't say this in the Naval Academy, the flight— shooting from a fixed position to another fixed position is not in the same category as flying from a moving ship on a heaving sea against another moving ship on a heaving sea. And not on a planar base either but on a spherical base. It turns out that all the variables in the Universe in a spherical planet are in the latter base and not a fixed one. I find that really so much of man's thinking is on the fixed-position-to-fixed-position.

"So I then got into the concept of what I call the Theory of the Navy, the theory of ships, of designing the ship itself, what its particular function was, then designing the blast furnace to make the steel... all of this just to get that platform out there and taking you 2\$ years before you get* all the things done... and then the forward supply bases;"

15 Jun'74 - Cite Tape transcript #5, p.9; RBF to W. Wolf, Phila. Pa.,

RBF DEFINITIONS

Navy Sequence;

"the industrial fflMBHBBHI fallout rebuild bases; ships of the train ana ships of the line... finally the line then was in contact and we did all these things against possible contact and when contact came after 50 years then you had an obsolete battleship...

"You have to have all this general industrial comprehensive anticipatory design science. Not a single thing in the Navy was there at the university until the principles discovered by man were actually reduced to practice and this extraordinary package could float all these things... Could float a fantastic power plant, to drive anything you wanted. So I realized that I'd really been trained in an extraordinary field where at that time there was nothing comparable to what was on land. We've put a lot on the land since that time. And I was really not just a passenger but was trained to know where everything was on that ship and how it worked. I got to know navigation dealing with the stars and the Universe. I got to understand the laws of storms. I learned to understand the social behaviors of peoples as well as the storms of humans and the ways they behave. These are great responsibilities and the line officer was a line officer because back then you were in line of command"

- Tape transcript #5, p.10; RBF to W.Wolf, Phila., Pa., 15 Jun'74

Navy Sequence;

"immediately if your seniors were killed, you had to take over the ship. If the other seniors were killed you had to take over the fleet. You had to be trained this way. You might be young, but that's the kind of training given you to be a comprehensivist. ... Then came finally contact. And it was said that in the first and second world wars we would know who was going to run the world for the next 25 years. You knew what the other man's tonnage was but you wouldn't really know what he could do with the same, or more with less, until you came into contact: And the other one went to the bottom. So he didn't know either. And these were kept secrets. This was what was meant by classified information. Anyway, I was privy to all this...

"And of all things, here I was in the Navy at an extraordinary moment of history where the masses of the water-ocean world were running the world < the British Empire at that time; and they suddenly were about to lose if they couldn't get America in because the submarines had not been anticipated and they were sinking their great line of supply. If they couldn't keep up their line of supply the war would come from Europe on to the British Isles and whoever controlled the British Isles was"

- Tape transcript #5, p.10; RBF to W. Wolf, Phila., PA, 15 Jun'74

Navy Sequence: (4)

"going to run the world. That was considered the unsinkable flagship that commanded all the harbors of the customers of Europe... where you cashed in everything you stole from the Orient.

"The Navy at that time was very secondhand... This was before World War I. Our chief battleship was Admiral Dewey's flagship. Because of their enormous sinkings they had to be refurbished from America; enormous production, and they wanted all these ships, and many men brought across the ocean to fight; and above everything they needed to build up their naval strength.

Therefore, they had to allow the American Navy to come to parity with the British Navy... And I was at the Naval Academy and they had to have the men that ran ships: That was the big show.

"I want you to realize, then how very different this whole complex of events is... And I'd become so familiar with my filing problem. In those days we didn't have a computer. The only thing we had was something called the Ford Range Keeper. And that became the property of the Sperry Corporation. We had it on the bridge of ohly the very biggest ships., and we had to do everything longhand. And they had, down in the plotting room down in the bowels of the ship; it was really the command"

- Tape transcript /5> p»11; RBF to W.Wolf, Phila., Pa., 15 Jun'74

Navy Sequence: (5)

"position of the ship. It was the most armored of all and in that plotting room we had enormous charts with all the variables that went into the firing problem. And anything you could put in there... the logistics were broken down into two things: the internal and external ballistics. And the internal ballistics were all the things that happened before you fired the gun. And the external were all the things that happened to the missile after the gun was fired. You could get all the previous... temperature, what the wind was blowing, direction, speed of your ship, keeping track of the speed of another ship, all those things were in there. Suddenly then, we had to get this... and there was a spotting problem. You're only firing still at visible range in those days. Five thousand yards; you're talking about three miles, five miles, ten miles. Ten miles was a very long one.

"Anyway, having learned what I just learned... immediately after World War I a series of things happened. We learned to scramble all the radio. We had never dared send messages by radio. But then we radioed information coded and ciphered, but you really didn't send any strategic ones. But the messages couldn't go any faster than the coding. For this reason the authority in"

"the Navy remained in the Navy and the commander in the Navy had to make decisions way away from home. After Abraham Lincoln decisions were made by telegram: all the land controls went into central position. Only in the Navy were decisions made way out there. After the war we then learned to ecramble messages and from this time on they no longer needed to have comprehensivists. ... They wanted specialists. Men became Naval aviators, or submarine, and so forth. I was the last of the breed of the comprehensivists being trained in that way. This is very relative to the problem you're up against now.

"I was fascinated with the things that some people improved on the firing data. They introduced theis and they introduced that and I said I wonder if some of thtse things aren't redundant. We put them all in to calculate. So I tried firing where you dropped this out; and if the answer was so badly altered that you could fire anywhere in the sky with equal success, then I put that one back in. 'hen I found it really hardly varied at all, I said which one of these should be dropped out. And I could weed out. I feel that's what brought me down to Earth, (hmm - eja) down to what I called min-max-fam-fax— the minimum-maximum family of facts."

— Tape transcript j?5, p»12; RBF to W. Wol, Phila. Pa., 15 Jun'74

Navv Sequence: "Now I did that in 1927 when I was out of the Navy and was trying to think how it could all be reestablished. But I had to start with the Universe. The Navy started with Universe. We're dealing in the celestial. It's important to realize that this long, long training had been in really a very diff- erant category. The

Navy automatically looked on the whole Earth. You assume there's only one Navy. And the other ones go on the bottom so you have any resources of Earth. You didn't have to think in terms of the barriers the Army had. That was when the great war games were the world games. That's when I turned those into positives."

Neck:

See Stick the Neck Out

Necklace:

"A necklace is unstable. The beads of a necklace may be superficially dissimilar, but they all have similar tubes running through them with the closed tension string leading through all the tubes. The simplest necklace would be one made only of externally undecorated tubes and of tubps all of the same length. As the overall shape of the necklace changes to any and all polygonal shapes and wavy drapings, we discover that the lengths of the beads in a necklace do not change. Only the angles between the tubes change. Therefore, stable refers only to angular invariability.

(A)

"A six-edged polygon is unstable; it forms a drapable necklace. If we make a five-sided polygon, i.e., a pentagonal necklace, it is unstable. It,too, is a drapable necklace and is structurally unstable. Why? A necklace of three rigid tubes also has three flexible angle-accommodating tension joints. Here are six separate parts, each with its unique behavior characteristics which self-interfere to produce a stable pattern. How and why? We are familiar with the principle of lever advantage gained per length of lever ana from the fulcrum. We are familiar with the principle of the shears in which two levers hhare a common fulcrum, and the stronger and longer the shear arms,"

9 Nov'73

Necklace:

"the more powerfully do they cut. Steel-bolt cutters have long lever arms."

"In every triangle each corner angle tension connector serves as the common interfulcrum of the two push-pull, rigid lever arms comprising two of the three sides of the triangle adjacent to their respectively common angular corners; each pair of the triangle's tubular necklace sides, in respect to a given corner of the triangle, represent levers whose maximum-advantage ends are seized by the two ends of the third, rigid, push-pull, tubular side of the triangle, whose rigidity is imposed by its command of the two lever arm ends upon the otherwise flexible opposite angle. Thus we find that each of the necklace's triangular rigid tube sides stabilizes its opposite angle with minimum effort by controlling the ends of the two levers fulcrumed by that opposite tension fastening of the triangle. Thus we find the triangle to be not only the unique patternself-stabilizing, multienergied complex, but also accomplishing pattern stabilization at minimum effort, which behavior coincides with science's discovery of the omni-minimum-effort behavior of all physical Universe."

- Cite SYNERGETICS text at Sec. 608.03; galley rewrite 9 Nov»73

Necklace: (C)

"The six independent energy units of the triangle that interact to produce pattern stability are the only plural polygon-surrounding, energy-event complexes to produce stabilized patterns."

(The necklace corners can be fastened together with three separate tension-connectors, instead of by the string running all the way through the tubes, wherefore the three rigid tubes and the three flexible tension connectors are six unique, independent, energy events.)

"We may say that structure is a self-stabilizing, pattern integrity complex. Only the triangle produces structure and structure means only triangle, and vice versa.

"Since tension and compression always and only coexist with first one at high tide and the other at low tide, and then vice versa, the necklace tubes are rigid with compression at visible high tide and tension at invisible low tide; and each of the tension-connectors has compression at invisible low tide and tension at visible high tide; ergo, each triangle has both a positive and a negative triangle congruently coexistent and each visible triangle is two triangles: one visible and one invisible."

Necklace: H)

- Necklace flexibility is a function of angular tensions and not of the compressional Islands or beads. Relative flexibility decreases as beads are progressively removed. When the numbers of beads are odd the waves in the necklace are blocked; when the number is even the waves are continuous.

"When the number of beads is reduced to six, continuous wave flexibility is permitted. When the number of beads is reduced to five the waves are blocked so the necklace is flexible. When reduced to four beads the necklace can be draped over human shoulders; one "V" in front and one "V" in back. When the beads of the necklace are reduced to three all flexibility ceases. Each angle is stabilized by the opposite side, exercising its push-pull effectiveness upon the two lever-ends of the angle's adjacent sides, RS would a pair of scissors be held in fixed opening by a pencil with the pencil's two ends tied respectively to the two finger circle terminals of the scissors, (drawing.)

Necklace;

"I have a very crude necklace. That is unique about the necklace is its flexibility, so it can be draped over the shoulders. . . . Looking closely to see how and why it can flex, we find that the individual pieces of wood here are not changing their length at all /hat is changing are the angles. All the flexing is in the terms of the angular change and not linear. . . . In other words an angle is an angle independently of the length of its edges. So these are angular behaviors. I'm going to take several pieces out of the necklace. IT's still very flexible so we take another one out. Still very flexible. Take out another piece. Still very flexible. Now I'll take out one more piece--- we're down to four pieces and it's still very flexible. This we'll drape over my shoulders

with a triangle in front and a triangle m back. Pan calls this a square, but we see this square as completely unstable. I became extremely interested in this when 1 was young, the fact that the square does not have any structural integrity of its own. It only behaves the way it did because the teacher put it on a rigid blackboard and it couldn't change there. Now I'm going to

take out one more piece. . and for the first time it will no longer flex."

News:

"Today's news consists of aggregates of fragments. Anyone who has taken part in any event that has subsequently appeared in the news is aware of the gross disparity between the actual and reported events. The insistence of reporters upon having advance 'releases' of what, for instance, convocation speakers are supposedly going to say, but in fact have not yet said, automatically discredits the value of the largely prefabricated news. We also learn frequently of prefabricated and prevaricated events of a complex nature purportedly undertaken for purposes either of suppressing or rigging the news, which in turn perverts humanity's tactical information resources. All history becomes suspect. Probably our most polluted resource is that of the tactical information Wo which humanity spontaneously reflexes."

News & Evolution;

"Daily news is a major ingredient of human evolution. Advertising alone provides the economic sustenance of the western world's news media. The magnitude of paid-for advertising received by each news media is directly proportional to the number of MB its buying readers. News media management searches for the type of news that sells the best. Year after year the publishers find that 'bad*' news attracts the most paying readers—possibly because the readers can congratulate themselves on not being the unfortunate ones. Whether or not this is the right explanation, it is a demonstrable fact that powerful economic sustenance for negative voices exists. Though the majority of humans are born positivists, popular acknowledgement of the effectiveness of their expressions is difficult to come by, and has little or no economic support. Positivist poets are proverbially poor.

"While there are many positively committed institutions— religious, academic, and political—we are considering here only the few independently thoughtful, positive individuals alive today whose work has come to be generally recognized in this era of billions of humans integrating into a common world culture, in contradistinction to the few millions of"

Newton vs. Einstein; (2)

"was beginning to take place in my generation's unfolding experience than had occurred between my father's and grandfather's and my grandfather's and great great grandfather's successive generations. It was clearly an environment that was changing; and though the environment changes might not alter man's genes, changes in his external conditions might permit man to realise many more of his innate capabilities. Dwellings are environment modifying machines; so are automobiles. Automobiles are little part-time dwellings on wheels. Both autos and dwellings are complex tools within the far vaster tool complex of world embracing industrialization. Life continually alters the environment and the altered environment in turn alters the potentials and realities of life. The environment is basically a complex of nonsimultaneously occurring but omniintegrating or interstimulating, and therefore interregenerating, mutations of man's integral, internal metabolic regeneration organism, on the one hand; on the other is his external, invention- realized, metabolic regeneration organism, which we think of and speak of as industrialization."

Newton's First Law of Motion; W MffWMilt °f

"Ask Newton what gravity is and he will answer, 'It a covarying inter-relationship of two or more bodies inherently nondieclosable by any one of the bodies considered separately.'"

- Cite RBF Tribute to Josef Albers; Dec*77

"I have attempted a new generalized statement of a 'First Law of Acceleration,' which goes as follows:

All local event systems (Newton's 'bodies') are in relevant continuity of frequency accelerations with a plurality of local and comprehensive patterning consequences, and all other local systems of macro and micro degrees affect all other local systems of Universe in varying degrees of angle and frequency modulation; and the effect of all the local systems of events upon any and all other systems of local events is precessions!."

"The astrophysical chain of events altogether compounded to permit Newton's discovery of the only-metaphysically-statable gravitational law which showed that the intensity of the interattraction of any two celestial bodies is initially proportional to the product of their masses and varies at a rate of the second power of the arithmetical distances progressively intervening--double the distance and reduce the interattraction to one-quarter of its previous intensity."

- Cite RBF tribute to Josef Albers, Dec'77

RBF DEFINITIONS

"Synergy... is a part of the great mystery Which always remains unexplained By such discoveries as Newton's Of the first-power arithmetical Vs. the second-power augmentation Rates of constantly intercovarying Gravitational interattractiveness Of separate bodies in Universe..."

- Cite WHAT I AM TRYING TO DO, p.2 revised, 10 Sep'74

"Isaac Newton discovers

The rational geometrical rate of change Characterizing the Interattractiveness Of any two celestial bodies

While their relative distance apart

Vary only at an arithmetical rate

Which attractiveness itself

Let alone its inverse

Second power rate of gain

Is not manifest

In any of the physical characteristics

Of either of the celestial bodies

When either is considered only separately

And only in terms of its

Integral dimensions, mass, chemistry

And independent electromagnetic properties..."

- Cite WHAT I AM TRYING TO DO, p.1., 4 Aug'74

**"Acceleration is second power, multiplying the number times itself.
As a hypothetical arrangement, when you doubled the distance apart
you decrease the interattraction fourfold.**

You have this increase in fourfold, which is second power."

NW "DXYPreq: PiscloBure of Entirely New Universe in Next Decade:

"Since Earthians' astronomical measurements have only been conducted for a few thousand years, and nine-tenths of the information has been accumulated in the last five centuries, to be conservative, we can say that 11,000 years exploration has brought in data covering 11 billion years.

**The ratio 11.000 - 1 clearly manifests a

11 billion 1 million high-order experiential acceleration in the rate of information gaining. Thus we take note of how MHBI really little we know and alert ourselves to the probability that the next decade will disclose what in effect must seem an entirely new Universe--- so much more of the cosmically eternal a priori mystery will have been vouchsafed to us."

- Cite HiiARTBEATb AND JL1L1UN, World Mag. p.23, 27 Mar*73
New York City:

"The appropriate metaphor for New York City is that of a ship. All of the equipment and the data are there. The ship is not sunk. The pumps all work.

"The people of New York could take one of several routes:

-- U.S. Army; they could turn it over to the Army to run it, but this would be fascist.

— Communist; to go communist would be equally unthinkable.

— Unions; they could accept the leadership of the unions.

"The union heads with all their talent and leadership could decide to operate the city. The confrontation of the unions has not been so much with the city itself as it has been with the banks, the bankers, and their paper money game. The union leaders should issue their own paper money scrip and enlist the support of all the other union leaders in the country. It is a game of paper money; they might as well play their own."

- Cite RBF via telephone from Djakarta to EJA; revised statement for N.Y. Times, 31 Jul*75

New York City;

"The city physically will stay there, but New York is obsolete. Factories, harbor, warehouses--- all these have gone elsewhere. The only way to make New York work would be if the people decided to make it work. If everybody said, »My life is involved, my family is involved,¹ and started to work cooperatively, it could be made to work, I don't know any other way."

New York City:

"When I was young the architects and their patrons assumed, and in fact hoped, that their great buildings would be permanent contributions to the world scene. Though the architects... thought of their buildings in this way, I have seen three separate sets of permanent buildings in New York City pulled down to be replaced by another set of assumedly permanent buildings, with the whole unexpected evolutionary displacement phenomenon repeating itself again, I have, in effect, seen three permanent waves of architecture forsaken and replaced by other permanent waves as the waves flowed northward on Manhattan Island. In the last 15 years I have seen two- and three-story-high cities of the world transformed into identical-building type skyscraper cities,**

New York:

"New York is a continual evolutionary process of evacuation#, demolitions, removals, temporarily vacant lots, new installations and repeat. This process is identical in principle to the annual rotation of crops in farm acreage--- plowing, planting the new seed, harvesting, plowing under, and putting in another type of crop....

"most people think of the building operations blocking New York's streets as temporary annoyances, soon to disappear in a static peace. They still think of permanence as normal, a hangover from the Newtonian view of the Universe. But those who have lived in and with New York since the beginning of the century have literally experienced living with Einsteinian relativity."

(Original citation <fc context at New York City. U)(2), 1964)

- RBF quoted by Alvin Toffler in FUTURE SHOCK, p.51, 1970

"Viewed from a ship entering New York harbor or from a plane coming in over the city, New York appears as an enormous complex of hard, permanent towers---crystalline asparagus* But these 'permanents' are as impermanent as women's hairdos. New York City's permanent-wave architecture is in fact a progressively rippling dynamic wave system. The last half-century has seen three successive replacements of would-be-permanent New York City buildings.

"New York is a continual evolutionary process of evacuations, demolitions, removals, temporarily vacant lots, new Installations, and repeat. This process is identical in principle to the annual rotation of crops in farm acreage---plowing, planting the new seed, harvesting, plowing under, and putting in another type of crop.

"New York's dynamic pattern of continually accelerating transformation was entirely unpremeditated by its static-minded, permanence-intending designers and their patrons. Up to the time when its earliest skyscrapers were built (the first was the Tower Building at 50 Broadway, completed in 1889 and demolished in 1914), its stone buildings, fine" - Cite WAVE TRAILSFCEI'ATIOW. OF THE CITY, N.Y. Guidebook, 1964 "residences, banks, and commercial structures were thought of by architects, owners, and the public as 'permanent' monuments of their conceivers' era. And the building arts being the most laggard of all men's activities, this conception of buildings as 'permanent' still persists in most men's minds. Most people look upon the building operations blocking New York's streets---the piles of sand and brick, the huge cranes fishing steel girders from curb-parked trucks-- as temporary annoyances, soon to disappear in a static peace. They still think

of permanence as normal, a hangover from the Newtonian view of the Universe. But those who have lived in and with New York since the beginning of this century have literally experienced living with Einsteinian relativity.

"Said Newton, in the first phase of his first law of motion, 'A body persists in a state of rest' (and then as an afterthought, 'or in a line of motion') except as it is affected by another body. This Newtonian norm of 'at rest' which means without change, has long been the base line of all our economic charts. From this point of view all events and"

-Cite »/AVL TRANSFORMATION OF THE CITY, N.Y. Guidebook, 1964

"their growth curves are abnormal. On such charts the curves of industrial and economic performance rise abnormally above, or more normally fall back to, or parallel with, the base-line norm of 'no change.' The would-be conservators of peace and of economic health have throughout history sought to 'iron out' the abnormal humps, to 'return to normal,' to no change.

"Einstein's relativity theory, evolved early in the century, made the static verities of Newtonian mechanics untenable.

But it took almost a half-century for the dynamics of Einstein's relativity to emerge in the daily papers as the atomic bomb, followed by a pattern of dynamic events clearly demonstrating that accelerating change is normal---just as normal as the human appetite for news of the accelerating accomplishment of breakthroughs that swiftly expand man's domain in the Universe.

"To the Newtonian conservative, the deliberately accelerated obsolescence of structures and equipment, such as we see everywhere about us in contemporary New York, constitutes waste. To the Einsteinian conservative, obsolete structures and equipment are a new mine of selectively concentrated chemical elements---a fundamental resource of the industrial"

- Cite WAVE TRANSFORMATION OF THE CITY, N.Y. Guidebook, 1964 "commonwealth. The materials from this mine are the means of realising ever more advanced design out of our Improving scientific potentials. As a consequence, metal scrap and plastic scrap now recirculate increasingly.

"New inventions increase our productive capacity per man- hour and per pound of resource---our 'performance capability', as it is called. Every time we mine obsolete structures or equipment for metal or plastic to use in improved designs, we get increased performance out of the same tonnage of fundamental chemical resources. Which suggests, for instance, that we should take all the obsolete two-ton automobiles off the road, melt them up, and produce from the resulting scrap twice as many one-ton automobiles, each of higher capability than the former cars in terms of performance per passenger and of fuel gallons per safely accomplished higher-velocity mile.

"All the world's great cities that grew up prior to New York were products of the Newtonian 'no change' norms. Their romance lies in their preoccupation with man's historical- bastioned past. 'What makes New York City 'the most important something* in all history is that long before the atomic" - City[®] JAVE TRANSFORMATION OF THE CITY, N.Y. GUIDEBOOK, 1964 "bomb hit the front page, this city had become the first Einsteinian reality. Its romance is its living manifestation of history continually in the making. Its streets and districts gradually grow, swell, transform, and disappear altogether. In the 'gay'90s' New York's great exposition and sports building on Madison Square

was known as Madison Square Garden. In 1924, the owners of that building built a new modern Madison Square Garden li miles north of Madison Square on Eighth Avenue. New York's Bowery, now the deadbeat's lingering threshold to death, was once the most splendid of growing New York's districts and boasted its Bowery Savings Bank. The Bowery Savings Bank now has Its main office five miles north of the Bowery on East 42nd Street. The Madison Avenue of the 'gay '90s' meant the area between Madison Square and 42nd Street, dominated by the J.P. Morgan residence at 38th and Madison. Madison Avenue of the first half of the 20th century referred to shopping section from 42nd Street to ?2nd Street, dominated at its base by Brooks Brothers, the Biltmore Hotel, and the Hoosevelt Hotel. So attractive did the Madison Avenue vantage appear to so many corporate newcomers that they, in effect, have pulled down all the old"

KfM YQI* City: (7)

"headquarters, its leading drama and art market* One Oklahoma stockyard, last year, collected and sent forward to the slaughter house a nose-to-tail chain of cattle 550 miles long. New York's two million typewriters and calculating machines last years produced rows of letters and figures long enough to run 20 ribbons between the planets Earth and Venus when these two are in closest proximity.

"The ideas in which New York traffics emanate from all around the Earth. It is the world's greatest import-export idea exchange. New York is not an idea factory, nor an idea mine, nor an idea garden, but it is the world's point of highest velocity in idea exchanging. As such, New York is the world's greatest traffic center in hopes and fears, valid or invalid.

"There are but relatively few native New Yorkers. Its population is transient. The average residence is three X^{earB}« Visitors to New York from around the world frequently assert antipathy to New York's coldness and bigness. They have not seen the New York we have been describing. They have seen one frame of a moving picture. It looks static."

- Cite WAVE TRANSFORMATION OF THE CITY, N.Y. Guidebook, 1964

"Only the old-time New Yorkers can know the great transforming dynamics and, more importantly, the city's myriad, of rich abstract resources. Because pure abstractions such as love, hate, happiness, and inspiration are as invisible as they are nonmerchandisable, all the real meaning of New York is both invisible and nonmarketed. The lucky few millions who are old-time New Yorkers usually love New York passionately for they know not why specifically.

"While the statistical voices warn us that the world population threatens to crowd itself off the Earth, It Is comforting to discover that New York City's buildings could contain the whole population of the Earth with no mere crowding than that experienced at a cocktail party—not room for anyone to lie down but all under cover. New York is so knit together with underground wires, tubes, cables, and pipes—that In effect Manhattan Island could be lifted in one piece and stood upon end, its roadways and tunnels acting as its supporting columns with Battery Park on top and Harlem as its base. In such a position its subways would become elevators and its elevators subway shuttles."

- Cite WAVE TRANSFORMATION OF TNL CITY, Y.Y. Guidebook, 1Q64
RBF DEFINITIONS

"Its street level is not the bottom level of New York. Legal statutes adopted by early Knickerbocker burrs required that when the utility companies dug up its streets and inserted pipes, cables, and subways, they should thereafter put all the same earth back where they found it and the city would then resurface it. This the public utilities have done to the letter. The earth tucked back into the street is no more the Earth's natural top crust than is the earth tucked into the flower pots high above in Manhattan's skyscraper apartments. The concrete and steel intrusions, below the streets and buildings, have become so multitudinous and penetrate at so many levels that they reach hundreds of feet below the theoretical surface. Like an Iceberg, structural and mechanical Manhattan is now chiefly below the surface.

"Old-time New Yorkers remember the unique commercial districts--- the leather district around Gold Street; the tea and spice districts along Water, Front, and Pearl Streets; the cotton and linen district on White Street; the machinery exchanges of Lafayette Street; and the great Gansevoort, Washington, and Manhattan market districts. These districts have been almost wholly diffused into uptown invisible districts. The real

- Cite WAVE TRANSFORMATION OF THE CITY; N.Y. Guidebook, 1964

"The real long-time New Yorker knows, however, that nothing has gone from New York and that its interests have multiplied a thousandfold. The unique vortexes continually transform and interchange.

"Old-world church and cathedral spires were originally conceived and built to reach high above the surrounding houses and stores. In New York one can look down from on high into a deep valley wherein minuscule spires reach up from the bottom like fine jewelry spicules, for, unlike business enterprises, the churches have usually been able to move and have been swallowed by the commercial avalanche, being no longer the centers of their parish dwellings. But their spires as yet inspire when, in our thoughts, our eyes wander down into those New York depths wherein approximately all that is physically left of yesterday is wedded with the physical of today, and we remember that we are as yet 'quick' and not dead, and that yesterday only the dead were normal, and that New York City is now being synchronised with the dynamism of the quick whose norm is Einstein's c , that is 186,000 times 186,000 miles per second, the normal rate at which we see."

- Cite WAVE TRANSFORMATION OF THE CITY, N.Y. Guidebook, 1964 "•I lift up mine eyes unto the hills from whence cometh my help'—possibly because of all our faculties, it is only our eyes that can apprehend the distant presence of the high hills— a presence of which we are informed by radiation from the Sun, reflected from

the hills to our eyes at 166,000 miles per second, all of which seems so instantaneous that we mistakenly say that we 'lift our eyes.' And we know that no man--no mere human being—invented that velocity, nor its reliable regularity throughout the full spectrum range of all electromagnetic wave phenomena, nor the regularity of its ultra-high-frequency inter-trafficking.

”Men of yesterday looked outwardly self-helplessly to the macrocosm, praying for miraculous salvation; today they look inwardly self-disciplinedly to the nuclear microcosm for yast sources of reliable physical power. What men thought they understood yesterday of their local experiences seemed regular, orderly, and logical; what they did not comprehend, extending outward to the macrocosm and inward to the microcosm, they thought of as turbulent, random, and chaotic.”

- Cite WAVE TRANSFORMATION OF THE CITY, N.Y. Guidebook, 1964

Now York_Cjtv: (12)

”Ken of the Einstein Age are discovering the universal orderliness of constant, comprehensive transformation, utterly transcendental in the exquisite and magnificent orderliness of its wavelength and frequency when compared to the crude, disorderly, conscious thinking and articulation of mere humans.

”And as the bees intent upon their honey-commerce are utterly unaware of the pollination-function of their bumbling tails, which inadvertently and unbeknownst to the bees service the organisation of tomorrow’s flowers and honey sources, so are the little, local real-estate manipulators and separate venture builders who redot the New fork City map utterly unaware of their part in the—only retrospectively scannable—comprehensive orderliness of New York City’s transformative growth. That growth is an invisible function of all men's experience of all history, translated now into the world-surrounding, dynamically functioning industrial network-system in which New York City is, for the moment, the most radiant communicationrelaying center on Planet Earth.” - Cite WAVE TRANSFORATION OF THE CITY, N.Y. NinetY-tMO Elements as Careoea of Energy:

See Wealth, 1947

"I have sought fundamental information on the experiences of man on Earth which might govern the shape of all developments men are experiencing. Charts of inventions, for example, are not satisfactory as the list is open-ended and is difficult to assess in terms of the relative importance of specific inventions. The significant area of information is the rate at which scientists have successively isolated the chemical elements.

"` This is the most important pattern of discovery with which man deals, embracing, as it does, all physical phenomena. The rate at which man found chemical elements seems to be the key controlling the development of the application of science to technology, and following from this, the application and effect of that technology on economics and, ultimately, the effect of the new technology on society itself."

"The chart... 'Profile of the Industrial Revolution,¹ begins"

- Cite THE YEAH 2000, San Jose State College, Mar'66

- Cite The YEAR 2000, reprinted in AD, Feb'67

"begihs with ,the year A.D. 1200 going up to A.D. 2000. We begin with a list of nine elements: carbon, lead, tin, mercury, silver, copper, sulphur, gold, and iron, which were known to man at the opening of our history. We do not know when they were first isolated or knowingly

used. The first known isolation of a chemical element is arsenic, in 1200. Following this, there is a 200-year gap and we come to antimony; another 200-year gap and we come to phosphorus. Then the gap narrows to 75 years and we have cobalt. From here on we average an isolation of an element every two years. It is an extraordinary period in history that the rate begins to accelerate.

"If you check the date 1730, not long before the American Revolution, you will notice that there are some separate shoulders or plateaus, appearing on the chart. Those shoulders are slowdowns when we have major wars--- the American Revolution, various civil wars, and World War I. They show that pure science does not prosper at the time of war--- which is contrary to all popular notions. Scientists are made to apply science in wartime, rather than' look for fundamental information.

"We can also see that in 1932, which was thought to be the"

- Cite THE YEAR 2000, reprinted in AD, Feb'67

"depth of the depression, man made his 92nd isolation of a chemical element. This completed the element table representing the full family now mastered by man--- in the sense of his ability to repeat element isolation and to rearrange elements, as fundamental ingredients of physical environment, in preferred patterns of use. From this point on we may notice something strange. Previous to completion of the table, element isolation occurred irregularly--- for example, element number 19 would be the 43rd element isolated; the 45th isolation would number 30, etc. With the post-uraniums the isolations show an absolute regularity of increase--- they come in by number. Man begins to control consciously the rate of development of his capability.

"We must note this in reviewing the contiguous developments in environment control {as shown at the top of the chart). Just as man is able to go into cold climates by putting on fur skins, or into hot by taking off clothes, he enters more hostile environments by having more control devices. The development of these devices is a fundamental measure of man's degree of advantage over his environment. The first time, to our knowledge, that he goes around the world in an invention was, as"

- Cite THE YEAR 2000 reprinted in AD, Feb'67

"shown on the chart, in a wooden sailing ship. It comes after the second isolation. Then there is a gap of 350 years and he now goes around the world in a steel steamship. This is an entirely new magnitude of control, no longer dependent on the wind. Itpon this, there swiftly follows the world journey in an aluminum airplane, then in an exotic metals rocket. There is a very great contraction in time between these developments. The wooden ship takes two years to circumnavigate the Earth; the steamship, two months, the airplane two days, and the orbiting satellite just over an hour. We have at least three accelerations of accelerating accelerations involved here.

"The consequence of what we have considered then, in relation to our charting is that the next point for a significant new chapter would be around 1975, nine years from now. What that will be we can only guess at--- sending ourselves around the world by radio?

"The key realization is the degree of acceleration of change, and that better than 99 percent of all important technologies affecting such change are invisible. Man cannot see what is going on. He cannot 'see' the chemistries; he cannot see the**

No Building Blocks:

"Kan haa an innate proclivity for wanting to monopolite, or to be monological. He wanta to fibd the key, the building block. Every news reporter tries to talk "in terra of 'finding the building blocka of universe.' But the physicists keep tryingt to tell society that it takes fundamental 'complementarity.' That is to say two different and complement?i|a|y 'building blocks.' They are the proton and the neutron. The two are intertransformable. But if one transforms to the other, the other does likewise. But they are always unique in themselves. You cannot build universe with just the rightness or leftness 'blocks' exclusively of one another."

- Cite NASA SPEECH, Pp. 67,68, Jun'66

' • Starting with the elementary viewpoint: you get a few things and put them together... The Darwinian idea. At his time the smallest thing you knew much about, you could look at It with a microscope, was a cell. We had again, Dalton, and his atoms, but not much was known about them in physics and basic chemistry. It came as a pretty nice idea from Darwin that he could seem to find the same cells occurring in all the things. You could say he started with the simplest cells and built up to the more complex cells. Cells were the building blocks.

' 'We have to note that man loves the idea of a building block. Itan has a tremendous propensity for one thing. He wants the key. He loves to talk about the building block or the key.

• 'What the modern physicist has found, and what Oppenheimer was giving us in his farewell address on TV (although it was not his discovery) was the idea of fundamental complementarity.

We discover that we are dealing in a Universe of functions and there is a plurality of unique patterns. They are not the same patterns and fundamental complementarity means that you"

Bo Energy Orf sia: (A)

"The Universe is nothing but energy. There is no energy created at all. It's a crisis of ignorance, fear, wrong thinking, an overblown bureaucracy, and conditioned reflexes.

"The poor President Carter_7 has a cabinet without an Inventor on it.... to switch to coal is just deferring the crisis to another time, leaving it to another generation.

You can't do it by politics, Carter is a politician. He is at the tail of the dragon where things are really snapping....

"Money-makers say they don't know how to put a meter between the people and the wind. This amount of energy is not being employed because people don't make money off it....We continue live on the cream and not on the milk. We go after high-grade oil, making money on high-grade power, but what you're actually doing is using up nature's own savings account. The Universe has accumulated that energy over billions of years by impounding photosynthesized energy. With people making billions of dollars it's difficult to stop that kind of thing....

"When the German oil wells were bombed, they got by on _n alcohols, converting trees into fuel, and they also were the

NQ Energy 'rlala'

(B)

first to make synthetic rubber from alcohol...⁴⁷ But America in World War II didn't have enough high-octane energy to satisfy both our aviation and our synthetic rubber needs, so the U.S. furtively made enormous amounts of synthetic rubber from alcohol. Then, when Eisenhower came in, the oil companies and the administration were careful not to let the public realize they were ever able to do it.

"Nature doesn't have pollution. Pollution is valuable chemicals in the wrong place....

"I don't get any gold medals from the oil companies, but I do know David Rockefeller was Impressed by the book 2 Medard Gabel's 'Energy, Earth & Everyone.!./. He knows that it's so. I've been asked to speak at a luncheon given by the chairman of the board of Atlantic Richfield. They al-o know it's so. They don't say *I hate you' or anything like that. They Just don't know how to let go of a hot. poker. It's not that they're bad human beings, but some are hooked on a bad game....

"Settling the energy crisis on the basis of how to make money may accelerate the coming of something we might not like---'

fidF DEFINITIONS

»o Energy- Crisis?

<C)

"socialism or communisn....

'The whole thing started with Yankee ingenuity. The Yankee inventor was well-thought-of. He gave people a service and people admired him because of his product. Then the conglomerates came along and reduced that human pride. The power of money was equated with progress. For the moment, we are losing something tremendously

47 Cite RBF to Susan Watters in W tWomen's Wear Daily); 13 Kay'77

valuable. If the energy crisis isn't properly handled, it could bring on another political system which promises to divide more equally an energy supply which people have incorrectly been led to perceive as limited. We could end up losing a very great battle."

^{NQ} Energy crisis (ti)

"We are on a tiny little planet. Our nervous system still sees the sun set, even though the sun doesn't set... we're just rotating out of its sight. We talk about things being 'up' and 'down' even though there are no such directions. We say the wind is blowing from the northwest when it is really being sucked from the southeast.

"The depth of ocean is really only 18,000th of the diameter of our Earth and yet we think of it as huge.

"They talk about the drought as if there had been no way to prepare for it... but we've known how to desalinate since the steamship. Instead of putting some pipes up through the hills, which takes enormous amounts of energy, we should have taken some of the billions we're going to lose now and desalinate some of the vast Pacific Ocean.

"When we go to the bathroom we waste four gallons of water to get rid of one pint of liquid. We should try dry toilets that don't splash. There's no energy problem, it's ignorance--- not recognizing that the solutions have always been available until the crisis is upon us.

- Cite R3F to Karen Winner, Copley News Service; 9 Apr'77

No Energy Crisis: (2)

"We have this philosophy that there's not enough to go around, therefore we're obsessed with 'survival.'

"There's ample to go around, we just need to understand how to use and dispose of it properly. People don't want to listen---they just want to forge blindly ahead with their drives and curiosities.

"This is a totally regenerative Universe. There is energy all around us. Take windmills---one windmill would provide the needed energy per household instead of diminishing coal, natural gas, or oil resources. There is the

problem of converting wind from direct to alternating current. So you take the wind and put it in the main public utility lines where you can store it."

Np Mechanical rand:

"I hear quite frequently of someone proposing the idea of a mechanical mind--- a mechanical mind that's going to do all the whole thinking for man. I will point out to you that this is completely impossible because the fact is that what the mind finds is not of the parts;

it is not in the data that you can put in the machine. You cannot program in what is not of the part5. You can program in any of the parts, but you cannot program in a discovery of what's between and not. This is of the mind and mind alone; it will always be of the mind; always only of the mind. It will never be manifest by any calculating machines."

Nonpolarized:

"All systems have poles, ergo spin axes, ergo they are polarizably identifiable. Nonpolarized simply means that the spin axis is unrecognized under the ccations considered. There is no such thing as a nonpolarized point because if you tuned-in the subvisible system---appearing only as a directionally-positioned micro-something---to visible comprehension, you would find that, as a system, it has poles and that it has seven potential alternately employable poles.

"So we may call a point a focal center, i.e., a 'noise* with a direction, but it is an as-yet undistinguished system, with all the latter's characteristics.

"There is inherent polarity in all observation which always introduces an additive twoness;

Nonpolarized = unrecognized

Focal event = infratunable system"

- Cite SYNERGETICS, 2nd. Ed. at Secs. 527.25 fc .26; RBF rewrite 11 Dec'75

Nonpolarized:

"All systems are polarized. Nonpolarized simply means unrecognized. There is no such thing as a nonpolarized point because if you tuned it in you would find that it had ∞ poles. So we may call it a focal center, i.e., a noise with a direction but with nondistinguished system characteristics .

"There is inherent polarity in all observation: that is the additive twoness.

"Nonpolarized - unrecognized."

"Focal event - *Infratunable* system."

^NQuaiaailtaneity:

"Any point can tune in any other point in Universe. Between any two points in Universe there is a tetrahedral connection. Thus systematic connection of two points results in the interconnecting of four points. But none of the four event points of the tetrahedron are simultaneous. They are all overlappingly co-occurrent, each with diffident beginnings and endings. All of the atoms are independently introduced and terminated; many are in gear, but many are also way out of gear."

. Cite SYNERGETICS, 2nd. Ed., Sec. 530.11, 30 May'75

"Because of our overspecialization and our narrow electromagnetic spectrum range of our vision, we have very limited integrated comprehension of the significance of total information. For this reason, we see and comprehend very few motions among the vast inventory of unique motions and transformation developments of Universe. Universe is a nonsimultaneous complex of unique motions and transformations. Of course, we do not 'see' and our eyes cannot 'stop' the 186,000-miles-per-second kind of motion. We do not see the atomic

motion. We do not even see the stars in motion, though they move at speeds of over a million miles per day. We do not see the tree's or child's moment-to-moment growth. We do not even see the hands of a clock in motion. We remember where the hands of a clock were when we last looked and thus we accredit that motion has occurred. In fact, experiment shows that we see and comprehend very little of the totality of motions."

. Cite srHEROSTICS text at Sec. 537.32; galley rewrite 7 Noe'73

•Thought discovers that we divide Universe into an 'outwardness and inwardness,• bo thinking is the first subdivision of Universe, because Universe, we discovered, was finite.

Thinking is a nonslmultaneously recallable aggregate of inherently finite experiences and finite experience furniture--- subh as photons of light. One of the most important observations about our thought is the discovery that experiences are nonsimultaneous. Nonsimultaneity is a fundamental characteristic, and if experiences are nonsimultaneous, you cannot have simultaneous reconsideration. •

- Cite SYNERGETICS text at Sec. 530.01; RBF galley rerwrite 7 Nbv'f
Nonsimultaneous;

"Until the present age, people thought that all of their faculties were simultaneously and instantly coordinate and operating at equal velocities. Einstein showed that neither 'simultaneous' nor 'instant*' are valid, i.e., experimentally demonstrable. Observe that when we send up four rockets one-half second apart, their afterimages are approximately simultaneous. So we say that we see four rocket bursts 'at the same time.' The illusion of simultaneity is one of the most important illusions for us to consider. Musicians may be able to comprehend

nonsimultaneity better than others do. Einstein emphasised the importance of attempted spontaneous comprehension of the nonsimultaneity of all events of Universe--- a concept akin to our discovery that in our Universe, none of the lines can ever go simultaneously through the same points (See Sec. 517.). What Einstein is telling us is that there is no conceptual validity to the notion that everything in Universe is actually in simultaneous static array."

[SYNC tornEVBUTJ
Non-simultaneous:

"The speed of light measurements plus Planck's quantum mechanics and Einstein's relativity showed that the universe is an aggregate of non-simultaneous events and their experiments showed that as each of the non-simultaneous events lost their energy they lost it to newly occurring events. Thus energy always became 100 percent accounted for."

- Cite NASA Speech, p. 26 jJun'66 [jaws,HW.Trfweir)-- SK.
Nonsimultaneous:

"We discovered that experiences were nonsimultaneous and therefore we had a finite but nonsimultaneous universe. Therefore, being nonsimultaneous it was nonsimultaneously conceptual. It was not a unit picture that could be given to us. We have had a tendency in our general thinking to say that which is finite is that which is statically conceptual as one unit glimpse so we have been seeming frustrated in trying to understand a universe which was more or less infinite and yet it was an omnidirectional experience and you felt there, ought to be an outwardness of this sphere. That is a stable concept and we begin to discover that we are not dealing with such a sphere because we have all these nonsimultaneous reports and all we have is interconnectedness of the nonsimultaneity. One of Einstein's most intellectual discoveries was this nonsimultaneity which he said apparently he could have come upon by virtue of his experience in examining the thoughts and patent claims regarding time-keeping devices, watches and clocks."

I. on-Simultaneous:

"It takes entirely different lengths of time to remember of 'look up' different names or past event facts. Universe, like the dictionary, though integral is ipso facto nonsimultaneously recollectable and, therefore, as with the set of all the words of the dictionary, is nonsimultaneously considerable and therefore is also nonsimultaneously reviewable, ergo is synergetically incomprehensible, yet progressively revealing."

- Citation t Context at Dictionary, 1960

Non-simultaneous:

'Neither the set of all experiences nor the set of all the words which describe them nor the set of all the generalized conceptual principles harvested from the total of experiences are either instantly or simultaneously reviewable.'

(Hyphens deleted.)

- Cite OMNIDIRECTIONAL HALO, pp. 131,132 • 1960

Non-simultaneous:

"As Einstein clearly demonstrated. the data coming in from all the scientists makes it-clear that the whole Universe is in continual transformation. The geology of our Spaceship Earth makes it very clear how severe have been the great transformations of history. The moment of top soils and burdens around the surface of the Earth is very new geologically speaking. As Einstein interpreted the speed of light information and the observation of the brownian movement of the constant motion in water, etc., he then posited a Universe in which we now knew that light took eight minutes to get to us from the Sun and two-and-a-half years to get to us from the nearest star, and astronomical information which shows that some of the stars we are looking at have been there for a million years with that kind of information Einstein had to

say physical Universe is quite obviously an aggregate of non-simultaneous and only partially overlapping transformation events."

X

New York City (10)

Human Beings & Complex Universe, (1\$)

Morth face Pomra*

"At our Vancouver site, in addition to the four MPG 'Molded Fiberglass' Company's Turtle Domes, there were two smaller North Face Domes. The name 'North Face*' derives from the north face of Kt. Everest. These two North Face domes were deve'bped by successful Everest climbers for their higff altitude, advanced base, dwelling devices---designed for environmental conditions far more formidable than those with which humans anywhere had ever before swiftly and effectively coped. The North Face domes are oval in plan. They are geodesic. They are made with the highest tensile strength aircraft aluminum struts and have inneb and outer dome skins of nylon with a double skin floor. They disassemble and roll into a pack two feet long by eight inches in diameter and weigh only eight pounds. An eight-pound home compounded with a sleeping bag permits human beings to be very intimate with nature under most hostile conditions."

- Cite Accommodating Human Unsettlement, p.20; 20 Sep'7&

"All humanity is now prone to become world beings, so we're going to have to accommodate the comings and going in very new places.

"When the United Nations was formed New York City was chosen as the headquarters because it could be reached by ships. At that time the chief way of getting around the world was by water, by vessel and ship. In 1961, long after the forming of the United Nations, three jet airplanes in one year outperformed the Queen Mary and the steamship United States at very much less cost; and suddenly the sea became obsolete as a way in which human beings would get from here to there.

"We have been in an east-west orientation. New York City and San Francisco have been ports of embarkation and debarkation for freight and traffic. You fly over New York City today and look at the thousands of docks and you'll find about a dozen of them in use. And look at the great Jersey City railroad yards: absolutely empty. New York City has become completely obsolete from what it was.

"That farm machinery I talked to you about / ` ` See Building Business. (2)_7 that brought about the farming in an entirely"

Noun:

"In architecture 'form' is a noun; in industry, 'form' is a verb. Industry is concerned with doing, whereas architecture has been engrossed with making replicas of end results of what people have industrially demonstrated in the past. Noun. in our phonetic etymology, means 'now-one,* i.e., the most recent chaos of thought reduced to an answer. The 'now-one' or noun must, in due course through selection by the intellect, become two or more observed characteristics of the one, there being no absolute identity. Nouns, from a language viewpoint, are tenable only as 'names' for facts recently determined. The noun is, therefore, more subject to constant revision than is any other part of speech. No longer is it 'stone.' No longer is it 'steel.* industry is dealing in hundreds of different steels, physically more dissimilar than the Chinese and the Swiss."

Novent:

| | |
|--------------|---|
| "Alan Watts: | But I mean there is a common assumption— it is ordinary
common sense— that space is nothing at all. |
| Fuller: | That's <u>novent</u> . I call it no-event.
I don't like the word space anymore because it implies
something. We have ohly frequencies, We have events and
no-events. We have the unique energy packages. |
| Watts: | But any sort of solid energy package seems to me
inconceivable without a special ground. |
| Fuller: | It doesn't bother me at all about the no-event. |
| Watts: | Well, how can you talk of curved space, the properties of
space? |
| Fuller: | But you can't talk of straight space. There are no straight
lines. Physics has found nothing but waves." |

Novent: (1)

"There are no specific directions or localities in Universe which may
be opposingly designatedas UP or DOW. In their place we must use
the words OUT and IN. We move in towards various taNt individual
masses or we move out from them. But the words IN and OUT are

not mirror image opposites. IN is in respect to individual experience foci--- OUT is coranon to all. IM is discrete. OUT is general. The IN's are discontinuous. The OUT's are continuous. OUT is nothingness, i.e. non-experience. Only the non-experience nothingness infers a continuum. The non-event continuum is the Novent. Inferentially, the Novent continuum permeates the finitely populated wlthinness and comprises the finit Novent withoutness. The rubber glove stripped inside-outingly from off the left hand now fits only the right hand. First the left hand was conceptual and the right hand was non-conceptual--- and then the process of stripping off inside-outingly seemingly annihilated the left hand and created the right hand-- then vice versa as the next strip-off occurred. When physics finds experimentally that a unique energy patterning,--- erroneously referred to in archaic terms as a particle,--- is annihilated, that

Cite NEHRUs spelch p_-12_13 Nov'69

"Annihilation is only of the rubber glove kind. The positive becomes the negative and the positive only seems to have been annihilated. We begin to realize conceptually the fi«nite, yet non-sensorial, outness which can be converted into sensorial inness by the inside-outing process. Ergo, novent is the finite but non-sensorial continuum. Sensoriality is a corporeally external pheneomenon--- reportingly relayed inwardly to the brain and therein imaginatively scanned by the mind which conceptualized independently in generalized formulations such as the conception of a nuclear grouping around a nucleus, □ quite independent of size..."

NfW HOMC: (1)

"What was present and physically demonstrated at Vancouver's /UN Habitat Conference/ Jericho Beach site was a mushroom group of swiftly foldable and movable geodesic domes and modernised Indian tepees produced, developed, and installed by a young world inspired to do something about its own future.

"Our World Game staff... put on an exhibit of four geodesic domes, which are now in manufacture by the Molded Fiberglass Company (KFC) of Ashtabula, Ohio... Their 14-foot, 5/8-«phere polyester fiberglass geodesic domes have alternate translucent or opaque fiberglass hexagon or pentagon panels. Their domes retail for *750.

"The World Game staff called their Exhibit the 'Now House.' This name derived from the fact that everything they had on display could be purchased right now from industrial mass production sources. All labor of their production occurred under the controlled environment-conditioning of factories: no rain, cold, heat, snow, ice, or wind. The MFC domes had no more need for old building technology than has the opening of an umbrella—a mobile, environment-controlling"

Now House: (2)

"artifact. The World Gamers brought their exhibit from Philadelphia to Vancouver in one camper truck pulling one trailer.

"The World Gamers first dug circular trenches slightly larger in diameter than the domes' circular bases. As they trenched they threw their shovelfuls of Earth into the enclosed circle and leveled it to form an elevated base for each dome. On the top of the Earth they laid edge-overlapping corrugated aluminum panels which were surmounted first by aluminized foamboard to reradiate heat, and next by plywood, and agin by indoor-outdoor carpeting. This made a very comfortable, springy and dry floor.

"They anchored the domes so that they could not blow away, for the domes weighed only 225 pounds each.

"Three of the domes were positioned in a triangular pattern with ten feet between them. A high pole was mounted at the center of the triangular area, which in turn supported a watertight translucent canopy. The large between-domes triangular area below the canopy was covered with the"

- Cite ACCOMODATING HUWIN dNtETT LEI LENT, p.11; 20 Sep'?6

Now House; (3)

"indoor-outdoor carpeting. The fourth dome stood mildly apart and could have been connected by a canopy but was not.

"One of the World Gamer4' domes contained a complete workshop with all manner of handtools, benches, metal- and wood-working equipment and general electronics servicing gear. Another dome was used for the kitchen, bathroom, toilet, office, and clothes hanging. The third dome was used as a video theater and dormitory. The fourtfdome was used for storage and laundry drying....

"Ten of the World Gamers lived in the Now House installation. They lived very comfortably and happily (as do acrew of 10 sailors living together on an ocean yacht, many of which are later equipped with hundreds of thousands of dollars worth of low-input, high-output, invisible performance instruments.)

"The Now House had been voluntarily equipped by many major corporations. Largest single supplier of all was the J.C. Penney Company. SONY let them have its most advanced multicolor videotape production and viewing system. Minnesota"

- Cite ACCOMMODATING HUMAN UKSETTLEKiNT, p.12; 20 Sep'76

Now House: (4)

"Mining had given them their best duplicating equipment.

They had silk-screening equipment, printing equipment, and typewriters, and were able to broadcastingly communicate to society from their headquarters and received their feedback from a thousand visitors a day.

"In the kitchen-bathing dome Herman Miller had provided most compact, economic but adequate, shelving on which to mount their kitchen equipment. They had a toilet which converted human waste into high-grade fertiliser. The heat necessary for this odorless process was provided alternately by electricity from the windmill hookup or by heat from the solar panel water-heating device. The toilet system produced fertilizer as a rich, dry, manured, loam-like substance which needed to be taken out of the system only once a year...

"The domes were equipped with a remote control telephone. Arrayed between two of the three domes under a translucent canopy were banks of tomatoes and other food

vegetation in hydroponic tanks, with noticeable growth accomplished during only the short two-week period of the installation."

— Cite ACCOMMODATING HUMAN UNSET¹} LEI-ILN'T, p.ljj 20 Sep*76

Now House: (5)

"While the domes, as already noted, were priced at \$750 each, the total package with all its \$17,000-worth of equipment amounted to \$20,(XX). This ratio of \$3,000 for the environmental dwelling shells and skin to \$20,000 for the totally and luxuriously equipped living facility-- approximately 1 : 7—is very close to the International ocean racing yachts' bareboat to sailaway equipped cost ratio. A modern 37~foot-overall length one-tonner at \$30,000 for the bare boat with full transoceanic racing equipment, sails, instruments, et al., costs approximately \$200,000. The reason the bareboat yacht hulls cost so much more than the bare Now House domes is due to all the stresses, strains, and other formidable conditions which must be coped with by the boat and their lightweight, high-strength equipment while operating at the interface of the airocean and the waterocean. The conditions are not present in the land installations....

'The /2 Now House will be ready for exhibit by August 28, 1977, and will soon thereafter become publicly available as the air-deliverable, only rentable, world-around dwelling machine service right on its scheduled 50th birthday.**....

RbF DEFINITIONS

Now House: (6)

"One of the most impressive facts at Vancouver was that disclosed by nature. During the first four days of the installation there were torrential rains. Mud was everywhere around the Jericho Beach forum grounds.... The World Gamers had placed large heavy planks on the ground leading to their installations so that by the time the visitors came over mats into the complex their feet were reasonably dry. With the large numbers coming daily it was amazing that the flooring of the complex remained comfortably dry throughout the rains.

"The domes consisted of half opaque panels and half translucent panels and could be rotatingly rearranged with the translucent side south to impound enormous amounts of Sun radiation. With the translucent panels north, they remained cool and let in only the north light so desirable to artists."

"There is no way in parallel thinking that man can come to any important conclusions. We tend tn think in parallels and perpendiculars when our Universe is not operating in parallels. Our Universe operates from a nucleus; it radiates and converges---it's a gravitational pulling together and a entropy trying to come apart. Everything is either growing or decaying. There is nothing in parallel at all; there is no nucleus in parallels. In nuclear growth a two goes into a three and a three goes back to two as electromagnetic waves go out and then converge. Waves are not drawn on a piece of paper in a plane; they are convergent and divergent expressing the great pulsations in our Universe. I find this is a very important part of fundamental thinking."

Nucleus:

"The coordinate system of nature as revealed in synergetics is one in which nature operates in convergent-divergent, associative-disassociative agglomerating, a system in which the inherent symmetry is maintained only by the equilateral triangles. Nature is synergetically both expansively radiant and convergently gravitational: radiant as radiation or as an expansive, disintegrative, coming apart, or nature as gravitationally convergent with increasing symmetry and order. Nature resolves her problems by convergence to an inherent nucleus."

- Cite SYNERGETICS, 2nd. Ed., at Sec. 260.41; 13 Nov'75

Nucleus:

"Two spheres in Universe ----- mass attraction ----- vector equilibrium nuclear assembly. Nuclear assembly starts with an inherent volume of 20, which is the minimum model of nucleation."

- citation 4 context at QuantM Sequence, (4), 23 Jun'75

Nucleus :

"The divergent characteristics of the tetrahedra at the center of the vector equilibrium demonstrate the nucleus. This is because the tetrahedron is a system and not anything in its own right.

"A nucleus is a complex of systems. A nucleus could not possibly be a simplex. Spherically and symmetrically there are 12-around-1. Volumetrically and asymmetrically there are 20 tetrahedra around a nucleus: that is what nucleates it."

- Cite RBF to EJA, Pagano Rest., Phila., PA., 22 Jun*75

Nucleus:

"The nucleus can accommodate wave passage without disrupting the fundamental resonance of the octaves. The tetrahedron is the minimum, ergo, prime nonnucleated structural system of Universe. The vector equilibrium is the minimum, ergo prime, nucleated structural system of Universe."

Numerology:

"What the numerologists does Is to add numbers horizontally (120 - 1+2+0 - 3) Until they are left with one digit. They have also assigned To the letters of the alphabet Corresponding numbers: A is one, B is two, C is three, etc. Numerologists wishfully assume thatthey can identify Characteristics of people By the residual digit Derived from integrating Of all the digits Corresponding to all the letters In the individual's complete set of names. Numerologists do not pretend to be scientific. They are Just fascinated with Correspondence of their key digits With various happenstances of existence.

Octahedron:

"The octahedron---both numerically and geometrically---should always be considered as quadrivalent: ie., congruent with self; i.e., doubly present*

` ` In the volumetric hierarchy of prime number identities we identify the octahedron's prime number twoness and the inherent volume fourness (in tetra terms) as volume 2^2 , which produces the experiential volume four."

` ` Git®. RDF to 3200 Idaho. Wash*. DC: incorporated in SYNEHGET-ICS, 2nd. Ed. at Sec. 10\$3.60l; 10 Dec«75

Octahedron:

"Octahedron: So *re have the octahedron in the middle. (Between the tetra and icosah.) It is also the second power of the only even prime number: 2^2 - 4. The octahedron is the most common form of energy associated as matter."

- Citation & context at Quantum Sequence. (5), 23 Jun*75

Octahedron: "The octahedron... restrainingly vector-blocked... can only infold itself pulsatingly to a condition of hemispherical congruence like a deflated basketball. Thue the octahedron's concave-convex, unitly-twoness state remains plurally obvious. You can see the concave Infolded hemisphere nested into the as yet outfolded convex hemisphere.

"Verifying the octahedron's fourness as being an evolutionary transformation of the tetrahedron's unty-twoness, we may take the four triangles of the tetrahedron which were edge-hinged together (bivalently) and reassemble them univalently (that is, corner-to-corner) and produce the octahedron, four of whose faces are triangular (ergo structurally stable) voids. This, incidentally, introduces the structural stability of the triangle as a visualizable yet physical nothingness."

Octahedron an Annihilation Model:

"Just reorienting one vector of the octahedron shows how it goes into the tetrahelix as a model of how energy goes from matter to radiation and vice versa* This shows now you can have annihilation and no energy is lost."

- Cite KBF to tJA by telephone from 200 Locust, Philadelphia

8 Mar'75

Octahedron as Annihilation Model:

"This an illustration of the symmetry of matter and how it precesses to radiation... It is that moment of Universe that Einstein was pre-occupied with. Just as three triangles edge-to-edge become four... topologically... they have made a tetrahedron... when you turn the triangle inside-out it makes a new vertex and the four have become five.

"We used to think that two is company and three is a crowd but now we see that four is company and five is a crowd... it's only the fifth ball that has to find a place to go. This is very exciting...,"

- Cite RBF to EJA from Hope Watts, DelRay, FL., 23 Feb'75

"The one-quantum 'leap¹ is also manifest when one vector edge of the volume 4 octahedron is rotated 90 degrees by disconnecting two of its ends and reconnecting them with the next set of vertexes occurring at 90 degrees from the previously interconnected-with vertexes, transforming the same unit-length, 12-vector structuring from the octahedron to the first three-triple-bonded-together (face-to-face) tetrahedra of the tetrahelix of the DNA-RNA formulation.

"One 90-degree vector reorientation in the complex alters the volume from exactly 4 to exactly 3. This relationship of one quantum disappearance coincident to the transformation of the nuclear symmetrical octahedron into the asymmetrical initiation of the DNA-RNA helix is a reminder of the disappearing-quanta behavior of the always integrally end-cohered Jitterbugging transformational stages from the 20 tetrahedral volumes of the vector equilibrium to the octahedron's 4 and thence to the tetrahedron's 1 volume. All of these stages are rationally concentric in our unified operational field of 12-around-one closest-packed spheres that is only conceptual as equilibrium. We note also that per each sphere space between closest packed spheres is a volume of exactly one tetrahedron: 6-5-1."

Octahedron as Conservation & Annihilation Model:

"We may consider the octahedron as a water-filled tube, pulling on a water-filled tube. The pulling will make it bulge in the middle. As we pull, the gravitational embracement causes a precessional rearrangement of the vector edge whereby one tetrahedron drops out. One quantum has drooned out, but, topologically it is still an octahedron:

$6V + 8F - 12 + 2$ (three face-bonded tetra), or $6V + SF - 12 + 2$ (octahedron)

Topologically there is no difference.

•'This is the quantum leap, the quantum jump. With interference it precesses from matter to radiation; and then back into matter again. This is the lever that will bring science into further consideration of synergetics."

- Citation & context at Quantum Sequence, (5), 23 Jun'75

"The octahedron goes from a volume of four to a volume of three as one tensor is pressed at 90 degrees. This is a demonstration in terms of tension and compression of how energy can disappear and reappear. The process is reversible like Boltzmann's law and like the operation of syntropy and entropy. The lost tetrahedron we can reappear and become symmetrical in its optimum form as a ball-bearing-sphere octahedron. There are six great circles doubled up in the octahedron. Compression is radiational: it reappears. Out of the fundamental fourness of all systems we have a model of how four can become three in the octahedron conservation and annihilation model.

"See the Iceland spar crystals for the octahedron's double vector-edge image.

- Cite SYNERGETICS, 2nd. Ed., at Sec, 936.15-.16, 23 May*75

"Suddenly Goldy realizes that all these discoveries she has been making combine to explain how it can be that the stars of the billions of now-discovered galaxies are giving off energies at incredible rates in such a manner that, as discrete quanta of energy, they become discontinued and apparently annihilated, yet the same quanta of energies reappear elsewhere, as for instance in the terrestrial vegetation's photosynthetic reduction and proliferation of hydrocarbon molecules in biologic organisms and in crystallographic growths.

"Since the pattern of two most dominant critical proximity, mass-interattraction (gravity) forces pulling diametrically on any one body produces the same model as that of Golay's water-filled, rubber tube, the processional squeezing of a symmetrical body, such as that of an octahedron, by two diametric gravitational forces, pulling embracingly upon it as it passes between two neighboring cosmic

bodies, will cause some part of the octahedron's integral vectorial structure to yield precessionally in a plane oriented at right angles to the line between the two pulling forces, thus to transform the octahedron from its symmetrical form into an asymmetrical form."

- Cite GOLDYLOCKS, pp. G11, G12, 16 May'75

"This is most economically accomplished by one of the octahedron's equatorial vector-edges disconnecting at both of its equatorially engaged, end vertexes and rotating precessionally 90 degrees to rejoin its two ends with the octahedron's two polar vertexes.

This local rotation results in the disappearance of the symmetrical octahedron and leaves in its stead the asymmetrical, face-bonded, three tetrahedra assembly in the form of an arc which is the neutral electromagnetic-wave-initiating state.

"The asymmetrical arc-wave consists of the same 12 vector edges and the same eight equiangled triangles and the same six vertexes as those of the original octahedron. Topologically described, it is the same polyhedron. However, it is clearly observable that the transformation not only converted omnidirectional symmetry into two-directional asymmetry, but it also reduced the octahedron's exact volume of four quanta to a volume of exactly three quanta in the form of the three face-interbonded tetrahedra. What has happened here is that matter (as the synergetic octahedron) is precessionally transformed into a directionally oriented electromagnetic wave which, upon interference with other radiation or matter, will"

- Cite GOLDILOCKS, p. G12, 16 May'75

"again be precessionally transformed back into the crystallographic form of the octahedron, thus syntropically regaining not only its symmetry but the one tetrahedron quantum of energy which it had entropically lost.

"Goldy realises that the scientist Boltzmann had long ago hypothesised that the physical Universe of energy as matter was able to export energies from all the stars only because those energies were being importingly reassembled in vast numbers of elsewheres. Einstein, too, assumed the foregoing to be true. However, many scientists remained skeptical, saying that entropy was universal and increasingly disorderly and expansive, wherefore Universe is spending itself inexorably and irrevocably.

"Since photons show that energy occurs only in discrete packages and is discontinuous, and since the stars lose energy quanta entropically, how can the lost quanta reappear elsewhere?

Goldy says to the bears, 'Vectorial geometry conceptually demonstrates the exact way in which energy quanta are lost and regained in the course of the entropic-syntropic turnaround events of astrophysics. The topological integrity of"

` `vectorial geometry elucidates both the one-quantum loss and the one-quantum of energy recovery incidental to the entropic transforming from matter to radiation and the syntropic transforming from radiation to matter, as clearly manifest in the octahedron to tetra-arc transformation and its reversal to the octahedron. This topological transformation, but not its energy-quantum relationship, was originally discovered in 1951 by the geodesic engineer-scientist, D.L. Richter,

"This elucidation of the way in which Universe can temporarily drop out or regain its energy quanta, elucidates much more, says Goldy. 'It explains what happens in the photosynthetic process as planet Earth's vegetation converts Sun radiation receipts into beautiful hydrocarbon molecules. Energy quanta are regained on Earth. It explains even more. It shows how the weightless metaphysical tetrahedron is lost and regained in Universe as life dies out here and is re-

born there. It shows how the tripli-bonded addition of the recoverable one tetrahedron, when added to th* neutral phase, W-profiled, tetra-arc, triplebonded assembly of three tetrahedra, must always produce either a male or a female twisting helix, which, when extended, becomes the DNA-RNA tetrahelix which is the structural system programmer of all living species and individuals of those species."

Q_{ctahcdr?n}: Eighth-pc tahini: (1)

Though I have twice visited the Great Pyramid at Gizeh, I have never carried a sextant and tape with me so I do not have the angular data I need. I know there are others who have made measurements, but my experience teaches me not to be too confident of the published statements of others when I do not know those personalities nor the degree of exactitude at which they operate.

"At the present moment I can give you some very interesting information regarding not only octahedra, but in particular eighth-octahedra. In the spherical octahedron each of the eight spherical surface corners are 90°. Each of the spherical octahedron's eight triangular edges are 90° of arc, which means that they subtend central angles of 90° each.

"Here is a very extraordinary asymmetrical tetrahedron with three 90-degree central angles and three 90-degree surface angles---as well as having six 90-degree internal corners where the three radii of the octahedron impinge perpendicularly upon the three great-circle arcs. All of the spherical octahedron's one-eighth symmetrical self-divisions have eight corners each of 90°.

• 76

Octahedron: Eirichth-octahedra: (2)

"The spherical octahedron's triangle is the only triangle in which the center of area of the triangle occurs at mid-altitude of the triangle's three perpendicular bisectors of its three corner angles:

* 4/

*

"In modern ocean cruising sailing craft in the high seas routes often cross the main ocean highway of steam and diesel ship channels. These great new high speed ships often operate by automatic navigational equipment with a watch officer idly standing by. They rush forward through night and fog at speeds in the 20-knot range. Little sailing craft up to 72 feet in length with their minuscule red, green, and white navigational lights are not visible from any great distance--- and often in high waves they are approximately invisible. Such sailing ships have relatively little metal in them. The radar scopes of the big ships show readily recognisable pips"

- Cite RDF Ltr. to Stephen Barba, N. Miami Beach, FL; 4 May '76

"for big steel ships and the radar scopes clearly outline land masses and other sizable objects. Because they do not show the little sailing ships, those little ships are in incredible danger as they cross--as they must---those big sailing ship lanes. As a consequence of this hazard, there has been evolved a device which can be mounted on the topmast or the yard-arm of sailing ships which does register as a clearly-defined pip on the radar scopes. This device consists of a spherical octahedron with three great circles made of aluminum-foil-covered cardboard surface. The three great circles cross each other at 90 degrees. The spherical surface is uncovered.

"As you look at the device---a radar reflector---you look into whatever number of the spherical octahedron's central-angular tetrahedra as may be within the line of view. It has been discovered that the ship's radar signals, when impinging on any one of those eighth-octahedra's concave tetrahedra, produce a reflection pattern which returns directly back to the radar-sending ship to register on the radar scope.

". /hat the radar's invisible-to-the-human-eye electromagnetic'*

Octahedron: EiEhth-octahedra; (4)

radiation wave does is to make it optically clear--as when a searchlight is aimed at such a sailing ship, at which time a very bright reflection beam returns to the viewer who is manipulating the searchlight aimed at the sailing ship. This is just one of the eight eighth-octahedra's concave tetrahedron's three faces, glowing vividly, beaming the light back to the source of the searchlight. You can diagram this yourself to see what happens....

"As you know, when light strikes a surface it bounces away at an angle which is exactly the same as the angle at which it impinges on its surface. Any beam entering the eighth-octahedra will bounce off at the same angle to a second side of the concave octahedron and then bounce off again at the sama angle. This means that the two bouncings add up to 180°, which means sending the radiation directly back to its source.

"These ahgular bouncings of electromagnetics... may relate very importantly to all the phenomena seeming to be mystically produced by the pyramid mystery cults."

Octahedron; Elghth-<Whgdri-

"By Internally interconnecting its six vertexes with three polar axes: X, I, and Z, and rotating the octahedron successively upon those three axes, three planes are internally generated that symmetrically subdivide the octahedron into eight uniformly equal, equiangle-triangle-based, asymmetrical tetrahedra, with three convergent, 90-degree-angle-surrounded apexes, each of whose volume is one-eighth of the volume of one octahedron: this is called the Eighth-Octahedron. (See also See. 912.) The octahedron having a volume of four tetrahedra. allows each Eighth-Octahedron to have a volume of one-half of one tetrahedron. If we apply the equiangular-triangular base of one each of these eight Eighth-Octahedra to each of the vector equilibrium's eight equiangle-triangle facets, with the Eighth-Octahedra's three-90-degree-angle-surrounded vertexes pointing outwardly, they will exactly and symmetrically produce the 24-volume, nucleus-embracing cube symmetrically surrounding the 20-volume vector equilibrium; thus with $8 \times \frac{1}{2} = 4$ being added to the 20-volume vector equilibrium producing a 24-volume total.

"The prime number twoness of the octahedron always occurs in structuring doubled together as four--- i.e., 2 -- a fourness which is also doubleness of unity. Unity is plural and, at minimum, is two. The unity volume 1 of the tetrahedron is, in structural verity, two, being both the outwardly displayed convex tetrahedron and the inwardly contained concave tetrahedron.

"The three-great-circle model of the spherical octahedron only 'seems' to be three; it is in fact 'double'; it is only foldably producible in unbroken (whole) great-circle sheets by edgecombining six hemicircularly folded whole great circles. Thus it is seen that the octahedron--- as in Iceland spar crystals--- occurs only doubly, i.e., omnicongruent with itself, which is 'quadrivalent.'

"Among the three possible omnisymmetrical prime structural systems--- the tetrahedron, octahedron, and icosahedron--- ohly the tetrahedron has each of its vertexes diametrically opposite a triangular opening. In the octahedron and icosahedron, each vertex is opposite another vertex; and each of their vertexes is diametrically blocked against articulating a self-inside-"

- Cite SYNERGETICS text at Secs. 9O5.11-.13, 16 Dec'73

"-outing transformation. In both the octahedron and the icosahedron, each of the vertexes is tense-vector-restrained from escaping outwardly by the convergent vectorial strength of the system's other immediately surrounding-- at minimum three--- vertexial event neighbors. But contrariwise, each of the octahedron's and icosahedron's vertex events are constrainingly Impulsed inwardly in an exact central-system direction and thence impelled toward diametric exit

and inside-outing transformation; and their vertex events would do so were it not for their diametrically opposed vertexes, which are surroundingly tense-vector-restrained from permitting such outward egress.

"As a consequence of its uniquely unopposed diametric vertexing--- ergo permitted--- diametric exit, only the tetrahedron among all the synrnetric polyhedra can turn itself pulsatingly inside-out, and can do so in eight different ways (see Sec, 624); and in each instance, as it does so, one-half of its combined concave- convex unity 'twoness*' is always inherently invisible.

"The octahedron, however, restrainingly vector-blocked as described, can only infold itself pulsatingly to a condition of hemispherical congruence like a deflated basketball.

- Cite SYNERGETICS text at Secss 905J3-.15, 16 Dec'73

Octahedron as Model of Doubleness of Unity: (3)

"Thus the octahedron's concave-convex, unlty-twoness state remains plurally obvious. You can see the concave infolded hemisphere nested into the as-yet outfolded convex hemisphere.

"Verifying the octahedron's foumess as being an evolutionary transformation of the tetrahedron's unity-twoness, we may take the four triangles of the tetrahedron which were edge- hinged together (bi-valently) and reassemble them univalently (that is, corner-to-corner) and produce the octahedron, four of whose faces are triangular (ergo structurally stable) voids. This, incidentally, introduces the structural stability of the triangle as a visualizable yet physical nothingness."

Cite SYNERGETICS text at Sec. 905.15, 16 Dec*73

"There are eight asymmetric octahedra which surround each face of the 'coupler.' It is probable that these eight asymmetric nuclear octahedra account all the varieties of intercomplex complexity required for the permutations of the 92 regenerative chemical elements. These eight variables alone provide for a fantastic number of rearrangements and reorientations of the A and B Quanta Modules within exactly the same volume.

"I now believe it is possible that there are no other fundamental complex varieties. So we have a limit of variation. With our friend octave coming in as before. This is how we now find out what we have been looking for when we have been talking about 'number one.' It is one nucleon, which can be either neutron or proton, depending on how you rearrange the modules in the same space."

RBF DEFINITIONS

Octahedron as Photosynthesis Model:

The vector-processed, three-quanta octahedron manifests interference and demonstrates radiation; when the vector-edge precesses again, the fourth quantum reappears, the interference disappears, and gravity is demonstrated. This is the way photosynthesis functions--- the conversion of radiation-in the leaf, or on your skin.

- Cite RBF to EJA, 3200 Idaho, Wash., DC., 11 Dec'75

"Gravity must always be thought of as embracing. For instance, it would be like the hoops of a barrel. The staves are wedges. Unless you have truncated the wedges they could all go right to the center of the sphere; and they would like to get out of the system, but the

bands hold them together. They cannot get any closer together because their outer parts are larger than their inner parts. They can't fall in. But the point is that the bands are finite: they come back upon themselves and they embrace. You have to return on to yourself to embrace. Gravity operates then by embracement. The larger the phenomenon that it embraces, the more leverage effect it has because you simply tighten the screws and the bands at the ends of the lever. This is why the pressures increase as you go into the Earth; they continually increase the further in you go due to the leverage effect of the embracement.

"Gravity does not operate perpendicularly. It operates not as a radius but at 90 degrees to the radius. All the radiation goes outward radiantly; the gravity is always circumferential and therefore finite and enclosing. I give you, for instance, the hexagon, where the six radii are trying to come apart explosively. They disintegrate; the radii do not help each other. But if you have the same number of sticks arranged" - Cite RBF to Hugh Kenner, Phila., PA, Transcript p.7; 8 Jun*75

"end-to-end. where mass interattraction works, they close back upon themselves and are always more effective. So the tendency of Universe to come apart is always well offset by the finite closure of the same six vectors.

"We must consider the effect of gravity on the octahedron in terms of embracement. Of the three structural systems in Universe—tetra, octa, and icosahedron—the octahedron is in the middle and always is inherently doubled-up, the vectors double up.

The

plentiful of all the crystals are octahedral crystals. The embracement of the octahedron is typical of matter, but the embracement is precessed causing a reaction at 90 degrees. Our pulling makes for greater pressure for it to try to come apart.

'The 12 vectors of the octahedron are embraced by gravity.

The two polar pyramids join in a quadrangular equator. This crystal gets between two other celestial masses and is pulled by them. They are pulling like the Chinese finger puzzle device that pulls your finger in and squeezes it. Precessionally, you pull it one way and it squeezes the other way. So this octahedron is a sort of rubber tube; if you pull on it it makes the tube contract. Compression operates on it."

- Cite RDF to Hugh Kenner, Phila.,PA, Transcript p.7; 8 Jun'75

RBF DEFINITIONS

"The precessional effect operates on the octahedron's 12 vectors, and one of them precesses. I want you to think of the six vertexes. You've got four at the top like a

pyramid---a regular Egyptian pyramid---and a reflecting pyramid at the bottom. So there are four vectors at the north pole; four at the south; and four around the equator. The embracing effect is to make one of the four equatorial vectors precess; it lets go from the two adjacent points in the equator and rotates 90 degrees to join the north pole to the south pole.

"We still have exactly the same six vertexes; we simply connected the poles instead of the adjacent equator points. You will find that what this does is to turn this form into an arc where you have three tetrahedra face-bonded. We go from an octahedron of volume four to three tetrahedra face-bonded: six vertexes, eight faces, 12 edges. There is no way topologically that you can tell that anything has happened. But you have dropped out one tetrahedron, or one unit of quantum.

"This explains why Boltzmann saw the Universe with all the stars giving off energy entropically. He said the energy must be being collected elsewhere. Einstein went along with it."

- Cite RBF to Hugh Kenner, Phila. PA., transcript p.7; 8 Jun'75

”But the scientists said that entropy means that energy gets lost: How could it possibly be picked up again over here? So we suddenly see how it does in this form of the three-tetra-arc. One minute you add a tetrahedron to it and the next you have lost one and it disappears. . It comes out on th end and becomes the tetrahelix. The tetrahelix is always this wave, an electromagnetic wave. This wave is the way gravitation becomes radiation. The quantum is separated out when the radiation has an interference with anything, then it immediately precesses again and becomes matter— and it goes from the three-tetra back to the four. And we suddenly have one unit of quantum seemingly disappear in the.Universe and it’s picked up again over there.

''This is how the quantum gets picked up by photosynthesis. Photo-synthesis had not been understood before: it is simply the picking up of that one unit of quantum.

"The transformation from the octahenron to the three tetrahedra was discovered by Don Richter, but he did not know the significance of it as he had not been thinking about it that way. He was not thinking about it as an accounting of energetic phenomena; but it completely explains how the gravitational effect will"

- Cite RBF to Hugh Kenner, Phila. PA., transcript p.8; 8 Jun'75 ”convert matter into radiation... and how the energy is only apparently lost. All the topological accounting is there. But nobody would ever know it because it« is topologically the same, A unit of quantum absolutely disappears from the described Universe. It explains how syntropy could occur. The entropy was there but no one could understand the syntropy. But there it is.”

Octahedron: Volume of Cube as Three: (3)

"I am going to take these four one-eighth octahedra, and because each has an equilateral triangular face, I can superimpose it on the equilateral triangular faces of a regular tetrahedron. There are four faces, so the four faces of the tetrahedra will accommodate four one-eighth octahedra superimposed so that the equilateral triangle faces are becoming congruent. This leaves a 90-degree angle sticking outwardly, and it makes the cube. So the cube then is one regular tetrahedron, with four one-eighth octahedra superimposed on its surface. The volume of a one-eighth octahedron is one-half, and four times

one-half on the faces ($4 \times \frac{1}{2} = 2$) and so the volume of the tetrahedron which I superimposed is one, so $2 + 1 = 3$) so the volume of a cube in the system is three. That gets to be very interesting. Here is another nice whole number. You have the tetrahedron as one, octahedron is four, and cube is three. A cube as three is not what people have been thinking. They have been thinking that a cube was one, but I am using unity where a tetrahedron is one."

- Cite Oregon Lecture 6, pp. 215-216. 10 Jul'62

'Here we take an octahedron which has a volume of four.

An octahedron has six vertexes and it is symmetrical because they are all equilateral triangles and all the edges are the same. Therefore we know by it being symmetrical that if we interconnect its opposite vertexes, being six of them, there will be three axes between the six opposite vertexes. Those three axes would be the well-known XYZ coordinate system and the XYZ coordinates then do exist inside the octahedron. If I cut the octahedron through one of the four planes, one of the planes of its equator, it makes me two half-octahedra. If the volume of an octahedron in respect to a tetrahedron is four, then a half-octahedron has a volume of two, and $2 + 2 = 4$."

- Cite Oregon Lecture #6, p.214. 10 Jul'62

XYZ Coordinates: (2)

Octahedron;

"There is a center of gravity of the octahedron and it has eight equilateral triangular faces and there is a little pyramid, or irregular tetrahedron which can be formed on one of the faces of the octahedron whose interior apex is at the center of gravity of the octahedron. . . . Because there are eight such faces and it is at the center of vol-

ume, there are eight of thes that make up one octahedron so this is a one-eighth octahedron. If the volume of an octahedron is four, the one-eighth of an octahedron has the volume of one-half of one tetrahedron."

"Each of the one-eighth octahedra ftas interiorly 90-degree angles because they are the XYZ coordinates and when the XYZ coordinates cross, it is 90 degrees. They have a central angle of 90 degrees and the external angles are 60 degrees each. □ . "

RBF DEFINITIONS

Octet Truesi

"In the octet truss system all the vectors are of identical length and all the angles around any convergence are the same. The patterns repeat themselves consistently. At every convergence there are always 12 vectors coming together and they are always 60° in respect to the next adjacent one.

(There are other angles in the system. By embracing additional angles we can find 90° relationships.) The prime relationship is with the 60° angle." *

- Cite Oregon Lecture #8, p. 299. 12 Jul¹62

Octet Truss :

"The octet truss--- a name compounded from octahedron and tetrahedron--- can be produced from complexes of tetrahedra or complexes of octahedra, whichever is economically preferable."

- Cite DIMAXION .VORLID OF RBF, Caption L2. i960

Octet Truss;

"The octet truss can be fashioned from flat ribbons by spot welding or other high-speed cohering processes.

"The octet truss can be fashioned from hubs employing the 12 faces of the rhombic dodecahedron. . .

"The octet truss can be woven together with continuous rods and wires, seized together by male and female turbinizing hubs.

"The octet truss can be assembled of tubes and rhombic dodecahedron hubs having face-mounted studs to slip into and fasten to tubes.

"The octet truss can be woven continuously from wire-like fencing structures."

- Cite DYMAXION WORLD OF RBF, Captions L3 - L11. (1959)

Octet Truss:

"The octet truss consist entirely of struts. No hubs are required. The x-shaped terminals of the struts unite in such a manner as to weave around the hub nuclei, forming the four planes of the vector equilibrium. The truss has phenomenal three-way 'finite' strength.

"In conventional beam structure systems, the supporting units are parallel to one another. Their ends are infinite (in that they do not curve back into the system) and therefore they do not help one another. In the three-way grid octet truss system loads applied to any one point are distributed radially outward in six directions and are immediately frustrated by the finite hexagonal circles entirely enclosing the six-way-distributed load. Each circle distributes the load 18 ways to the next circle, which 'finitely'¹ inhibits the radially distributed load. Thus the system joins together synergetically to distribute and inhibit the loads. The total loads are finally distributed three ways to the three point support."

ber£T S£G

Octet Truss;

` ` The equilibriously regenerative octet truss is regenerated as fast and as extensively as man explores and experiences it. As I define Universe as the sum-total aggregate of men's experiences, then we may say that the octet truss-vector equilibrium is universally extensive. "Universally extensive" is a term quite other than "to infinity"--- a term which synergetic geometry may not permit. The open end of an angle is infinite, but so is its convergent end, in that the actions cannot pass instantaneously or either simultaneously through the same point. As with the vector equilibrium, infinite is only increasing degrees of experience--- meaning: more or less tunable."

Octat Truss in Tale Art Gallery;

"When a Tale Professor of architeature, Louis Kahn, employed my octet truss in a design for the floor structuring throughout the new Art Gallery at Yale University, that trues, in economic compliance with the building code, had to be fabricated in reinforced concrete. But the Yale Engineering Department and its consulting engineers

refused to credit my three-way beam for the task on the grounds of the Invalidity of two nuan crisscross beams, 'bevauses,' they said, 'three were even more redundant,' Yale, therefore, built the floors on the basis that only one axis of the truss could carry the load. They called it a 'slanting beam construction,' Result: the octet truss was reduced to a role of aesthetic nonsense--- a fantastically expensive set of lampshades.

"Fallacy here was that the architect should not have employed a system which he could not defend structurally before the ignorance of the engineers. Result: relegation of an important new development to submergence in ignorance,"

□There is a phenomenon that we might describe as the sternal disquietude of the Odd Ball promulgating eternal reorders, realignments, and inexorable transformations to accommodate the eternal regeneration integrity of intellectually-differentiable Universe, which

suggests philosophically that the individual metaphysical human viewpoint-- th* individual ego of the human--- is indeed an essential function of the eternally regenerative integrity of complex law-governed Universe.

"Possibly this mathematical Odd-Ball-oneness inherently regenerates the ever-reborn ego. Just when you think you are negative you find that you are positively so. This is the eternal wellspring of positive-negative regeneration of acceleratingly heating entropy and cooling off syntropy, which is synergetically interoperative between the inherently terminal physical differentiating and the inherently eternal metaphysical integration."

Omnidirectional:

"This very initiation itself of first division of Universe into an omnidirectional, radially defined sone, between maxima and minima within-ness and without-ness sense and experience tunability, affects not only the local tuned-in system, but also the balance of Universe, within and without, even as does the little and big spherical triangle subdivide the system's 'surface* zoneness, circumferentially, so also here do the basic maxima and minima, radial and circumferential dichotomies, which are the basically differentiated acceleration functions and inherent reciprocal self-processors."

. Frequency to the second power times ten plus two: is the number of balls in any given layer. This simple formula governing the rate at which balls are agglomerated around other balls or shells in closest packing is an elegant manifest of the reliably Incisive transactions, formings and transformings of universe. X made that discovery and published it in 1944. This is the mathematics which the molecular biologists have confirmed and developed by virtue of which we can predict the number of nodes in the external MBZZBi proteinphells of all the viruses, within which shells are housed the 1JNA-RNA programmed design controls of all the biological species and individuals within those species. Although the poliovirus is quite different from the common cold virus, and both are different from other viruses, all of them employ frequency to the second power times ten plus two in producing those most powerful structural enclosures of all the biological regeneration of life. It is the power of these geodesic-sphere shells that make so lethal those viruses unfriendly to man. They are almost indestructible."

- Cite kBF marginalia. New York, 19 June 1971, to Synergetics draft, Section. 222.32.

"Omnidirectional concentric closest packing of equal spheres about a nuclear sphere forms a series of vector equilibria of progressively higher frequencies. The number of vertices or spheres in any given shell or layer is always edge frequency (F) to the second power plus ten plus two.

Equation: $10 F + 2 \cdot \text{number of vertices or spheres in any layer.}$

"The equation for the total number of vertices, or sphere centers, in all symmetrically concentric shells -

$10 (F_1 + F_2 + F_3 + \dots + F_n) + 2F_n + 1$.-

Omnidirectional Closest Packing of Spheres;

Synergetics

"Now I am going to take an inventory of those balls in the different layers. There are 12 balls in this layer and if we count these up we find that there are 42 balls in the next layer. In this top layer there are 92 balls. If I put on another layer you will find that there are 162--- and another layer will be 252, The number of layers always comes out with the number two as a suffix. We know that this system is a decimal system of notation. Therefore we are counting in what the mathematician calls congruence in modulo ten--- a modulus of 10 units--- and there is a constant excess of two.

"We find in algebraic work if you use a constant suffix (where you always have, say, 33 and 53, you could treat it as 50 and come out with the same algebraic conditions.) Therefore if all these come out with the number two, I can drop off the number two and not affect the algebraic relationships.

"If I drop off the number two in that column they will all be zeros; so this would read. 10, 40, 90, 160, 250, and if I had another one it would be 300. I see each one of these are 10^n s,"

Closest Packing of Spheres: Synergetics Principle Of- 12J

"so I divide each one by 10 and then I have 1, 4, 9, 16, 25 and you recognise that it is a progression of second powering. The next one would be 36, then 49. Each one of these are two to the second power, three to the second power, and so forth.

"We then discover that the number of balls in any one layer--- we could call it frequency, or radius, because we have found that they are the same words. In the vector equilibrium the number of units coining from the center outwardly are exactly the same as the edge units; so I can say frequency to the second power times ten plus two: that is how many balls there will always be in a given layer. It is a very simple kind of formula-- frequency to the second power, times 10, plus 2. That is the formula I have discovered regarding the rate at which balls are agglomerated around other balls or shells. I made that discovery and published it in 1944.

"And that was the mathematics that the molecular biologists discovered that I had developed by virtue of which I was able to predict the number of external shell members they found were following this form in the virus, and that is when they really**

"Omnidirectional means that a center of a movable sphere of observation has been established a priori by Universe for each individual's life's inescapably mobile viewpoint which, like humans' shadows, move everywhere silently with them. These physical existence environment surrounds of life events spontaneously resolve into two classes:

(1) those events which are passing tangentially by

the observer, and

(2) those events entitled other than self which

are moving radially either towards or away from the observer.

"The tangentially passing energy events are always and only moving in lines perpendicular to the radii of the observer, which means that the multiplicity of his real events does not produce chaos: it produces discretely apprehendable experience increments all of which can be chartingly identified by angle and frequency data."

"All model studies are mainly probability studies and nearly always deal with linear probability. But my problems are not linear; they are omnidirectional. I am dealing with total system. That's what the world is not paying any attention to and that's why we're in trouble: Synergy shows that you cannot solve comprehensive problems by exclusively local linear models, "rfe must begin with the general coordinating system used by nature in the closest packing of atoms such as the coordinates of the Dymaxion airocean world map. Another example is the omnitriangulated strip whose width M exactly equals the altitude of the tetrahedron. You can completely spool wrap all four faces of the tetrahedron; and the tetrahedron so wrapped has an axis running through it and out through the two unwrapped edges of the tetrahedron spool. Being a tetrahedron, this spool may be endlessly wrapped as an omnidirectionally closed system. Ergo, we have a device for recording all of the omnidirectionally occurring and observed data into a minimum system which is unwrappable into a flat ribbon printout with four-dimensional coordination."

"larity, as in the Dymaxlon map where any star regains in exact perpendicularity over the point on the map of the world. The same triangles are going to come out flat and the same stars are in exact zenith over that point, as the radii remain perpendicular to the system independent of whether the triangular area edges are arcs or chords.

This is an extraordinary mathematical transformation in which you can have omnidirectionality phenomena of all systems--- all gravitation, radiation, stars, fishes, everything--- all coming into coordinate printout in one flat ribbon map.

"What we have is an actual literal model of an omnidirectional typewriter providing a complete convergent-divergent modelability for the data. When you put the data on such a strip it is identified specifically in the transformation wherever it is at all times.

"This can really identify the largest of all the computers on the Earth due to the fact that it reflects the pattern of the greatcircle railroad tracks of energy. In other words, if you want to go from here to there in Universe, you've got to go through"

"I seek a word to express most succinctly the complexedly pulsative, inside-outing, integrative-disintegrative, countervailing behaviors of the vector equilibrium. 'Librium' represents the degrees of freedom. Universe is omnilibrious because it accommodates all the every-time-recurrent, 12-alternatively-optional degrees of equieconomical freedoms. Omniequilibrium means all the foregoing.

"The sphere is a convex vector equilibrium, and the spaces between closest-packed uniradius spheres are the concave vector equilibria or, in their contractive form, the concave octahedra. In going contractively from Sector equilibrium to equi-vector-edged tetrahedron we go from a volumetric 20-ness to a vblumetric bneness, a twenty-fold contraction.

In the vector-equilibrium Jitterbug, the axis does not rotate, but the equator does. On the other hand, if you hold the equator and rotate the axis, the system contracts. Twisting one end of the axis to rotate it terminates the jitterbug's 20-volume to 4-volume octahedral state contraction, whereafter the contraction momentum throws a torque in the system with a leverage force of 20 to 1. It contracts until it becomes a"

Omni-intertangency:

"Systems are individually conceptual polyhedral integrities. Human awareness's concession of 'space' acknowledges a nonconceptually-defined experience. The omniorderly integrity of omnidirectionally and infinitely extensible, fundamentally coordinating, closest packing of uniradius spheres and their ever coordinately uniform radial expandibility accommodates seemingly remote spherical nucleations which expand radially into omni-intertangency. Omni-intertangency evidences closest sphere packing and its inherent isotropic vector matrix, which clearly and finitely defines the omnirational volumetric ratios of the only concave octahedra and concave vector equilibria discretely domaining all the in-betweeness of closest-packed-sphere interspace. The closest-packed-sphere interspace had been inscrutable a priori to the limit phase of omni-intertangencies: which limit phase is, was, and always will be, omnipotential of experimental verification of orderly integrity of omni-intercomplementarity of the space-time, special-case, local conceptualising and the momentarily unconsidered seeming nothingness of all otherness.^{1*}

Omnilibrium:

"I want a word to express the integrative-disintegrative balance of the vector equilibrium. 'Librium'¹ represents the degrees of freedom. Umnilibrious: Universe is omni- librious because it accom-odates all the degrees of freedom Omnilibrious means we do not have to use degrees of freedom any more.

'•The sphere is the convex vector equilibrium and the spaces between are the concave vector equilibrium or, in its contractive form, the octahedron.

"We go from a 20-ness to a fourness: a fivefold contraction, ... as pulsars, stars go to dwarfs. ITIs a five-power acceleration. . . in the jitter-bug the axis does not rotate but the equator does. On the other hand, if you hold the equator and contract the system, you force the axis to twist; it throws a torque in it at a 20-to-1 leverage. Lt contracts until it becomes the tetrahedron. This is the way galaxies interpulsate. The nebula plunge through zero and become negative, invisible, the black hole."

"There are two kinds of flying:

(a) soaring— like a gull

(b) running on water— like a duck. You've seen a duck taking off the water or landing: it's like a

hanin er th rower or a pdie vaulter: jet stilting.

"Fruits and seeds are also streamlined, not just birds. Seeds are tubes designed to withstand the frost, to work down into the Earth, and also to come ud at the right time....

"A naked man jumps his own height in the high jump. With a pole vault he can jump about three times his own height, even though he is weighted down by the pole, by running he can build up momentum into the situation. If he could grab another pole each time he could keep up the momentum and vaulting indefinitely.

"A duck keeps falling but builds it up into more altitude. Like a plane launched from a carrier, the first thing it does is to nose down for increased speed. Jet stilts. A duck has two jet stilts; it then builds up the lift like a blimp flier.

- Cite HJF at Penn Bell videotaping, Philadelphia, 29 Jan'75 "All this suggests that we could build an omnimediu vehicle without wings; therefore it could be much lighter and be propelled by twin-angled jet stilts. Omnimediu twin-jet orientable stilts. It could have a turbine jet effect with liquid oxygen for jet propulsion and with wheels. The stilts would converge just above your head. Like stilt walking: when you move the stilt forward it becomes the third compression member which is always initiatable. You'd be hanging from the vectors which converge above your head. A tetrahedron.

"There was not enough capital available for a proper design solution to the housing shortage; nor was there enough capital for the development of a full omnimediu transport system. I saw that the first artifact could suggest only one phase of a full omnimediu transport system, the Dymaxion car was not designed as just a new type of automobile; it was designed to test the ground-taxi-ing nualty of an omnimediu transoort system. The most dangerous condition of flying is when you make contact with the Earth. The fairing and streamlining has to be superb. It was difficult to control the Dymaxion car with wind on the highway and you had to learn how to manage it."

- Cite K3F at Penn dell videotaping, Philadelphia, 29 Jan*75

RBF DEFINITION

"I did not design an automobile; I was not putting a car into production. I was merely designing a prototype omnimediu vehicle. The propulsion was up forward and the steering was in the rear--- for ruddering: that's the way nature does it-- with front traction and rear steering.

"Take a wheelbarrow. You push it and a bad bump will hit you in the stomach. But if you pull a wheelbarrow it will not skid.... The front-steered car, due to kingpins, can only turn at about 34 degrees, without a rudder post, out with a rudder post you can turn at 90 degrees. And the center of gravity was so low that you could not turn it over; it was like a gun carriage. At 15 m.p.h. the inboard wheel could turn on a one-foot radius.

"It could carry eleven passengers. It was 19 feet long. But it tended to head into cross winds. So very fine controls were needed. So we had all custom hardware and shivs. The tires would tend to distort.

"One of the oldest creatures known to man is the horseshoe crab. It is designed to go across streams. It is shaped in"

- Cite RBF at -Penn Bell videotaping, Philadelphia, 29 Jan'75 a **120-degree crescent with single-tail focus, thup able to use its secondary tail to go across currents. So I made the second Dymaxion with its rear wheel on an extensible boom that retracts when the car slows down. It went 122 m.p.h.**

I just wanted to see whether the principles were right. It had a beautiful faired underbelly. And the car could waltz: it really could waltz.

"I worked with Starling Burgess. He understood that the navy is world and the army is local. At one stage we had what Burgess called the 'flying bedstead': he thought it could work at low altitude, just above water, with JATO and ram-jets. The ideal would be to put humans in harness with jet stilts."

RBF DEFINITIONS

"The sphere is complex unity and the triangle simplex unity. Here and here alone lie the principles governing finite solution of all structural and general systems theory problems. Local Isolations of infinite open-ended, plane and linear edged (seemingly 'flat' anti infinite) segments of what are, in reality, Vast spherical systems--- when taken out of context--- are hopelessly special-cased, indeterminate situations. '

"Unfortunately engineering has committed itself in the past exclusively to these locally infinite and inherently indeterminate systems and have had to rely essentially on the test proven, local behaviors of small systems such as columns, beams, levers, et. al., opinionatedly fortified with 'safely guesstimated'¹ complex predictions. Kot until we have universal finite, omnitriangulated. nonredundant, structural system comprehension can we enjoy the advantage of powerful physical generalizations concisely describing all structural behaviors."

XYZ Coordinate System, Jun*66

"Triangular Spiral Events Form Polyhedral Open triangular spirals may be combined to make a variety of different figures Note that the tetrahedron and icosahedron require both left- and right-handed (positive and negative) spirals in equal numbers, whereas the other polyhedra require spirals of only one-handedness. (See Sec. 452, Great Circle Railroad Tracks of Energy.) If the tetrahedron is considered to be one quantum, then the triangular spiral equahs one-half quantum. It follows from this that the octahedron and cube are each two quanta, the icosahedron five quanta, the two-frequency spherical geodesic is 15 Quanta."

Operating Manual for Spaceship Earth:

See Spaceship Earth, (c)

Operational:

'` The Greeks defined a triangle as an area bound by a closed line of three edges and three angles. A triangle drawn on the earth's surface is actually a spherical triangle described by three great-circle arcs. It is evident that the arcs divide the surface of the sphere into two areas each of which is bound by a closed line consisting of three edges

and three angles, ergo dividing the total area of the sphere into two complementary triangles. The area apparently 'outside' one triangle is seen to be 'inside' the other. Because every spherical surface has two aspects--- convex if viewed from outside, concave if viewed from within--- each of these triangles is, in itself, two triangles. Thus one triangle becomes four when the total complex is understood. 'Drawing' or 'scribing' is an operational term. It is impossible to draw without an object upon which to draw. The drawing may be by depositing on, or by carving away, that is, by creating a trajectory or tracery of the operational event. All the objects upon which drawing may be operationally accomplished are structural systems having insideness and out- sideness. The drawn upon object may be symmetrical or asymmetrical, a piece of paper or a blackboard system having insideness and outsideness."

- Cite RBF holograph revised caption for Synergetics Illustration, //1S (EJA Master Set), typed up 3 Jan'72. (Sees. 811, 812 +

Operational:

"!e cannot produce constructively and operationally, a real experience-augmenting operational system, with less than four points, i.e., a fourth point not in the piano of the first three points. It takes three points to define a plane. The fourth point not in the plane of the first three produces a tetrahedron having inside-ness and outsideness corresponding with the reality of operational experience."

- Cite SYNERGETICS draft "Antitetrahedron," 7 Oct. *71.

p. 1. (dictated to EJA.)

Operational;

"We got to that big definition of Universe and we discovered that it was the only way we could state it and be faithful to our rule of this game, which is what Bridgman called operational. that is, we must state whatever we have to state in terms of our personal experience. Some of the philosophers of a century ago were calling it pragmatism. At any rate they were stating what we know about our life in terms of a description of the events themselves, the most faithful description of the events themselves that precipitated any thought in any way we could think about it. Faithfulness of the description of our own experiences, so we were not interested in what somebody said they thought was significant."

Optical Motion spectra- H)

"There are a myriad of economic trends and other vital evolutionary events taking place today which are invisible to humanity only because they are too fast or too slow for man to apprehend and to comprehend them. We will be able to accelerate or decelerate such evolutionary events by electronic controls as played visibly as played on our football-field- sized playing surface.

"Humanity has a very limited optical spectrum, wherefore man can see today only one-millionth of the total physical 'reality' as the latter is evidenced by the full range of the electromagnetic spectrum, man used to think of reality as everything that he could sense with his eyes, ears, nose, taste, and touch. We have learned only since about 1930--- when the first technical chart of the great electromagnetic spectrum was published--- that man has sensorial tunability and is sensorially aware of only one millionth of physical reality. The little rainbow color band of human 'seeing' is less than one-millionth of the stretched-out reality of the invisible colors of all the 92 regenerative chemical elements of associative energy or of the various radiations"

- Cite SENATE HEARINGS,p.6, 4 Mar'69

Optical Motion Spectrum; (2)

"of energy in its disassociative phase.

"In addition to the electromagnetic frequencies spectrum we have also a motion spectrum. The sense of motion is produced by an overlapping continuity of afterimages of a plurality of optically tunable separate and sequentially occurring electromagnetic frequency events Just as music is produced for the hearing by a metrically momentum sequence of both separate and resonantly overlapped sound frequency notes. Motion is visual music made possible by the spontaneous retention in the brain of a series of separate still

picture® frames of our separate sense experiences scanned and reviewed in the brain at a vastly accelerated sequence rate. Our brain discovers that each successive electromagnetic picture is just a little different from the ones OH before and our dawning awareness of that increasing difference constitutes our motion sense."

"The overall range of our human motion spectrum is even more limited in respect to the full range of cosmic motions than is our optical frequency spectrum tunability in respect to the total electromagnetic spectrum. We can't see the atoms in"

- Cite SENATE HEARINGS, p.6, 4 Mar'69
Optical Motion Spectrum; (3)

"motion; we can't see the stars move, though their motions are thousandsfold faster than our fastest rockets; we can't see the trees grow; we can't see the hands of the clock move. Most important of all we cannot see the abstract weightless thoughts in the minds of other men. When we survey the total inventory of motions and informations which we can sense, we find it to be very limited. The significance of all the foregoing is appreciated when we realize that it is only by such phenomena as can be seen to be moving or changing by the public that are politically recognized and heeded. That is why public opinion and vote sampling has come into ever more reliable use.

**Our computerized world game is designed to accelerate the too slow and to decelerate the too fast of all the known vital trendings and thereby to bring them dramatically within popular consideration and our world game's solution. The game will show clearly how the trends will affect everybody's lives everywhere around Earth and how they could be taken advantage of in ways' favorable to all humanity.'*

Orbital Escape from Critical Proximity: {1j}

"Human mind, while discovering generalized principles, eternally persisted in special-case experience sequences, but has gradually developed the capability to employ those principles and then self into such acceleration as to escape the fall-back-in proclivity and to escape the general ecological fall-in program of invisible interorbiting regeneration.

"As each human being discovers self and others and employs more principles Ml more and more consciously to the advantage of others, the more effectively does the individual retain the integrity of his own unique orbiting in Universe, local though it may seem aboard our planet. Hit unique orbiting brings him into a vast variety of critical-proximity fall-ins. Fan has progressively acquired enough knowledge to raise his vision from the horizontal to the vertical, to stay first atop the watery ocean and next atop the airocean heights, and most recently to orbit beyond the biosphere with ever greater independence, with ever greater competence, and with ever greater familiarity with the reliability of the generalized principles."

Orbital escape from Critical Proximity: {2}

"Little individuals in orbit around little berry patches, fruit trees, nut piles, and fishing holes are instinctively programme i to pick up rocks and pile up walls around the patches, orchards, and gathering places. Some men floating on the waters and blown by the wind were challenged to respond to the accelerating frequency of stress and high-energy impacts, and they went into vastly longer orbital voyages. Others went into lesser and slower orbits on camels and horses, or even slower orbits on their own legs. The effect of human beings on other human beings is always precessional. All of us orbit around one another in ever greater acceleration, finally going into

greater orbits. The critical-proximity fall-in and its 99.9999 percent designed-in programming become longer in critical-proximity evidence, while all the time the apprehending and comprehending of the generalized principles elucidates their eternal integrity in contrast to the complex inscrutability of the local critical-proximity aberrations permitted and effected in pure principle whenever the frictional effect on the two stones lying before us overcomes their tendency to fall into one another--- with $\square\square$ QB naught else in Universe but two of tones--- which statement

- Cite SYNERGETICS text at Sec. 1009.72; RBF galley rewrite of 29 Lee'73

Qrbtlal. Escape frpm.CritlcalPrpxlmitj: (3)

"in itself discloses our proclivity for forgetting all the billions of atoms involved in the two stones, and their great electron orbits around their nuclei; guaranteeing the omniacceleration, yet synergetically and totally cohered by the mass-interattractiveness, which is always more effective (because of its finit&losures) than any of the centrifugal disintegrative effects of the acceleration. All the interaberrations imposed on all the orbits bring about all the wave-frequency phenomena of our Universe. The unique wave frequencies of the unique 92 chemical elements are unique to the local critical-proximity event frequency of the elemental event patternings locally and precessionally regenerated.

Finally, we must recall that what man has been calling 'linear.' is simply big orbit arc seemingly attained by escaping at 90 degrees from local orbit. There are only two kinds of acceleration, greater and lesser, with the greater being like the lesser, with the lesser being like the radius of the nucleus of an atom in respect to the diameter of its electron shell."

- Cite SYNEkGbTICb text at Sec. 1009.72; RBF galley rewrite of 29 Dec'73

Orbital Escape from Critical Proximity:

(4)

"Humanity at this present moment is breaking the critical- proximity barrier that has programmed him to operate almost entirely as a part of the ecological organisms growing within the planet Earth's biosphere. His visit to Moon is only symptomatic of his total, local social breakout from a land-possessing, fearful barnacle into a world-around-swimming ealmon. Some have reached deep-water fish state, some have become world-around migrating birds, and some have gone out beyond the biosphere. Long ago man's mind went into orbit to understand a little about the stars. And little man on little Earth has now accumulated in the light emanating from all the stars a cosmic inventory of the relative abundance of each of the 92 regenerative chemical Agents present in our thus-far-discoverdd billion galaxies Of approximately a hundred billion stars each, omnidirectionally observed around us at a radius of 11 billion light years. Man can always go into infinitely great, eternalorbit. Kind always has and always will.

Order:

"We become more aware of this uniqueness of organising principle in the Universe, in science. The long held myth that science wrests order out of chaos is fast disappearing in due ratio to the extent that all great scientists have found the Universe to exhibit an a priori orderliness. All the various specialties are discovering that their variously remote studies which seemingly 'ordered' local aspects of nature are converging within progressively simpler and more comprehensive patterns. The 'ordering' is coming together. When we refer to the computer and automation taking over we refer really to man's externalization of his internal and organic functions into a total organic system which we call industrialization. This metabolic regenerating automated organism is going to be able to support life in an extraordinary way. -The machines will increasingly assume various specialized functions. Man who was born spontaneously comprehensive but was focused by survival needs into specialization is now to be brought back to comprehensivity."

- Citation and context at Population Sequence (5), Feb*67

Order:

"Order is achieved through— positive and negative—
Magnitude and frequency controlled
Iteration
Of the successive steering angles.
We move by zig-zagging control
Aasar
From one phase of physical universe evolution to another."

- Cite HOW LITTLE, p. ?1.
- Also cite AAUW Journal, May *65.

Order:

"As man becomes less of a subconscious function in the universe,, which he has been, and consciously employs his faculty to differentiate experiences and to reassociate them in preferred ways, he will become more and more effective. By becoming more conscious and developing more and more orderliness, he simply discovers more facets of the universe Neither he nor the universe are getting more complex.« As he learns more, man is becoming more orderly, more understanding, and more understandable."

(The question was: "Do you believe the world is getting more complex?")

- Cite AAUW JOURNAL, Ray 1965, P. 176

Order;

"Order is achieved through positive and negative, magnitude and frequency-controlled alteration of the successive steering angle. We move by zigzagging control from one phase of physical Universe evolution to another."

from JOURNAL, T., 1965, T, 170

- Citation and context at Ruddering: Rudder Concept, May 1965

Order:

The "extraordinary world of weightless, Invisible waves is governed by mathematical laws and not by the opinions of men. The magnificent orderliness of that ever individually and uniquely patterning weightless wave universe is not of man's contriving. The infinite variety of evolutionary complexities, inherent to the orderliness of complementary principles operative in the universe, is of unending synergetic uniqueness."

- Cite MEXICO, p. 102, 10 Oct'63

Order:

"The actual fact is that each scientist penetrating into his own area, when he has made a discovery, has always discovered orderliness. Orderliness was a priori. There was no beginning of orderliness. He went from a rather rough disorderly hypothesis and had enough conviction to set up an apparatus to make an experiment and after the experiments were made he found orderliness. Now they are beginning to discover that gradually they are all coming into the same room, and all the orderliness is permeated, so the orderliness is all interrelated. They are suddenly coming into a comprehensive coordinate system employed by nature, which apparently, as far as any scientist could possibly tell you, if you were to talk comprehensively, has always been operative. There is no beginning about it."

- Cite Oregon Lecture #4, p. 128. 6 Jul'62

Order:

"I am not a creator. I am a swimmer and a dismitter of irrelevancies. Everything we need to work with is around us, although most of it is initially confusing. To find order in what we experience we must first inventory the total experiences, then temporarily set aside all irrelevancies.

I do not invent my thoughts. I merely separate out some local patterns from a confusing whole. The act is a dismissal of pressures. Flight was the discovery of the lift--- not the push."

- Cit Robt. W. Marks DYHAXION WORLD OF RBF, p.63, 1960

"Order *k* Disorder:

"Order is obviously the complementary, but not mirror-image of disorder."

- Citation and context at Svntropy k Entropy. 5 May'74

"...There is a great deal of difference Between absolute disorder, i.e., chaos, And the only one-sidedly considered, Relative asymmetry, whose pulsative balancing At a later time with other systems was not awaited By the too hasty and biased observer.

On the contrary, I am convinced By comprehensively considered experience That a total integrity of order prevails..."

- Cite BRAIN & MIND, p.91 toy '72
Order k Disorder:

"The seeming disorder of physical entropy is only superficial and explains why metaphysical thought can always find the orderliness which engulfs disorderliness. DiBorderliness is nonthinking.**

- Citation & context at Relationship Analysis Jun*66
RBF DEFINITIONS
Order & Disorder?

"Men of the Einstein Age are discovering the universal orderliness of constant, comprehensive transformation, utterly transcendental in the exquisite and magnificent orderliness of its wavelength and frequency when compared to the crude disorderly, conscious thinking and articulation of mere humans."

- Citation & context at New York City (12); 1964 ";/e don't have any idea of the relative depth of the heavens. The fact that the heavens seem to be a sort of array which we are familiar with is extremely deceiving. Where those stars really are we don't hardly know at all. They seem to be rather disorderly in the sky. They may be in fabulously orderly array if we were able to get better kinds of reports. ..hen we begin to get into the macrocosm this same kind of feeling about this disorderly chaos

obtained for a long time. Ken's minds have been confused and therefore they have thought of the Universe as confused. Not being a nonsimultaneously conceptual affair gets the human mind into a lot of troubles. «t any rate, man thought of the universe as chaotic. . . .

"We find that the portion of the Universe that is still chaos is rapidly diminishing. As fast as we get a telescope or microscope, the orderliness □ is discovered : and it begins to be fairly much in evidence that the Universe was at all times orderly. The only idea of disorderliness was in the human mind. «e are dealing in a finite Universe of extraordinary order and which was always orderly and the only thing which has ever been disorderly is in man's mind."

"... All of these specialists, we get more and more of them in there, and even though each one is getting finer and finer, each of them are shoulder to shoulder representing a larger and larger angle and they begin to overlap. I spoke of them all discovering themselves rally in the same Universe and they were not in separate departments of nature. They began then to have to divide up the work, and every one of them had made an important discovery, recognising that in his line he had discovered a greater orderliness operative in nature than he had supposed was there; and then they are finding an integrity of all those informations.

"... In the immediate decade ahead you are going to hear more and more from the world of science, stating that it is clearly discovering a comprehensive operational integrity, a very complex plurality of clearly differentiable principles, such as tension and compression that are complementary and utterly reliable in their total interactions and the whole thing Is clearly not something that has come out of the ooze at all but the pure principles were generalizable and of no weight at all. The principles were always there and the generalizable had nothing to do with the special case. The generalized was?

Outlaw;

"Three-quarters of the spherical Earth's surface is water and men's dry-land-made laws were unenforceable upon the seas. Those whose lives were lived on the sea lived outside any manmade laws and were inherently * outlaws_T' not because they flouted other men's laws, but because they lived and operated where only the physical laws of Universe were enforced. And those laws of nature were often formidably harsh. The sailormen had to take the initiative moment upon moment, and with keenest logic, else they perished. But the sailormen of Penobscot Bay addresses as 'Darling*' or 'Dear' all young people both of its own family or of the stranger's family. He didn't learn to do so from Hollywood's people. The 'Darling*' custom antedates Hollywood by at least several centuries. The custom developed, we may guess, from the coastal-fisherman's throttling to idling speed his otherwise powerful and incisive capabilities. Getting angry at hurricanes won't save you. 'Easy does it ' they say,"

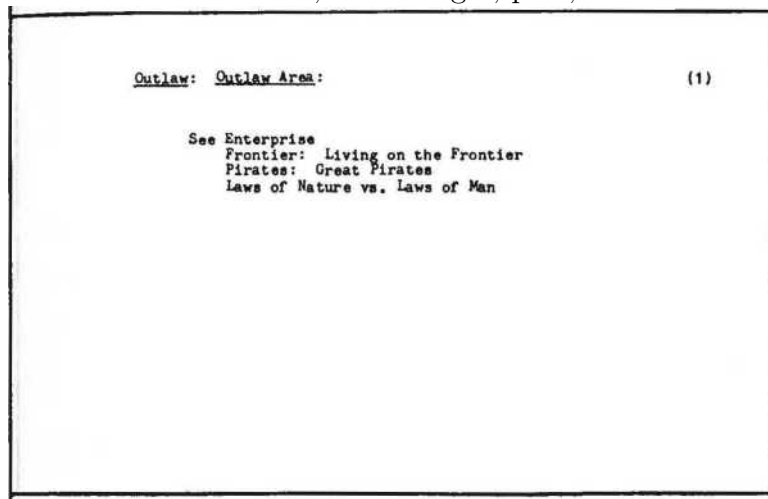

- Cite BEAK ISLAND LTUKY, galley p.1'7, 1968

The Outlaw Area:

". . . Since the last ice age three-quarters of the Earth has been water, and of the one-quarter that is land very little has been lived on. Ninety-nine percent of humanity has lived on only about five per cent of the Earth--- a few little dry spots. Now, the law has always been applicable only to this five per cent of the Earth, and anyone who went outside of it--- the tiny minority who went to sea, for example--- immediately found himself outside the law. And the whole development of technology has been in the attlaw area, where you're dealing with the toughness of nature. T find this fascinating and utterly true. All improvement has to be made in the outlaw area. You can't reform man, and you can't improve his situation where he is. But whehw you've made things so good out there in the outlaw area that they can't help being recognized, then gradually they get drawn in and assimilated. . .

"A good example of what I mean is going on right now in the space program . . . where there's no atmosphere and no water and no sewer lines and no berries to eat, for the first time in history you have to look out for man. Inadvertently, man is trying for the first time to learn how to make man a success. It-'s inadvertent, but it's being done."

Package:

"We package our foods coming inbound: 'Why don't we package them going outbound? It's just exactly as easy. When nature takes so much trouble to separate liquids and solids it is preposterous to put them together again."

- Citation 4. context at Wichita House, (1) (2), 31 Jan'75

RBF DEFINITIONS

Package:

`` Radiation is always packaged... All the quanta are local- system, center-of-event activity, focal points--- fractionations of the whole point: what are minimally, ergo most economically packaged, and expanded outwardly and omnidiametrically as three-central-angle-defined tetrahedra."

Citation and context at
tv of Universe.

2) Sep*73

Package:

"In the quantum and wave phenomena we deal with individual packages. We do not have continuous surfaces. In synergetics we find the familiar practice of second powering displaying a congruence with the points, or little separate energy packages of the shell arrays. Electromagnetic frequencies of systems are sometimes complex, but they always exist in complementation of gravitational forces and together provide prime rational integer characteristics in all physical systems. Little energy actions, little separate stars: this is what we mean by quantum. Synergetics provides geometrical conceptuality in respect to energy quanta."

- Cite SYNERGETICS draft at Sec. 964.33-, 17 Nov'72

Parable:

"Playboy: 'But since you mentioned Adam and Eve a moment ago, let's take the Garden of Eden as a parable and ask if the element of man's will mightn't make him a stranger to this universal perfection. Couldn't the Scenario Universe be a tragedy as far as human affairs are concerned?'"

"Fuller: 'In the first place I don't take anything arfa parable. I'm interested in stories if I can understand them, but I don't use fiction as the basis of doing any strong thinking, •specially wheh it comes to such matters as •man's will.' I think we'd better not assume that what we've been told about the Garden of Eden has any validity whatsoever. I don't think there was a Garden of Eden, and I don't think there was an Adam and Eve, and I don't think Eve was born out of Adam's rib. So I can't accept the parable. '"

Parallax:

"When the relative circle size in respect to the observer is of macro-differential magnitudes, such as that of the circumference of the galactic system in respect to each planet observer, then the central-angle magnitude of the subtended macrocosmic arc becomes undetectable and the astronomer and navigator assume parallelism—parallax— to have set in, which produces a constant factor of error which must be incorporated in mathematical formulation of system descriptions. In quantum accounting and analysis of energy events and transformative transactions, this parallelism separates one quantum tetrahedron from its three surrounding tetrahedra."

(D

"One of the most interesting things about the modern chemistry and physics is that men have discovered that there are no things, there are no small particles. The physicist deliberately misleads society by using-the ,words 'solid state*' and things like that and-by still using the word particle. .. he may say that of course, he doesn't mean anything by it, but he just doesn't know what else to call it.. He is so busy with his work that he doesn't want to bother with semantics so he aalls it a particle. There is some kind of local preoccupation here and we just call it particle. We identify it as special local behavior. It is a special local behavior but it is pure principle, such as the wave concent. It has no weight whatsoever. . .

"a'e well then® get in to what we call the nucleus, the positive particles if you want to call them that. 3ut it has since been discovered that every one of them has an antiparticle. All the negative particles have negative weight and so you have neutrons, positrons, and so on: you have positives, and negatives and neutrals. The sum total of

- Cite Oregon Lecture #4, p.123, 6 Jul'62

"all the fugitive weights and all the negative weights is »ero. You are dealing in pure principle. This is the actual fact. And it is weightless. There is no smallest thing.

There are very minute energy events in pure pattern, but they are pure pattern--- Just as the knot was not a rope but a pure regenerative principle. The wave was not the water or the milk or the kerosene. The quantum in wave mechanics is simply the way we deal with these pure principles in an absolutely weightless manner."

KBF DEFINITIONS

Patent:

*A basic patent mist be statable In one line. That's the nark of an
original invention.**

- Cite HBF to 8JA, 3200 Idaho, WaA.DC, 16 Dec>73

KBF DEFINITIONS

Patent:

"Patent law and precedence requires specific choices of technical
way* and mean* for each patent claim. A number of claims can be
filed covering alternate realization* of the same invention. Overall
legal costs per patent are so high that usually but few of the alternate
realizations are covered, the most economical under the contempo-
rary economical conditions being hopefully selected by the inventor.
..."

- Citation and context at Inventability Sequence (2), 9 Jul'73

Patent:

"It is interesting that the Russians go along with the old patent idea. You can't apply for one; the government simply awards it at the point when it comes into use. And if the invention is so good that it gets adopted within 12 months, they award a patent and a patent in Russia gives the individual the right to go into any establishment and look things over and see what he might do; it gives him the right to ride wherever he wants on the transportation system; it is really a more effective thing than what we have here. He gets a fundamental advantage and an actual payment.

"It's interesting that the idea of giving Inventors some advantage persisted from the old feudal monarchies through democracy and into communism.

"A patent in the United States is just a license to sue. There have been over 300 licenses of geodesic domes and over 50 have been to big, major corporations. Every time their patent attorneys would come to mine, saying of course we'd like to get around your patent but it's too well written, so we have to come to you.... You absolutely have to have a world patent; a U.S. patent is useless."

- Cite RBF to Barry Farrell; Bear Island; Tape #8, Side A, transcript p.5; 22 Aug '70

Patent:

"In general, it can be said that patents are never granted for covering fundamental principles of nature. You cannot patent any unique geometry. I have a great many patents and none of them are granted in the terms

of the specific mechanical, structural, and chemical technology employed to realize an interaction of a plurality of principles,

"It is also necessary that there be a fundamental surprise quality in an invention. Though patents can be secured from the patent office, they hold up in court when this fundamentally unique and illusive quality of surprise is undeniably present..□

"I am saying these many things to you not with the idea of discouraging you as an inventor but to save you money in your patent work. I have always found it a great help to have powerful patent searches made. They often disclose earlier invention in areas where I had thought myself to be the inventor. I never let an earlier invention discourage me, but I do not want to kid myself into thinking I am an inventor when I am not."

- Cite RBF Ltr. to Steve Baer, 19 Apr'66

Patent

"The patent examiner's actions of one-third of a century call for subdivision because there is no comprehensive dynamic class of functioning environment valve.

"This is the case for simplicity in legal action where the simplest rather than the most complicated documents are most effective and most costly. The criterion for a basic

patent is one of approximately one sentence, or one line in length--- ergo, most far-reaching and of highest value, and resultant to the largest experience, and greatest breadth and penetration of thought and therefore resultant to greatest experience--- which is basic cost, ergo, most costly; but because of its end result being mistaken by the many for the just naturally obvious simplicity and therefore of negligible cost." °

Pathology: Preventive vs. Curative: (1)

"Nobody seemed to know where the housing traditions and the diseases they bred came from and why they were going on. I could not seem to be able to maintain health conditions as I wanted them in the kind of rentals I could afford, and I blamed it very much on housing. The more I saw of the housing world the more it seemed to me that about this great ignorance much could be done if we could think of our whole economics in the terms of preventive pathology instead of curative pathology. In our curative pathology we wait until somebody is very sick, and if they are lucky they might be able to get the right drugs from the research institute. I am talking of the picture of 1927.

"This present war has, however, seen an enormous advance in these curative matters. One of our boys here today had an infection in his nose which started in his eye the day before yesterday. They rushed him to the hospital and they gave him penicillin. He is all right now.

It might have been a fatal case a few years ago, since the infection would have gone right up into his brain. It is just wonderful; but that has happened now in 1946. War releases an enormous amount of technology, and that is at least one benefit showing up."

- Cite DESIGNING A NEW INDUSTRY, (RBF Reader, pp.153.15U 1946
Pathology; Preventive vs. CuratITO;
(2)

"But that came as a remedial form of pathology.

"If we were really to attempt preventive pathology, we would question how these things got started and, it seemed to me in 1927, we would learn to measure and to adopt the enormous amount of data being sent down by technologists everywhere relative to measurements of man's Universe and man himself and the forces seeking to destroy him and we would try to build in advance a form of environment control for man that would be both occupationally, in the manufacture of this environment control, and equally, in its end use, prevent much of the present inroads of physical and mental and moral diseases into good health and well-being and general happiness."

Pattern:

"Kepes at M.I.T. made a beautiful demonstration that the scientist's and artist's need to articulate. He took hundreds of eight by ten black and white photographs of modern paintings and shuffled them thoroughly with photographs taken by scientists through microscopes or telescopes of all manner of natural phenomena: sound waves, chromosomes, and such. The only way you can classify photographs with nothing recognizable in them is by your own spontaneous pattern classifications. Group the mealy, the blotchy, the striped, and so forth. The pattern groups of photographs were put on display. The artists' work and the scientists' were indistinguishable. Checking the data, it was found that the artist frequently conceived of a pattern in his imagination before the scientist found it in nature. Science began to take a new view of artists."

"Out of multi-overlaid experience pattermings there sometimes emerges an awareness of what we may call a coincidence pattern--- a localized thickening of points. These emergent patterns of frequency congruences and concentrations display a unique configuratlon-MHHH -Integrity which has up to now been so dilute in any one experience as to be only invisibly common to many differentiated or special experiences, e.g., a pack of one hundred 4-inch by 5-inch file cards each riddled with hundreds of different sized IMMA small holes. Each card appears to be chaotically patterned with holes. However, when the cards are stacked with edges aligned three holes in each card are vertically aligned; all others are obscured by blank spaces on one card or another. A triangular pattern relationship of

the light coming through three tubes in the stack of cards is now lucidly conceptual. To such persistently emergent, uniquely mutual, coincidence-patterning relationships as the same triangle array of holes in each and every card we may apply the term * pattern generalization¹ as used in a mathematical sense, in contradistinction to the word 'generalization' as used in the literary sense. The latter often means a too-ambitious subject range which consequently permits only superficial considerations of any specific case □Idata."

- Cite INTRODUCTION TO OMNIDIRECTIONAL HALO, pp.118-119, 1959
Pattern freralization: (2)

"When the uniquely emergent generalised patternings become describable by us in mentally regenerative conceptual terms, as completely divorced from any one of the specific sensorial conditions of any of the special experiences out of which they emerged, yet apparently, as seen in retrospect, to have been persistent in every special case, then we may tentatively assume such unique mutual pattern content to be a generalized conceptual principle, as for instance the conception of tension as opposed to compression, independent of textures, smells, colors, sound, or size, or any one tension-dominated experience,"

flmorn Xatwltr (A)

"No longer do I want to talk about the chemical elements as things but as pattern integrities. Each one of them is a unique pattern integrity... in a sense a form of knots. So we get where there are chemical compounds and the knots tend to be Interlinkable and they will catch on one another. This one is holding together, all right, but this ball of twine and this ball of twine, suddenly one weaves into the other every so often and associates...

"One of the interesting things I have found to consider about humanity, whereas each one of us weighs in at an average of seven pounds--- there is a pattern integrity that is very extraordinary, because no sooner is a child born than people say, •That is Aunt

Mary,' and so forth. There are certain strange pattern characteristics that suddenly reappear. And it is not just that there are species, that they are human--- I don't think people tend to do this too much, but they do, even in hybrids of plants--- to bring out the red and the white, split petal, or whatever it may be. At any rate, we say 'Tmhere is Aunt Mary,' and probably when it only weighed one ounce it still had Aunt Mary in there."

pattern integrity.: (B)

"There is some pattern integrity that came in in a family--- absolutely discontinuous, because Aunt Mary had absolutely nothing to do with this wedding. She was just Aunt Mary, and there is some Aunt Mary in this child, all right. I call that pattern integrity quite independent of the relative size--- whether it is the one ounce size, or the seven pound size, or the 70 pound size--- because later on it gets to be 70 pounds--- then it gets to be 170, and then it had better watch its Me-tracal. There is a pattern integrity which is something independent of weight; and each human being is an extraordinary complex of these pattern integrities."

- Cite Oregon Lecture #5, p.166, 9 Jul»62

Pattern InUKritYi AXgmic Knots:

"Each of the chemical elements is a unique complex pattern of energy event interrelatednesses which interact inter-inter-feringly to continually relocalize the involved quantity of energy. These self-interference patterns of atomic element components are in many ways similar to the family of knots that are tied with rope by sailors to produce various local behaviors, all of which, however, result in further contraction of the knot as the two ends of the rope immediately outside the knot are pulled away from one another by forces external to the knot--- and thus all the attractive forces of Universe operating upon the atoms may result precessionally in keeping the atomic knots pulled together."

Pauline. Linus;

"After X-ray diffraction in 1932, Linus Pauling who received the Nobel Prize for his pioneering exploration of chemical structuring, began to discover that metals were also / see Janet Hoff, 1965.7 tetrahedrally coordinated and interlinked, not point-to-point but through one another as chains are linked with dynamically coordinate or coincident gravitational centers. If we think of six-edged chain links (Tempering

that the tetrahedron is a six-edged pyramidal frame we can envision the manner in which we may link tetrahedra in six different directions. That multidirectional connectivity explains the way in which metals are linked together."

a Cite Conceptuality of Fundamental Structures (Kepes), p.72-76, 1965

"When you get to the reconstructs from x-ray diffraction, Linus Pauling began to discover that all the metals were tetrahedrally organized, but instead of being vertex to vertex they were center of gravity to center of gravity. ... An alloy could be stranger where you had congruent centers of gravity--- that was a characteristic of metals, In fact, because the tetrahedron has six edges you could chain or link it in six ways to six others and they would not be vertex to vertex but edge to edge as linkage. So the metals were tetrahedrally organized too and Linus Pauling went on examining metal after metal. He has never found a metal yet which is not tetrahedrally organized.** - Cite Oregon Lecture #2, pp.74-75, 2 Jul*62

Perceptual Peephole as Fraction of Reality:

RbF DEFINITIONS

"How did the Universe come into being with its complete integrity, its comprehensively interaccommodative, omnidifferentiated rates and methods of transforming? Such questions remain ever more importantly unanswered and seemingly unanswerable. Yet, all of our present customs, ways of thinking, and means of communication have been developed under the misapprehension that only the minuscule, millionth part of the Physical Universe, which the peepholes of our perceptual senses reveal, comprises the whole of

reality. Because humanity has deliberately fractionated the formal study of residual reality into ever more minute specializations, which continually know more and more about less and less, the residual preoccupations have lost sight completely of any of the comprehensive and infinitely inspirational mystery of totality. First pragmatism, then utter despiritization, have resulted. It is not God who died. It was sophisticated man who died, choked to death by the ever-tightening noose of specialization--- 'enlightened selfishness.'"

Mathematical concepts of group phenomena may be acquired in principle by the willingness (subjectively initiated) of the individual to be governed by the integrity of progressive conceptioning principle— the objective synchronisations are implicit and unavoidable competence and comprehensive, realizable design will result. Let us MB pursue further the conceptioning in specifics of group principle.

"It is not difficult to understand that the trends to synchronization by harmonic interval of one collection of events can seemingly and sum-totally create an aspect of such superficial incongruity in respect to the sumtotal collected harmonic events of other phases of functional disposition, of the differentiable Universe, as to predispose us to assume that there might never be synchronization of one major collection with another, rfe obviously incline to this predisposition by virtue of the persistence of the familiar in our own environmental close-up--thought, which causes the dynamic inter- penetrations to appear as a static, rather than as a periodic- continuity environment reality.

- Cite TOTAL THINKING, I t I, pp.237-238, May'49

"Misapprehension of our own dynamic significance becomes in environmental close-ups a bundle of persistent periodicities developing into a spontaneous anticipation of repetition of harmonic intervals and their familiar synchronization.

"So marked is our proclivity for such anticipation that we set ourselves as though we were alarm clocks to waken at specific blocks of intervals of familiar periodicities of experience. We relate our own heartbeat to minutes of hours of days, and our meals--- or chemical fueling--- to the days of the postman's coming and going, and even to periodicities such as invented Father's Days and other soon-familiar invented conventions , of the persistent, complex periodic continuities of our days into years. The invented periodicities may become only monotonous.

"Life in retrospect, however, may be informatively discovered to have been comprised of a progressive series of interruptions and penetrations of the successively latest a priori environment continuities--- by unfamiliar frequencies or biodynamic groups of frequencies, always occurring as unfamiliar to the ignorantly accepted trend to mono-tony.

- Cite TOTAL THINKING, licl, p.238, Kay*49

'The new event always comes as an harmonic interruption of frequencies, or an interference with the increasing inventory of already assimilated synchronizations (up to the latest instant), which have only become obvious by virtue of the spontaneous synchronization of the sum total of acquired experiences and progressively integrated interruptions.

"It is necessary that the comprehensive realizer ascertain in principle how the mathematical proportioning of experience is persuasive to the erroneous concept that the sum total bundle of already-experienced frequencies constitutes so unified, or well synchronized an experience i4iole as to have seemingly always been 'known.* The comprehensive realizer will discover that his adequacy as rearranger of local Universe, in principle, will, if competently effected, be acquired by men as an obvious accretion, and that the more competent his realizing-rearrangements of design, the less grateful the beneficiaries, which will be precisely the objective of the comprehensive realizer.
